Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: Allemani C, Matsuda T, Di Carlo V, et al. Global surveillance of trends in cancer survival 2000–14 (CONCORD-3): analysis of individual records for 37 513 025 patients diagnosed with one of 18 cancers from 322 population-based registries in 71 countries. *Lancet* 2018; published online Jan 30. * Data with 100% coverage of the national population.

† Data with 100% coverage of the national population for childhood malignancies only.

‡ **Korea:** Republic of Korea; **Russia:** Russian Federation.

¶ **Incomplete dates:** records in which the year of birth is unknown; or the month and/or year of diagnosis is unknown; or the year of last known vital status is unknown. **In situ** malignancy (ICD-O-3 behaviour code 2): some registries do not register in situ cancers; other registries did not submit them. **Other:** records with incomplete data, or for tumours that are benign (behaviour code 0, except brain tumours), of uncertain behaviour (1), metastatic from another organ (6), or unknown if primary or metastatic (9); or for patients with age outside the range 0-14 years (children) or 15-99 years (adults); or other conditions (see text).

|| **DCO:** tumours registered from a death certificate only (DCO), or detected solely at autopsy. Sweden does not register DCOs; autopsy-detected cases were not submitted for CONCORD-2, but have been submitted for CONCORD-3. **Other:** vital status or sex unknown; invalid date or sequence of dates; inconsistency of sex-site, site-morphology, age-site, age-morphology, or age-site-morphology.

†† **MV:** microscopically verified. **Non-specific morphology** (solid tumours only): ICD-O-3^{14,15} morphology code in the range 8000-8005. **Censored:** patients whose last known vital status is “alive” and who were censored within five years of diagnosis or, if diagnosed in 2010 or later, before 31 December 2014.

Acute lymphoblastic leukaemia (children)
Lymphomas (children)

Survival estimates that are not age-standardised are italicised.

- * Data with 100% coverage of the national population.
- † Data with 100% coverage of the national population for childhood malignancies only.
- ‡ **Asia: Korea:** Republic of Korea; **Europe: France, Burgundy (digestive):** data for Côte-d'Or and Saône-et-Loire *départements*; **Italy, Biella:** coverage now includes Provincia di Vercelli as well as Provincia di Biella; **Milano:** coverage now includes Provincia di Milano and Lodi as well as Milan; **Naples:** coverage now includes all of the *Azienda Sanitaria Locale* Napoli 3 Sud and the municipalities of Acerra and Casalnuovo; **Romania, Cluj:** coverage now includes Bistrița-Năsăud county as well as Cluj county. **Poland, Holy Cross** (formerly Kielce), **Lower Silesia** (formerly Wrocław), **Subcarpathia** (formerly Podkarpackie); **Russia:** Russian Federation; **Spain Childhood:** data are for the province of Barcelona.
- § Survival estimate considered less reliable because 15% or more of patients were (a) lost to follow-up or censored alive within five years of diagnosis or, if diagnosed in 2010 or later, before 31 December 2014; **or** (b) registered only from a death certificate or at autopsy; **or** (c) registered with incomplete dates, i.e., unknown year of birth, unknown month and/or year of diagnosis, or unknown year of last vital status.

The maps show the territories for which we received data. Some registries only provided data for part of their territory.

The names of countries and territories used in this web-appendix are those used for statistical purposes by the Statistics Division of the UN Secretariat.²⁴ We use “national coverage” to contrast with “regional coverage” solely for statistical purposes. These designations and the presentation of data here do not imply any assumption regarding the political affiliation of countries or territories, or the expression of any opinion whatsoever on the part of the CONCORD programme concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Survival estimates for each country are ranked from highest to lowest within each continent. For ease of reference, the ranking of countries for 2010-2014 is also used for 2000-2004 and 2005-2009. Where data were available for more than one registry in a given country, the survival estimates are derived by pooling the data for that country, but excluding data from registries for which the estimates are considered less reliable (see text).

* Data with 100% coverage of the national population.

† National estimate not age-standardised.

