| " | PDTCH/CS-4 | TUhigh/FH | 10 | 6000 |
| " | USF/CS-1 | TUlow/no FH | 1 | 60000 |
| " | USF/CS-1 | TUhigh/no FH | 1 | 60000 |
| " | USF/CS-1 | TUhigh/FH | 1 | 60000 |
| " | USF/CS-1 | RA/no FH | 1 | 60000 |
| " | USF/CS-2/CS-3/CS-4 | TUlow/no FH | 1 | 60000 |
| " | USF/CS-2/CS-3/CS-4 | TUhigh/no FH | 1 | 60000 |
| " | USF/CS-2/CS-3/CS-4 | TUhigh/FH | 1 | 60000 |
| " | USF/CS-2/CS-3/CS-4 | RA/no FH | 1 | 60000 |
| NOTE 1: For PDTCH sub-tests under fading conditions, the number of RLC blocks indicated above shall be transmitted on each downlink timeslot of the multislot configuration. | | | | |
| NOTE 2: For USF sub-tests under fading conditions, the number of RLC blocks indicated above shall be per uplink timeslot of the multislot configuration. | | | | |

14.16.1 Minimum Input level for Reference Performance

14.16.1.1 Definition

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

14.16.1.2 Conformance requirement

- The block error rate (BLER) performance shall not exceed 10 % at input levels according to the table below.

| Type of channel | | Propagation conditions | | | | |
|--|-----|------------------------|----------------|-------------------|------------|------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| PDTCH/CS-1 | dBm | -104 | -104 | -104 | -104 | -103 |
| PDTCH/CS-2 | dBm | -104 | -100 | -101 | -101 | -99 |
| PDTCH/CS-3 | dBm | -104 | -98 | -99 | -98 | -96 |
| PDTCH/CS-4 | dBm | -101 | -90 | -90 | * | * |
| DCS 1 800 and PCS 1 900 | | | | | | |
| PDTCH/CS-1 | dBm | -104 | -104 | -104 | -104 | -103 |
| PDTCH/CS-2 | dBm | -104 | -100 | -100 | -101 | -99 |
| PDTCH/CS-3 | dBm | -104 | -98 | -98 | -98 | -94 |
| PDTCH/CS-4 | dBm | -101 | -88 | -88 | * | * |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

| | |
|--|------------|
| GSM 400, GSM 700, GSM 850 and GSM 900 small MS | +2 dB |
| DCS 1800 class 1 or 2 MS | +2/+4 dB** |
| DCS 1800 class 3 and PCS 1 900 class 1 or 2 MS | +2 dB |
| PCS 1 900 class 3 MS | 0 dB |

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

- The block error rate (BLER) performance shall not exceed 1 % at input levels according to the table below.

| Type of channel | | Propagation conditions | | | | |
|--|-----|------------------------|----------------|-------------------|------------|------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/CS-1 | dBm | < -104 | -101 | -103 | -103 | -101 |
| USF/CS-2 to 4 | dBm | < -104 | -103 | -104 | -104 | -104 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/CS-1 | dBm | < -104 | -103 | -103 | -103 | -101 |
| USF/CS-2 to 4 | dBm | < -104 | -104 | -104 | -104 | -103 |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

| | |
|--|------------|
| GSM 400, GSM 700, GSM 850 and GSM 900 small MS | +2 dB |
| DCS 1800 class 1 or 2 MS | +2/+4 dB** |
| DCS 1800 class 3 and PCS 1 900 class 1 or 2 MS | +2 dB |

PCS 1 900 class 3 MS

0 dB

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

4. The reference sensitivity performance specified above need not be met in the following cases:

for MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB;

for MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB;

The interfering adjacent time slots shall be static with valid GSM signals in all cases;

3GPP TS 05.05, subclause 6.2.

5) For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1% of the radio blocks. This requirement shall be met for all input levels up to -40 dBm.

3GPP TS 05.05, subclause 6.4

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.16.1.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the minimum input level for reference BLER performance conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of a the Block Check Sequence indicating a Block Error.
2. To verify that the MS does not exceed conformance requirement 1 for CS-3 and CS-4 under STATIC, TUhigh, HT and RA propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

14.16.1.4 Method of test

14.16.1.4.1 Initial conditions

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\)$ to $35 \text{ dB}\mu\text{Vemf}(\)$. Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

NOTE 4: The PSI1 message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSI1 is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots, with the MS transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in 3GPP TS 04.14 (subclause 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

14.16.1.4.2 Procedure

- a) The SS transmits packets under Static propagation conditions, using CS-3 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using CS-3 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with CS-3 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- d) Once the number of blocks transmitted with CS-3 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following four fading conditions and hopping modes: TUhigh/noFH, TUhigh/FH, HT/noFH and RA/noFH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.

