INTRODUCTION TO EDITION XI

This list is presented as a spelling guide for validly published taxa accepted at the Bromeliad Identification Center. The list contains the following information:

- 1) Genus number (the left-hand number) based on the systematic sequence published in the Smith & Downs monograph: Bromeliaceae (Flora Neotropica, number 14, parts 1-3; 1974, 1977, 1979). Whole numbers are as published in the monograph.
- 2) Species number (the second number) according to its systematic position in the monograph.

Note: Taxa not included in the monograph or that have been reclassified have been assigned numbers to reflect their systematic position within the Smith & Downs framework (e.g., taxon 14.1 is related to taxon 14). The utility of this method is that one may assume for example that *Tillandsia comarapaensis* (150.2) is related to *T. didisticha* (150) and therefore may have certain horticultural qualities in common with that species.

- 3) Genus and species names follow the respective numbers.
- 4) Subspecific taxa (subspecies, varieties, forms) names are indented below the species names.

Note: Variety "a" (the type variety) is not listed unless it contains a form (see *Aechmea caudata*). Similarly, the type form is not listed.

- 5) Author name follows the specific and subspecific names. These names are included for the convenience of specialist users of the list.

This list does not contain publication data or synonymy, as it is not our intent for it to be a technical nomenclatural guide. Also, horticultural hybrid and cultivar names are not included.

Nomenclatural problems continue to plague the resurrected genus *Pepinia*. A number of taxa (marked with **) that appear to belong in *Pepinia* have never been formally transferred from *Pitcairnia*. All taxa with a valid name in the genus *Pepinia* are listed as *Pepinia*; those without (mostly subspecific taxa), remain in the genus *Pitcairnia*. The genus *Pepinia* comprises the species of *Pitcairnia* with the numbers 1 through 40. We trust that these temporary distractions will not take away from the utility of the list as a guide to proper spelling of epithets and authors.

**This list enumerates 3172 species
of bromeliads among 58 genera
and 2 nothogenera.**