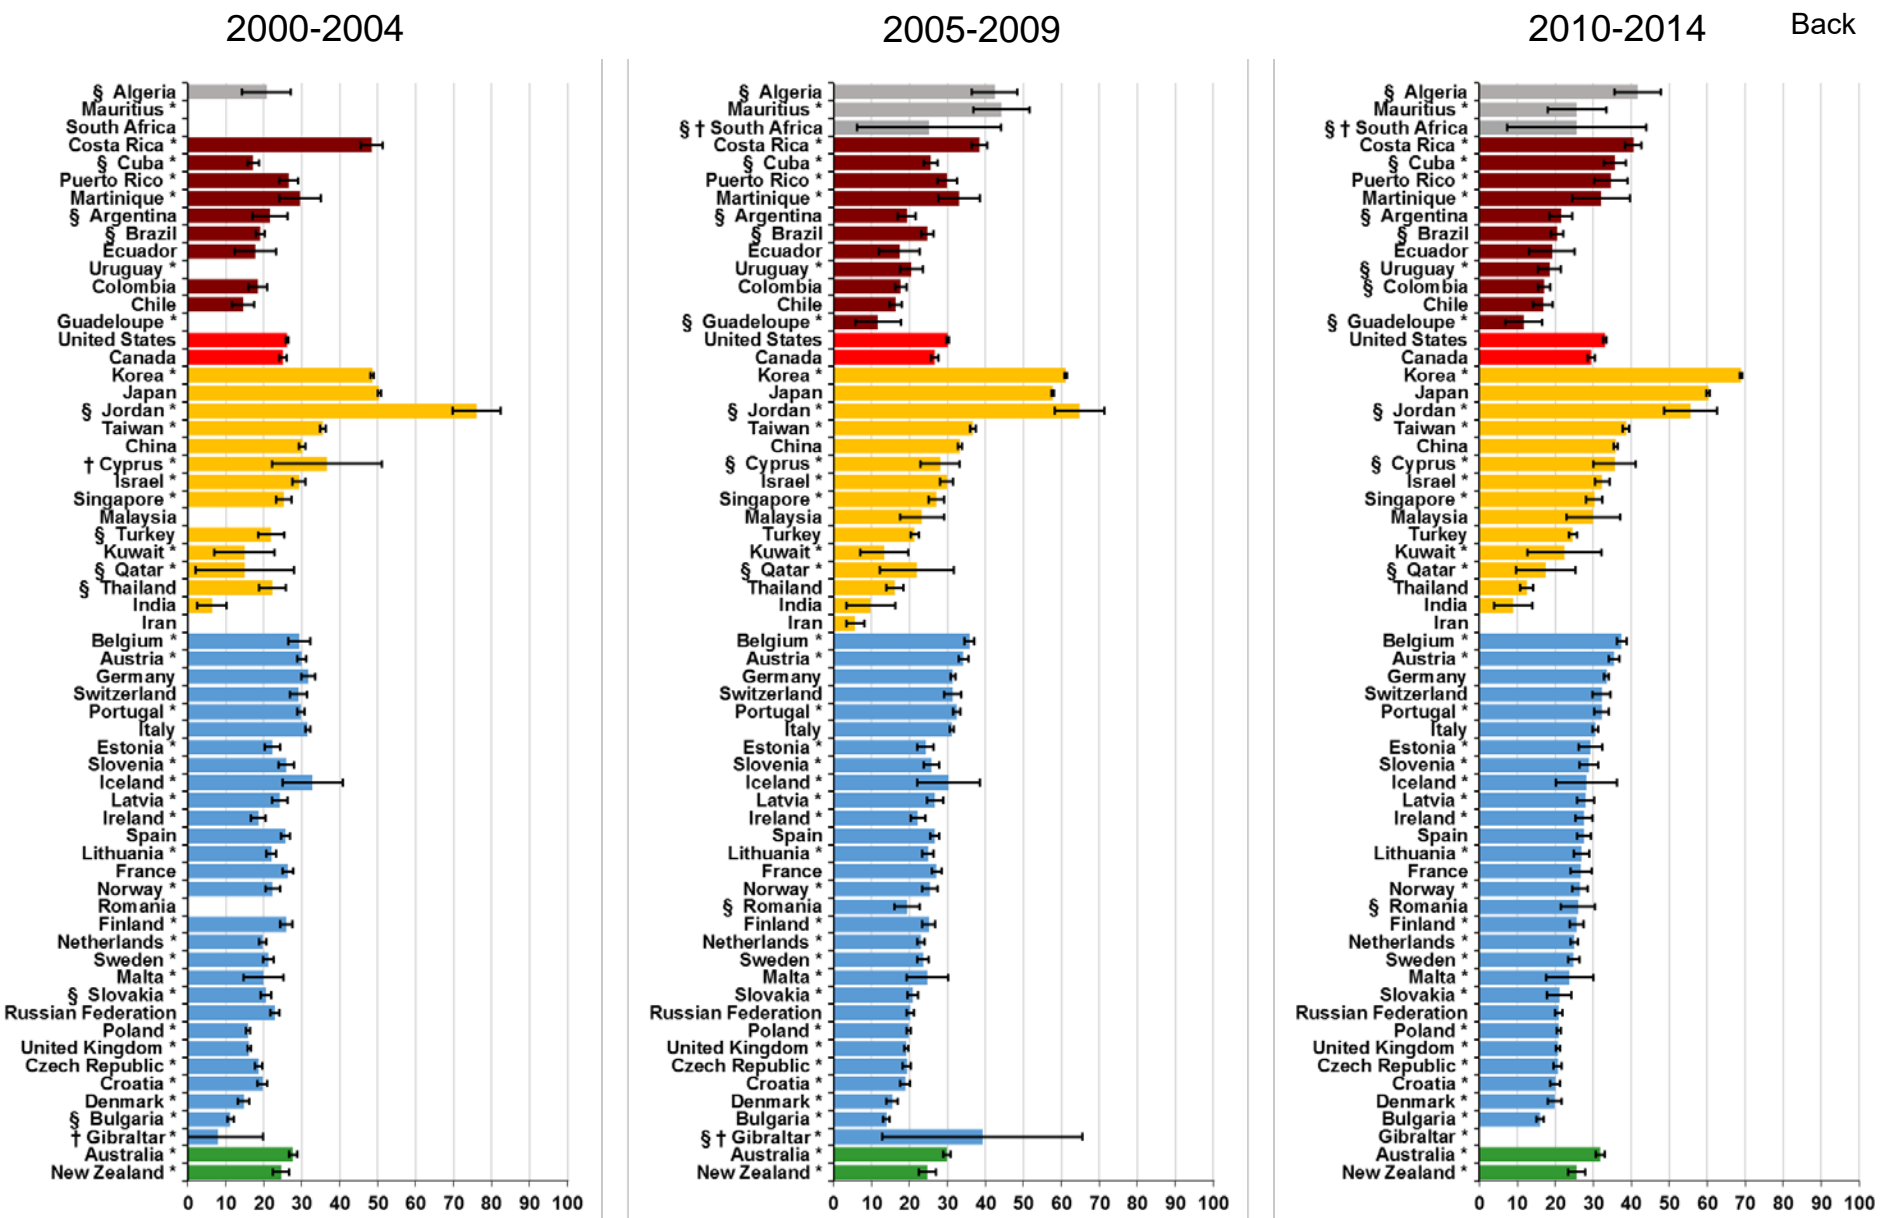

§ National estimate flagged as less reliable because the only available estimates are from a registry or registries in this category.

Each box-plot shows the range of survival estimates among all cancer registries for which suitable estimates could be obtained for patients diagnosed in each calendar period, in each continent. The number of registries included in each box-plot is shown in parentheses. Survival estimates considered less reliable are not included (see text). The vertical line inside each box represents the median survival estimate among all contributing registries (the central value in the range, or 50th centile). The box covers the inter-quartile range (IQR) between the lower and upper quartiles (25th and 75th centiles). Where there are only a few widely scattered estimates, the median may be close to the lower or upper quartile. The extreme limits of the box-plot are $1.5 \times \text{IQR}$ below the lower quartile and $1.5 \times \text{IQR}$ above the upper quartile. Open circles indicate 'outlier' values, outside this range.

Patients diagnosed between 2000 and 2014 may be followed up in successive years until the end of 2014 (or later). The numbers in the cells indicate the **minimum number of complete years of follow-up** available for patients who were diagnosed in a given year (rows) and who survived to the end of a later year (columns).