- f) The SS repeats steps b) to d) using CS-4 coding with the following three fading conditions: Static/FH, TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to f) under extreme test conditions.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
 - P0 = 14 dBm;
 - BTS_PWR_CTRL_MODE = Mode A;
 - PR_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond to the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH.
 - j) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
 - k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
 - l) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
 - m) The SS repeats steps j) to l) using USF/CS2 to 4 coding.
- NOTE: Since coding for USF-bits is identical for CS2 and CS3, it's not required to perform the step for both of those CS.
- n) The SS repeats steps i) to m) under extreme test conditions.
 - o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/CS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

14.16.1.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step o) the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level – Pb) then the MS is not required to fulfil 3GPP TS 05.05 requirements for the first 25 blocks addressed to this MS (3GPP TS 05.08, subclause 10.2.2).

NOTE: This is stated in the Rel 99 version of 3GPP TS 05.08.

14.16.1a Minimum Input level for Reference Performance in TIGHTER configuration

14.16.1a.1 Definition

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

14.16.1a.2 Conformance requirement

For a MS indicating support for TIGHTER Capability (see 3GPP TS 24.008), the minimum input signal levels for which the reference performance shall be met are specified in table 1w, according to the propagation condition. The performance requirements for GSM 400 and GSM 700 systems are as for GSM 900 in table 1w, except that the GSM 400 MS speed is doubled from that of GSM 900, e.g. TU50 becomes TU100, and the GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60.

1. The block error rate (BLER) performance shall not exceed 10 % at input levels according to the table below.

| Type of channel | Propagation conditions | | | | |
|---|------------------------|----------------|-------------------|------------|------------|
| | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| PDTCH/CS-1 dBm | -105 | -106 | -106 | -105,5 | -104,5 |
| PDTCH/CS-2 dBm | -105 | -102 | -103 | -102,5 | -100,5 |
| PDTCH/CS-3 dBm | -105 | -100 | -101 | -99,5 | -97,5 |
| PDTCH/CS-4 dBm | -102 | -92 | -92 | (note 2) | (note 2) |
| DCS 1 800 and PCS 1 900 | | | | | |
| PDTCH/CS-1 dBm | (note 3) | -106 | -106 | -105,5 | -104,5 |
| PDTCH/CS-2 dBm | (note 3) | -102 | -102 | -102,5 | -100,5 |
| PDTCH/CS-3 dBm | (note 3) | -100 | -100 | -99,5 | -95,5 |
| PDTCH/CS-4 dBm | (note 3) | -90 | -90 | (note 2) | (note 2) |
| NOTE 2: PDTCH for MCS-x cannot meet the reference performance for some propagation conditions. | | | | | |
| NOTE 3: The requirements for the DCS 1800 & PCS 1900 Static propagation condition are the same as for the GSM 850 & GSM 900 Static propagation condition, the requirements for the GSM 850 & GSM 900 TU50 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition. | | | | | |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

| | |
|--|------------|
| GSM 400, GSM 700, GSM 850 and GSM 900 small MS | +2 dB |
| DCS 1800 class 1 or 2 MS | +2/+4 dB** |
| DCS 1800 class 3 and PCS 1 900 class 1 or 2 MS | +2 dB |
| PCS 1 900 class 3 MS | 0 dB |

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

2. The block error rate (BLER) performance shall not exceed 1 % at input levels according to the table below.

| Type of channel | | Propagation conditions | | | | |
|--|-----|------------------------|-------------------|----------------------|---------------|---------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/CS-1 | dBm | < -104 | -101 | -103 | -103 | -101 |
| USF/CS-2 to 4 | dBm | < -104 | -103 | -104 | -104 | -104 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/CS-1 | dBm | < -104 | -103 | -103 | -103 | -101 |
| USF/CS-2 to 4 | dBm | < -104 | -104 | -104 | -104 | -103 |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

| | |
|--|------------|
| GSM 400, GSM 700, GSM 850 and GSM 900 small MS | +2 dB |
| DCS 1800 class 1 or 2 MS | +2/+4 dB** |
| DCS 1800 class 3 and PCS 1 900 class 1 or 2 MS | +2 dB |
| PCS 1 900 class 3 MS | 0 dB |

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

4. The reference sensitivity performance specified above need not be met in the following cases:

for MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB;

for MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB;

The interfering adjacent time slots shall be static with valid GSM signals in all cases;

3GPP TS 05.05, subclause 6.2.

