## Abstract

We give a short proof of a recent inequality of Audenaert, Datta and Ozols, and determine cases of equality.

## 1 Introduction

Let X and Y be independent  $\mathbb{R}^n$  valued random variables with probability densities  $\rho$  and  $\sigma$ respectively. For any  $\theta \in (0, \pi/2)$ , a simple calculation shows that the sum  $\cos \theta X + \sin \theta Y$  has the density

<span id="page-0-0"></span>
$$
\rho \star_{\theta} \sigma(x) := \int_{\mathbb{R}} \rho(x \cos \theta + y \sin \theta) \sigma(-x \sin \theta + y \cos \theta) dy . \tag{1.1}
$$

If  $U_{\theta}$  is the orthogonal transformation on  $\mathbb{R}^{2n}$  given in block form by  $U_{\theta} = \begin{bmatrix} \cos \theta \mathbb{1} & -\sin \theta \mathbb{1} \\ \sin \theta \mathbb{1} & \cos \theta \mathbb{1} \end{bmatrix}$  $\sin \theta \mathbf{1}$   $\cos \theta \mathbf{1}$ 1 , we can rewrite  $(1.1)$  as

$$
\rho \star_{\theta} \sigma(x) := \int_{\mathbb{R}} \rho \otimes \sigma(U_{\theta}(x, y)) dy . \qquad (1.2)
$$

Every probability density  $\rho$  on  $R$  that has a finite second moment has a well-defined entropy  $S(\rho)$  given by  $S(\rho) = \int_{R} \rho \log \rho(x) dx$  with  $S(\rho) \in [-\infty, S(\gamma_{\rho})]$  where  $\gamma_{\rho}$  is the centered Gaussian

density with the same variance as ρ. One form of Shannon's Entropy Power Inequality, first proved by Stam [\[8\]](#page-3-0), is that for all  $\rho$  and  $\sigma$  with finite variance, and all  $\theta \in (0, \pi/2)$ ,

<span id="page-1-0"></span>
$$
S(\rho \star_{\theta} \sigma) \ge \cos^2 \theta S(\rho) + \sin^2 \theta S(\sigma) \tag{1.3}
$$

For a different proof, see [\[6\]](#page-3-1).

Several authors [\[1,](#page-3-2) [4\]](#page-3-3) have recently investigated quantum analogs of the entropy power inequality. Let H be a separable Hilbert space. Let U be any unitary operator on  $\mathcal{H} \otimes \mathcal{H}$ , and let  $\rho$ and let  $\rho$  and  $\sigma$  be two density matrices on H; i.e., positive trace class operators on H. Then the operation

$$
(\rho,\sigma)\mapsto \mathrm{Tr}_2[U^*(\rho\otimes \sigma)U]
$$

where Tr<sub>2</sub> is the partial trace over the second factor on  $\mathcal{H} \otimes \mathcal{H}$ , provides general quantum analog of the classical scaled convolution operation in [\(1.3\)](#page-1-0). To get a closer analog, for which one can prove an analog of the Entropy Power Inequality  $(1.3)$ , one must make a choice of U that is somehow analogous to the classical rotation in [\(1.3\)](#page-1-0). There is a natural way to do this for a system of n bosons, and the quantum analog of  $(1.3)$  was proved in this setting by König and Smith [\[4\]](#page-3-3), using a quantum implementation of the method of Stam  $[8]$ . In their setting, the Hilbert space  $\mathcal H$  is infinite dimensional. More recently, Audenaert, Datta and Ozols have sought and proved  $[1]$ an analog of  $(1.3)$  that does not require the structure associated to a system of n bosons for its formulation, and is valid for any pair of density matrices on any separable Hilbert space H.

Let  $\mathcal H$  be any separable Hilbert space, possibly but not necessarily finite dimensional. Define the swap operator S on  $\mathcal{H} \otimes \mathcal{H}$  by  $S(u \otimes v) = v \otimes u$ . S is self adjoint and unitary, and for each  $\theta \in [0, \pi/2]$ ,  $\cos \theta \mathbb{1}_{\mathcal{H} \otimes \mathcal{H}} + i \sin \theta S$  is unitary. To simplify the notation in what follows, we define  $\sqrt{t} := \cos \theta$  so that for  $\theta \in (0, \pi/2)$ ,  $\sin \theta = \sqrt{1-t}$ . For each  $t \in [0, 1]$ , define

$$
U_t = \sqrt{t} 1_{\mathcal{H}\otimes\mathcal{H}} + i\sqrt{1-t} S . \qquad (1.4)
$$

Then as t varies between 0 and 1,  $U_t$  provides a continuous unitary interpolation between the identity and the swap operator S. Hence, for  $t \in (0,1)$ ,  $U_{\theta}$  may be thought of as a *partial swap*. See [\[1\]](#page-3-2) for the phyical context. For any two density matrices  $\rho$  and  $\sigma$  on  $\mathcal{H}$ , and any  $t \in [0,1]$ , define

$$
\rho \star_t \sigma = \text{Tr}_2(U_t(\rho \otimes \sigma)U_t^*) \ . \tag{1.5}
$$

