

FOREWORD

This report is the forty-second in the Agency's series of annual reports on operating experience with nuclear power stations in Member States.

As in previous years, in addition to annual performance data and outage information, the report contains a historical summary of performance and outages during the lifetime of individual plants and six figures illustrating worldwide performance and statistical data. Since 2006 the report is in an electronic version on CD-ROM which provides enhanced features for data searching and analysing.

It is hoped that this report and related Agency publications will be useful to everyone concerned with nuclear power reactors. Suggestions and corrections from readers would be most welcome.

1. INTRODUCTION

This report is the forty-second in the Agency's series of annual reports on operating experience with nuclear power stations in Member States. For the sixth time it is issued purely in an electronic version.

The report is a direct output from the Agency's Power Reactor Information System (PRIS), whose databank contains all operating experience data published in the Agency's operating experience annual reports since 1970 and basic information on power reactors, including design data. It presents operating experience data for all worldwide nuclear power plants after starting commercial operation. The PRIS databank is available free of charge to IAEA Member States through its public website and on-line application PRIS-Statistics. The web-site www.iaea.org/pris contains publicly available information about reactor units and nuclear industry results. The PRIS-Statistics (<http://prisweb.iaea.org>) allows direct access to the database through the Internet. This application allows registered users report generation through pre-designed reports and filters.

Load, operation and availability factors are used as the basic performance indicators. Energy unavailability factors, separately for planned and unplanned unavailability (due either to causes under plant management control or external causes out of plant management control), are used as a measure of energy lost through a unit not being available. However, some ambiguity remains in the operators' reports of the unavailability data, resulting in inconsistencies in these factors. It is recognized that there is an inherent difficulty in reporting unavailability in energy due to external causes with relation to energy losses due to load following operation and grid limitation. It should be noted that, for load, operation and unavailability factors, there might be differences between the data of this report and those published elsewhere. To avoid confusion, reference should be made to the definitions given in Section 2. In Section 3 this report presents figures illustrating worldwide performance indicators up to 2010.

According to the information available to the Agency at the end of 2010, there were 441 nuclear power reactors operating in the world, with a total net capacity of 375.3 GW_(e). This was about 5 GW_(e) more than at the end of 2009 due to five new grid connections and only one final shutdown, Phenix in France.

While 2009 saw two new grid connections in 2010 five new reactors were connected to the grid: Lingao-3 (1000 MW_(e)) and Qinshan 2-3 (610 MW_(e)) in China; Rajasthan-6 (202 MW_(e)) in India; Shin-Kori-1 (960 MW_(e)) in the Republic of Korea and Rostov-2 (950 MW_(e)) in Russia.

For nuclear power, 2010 was another year in a row with a high number of construction starts on new reactors. There were sixteen construction starts: Angra-3 (1245 MW_(e)) in Brazil; Fangchenggang-1&2, Fuqing-3 Haiyang 2, Ningde-3&4, Yangjiang-3 (all 1000 MW_(e)), Changjiang 1&2 (610 MW_(e)), Taishan-2 (1700 MW_(e)),

in China; Kakrapar 3&4 (630 MW_(e)) in India; Ohma (1325 MW_(e)) in Japan and Leningrad 2-2 (1085 MW_(e)), Rostov-4 (1011 MW_(e)), in the Russian Federation. This compares with eleven construction starts in 2009 and ten in 2008. At the end of 2010 there were 67 nuclear power plants under construction in the world (the largest number since 1989) with a total net capacity 64.1 GW_(e).

Section 6 consists of information related to non-electrical application of nuclear power reactors. It provides production data related to district heating, industrial process heat delivery and to water desalination. In 2010 the nuclear energy was utilized for non-electrical application in 11 Member States involving energy from 75 nuclear reactors.

As the previous year the 2011 edition contains also detail design characteristics of reactor units and dashboards with a general overview of each individual operating nuclear power reactor.

This publication includes information received by the Agency up to 20 May 2011. Up to this date data from all operating units had been reported. Any data modification received after that date, although not included in this publication, is available in the PRIS database.

The information contained in the report was made available to the Agency through designated national correspondents. The Agency appreciates the valuable assistance of the national authorities, official correspondents and various electrical utilities in gathering the information for this report.

The report was compiled by staff of the Agency's Division of Nuclear Power. It is hoped that it will be useful to nuclear power plant operators, nuclear system designers, nuclear power planners, interested professional engineers and scientists and others concerned with the operating experience of nuclear power reactors. Suggestions and corrections from readers would be most welcome.