5. For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1% of the radio blocks. This requirement shall be met for all input levels up to -40 dBm.

3GPP TS 05.05, subclause 6.4

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.16.1a.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the minimum input level for reference BLER performance conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of a the Block Check Sequence indicating a Block Error.

2. To verify that the MS does not exceed conformance requirement 1 for CS-3 and CS-4 under STATIC, TUhigh, HT and RA propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

14.16.1a.4 Method of test

14.16.1a.4.1 Initial conditions

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\)$ to $35 \text{ dB}\mu\text{Vemf}(\)$. Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

NOTE 4: The PSI1 message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSI1 is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots, with the MS transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in 3GPP TS 04.14 (subclause 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

14.16.1a.4.2 Procedure

- a) The SS transmits packets under Static propagation conditions, using CS-3 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using CS-3 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS

transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.

- c) The SS counts the number of blocks transmitted with CS-3 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with CS-3 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following four fading conditions and hopping modes: TUhigh/noFH, TUhigh/FH, HT/noFH and RA/noFH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using CS-4 coding with the following three fading conditions: Static/FH, TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to f) under extreme test conditions.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
- P0 = 14 dBm;
 - BTS_PWR_CTRL_MODE = Mode A;
 - PR_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH.
- j) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) using USF/CS2 to 4 coding.

NOTE: Since coding for USF-bits is identical for CS2 and CS3, it's not required to perform the step for both of those CS.

- n) The SS repeats steps i) to m) under extreme test conditions.
- o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/CS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

14.16.1a.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step o) the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level – Pb) then the MS is not required to fulfil 3GPP TS 05.05 requirements for the first 25 blocks addressed to this MS (3GPP TS 05.08, subclause 10.2.2).

NOTE: This is stated in the Rel 99 version of 3GPP TS 05.08.

14.16.2 Co-channel rejection

14.16.2.1 Co-channel rejection for packet channels

14.16.2.1.1 Definition

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

14.16.2.1.2 Conformance requirement

1. The block error rate (BLER) performance shall not exceed 10 % at co-channel interference ratios (C/I_c) exceeding those according to the table below.

| Type of channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| PDTCH/CS-1 | dB | 13 | 10 | 9 | 9 |
| PDTCH/CS-2 | dB | 15 | 14 | 13 | 13 |
| PDTCH/CS-3 | dB | 16 | 16 | 15 | 16 |
| PDTCH/CS-4 | dB | 21 | 24 | 24 | - |
| DCS 1 800 and PCS 1 900 | | | | | |
| PDTCH/CS-1 | dB | 13 | 9 | 9 | 9 |
| PDTCH/CS-2 | dB | 15 | 13 | 13 | 13 |
| PDTCH/CS-3 | dB | 16 | 16 | 16 | 16 |
| PDTCH/CS-4 | dB | 21 | 27 | 27 | - |

3GPP TS 05.05, table 2a; 3GPP TS 05.05, subclause 6.2.

2. The block error rate (BLER) performance shall not exceed 1 % at co-channel interference ratios (C/I_c) exceeding those according to the table below.

| Type of channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| USF/CS-1 | dB | 19 | 12 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 10 | 9 | 8 |
| DCS 1 800 and PCS 1 900 | | | | | |
| USF/CS-1 | dB | 19 | 10 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 9 | 9 | 7 |

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.16.2.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TU_{low}/no FH, TU_{high}/noFH, TU_{high}/FH and RA/no FH with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TU_{high}/noFH, with an allowance for the statistical significance of the test.

14.16.2.1.4 Method of test

14.16.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS transmits Standard Test Signal C1.

In addition to this wanted signal (C), the SS produces an independent, uncorrelated interfering signal (I).