A straightforward computation yields the explicit formula:

<span id="page-1-2"></span>
$$
\rho \star_t \sigma = t\rho + (1 - t)\sigma + i\sqrt{t(1 - t)}[\rho, \sigma]. \qquad (1.6)
$$

For a density matrix  $\rho$  on H, let  $S(\rho) := -\text{Tr}[\rho \log \rho]$  be the von Neumann entropy of  $\rho$ . Audenaert, Datta and Ozols prove [\[1\]](#page-3-2) the following analog of [\(1.3\)](#page-1-0):

<span id="page-1-1"></span>
$$
S(\rho \star_t \sigma) \ge tS(\rho) + (1-t)S(\sigma) \tag{1.7}
$$

In  $[1]$ ,  $(1.7)$  is by means of a *majorization inequality*; see  $[7]$ : Given two monotone non-increasing sequence  $\{\kappa_j\}$  and  $\{\lambda_j\}$  of non-negative numbers with  $\sum_{j=1}^{\infty} \kappa_j = \sum_{j=1}^{\infty} \lambda_j < \infty$ , then  $\{\kappa_j\}$  is

majorized by  $\{\lambda_j\}$  if and only if for all  $k \in \mathbb{N}$ ,  $\sum_{j=1}^k \kappa_j \leq \sum_{j=1}^k \lambda_j$ , in which case we write  $\{\kappa_j\} \prec \{\lambda_j\}.$ 

A theorem of Hardy, Littlewood and Pólya  $[2]$  and Karamata  $[3]$ , extended to infinite se-quences in [\[5\]](#page-3-7), says that  $\{\kappa_j\} \prec \{\lambda_j\}$  if an only if there is a doubly stochastic matrix  $S(S_{i,j} \geq 0)$ and  $\sum_{j=1}^{\infty} S_{i,j} = \sum_{j=1}^{\infty} S_{i,j} = 1$  for all  $i, j$  such that  $\kappa_i = \sum_{j=1}^{\infty} S_{i,j} \lambda_j$  for all j. Then by the strict concavity of  $h(x) = -x \log x$  on [0,1] we have the following: When  $\{\kappa_j\}$  and  $\{\lambda_j\}$  are two non-negative non-increasing sequences with  $\sum_{j=1}^{\infty} \kappa_j = \sum_{j=1}^{\infty} \lambda_j = 1$ , and  $\{\kappa_j\} \prec \{\lambda_j\}$ , then  $-\sum_{j=1}^{\infty} \kappa_j \log \kappa_j \geq -\sum_{j=1}^{\infty} \lambda_j \log \lambda_j$ , and when  $\sum_{j=1}^{\infty} \lambda_j \log \lambda_j < \infty$ , there is equality if and only if  $\{\kappa_j\} = \{\lambda_j\}.$  For any non-negative compact operator A on H, let  $\lambda_j(A)$  denote the jth largest eigenvalue of A, with the eigenvalues repeated according to their multiplicity. The first part of the following theorem is proved in  $[1]$  by a much longer argument.

<span id="page-2-0"></span>**1.1 THEOREM.** For any two density matrices  $\rho$  and  $\sigma$  on  $\mathcal{H}$ , and any  $t \in [0,1]$ , let  $\rho \star_t \sigma$  be given by  $(1.6)$ . Then

<span id="page-2-1"></span>
$$
\{\lambda_j(\rho \star_t \sigma)\} \prec \{t\lambda_j(\rho) + (1-t)\lambda_j(\sigma)\} \ . \tag{1.8}
$$

Moreover,  $\{t\lambda_j(\rho) + (1-t)\lambda_j(\sigma)\} = \{\lambda_j(\rho \star_t \sigma)\}\$ if and only if there is an orthonormal basis  $\{\phi_j\}$ of H such that  $\rho \phi_j = \lambda_j(\rho) \phi_j$  and  $\sigma = \lambda_j(\sigma) \phi_j$  for each j.

By Theorem [1.1](#page-2-0) and what we have said about majorization and  $h(x) = -x \log x$ ,

$$
S(\rho \star_t \sigma) \ge -\sum_{j=1}^{\infty} h(t\lambda_j(\rho) + (1-t)\lambda_j(\sigma)) \ge
$$
  
- 
$$
t \sum_{j=1}^{\infty} h(\lambda_j(\rho)) - (1-t) \sum_{j=1}^{\infty} h(\lambda_j(\sigma)) = tS(\rho) + (1-t)S(\sigma), \quad (1.9)
$$

and this proves  $(1.7)$ . If there is equality in  $(1.7)$  and the left side is finite, then by Theorem [1.1,](#page-2-0) there is an orthonormal basis  $\{\phi_j\}$  of H such that  $\rho \phi_j = \lambda_j(\rho) \phi_j$  and  $\sigma = \lambda_j(\sigma) \phi_j$  for each j. Since the second inequality in [\(1.9\)](#page-2-1) must also be saturated, it must be the case that  $\lambda_i(\rho) = \lambda_i(\sigma)$ for each j, and hence  $\rho = \sigma$ . Thus our statement about cases of equality in Theorem [1.1](#page-2-0) implies that finite equality holds in [\(1.7\)](#page-1-1) if and only if  $\rho = \sigma$ .