2. DEFINITIONS

1. Reference Unit Power, RUP [$MW_{(e)}$]

The reference unit power is the maximum (electrical) power that could be maintained continuously throughout a prolonged period of operation under reference ambient conditions.

It is specified that this value must remain constant for a given unit unless, following permanent modification, or a new permanent authorization, the management decides to amend the original value.

The reference unit power may be gross of net:

– The gross RUP (P_g , $MW_{(e)}$) is deemed to be measured at the output terminals of all generator sets in the station; it includes therefore the power taken by the station auxiliaries and losses in transformers that are considered integral parts of the station.

– The net RUP (P_n , $MW_{(e)}$), indicating the maximum power that can be supplied, is measured at the station outlet terminals, i.e. after deducting the power taken by station auxiliaries and the losses in the transformers that are considered integral parts of the station.

2. Design net capacity [$MW_{(e)}$]

The net reference unit power as specified in an original unit design.

3. Reference period, T [hours]

For units in power ascension at the end of the period, the clock hours from the beginning of the period or the first electrical production, whichever comes last, to the end of the period.

For units in commercial operation at the end of the period, the clock hours from the beginning of the period or of commercial operation, whichever comes last, to the end of the period or permanent shutdown, whichever comes first.

4. On-line hours, t [hours]

The total clock hours in the reference period during which the unit operated with breakers closed to the station bus.

5. Reference Energy Generation, REG [$MW_{(e)}h$]

Net electrical energy which would have been supplied to the grid if the unit were operated continuously at the reference unit power during the whole reference period.

6. Energy Generated (net), EG [$GW_{(e)}h$]

Net electrical energy produced during the reference period as measured at the unit outlet terminals, i.e. after deducting the electrical energy taken by unit auxiliaries and the losses in transformers that are considered integral parts of the unit. If this quantity is less than zero, zero is reported.

7. Load Factor, LF [%]

$$LF = \frac{EG}{REG} \times 100$$

EG = energy generated (net), [MW_(e)h]
REG = reference energy generation [MW_(e)h]

Load factor, for a given period, is the ratio of the energy, which the power unit has produced over that period, to the energy it would have produced at its reference power capacity over that period.

8. Operation factor, OF [%]

$$OF = \frac{t}{T} \times 100$$

t = number of hours on-line [h]
T = number of hours in the reference period [h]

Operation factor is the ratio of the number of hours the unit was on-line, to the total number of hours in the reference period, expressed as a percentage. It is a measure of the unit time availability on the grid and does not depend on the operating power level.

9. Available capacity, P [MW_(e)]

The available capacity at a given moment is the maximum net capacity at which the unit or station is able or is authorized to be operated at a continuous rating under the prevailing conditions assuming unlimited transmission facilities.

10. Energy loss, EL [MW_(e)h]

Energy loss is the energy which could have been produced during the reference period by the unavailable capacity; it is categorized into three types:

- PEL - planned energy loss
- UEL - unplanned energy loss
- XEL - energy loss due to causes external to the plant

UEL comprise shutdowns, unplanned load reductions or outage extensions.

11. Unavailability

The unit unavailability is defined as a status when the plant is not able to operate at its maximum capacity (reference power). This condition, which may be under or beyond plant management control, should only reflect lack of availability of the plant itself, regardless of energy demand, transmission grid condition or political situation in the country.

Unavailability is classified as planned if it is foreseen at least 4 weeks in advance, generally at the time when the annual overhaul programme is established, and if the beginning of the unavailability period can be largely controlled and deferred by management. Unavailability is classified as unplanned if not scheduled at least four weeks in advance. Power plant operation at lower than maximum capacity because of lower demand from the grid but available to operate at the maximum capacity, does not constitute unavailability, either planned or unplanned.

12. Energy Availability Factor, EAF [%]

$$EAF = \frac{REG - PEL - UEL - XEL}{REG} \times 100$$

The energy availability factor over a specified period, is the ratio of the energy that the available capacity could have produced during this period, to the energy that the reference unit power could have produced during the same period.

13. Energy Unavailability Factor, EUF [%]

$$EUF = \frac{EL}{REG} \times 100$$

The unavailability factor over a specified period is the ratio of the energy losses EL that have not been produced during this period due to the unavailable capacity, to the energy that the reference unit power could have produced during the same period.