This unwanted signal is random, continuous and GSM-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in GSM Rec. 4.14 (para 5.4) will be used for uplink TBF. If the MS is capable of both:

- Mode (a) transmitting pseudo-random data sequence in RLC data blocks;
- Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

Specific PICS statements:

- Support of DARP Phase 1 (TSPC_DARP_Phase1)

PIXIT Statements:

-

14.16.2.1.4.2 Procedure

- a) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted and the interfering signal is TU_{low}, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) In the case of CS-1 the SS repeats step c) to e) with the fading conditions and hopping modes: TUhigh/FH, and RA/noFH and, if the MS does not support DARP phase 1 also with TUhigh/noFH fading condition. In the case of CS-2 the SS repeats step c) to e) with the fading condition and hopping mode RA/no FH only. In the case of CS-3 the SS repeats step c) to e) with the fading condition and hopping mode TUhigh/FH only. In the case of CS-4 and the MS does not support DARP phase 1 the SS repeats step c) to e) with the fading condition and hopping modes: TUhigh/noFH.
- g) The SS repeats the steps b) to f) for each of the coding schemes CS-2, CS-3 and CS-4.
- h) The SS sets the fading function to TUhigh/noFH.
- i) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, using a co-channel interference level of 1 dB above the level given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
- l) The SS repeats steps i) to k) using USF/CS2 coding.

14.16.2.1.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 subclause 6.3 together with subclause 14.16.2.1.4.2 c) shall be set according to the table below.

| Type of channel | | Propagation conditions | | | |
|---|-----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, T-GSM 810, GSM 850 and GSM 900 Small Ms (see note (1)) | | | | | |
| PDTCH/CS-1 | dBm | -77 | -80 | -81 | -81 |
| PDTCH/CS-2 | dBm | -75 | -76 | -77 | -77 |
| PDTCH/CS-3 | dBm | -74 | -74 | -75 | -74 |
| PDTCH/CS-4 | dBm | -69 | -66 | -66 | - |
| DCS 1 800 and PCS 1 900 (class 1 and 2) (see note (2)) | | | | | |
| PDTCH/CS-1 | dBm | -77 | -81 | -81 | -81 |
| PDTCH/CS-2 | dBm | -75 | -77 | -77 | -77 |
| PDTCH/CS-3 | dBm | -74 | -74 | -74 | -74 |
| PDTCH/CS-4 | dBm | -69 | -63 | -63 | - |
| NOTE 1: For other GSM 400, GSM 900, T-GSM 810, GSM 850 and GSM 700 MS the values in the table above should be decreased by 2 dBm. | | | | | |
| NOTE 2: For other classes of PCS 1 900 MS the values in the above table should be decreased by 2 dBm. For DCS 1 800 MS under extreme conditions the values in the above table should be increased by 2 dBm. | | | | | |

14.16.2.1a Co-channel rejection for packet channels – TIGHTER configuration

14.16.2.1a.1 Definition

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

14.16.2.1a.2 Conformance requirement

For a MS indicating support for TIGHTER Capability (see 3GPP TS 24.008), the minimum input signal levels for which the reference performance shall be met are specified in table 1w, according to the propagation condition. The performance requirements for GSM 400 and GSM 700 systems are as for GSM 900 in table 1w, except that the GSM 400 MS speed is doubled from that of GSM 900, e.g. TU50 becomes TU100, and the GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60.

1. The block error rate (BLER) performance shall not exceed 10 % at co-channel interference ratios (C/I_c) exceeding those according to the table 14.16.2.1a-1 as below.

Table 14.16.2.1a-1

| Type of channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| PDTCH/CS-1 | dB | 9 | 6,5 | 5,5 | 6,5 |
| PDTCH/CS-2 | dB | 11 | 10,5 | 9,5 | 10,5 |
| PDTCH/CS-3 | dB | 12 | 12,5 | 11,5 | 13,5 |
| PDTCH/CS-4 | dB | 17 | 20,5 | 20,5 | - |
| DCS 1 800 and PCS 1 900 | | | | | |
| PDTCH/CS-1 | dB | 9 | 5,5 | 5,5 | 6,5 |
| PDTCH/CS-2 | dB | 11 | 9,5 | 9,5 | 10,5 |
| PDTCH/CS-3 | dB | 12 | 12,5 | 12,5 | 13,5 |
| PDTCH/CS-4 | dB | 17 | 23,5 | 23,5 | - |

3GPP TS 45.005, table 2ad; 3GPP TS 45.005, subclause 6.2.

2. The block error rate (BLER) performance shall not exceed 1 % at co-channel interference ratios (C/I_c) exceeding those according to the table 14.16.2.1a-2 below.

Table 14.16.2.1a-2

| Type of channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| USF/CS-1 | dB | 19 | 12 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 10 | 9 | 8 |
| DCS 1 800 and PCS 1 900 | | | | | |
| USF/CS-1 | dB | 19 | 10 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 9 | 9 | 7 |

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.16.2.1a.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUlow/no FH, TUhigh/noFH, TUhigh/FH and RA/no FH with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

14.16.2.1a.4 Method of test

14.16.2.1a.4.1 Initial conditions

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS transmits Standard Test Signal C1.