We now give a very short proof of Theorem [1.1.](#page-2-0) The second part, on cases of equality, is new. The heart of the matter is the following lemma.

<span id="page-2-3"></span>**1.2 LEMMA.** For all non-negative compact contractions A and B on  $\mathcal{H}$ , and all  $t \in (0,1)$ , let  $A \star_t B := tA + (1-t)B + i\sqrt{t(1-t)}[A, B]$ . Then  $\lambda_1(A \star_t B) \leq t\lambda_1(A) + (1-t)\lambda_1(B)$ . There is equality if and only if there is a unit vector  $\phi \in \mathcal{H}$  such that  $A\phi = \lambda_1(A)\phi$  and  $B\phi = \lambda_1(B)\phi$ .

Proof. To prove the inequality, it suffices to show that

<span id="page-2-2"></span>
$$
[t\lambda_1(A) + (1-t)\lambda_1(B)]\mathbf{1} - A \star_t B \ge 0.
$$
 (1.10)

Define

$$
X = (\lambda_1(A)1 - A)
$$
,  $Y = (\lambda_1(B)1 - B)$  and  $Z = \sqrt{t}X + i\sqrt{1 - t}Y$ . (1.11)

Note that  $i\sqrt{t(1-t)}[A,B] = i[\sqrt{t}X,\sqrt{1-t}Y] = -ZZ^* + tX^2 + (1-t)Y^2$ . Therefore, the left side of [\(1.10\)](#page-2-2) can be written as  $t[X - X^2] + (1 - t)[Y - Y^2] + ZZ^*$ . Since  $0 \le X, Y \le 1, X - X^2 \ge 0$ and  $Y - Y^2 \geq 0$ , and this proves [\(1.10\)](#page-2-2).

For the cases of equality, suppose that  $\phi$  is in the null space of  $t[X - X^2] + (1-t)[Y - Y^2] + ZZ^*$ . Then  $\langle \phi, [X - X^2] \phi \rangle = 0$ , and hence either  $X\phi = 0$  or  $X\phi = \phi$ , and likewise for Y in place of X. Then if either  $X\phi = \phi$  or  $Y\phi = \phi$ , then  $||Z^*\phi|| \ge \sqrt{t(1-t)} ||\phi||$ , so if  $\phi \ne 0$ ,  $X\phi = Y\phi = 0$ , and this proves the statement about cases of equality.  $\Box$ 

*Proof of Theorem [1.1.](#page-2-0)* For any  $k \in \mathbb{N}$ , let  $\bigwedge^k \mathcal{H}$  denote the antisymmetric k-fold tensor product of H. For any bounded operator A on H, define the operator  $a^{[k]}$  on  $\bigwedge^k \mathcal{H}$  by

$$
A^{[k]}(v_1,\wedge\cdots\wedge v_k)=(Av_1\wedge v_2\wedge\cdots\wedge v_k)+(v_1\wedge Av_2\wedge\cdots\wedge v_k)+\cdots+(v_1\wedge\cdots\wedge v_{k-1}\wedge Av_k).
$$

If A is self adjoint, non-negative and compact, so is  $A^{[k]}$  and  $\lambda_1(A^{[k]}) = \sum$ k  $j=1$  $\lambda_j(A)$ . In particular, if

A is a density matrix, then for all  $k \in N$ ,  $A^{[k]}$  is a non-negative contraction. Also, for any bounded operators  $A, B$  on  $H, [A^{[k]}, B^{[k]}] = [A, B]^{[k]}$ .

It now follows from Lemma [1.2](#page-2-3) that for any density matrices  $\rho$  and  $\sigma$ , the sequence  $\{\lambda_i(\rho \star_t \sigma)\}\$ is majorized by the sequence  $\{t\lambda_j(\rho)+(1-t)\lambda_j(\sigma)\}\$ , and moreover, if  $\sum_{j=1}^k \lambda_j(\rho \star_t \sigma) = \sum_{j=1}^k (t\lambda_j(\rho) +$  $(1-t)\lambda_i(\sigma)$  for each k, then  $\rho$  and  $\sigma$  have a common eigenvector basis  $\{\phi_i\}$  such that  $\rho\phi_i = \lambda_i(\rho)\phi_i$ and  $\sigma = \lambda_j(\sigma)\phi_j$  for each j.