The energy unavailability factor EUF over a specified period can be divided into:

PUF = planned unavailability factor

UUF = unplanned unavailability factor due to causes in the plant

XUF = unplanned unavailability factor due to causes external to the plant.

The unavailability factor can be expressed as: $EUF = 100 - EAF$

14. Unit capability factor, UCF [%]

$$UCF = \frac{REG - PEL - UEL}{REG} \times 100$$

Unit capability factor is defined as the ratio of the energy that the unit was capable to generate over a given time period considering only limitation under the plant management control, to the reference energy generation over the same time period, expressed as a percentage. Both of these energy generation terms are determined relative to reference ambient conditions.

15. Unplanned capability loss factor, UCL [%]

$$UCF = \frac{UEL}{REG} \times 100$$

Unplanned capability loss factor is defined as the ratio of the unplanned energy losses during a given period of time, to the reference energy generation, expressed as a percentage. Unplanned energy loss is energy that was not produced during the period because of unplanned shutdowns, outage extensions, or unplanned load reductions due to causes under plant management control. Causes of energy losses are considered to be unplanned if they are not scheduled at least four weeks in advance.

16. Construction start

Date when first major placing of concrete, usually for the base mat of the reactor building, is done.

17. First criticality

Date when the reactor is made critical for the first time.

18. Grid connection

Date when the plant is first connected to the electrical grid for supply of power.

19. Commercial operation

Date when the plant is handed over by the contractors to the owner and declared officially to be in commercial operation.

20. Permanent Shutdown

Date when the plant is officially declared shut down by the owner and taken out of operation permanently.

21. Long-term Shutdown

A unit is considered in the long-term shutdown status, if it has been shut down for an extended period (usually several years) without any firm recovery schedule at the beginning but there is the intention to re-start the unit eventually.

22. Outages

For the purpose of PRIS coding, the outage is defined as any status of a reactor unit, when its actual output power is lower than the reference unit power for a period of time. By this definition, the outage includes both power reduction and unit shutdown. The outage is considered significant, if the loss in the energy production corresponds to at least ten hours of continuous operation at the reference unit power or if it has been caused by an unplanned reactor scram (even if the unit had been shut down for less than 10 hours).

23. Outage duration [h]

The total clock hours of the outage measured from the beginning of the reference period or the outage, whichever comes last, to the end of the reference period or the outage, whichever comes first.

24. Factors refer to the plants which were in commercial operation during the whole of the reference period.

25. Cumulative factors are given for the plants which were in commercial operation during full calendar years.

26. A blank and three periods (...), if used in tables, denote information that is not applicable or not available, respectively.

27. Types of outages

The outage type is a three-character code. The third character is for unplanned outages only:

Code_1 description:

- (P) Planned outage due to causes under the plant management control
- (U) Unplanned outage due to causes under the plant management control
- (X) Outage due to causes beyond the plant management control ("external")

Code_2 description:

- (2) Controlled shutdown or load reduction that had to be performed in the next 24 hours after the cause occurred
- (3) Extension of planned outage

4. 2010 Summary of Operation

UNIT 6 WAS OPERATED AT BASE LOAD MODE IN ACCORDANCE WITH THE LOAD SCHEDULE AGREED BY TSO. THE UNIT WAS OPERATED AT FUEL COAST DOWN MODE IN THE PERIOD 28TH AUGUST - 17 TH SEPTEMBER. THE PLANNED OUTAGE FOR ANNUAL MAINTENANCE ACTIVITIES, REFUELING AND MODERNIZATION WAS PERFORMED IN THE PERIOD 18TH SEPTEMBER - 30 TH OCTOBER. THE MOST IMPORTANT MODERNIZATION PROJECT IMPLEMENTED DURING THE PLANNED OUTAGE IS A REPLACEMENT OF THE SG FEED WATER HIGH PRESSURE REHEATERS. BECAUSE OF PROBLEM WITH THE CONTROL RODS DRIVE MECHANISMS PROTECTIVE PIPES THE PLANNED OUTAGE WAS EXTENDED FOR ITS REPLACEMENT. THE TOTAL DURATION OF THE UNIT OUTAGE WAS 49 DAYS. TWO UNPLANNED TG OUTAGE WERE OCCURRED (IN JANUARY AND IN MARCH). DURING THE TRANSIENTS AFTER TG TRIP IN MARCH THE REACTOR SCRAM WAS ACTIVATED AUTOMATICALLY. THE LAST REACTOR SCRAM WAS OCCURRED ON 22TH DECEMBER, 1996.