In addition to this wanted signal (C), the SS produces an independent, uncorrelated interfering signal (I).

This unwanted signal is random, continuous and GSM-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in GSM Rec. 4.14 (para 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

Specific PICS statements:

PIXIT Statements:

-

14.16.2.1a.4.2 Procedure

- a) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted and the interfering signal is TUlow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) In the case of CS-1 the SS repeats step c) to e) with the fading conditions and hopping modes: TUhigh/FH and RA/noFH.
In the case of CS-2 the SS repeats step c) to e) with the fading condition and hopping mode RA/no FH only.
In the case of CS-3 the SS repeats step c) to e) with the fading condition and hopping mode TUhigh/FH only.

- g) The SS repeats the steps b) to f) for each of the coding schemes CS-2, CS-3 and CS-4.
- h) The SS sets the fading function to TUhigh/noFH.
- i) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, using a co-channel interference level of 1 dB above the level given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14.16-2, the SS calculates the Block error ratio. The SS resets both counters.
- l) The SS repeats steps i) to k) using USF/CS2 coding.

14.16.2.1a.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 subclause 6.3 together with subclause 14.16.2.1a.4.2 c) shall be set according to the table 14.16.2.1a-3 as below.

Table 14.16.2.1a-3

| Type of channel | | Propagation conditions | | | |
|---|-----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, T-GSM 810, GSM 850 and GSM 900 Small Ms (see note (1)) | | | | | |
| PDTCH/CS-1 | dBm | -81 | -83,5 | -84,5 | -83,5 |
| PDTCH/CS-2 | dBm | -79 | -79,5 | -80,5 | -79,5 |
| PDTCH/CS-3 | dBm | -78 | -77,5 | -78,5 | -76,5 |
| PDTCH/CS-4 | dBm | -73 | -69,5 | -69,5 | - |
| DCS 1 800 and PCS 1 900 (class 1 and 2) (see note (2)) | | | | | |
| PDTCH/CS-1 | dBm | -81 | -84,5 | -84,5 | -83,5 |
| PDTCH/CS-2 | dBm | -79 | -80,5 | -80,5 | -79,5 |
| PDTCH/CS-3 | dBm | -78 | -77,5 | -77,5 | -76,5 |
| PDTCH/CS-4 | dBm | -73 | -66,5 | -66,5 | - |
| NOTE 1: For other GSM 400, GSM 900, T-GSM 810, GSM 850 and GSM 700 MS the values in the table above should be decreased by 2 dBm. | | | | | |
| NOTE 2: For other classes of PCS 1 900 MS the values in the above table should be decreased by 2 dBm. For DCS 1 800 MS under extreme conditions the values in the above table should be increased by 2 dBm. | | | | | |

14.16.3 Acknowledged mode / Downlink TBF / I_LEVEL measurement report

14.16.3.1 Conformance requirements

The PACKET DOWNLINK ACK/NACK message contains a Channel Quality Report (see 3GPP TS 05.08). The optional I_LEVEL measurement results shall be included in at least every other PACKET DOWNLINK ACK/NACK message.

The accuracy of the received signal level and interference measurements shall be as defined in subclause 8.1.2. The measured signal strength values shall be mapped to the reported C values as defined for RXLEV in subclause 8.1.4. If included in a PACKET MEASUREMENT REPORT message, the measured interference level, γ_{CH} , shall be mapped to a reported I_LEVEL as defined for RXLEV in subclause 8.1.4. If included in a PACKET DOWNLINK ACK/NACK or a PACKET RESOURCE REQUEST message, the measured interference level, γ_{CH} , shall be mapped to a reported I_LEVEL value between 0 and 15, relative to reported C value as follows:

I_LEVEL 0 = interference level is greater than C
 I_LEVEL 1 = interference level is less than or equal to C and greater than C - 2 dB
 I_LEVEL 2 = interference level is less than or equal to C - 2 dB and greater than C - 4 dB
 :
 :
 I_LEVEL 14 = interference level is less than or equal to C - 26 dB and greater than C - 28 dB
 I_LEVEL 15 = interference level is less than or equal to C - 28 dB

14.16.3.2 References

3GPP TS 04.60, 3GPP TS 44.060, subclause 8.1.2.2.

3GPP TS 05.08, 3GPP TS 45.008, subclauses 10.3

14.16.3.3 Test purpose

To verify that correct I_LEVEL measurement results are included in at least every other PACKET DOWNLINK ACK/NACK message.

