33	Annex 1: Percent Distribution of Population by States	138

Sub-national Population Projections of Sudan and Age-Sex Composition

The future population estimates are important for countries attempting to plan their economic and social development. The primary needs of the people, which the development programmes aim to satisfy, cannot be appraised without regard to the expected size and composition of the population. Better statistics furnishing detailed current and past information on population changes undoubtedly make better estimates possible, but any estimate relating to the future, contains an element of uncertainty which cannot be overcome, no matter how abundant the statistical information on which it is based. A careful appraisal of the available statistics, even though they are fragmentary and defective, can yield future population estimates that have practical utility for planners, just as weather forecasts.

In turning from the national projection of Sudan to projections for geographic subdivisions (States), we must concern with the internal migration. Although the assumption that future international migration will be nil seems to be acceptable for many countries, internal migration (particularly rural-urban migration) involves a large proportion of population in almost all countries. Thus, the growth rates of the 15 States differ largely because of internal migration rather than natural increase.

Ratio Method:

In this method the percentage distribution of the Sudan population among the States is observed for past dates, projected to future dates, and applied to an independently derived projection of the Sudan. For the projection of the percents, the percent distribution may be held constant at the last observed level or may be modified

in some way to take account of the past trend. Although, in principle, the chief factor affecting the redistribution of population is internal migration and this component of change is quite likely to be influenced by economic developments and/or natural or man-made disasters, there is no direct practical way of taking account of plans or expectations concerning the economic development of States or disasters in the ratio method.

First, the percentage distributions of the national population by States in 1993 and 2008 are calculated and the average is used as the base because of the over-enumeration or under-enumeration which might be witnessed for some States or segments of population like nomads. Second, the percent distributions of the past censuses are then extrapolated mathematically to the year 2018, and *pro rata* adjustment for these percents is required to be added to 100.0. Finally, the absolute figures are obtained by multiplying the percents by an independently derived projection of the total population of the country. The ratio method was adapted to derive projections of the age-sex distribution of States.

In order to obtain the young population by single ages, for planners of vaccination and school enrollment, the "Interpolation Coefficients Based on the Karup-King Formula" has been used.

The mathematical and ratio methods of projecting regional population generally have the advantage of simplicity of computation, but they provide little information to the demographic or socioeconomic components of the indicated trends. Nevertheless, the results may usefully serve as approximations to the future geographic distribution of the population of Sudan.

Table 1: The Total Projected Population of States for the Period 2009 to 2018

States	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