4. 2010 Summary of Operation

THE UNIT EXPERIENCED A NUMBER OF FORCED OUTAGES. IN JANUARY THE UNIT WAS TAKEN OFF LINE TO REPAIR ECI INTERGATE LINES. IN MAY THE UNIT WAS FORCED OFF LINE DUE TO A MODERATOR CONTROL ISSUE. JUNE THE UNIT REDUCED POWER BECAUSE THE CONDENSATE EXTRACTION PUMP OUT OF SERVICE. IN SEPTEMBER, THE UNIT WAS FORCED FROM SERVICE DUE TO LIQUID ZONE CONTROL ISSUES. END OF FEBRUARY TO APRIL THE UNIT WAS IN A PLANNED OUTAGE FOR 60 DAYS TO COMPLETE THE LAST ROUND OF WESTSHIFT. IN ADDITION, THERE WERE POWER LOSSES FROM JUNE TO NOVEMBER DUE TO HIGHER THAN AVERAGE LAKE TEMPERATURES.

4. 2010 Summary of Operation

AT THE BEGINNING OF THE YEAR THE UNIT WAS FORCED TO REDUCE POWER BECAUSE OF A FUEL DEFICIT. MID-JANUARY THE UNIT CAME OFFLINE DUE TO A SHUTDOWN SYSTEM TRIP. THE FORCED OUTAGE WAS EXTENDED TO EXECUTE REPAIRS TO THE ECI INTEGRATE LINES. IN SEPTEMBER THE UNIT WAS FORCED TO REDUCE POWER DUE TO HIGH MODERATOR OUTFLOW TEMPERATURE AND THEN AGAIN DUE TO GOVERNOR VALVE LIMITATION DURING OSCILLATIONS. IN ADDITION, THERE WERE POWER LOSSES FROM JUNE TO NOVEMBER DUE TO HIGHER THAN AVERAGE LAKE TEMPERATURES.

4. 2010 Summary of Operation

THE UNIT EXPERIENCE A GRID RELATED LOSS IN MARCH AND IN APRIL. APRIL ALSO EXPERIENCED POWER LOSSES DUE TO DERATES BECAUSE OF LACK OF DEMAND IN THE PROVINCE. IN JUNE POWER WAS REDUCED BECAUSE OF FUEL MACHINE UNAVAILABILITY. OCTOBER AND NOVEMBER THE UNIT HAD A PLANNED OUTAGE FOR REGULAR MAINTENANCE. IN ADDITION, THERE WERE POWER LOSSES FROM JUNE TO NOVEMBER DUE TO HIGHER THAN AVERAGE LAKE TEMPERATURES.

THE UNIT OPERATION AFTER THE COMMERCIAL OPERATION IS AS FOLLOWS: 1. 2010-11-03 18:00-2010-11-07 12:30, THE UNIT REDUCED POWER TO 295MWE, DEALING WITH THE MAIN FEED-WATER PUMP APA302PO BEARING HIGH TEMPERATURE DEFECTS. 2. 2010-11-12, IC PERSONNEL PERFORMED T3 TEST. AT 12:29, THE TEST SWITCH DEFICIENCY RESULTED IN TURBINE TRIP. 10 SECONDS LATER, THE SIGNAL OF CONDENSATE WATER PRESSURE WAS FAULT, SO THAT CONDENSER FAILURE SIGNAL TRIGGERED. REACTOR TRIPPED DUE TO COINCIDENCE OF P10, C8 AND CONDENSER FAILURE SIGNAL. 3. 2010-11-13 14:25, THE UNIT WAS CONNECTED TO THE GRID. WHEN RAISING THE POWER, THE CUSHION OF 1# LOW-PRESSURE CYLINDER INTAKE-PIPE LEAKED AND TRIPPED THE TURBINE TO TREAT WITH THE DEFECT. 4. 2010-11-15 2:18, THE UNIT WAS RECONNECTED TO THE GRID.

GOOD PRODUCTION YEAR AND ONLY SMALL PRODUCTION LOSSES. UNIT WAS OPERATING AT BASE LOAD MODE. UNIT WAS STARTED AFTER ANNUAL OUTAGE AS SCHEDULED BUT LINEAR HEAT RATING OF THE NEW FUEL WAS LIMITING THE POWER 2-3 % THE WHOLE SEPTEMBER. COLD WINTER CAUSED SOME SMALL INCIDENTS BUT SAFETY OR PRODUCTION WERE NOT DIRECTLY AFFECTED.