14.16.3.4 Method of test

14.16.3.5 Initial Conditions

System Simulator:

- 1) cell, default setting, PBCCH not present. The power control parameter ALPHA (α) is set to 0.
- 2) The level of the serving cell BCCH and of the PDTCH is set to 30 dB above the reference sensitivity level which is specified in 3GPP TS 05.05. For instance for class 2 or 3 MS, in GSM 900 MS, the level of the serving cell BCCH and of the PDTCH shall be set to $-104 \text{ dBm} + 30\text{dB} = -74\text{dBm}$.
- 3) PC_MEAS_CHAN indicates that the MS shall measure the received signal level of each radio block on one of the PDCH monitored by the MS for PACCH.
- 4) The interference filter parameter N_AVG_I is set to 3 (coded value 0011)
- 5) The C value filter parameter T_AVG_T is set to 15 (coded 01111).
- 6) Normal conditions as defined in Annex D of 3GPP TS 05.05 are applied.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

14.16.3.6 Void

14.16.3.7 Test Procedure

In addition to the wanted signal on PDTCH, the SS produces an uncorrelated co-channel interfering signal, GMSK modulated: the unwanted signal is sent during idle frames of PDTCH of the wanted signal, and has no fixed relationship with the bit transitions of the wanted signal.

This interfering signal is sent on the same nominal carrier frequency as the PACCH and PDTCH and at a level x dB above the level of the PDTCH and modulated with random data.

x is a random value in [1 dB; -29 dB] in steps of 2 dB, negative values of x meaning that the resulting interference level is below the level of the PDTCH.

For instance, for GSM 900 MS, the resulting interference level depends on the x random value as follows:

| x | Interference level |
|----------|---------------------------|
| 1 dB | -73 dBm |
| -1 dB | -75 dBm |
| -3 dB | -77 dBm |
| -5 dB | -79 dBm |
| -7 dB | -81 dBm |
| -9 dB | -83 dBm |
| -11 dB | -85 dBm |
| -13 dB | -87 dBm |
| -15 dB | -89 dBm |
| -17 dB | -91 dBm |
| -19 dB | -93 dBm |
| -21 dB | -95 dBm |
| -23 dB | -97 dBm |
| -25 dB | -99 dBm |
| -27 dB | -101 dBm |
| -29 dB | -103 dBm |

NOTE: Values of the reference sensitivity level for every frequencies are defined in “3GPP TS 05.05.

- a) The SS establishes a downlink TBF and sends RLC data blocks.
- b) The MS is polled every 12 RLC data block by setting the S/P bit.
- c) The SS verifies that a correct I_level parameter is included in the Channel Quality report of at least every other two Packet Downlink Ack/Nack messages.
- d) The SS verifies that the reported value of I_level is correct: the measured interference level is mapped to a reported I_LEVEL value between 0 and 15, relative to reported C value as follows (as stated in 3GPP TS 05.08, subclauses 10.3), level resulting from the value of x:

| x | I_LEVEL |
|----------|----------------|
| 1 dB | 0 |
| -1 dB | 1 |
| -3 dB | 2 |
| -5 dB | 3 |
| -7 dB | 4 |
| -9 dB | 5 |
| -11 dB | 6 |
| -13 dB | 7 |
| -15 dB | 8 |
| -17 dB | 9 |
| -19 dB | 10 |
| -21 dB | 11 |
| -23 dB | 12 |
| -25 dB | 13 |
| -27 dB | 14 |
| -29 dB | 15 |

The accuracy of the interference measurement shall fulfil the requirement as defined in 3GPP TS 05.08, subclauses 8.1.2:

the R.M.S received signal level at the receiver input shall be measured by the MS and the BSS over the full range of -110 dBm to -48 dBm with an absolute accuracy of ± 4 dB from -110 dBm to -70 dBm under normal conditions and ± 6 dB over the full range under both normal and extreme conditions.

Thus, for GSM 900 MS, the resulting tolerance is ± 4 dB for every value of the x random variable.

14.16.4 DARP Phase 1 GPRS tests

14.16.4.1 Synchronous single co-channel interferer (DTS-1)

14.16.4.1.1 Definition

The DARP reference test scenario DTS-1 for a single synchronous co-channel interferer defines an interfering signal and corresponding performance limits. This test is a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of this specific unwanted signals.