Three calendar periods of diagnosis are defined. Patients diagnosed during 2000-2004 and 2005-2009 all have a potential follow-up of at least 5 years by the end of 2014. Their survival can be estimated in classical **cohort** fashion (solid outlines): conditional probabilities of survival are multiplied within successive intervals (along the row) to obtain a cumulative probability of survival up to five years. For patients who were diagnosed or followed up during 2010-2014, a **period** estimate of survival is obtained by multiplying the conditional probabilities of survival up to five years within each calendar year (column) (shaded area; see text).

Web-annex 2: CONCORD-3 life table report

Method: Single-year-of-age life tables for Finland for the years 2000 and 2014 were constructed from the numbers of deaths and population counts by single year of age, sex and calendar year, using Poisson regression and flexible functions. Life tables for intervening years were constructed by linear interpolation. (Rachet B, Maringe C, Woods LM, Ellis L, Spika D, Allemani C. Multivariable flexible modelling for estimating complete, smoothed life tables for sub-national populations. *BMC Public Health* 2015; **15**: 1240).

Figure 2: Observed and fitted mortality rates (mx; arithmetic scale) by broad age band and sex

Figure 3: Fitted versus observed mortality rates: residual deviance

We plotted the deviance residuals of the model against age to assess goodness of fit. Deviance residuals are a measure of how closely the modelled values fit the observed data. They should be approximately normally distributed if the model fits the data well. The ideal range is between -2 and +2 (the red lines).

*The lines at +2 and -2 show the ideal range for deviance residuals.