GOOD PRODUCTION YEAR AND ONLY SMALL UNPLANTED PRODUCTION LOSSES. UNIT WAS OPERATING AT BASE LOAD MODE. UNIT WAS STARTED AFTER ANNUAL OUTAGE ALMOST THREE DAYS EARLIER THAN SCHEDULED. THE OVERHAUL OF ONE TURBINE UNIT DURING ANNUAL OUTAGE WAS A SUCCESS AND THE POWER OF THE TURBINE IS NOW AROUND 1,5 MW HIGHER THAN BEFORE. COLD WINTER CAUSED SOME SMALL INCIDENTS BUT SAFETY OR PRODUCTION WERE NOT DIRECTLY AFFECTED.

4. 2010 Summary of Operation

THE PLANT UNITS OPERATED SAFELY AND RELIABLY DURING THE PERIOD UNDER REVIEW. THE OUTAGE CONDUCTED AT OL1 IN 2010 WAS THE MOST EXTENSIVE MAINTENANCE OUTAGE IN THE HISTORY OF THE OLKILUOTO POWER PLANT. MAJOR WORK CARRIED OUT DURING THE OUTAGE INCLUDED. E.G. REPLACEMENT OF ALL THE FOUR LOW-PRESSURE TURBINES, REFURBISHMENT OF THE GENERATOR COOLING SYSTEM, THE MAIN SEAWATER PUMPS AND THE INNER EXTRACTION DUCTS OF THE TURBINE CONDENSER AS WELL AS REPLACEMENT OF THE INNER ISOLATION VALVES IN THE STEAM LINES OF THE REACTOR. THANKS TO THE MODERNIZATION WORK, THE EFFICIENCY OF THE TURBINE PLANT IMPROVED, AND THE ELECTRICAL OUTPUT INCREASED BY APPROXIMATELY 20 MW. THE OUTAGE LASTED ABOUT 26 DAYS.

IN JANUARY, FROM THE 27TH, THE LAST PART OF THE LAST FINAL TEST ABOUT CORE FLOWERING TOOK PLACE. ON MONDAY FEBRUARY 1ST, 2010 AT 17H30 THE PHENIX REACTOR STOPPED FOR EVER. THAT WAS DONE WITH A MANUAL SCRAM: TWO PEOPLE PRESSED THE 2 BUTTONS. ONE WAS THE NORMAL OPERATOR IN HIS SHIFT AND THE OTHER ONE WAS THE OPERATOR, NOW RETIRED FOR A LONG TIME, WHO MADE THE REACTOR CRITICAL FOR THE VERY FIRST TIME ON AUGUST 31ST, 1973. THE LOOP IS CLOSED.

4. 2010 Summary of Operation

FIRST UNIT OF MOCHOVCE NPP WAS OPERATED LARGELY AT FULL POWER IN A BASE LOAD MODE. A LOAD-FOLLOWING HAS BEEN REQUIRED BY DISPATCHER FOR A PERIOD. UNIT PROVIDES GRID SUPPORTING SERVICES – PRIMARY, SECONDARY POWER CONTROL FOR GRID ADJUSTMENT AND TERTIARY POWER CONTROL. OVER THE REPORTING PERIOD THERE WERE APPROXIMATELY 6.5 EFPD LOSSES DUE TO FORCED UNPLANNED EVENTS. THERE WERE NO AUTOMATIC REACTOR SCRAMS. ALL PLANNED MAINTENANCE ACTIVITIES DURING THE SHORT GENERAL OVERHAUL WERE ACCOMPLISHED EARLIER AND FIRST TURBOGENERATOR WAS CONNECTED TO THE GRID 0.7 DAY IN ADVANCE. THE MOST IMPORTANT EVENT LOAD SHED LOGIC ACTUATION OCCURRED IN JULY DUE TO FAILURE OF SELF-CONSUMPTION TRANSFORMER 0BBT01. THROUGHOUT THE YEAR THERE WERE NOT ANY DELAYS OF THE PLANNED OUTAGES NEITHER THE LOSSES DUE TO GRID PROBLEMS. OTHER FACTORS AFFECTING ENERGY GENERATION OVER THE REPORTING PERIOD WERE LIMITATIONS DUE TO FUEL MANAGEMENT, COAST-DOWN OPERATION AND ENVIRONMENTAL CONDITIONS (COOLING WATER TEMPERATURE LIMITS).