14.16.4.1.2 Conformance requirement

MS indicating support for Downlink Advanced Receiver Performance – phase I (see 3GPP TS 24.008) shall fulfil the requirements in table 2o for wanted signals on GMSK modulated channels under TU50 no FH propagation conditions and GMSK modulated interferers for the test scenarios defined in annex L. The reference performance shall be:

- For packet switched channels (PDTCH) BLER: $\leq 10\%$

The values in table 2o are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex L).

3GPP TS 45.005; clause 6.3.

Reference Test Scenarios for Synchronous single co-channel interferer

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-1 | Co-channel 1 | 0 dB | none | no delay |

3GPP TS 45.005; Annex L.

| GSM 900 and GSM 850 | |
|-----------------------|-------------------|
| Propagation condition | DTS-1, TU50 no FH |
| Type of channel | C/I |
| PDTCH CS-1 | 3 dB |
| PDTCH CS-2 | 6 dB |
| PDTCH CS-3 | 8,5 dB |
| PDTCH CS-4 | 19,5 dB |

| DCS 1 800 & PCS 1900 | |
|-----------------------|-------------------|
| Propagation condition | DTS-1, TU50 no FH |
| Type of channel | C/I |
| PDTCH CS-1 | 2,5 dB |
| PDTCH CS-2 | 6 dB |
| PDTCH CS-3 | 9 dB |
| PDTCH CS-4 | 22 dB |

3GPP TS 45.005; table 2o (extracts).

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; subclause 2

14.16.4.1.3 Test purpose

To verify that the MS does not exceed conformance requirement for different coding schemes and under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.16.4.1.4 Test method

14.16.4.1.4.1 Initial condition

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces an independent, uncorrelated interfering signal (I1). This unwanted signal is random, continuous and GSM-modulated and has no fixed relationship with the bit transitions of the wanted signal.

14.16.4.1.4.2 Procedure

- a) The co-channel interferer signal I1 (unwanted signal) is set to -80 dBm.
- b) The fading characteristic of the wanted signal C1 and the interferer signal I1 is set to TU High. No FH applies.
- c) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.
- d) The SS sets the level of the wanted signal 1dB above the value according the Table 14.16.4.1.5-1 and Table 14.16.4.1.5-2.
- e) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.
- f) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.16-2 the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats the steps c) to f) for each of the coding schemes CS-2, CS-3 and CS-4.

14.16.4.1.5 Test requirement

The block error ratio, as calculated by the SS for different channels under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2o.

Table 14.16.4.1.5-1

| GSM 900 and GSM 850 | | |
|---------------------|-------|--------|
| PDTCH CS-1 | C/dBm | - 77.0 |
| PDTCH CS-2 | C/dBm | - 74.0 |
| PDTCH CS-3 | C/dBm | - 71.5 |
| PDTCH CS-4 | C/dBm | - 60.5 |

Table 14.16.4.1.5-2

| DCS 1 800 & PCS 1900 | | |
|---------------------------------|-------|--------|
| PDTCH CS-1 | C/dBm | - 77.5 |
| PDTCH CS-2 | C/dBm | - 74.0 |
| PDTCH CS-3 | C/dBm | - 71.0 |
| PDTCH CS-4 | C/dBm | - 58.0 |

14.16.4.1a Synchronous single co-channel interferer (DTS-1) in TIGHTER configuration

14.16.4.1a.1 Definition

The DARP reference test scenario DTS-1 for a single synchronous co-channel interferer defines an interfering signal and corresponding performance limits. This test is a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of this specific unwanted signal.

14.16.4.1a.2 Conformance requirement

A MS indicating support for TIGHTER Capability (see 3GPP TS 24.008) shall fulfil the requirements in table 2ad for co channel interference (C/Ic), table 2af for adjacent channel (200 kHz) interference (C/Ia1), and the additional requirements in table 2ae for wanted signals on GMSK modulated channels for the test scenarios defined in annex L.

The reference performance shall be:

- For packet switched channels (PDTCH) BLER: ≤ 10 %

The values in table 2ae are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex L).

3GPP TS 45.005 sub clause 6.3.5

Reference Test Scenarios for Synchronous single co-channel interferer

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|--------------------------------|---------------------------|--|------------|-------------------------------|
| DTS-1 | Co-channel 1 | 0 dB | none | no delay |

3GPP TS 45.005; Annex L.