THE BIGGEST UNPLANNED OUTAGES WERE RECORDED IN NOVEMBER WHEN MANUAL TG21 WAS SHUT DOWN DUE TO LEAKAGE AT THE TURBINE OIL CONTROL SYSTEM. CONSEQUENTLY ANOTHER MANUAL TG21 SHUT DOWN WERE DONE BECAUSE OF FIRE AT THE HIGH PRESSURE PART ISOLATION. PLANNED EXTENDED GENERAL OVERHAUL WAS ACCOMPLISHED WITH AN ADVANCE OF 3.6 DAYS. DUE TO PROGRESS OF TUBES UNTIGHTNESS SEVERAL POWER REDUCTIONS WERE EFFECTED FOR CONDENSER REVISION AND LEAKAGE REPAIR. THROUGHOUT THE YEAR THERE WERE NOT ANY DELAYS OF THE PLANNED OUTAGES NEITHER THE LOSSES DUE TO GRID PROBLEMS. OTHER FACTORS AFFECTING ENERGY GENERATION OVER THE REPORTING PERIOD WERE LIMITATIONS DUE TO FUEL MANAGEMENT, COAST-DOWN OPERATION AND ENVIRONMENTAL CONDITIONS (COOLING WATER TEMPERATURE LIMITS).

4. 2010 Summary of Operation

THE YEAR 2010 PRODUCTION YEAR WAS NOT SO GOOD AS PLANNED/EXPECTED DUE TO INTRODUCTION OF OCILLATION PROBLEMS ON CONTROL VALVES AT THE TURBINE SIDE WHEN THE VALVES WAS MODIFIED TO OPERATE IN A SUITABLE MANNER ALSO AFTER THE PLANT POWER UPGRADE WAS MADE. THE PLANNED ANNUAL OUTAGE BECAME EXTENDED WITH ABOUT FIVE DAYS MAINLY DUE TO A SMALL STEAM LEAKAGE WAS DISCOVERED DURING START-UP COMMING FROM A TEST PIPE CONNECTED TO MAIN STEAM ISOLATION VALVE . DURING THE OPERATING PERIOD ALSO A NUMBER OF CONTROLS AND TESTS HAVE BEEN PERFORMED FOR REPLACEMENT OF CONTROL VALVES INCLUDING STOP OF TURBINES. THE VALVES WAS FINALLY REPLACED IN OCTOBER DURING A ADITIONAL OUTAGE PERIOD.

4. 2010 Summary of Operation

HIGHLIGHTS OF OPERATION DURING THE YEAR IN THE 39TH YEAR OF OPERATION THE NPP MÜHLEBERG WAS ABLE WAS TO KEEP AND CONTINUE THE GOOD RESULT OF THE NUCLEAR POWER OF PREVIOUS YEARS. THE MAXIMUM ANNUAL RESULT REFLECTS THE GOOD CONDITION OF THE PLANT. THE ENERGY PRODUCTION COULD BE SLIGHTLY INCREASED DUE TO THE SHORTER FUEL OUTAGE. IT IS THE HIGHEST SINCE THE COMMISSIONING OF THE PLANT. FROM JANUARY 19 TO 29 AN ON-LINE ON NOBLE METAL CHEMICAL APPLICATION WAS PERFORMED TO PROTECT REACTOR PRESSURE VESSEL INTERNALS. IN EARLY NOVEMBER THE RECIRCULATION PUMP CONTROLS A AND B WERE FIXED.

4. 2010 Summary of Operation

DURING 2010 THERE WAS A PLANNED GRAPHITE INSPECTION OUTAGE COMMENCING ON 03 SEPTEMBER OF ABOUT 41 DAYS, AND THE REACTOR RETURNED TO SERVICE ON 14 OCTOBER. THERE WAS AN AUTOMATIC UNPLANNED TRIP ON 11 NOVEMBER DUE TO A GAS CIRCULATOR TURBINE TRIP. WHEN AN UNPLANNED TRIP SUCH AS THIS ONE OCCURRED THERE IS A REQUIREMENT UNDER THE GRAPHITE SAFETY CASE TO CARRY OUT CHANNEL VIEWING ON ABOUT 130 CHANNELS. THIS TOOK THE REST OF THIS CALENDAR YEAR.