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.16.4.1a.3 Test purpose

To verify that the MS does not exceed conformance requirement for different coding schemes and under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

| GSM 900 and GSM 850 | |
|------------------------------|--------------------------|
| Propagation condition | DTS-1, TU50 no FH |
| Type of channel | C/I |
| PDTCH CS-1 | -7 dB |
| PDTCH CS-2 | -4 dB |
| PDTCH CS-3 | -1,5 dB |
| PDTCH CS-4 | 9,5 dB |

| DCS 1 800 & PCS 1900 | |
|-----------------------|-------------------|
| Propagation condition | DTS-1, TU50 no FH |
| Type of channel | C/I |
| PDTCH CS-1 | -6,5 dB |
| PDTCH CS-2 | -3 dB |
| PDTCH CS-3 | 0 dB |
| PDTCH CS-4 | 13 dB |

3GPP TS 45.005; table 2ae (excerpt)

14.16.4.1a.4 Test method

14.16.4.1a.4.1 Initial condition

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid-range, on the maximum number of receive timeslots, with the MS transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces an independent, uncorrelated interfering signal (I1). This unwanted signal is random, continuous and GSM-modulated and has no fixed relationship with the bit transitions of the wanted signal.

14.16.4.1a.4.2 Procedure

- a) The co-channel interferer signal I1 (unwanted signal) is set to -80 dBm.
- b) The fading characteristic of the wanted signal C1 and the interferer signal I1 is set to TU High. No FH applies.
- c) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.
- d) The SS sets the level of the wanted signal 1dB above the value according the Table 14.16.4.1a.5-1 and Table 14.16.4.1a.5-2.
- e) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the ACK/NACK Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink ACK/NACK as sent from the MS to the SS on the PACCH.
- f) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.16-2 the SS calculates the Block error ratio. The SS resets both counters.
- g) The SS repeats the steps c) to f) for each of the coding schemes CS-2, CS-3 and CS-4.

14.16.4.1a.5 Test requirement

The block error ratio, as calculated by the SS for different channels under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2ae.

Table 14.16.4.1a.5-1

| GSM 900 and GSM 850 | | |
|---------------------|-------|--------|
| PDTCH CS-1 | C/dBm | - 87.0 |
| PDTCH CS-2 | C/dBm | - 84.0 |
| PDTCH CS-3 | C/dBm | - 81.5 |
| PDTCH CS-4 | C/dBm | - 71.5 |

Table 14.16.4.1a.5-2

| DCS 1 800 & PCS 1900 | | |
|----------------------|-------|--------|
| PDTCH CS-1 | C/dBm | - 86.5 |
| PDTCH CS-2 | C/dBm | - 83.0 |
| PDTCH CS-3 | C/dBm | - 80.0 |
| PDTCH CS-4 | C/dBm | - 67.0 |

14.16.4.2 Synchronous multiple interferers (DTS-2 / DTS-3)

14.16.4.2.1 Definition

The DARP reference test scenarios DTS-2 and DTS-3 for multiple synchronous interferers define a set of interfering signals and the corresponding performance limits. These tests are a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted signals.

14.16.4.2.2 Conformance requirement

The block error rate (BLER) performance for PDTCH / CS-1 to CS-4 shall not exceed 10 % at the multiple interference ratios (C/I_c) according to table 14.16.4.2.2-1.

Table 14.16.4.2.2-1: Reference Test Scenarios for synchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|--------|------------------------|
| DTS-2 | Co-channel 1 | 0 dB | none | no delay |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |
| DTS-3 | Co-channel 1 | 0 dB | random | -1 to +4 symbols |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |

The values in Table 14.16.4.2.2-2 and Table 14.16.4.2.2-3 are given as the C/I_1 ratio, where C is the power level of the wanted signal and I_1 is the power level of the dominant co-channel interferer (3GPP TS 45.005, annex L).

Table 14.16.4.2.2-2

| GSM 900 and GSM 850 | | |
|-----------------------|------------|---------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH CS-1 | 8 dB | 8,5 dB |
| PDTCH CS-2 | 10,5 dB | 11 dB |
| PDTCH CS-3 | 13 dB | 13,5 dB |
| PDTCH CS-4 | 22 dB | 22,5 dB |

Table 14.16.4.2.2-3

| DCS 1 800 & PCS 1900 | | |
|-----------------------|------------|-------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH CS-1 | 7 dB | 8 dB |
| PDTCH CS-2 | 10,5 dB | 11 dB |
| PDTCH CS-3 | 12,5 dB | 13 dB |
| PDTCH CS-4 | 23,5 dB | 24 dB |

Reference 3GPP TS 45.005, annex L, table 2o

14.16.4.2.3 Test purpose

To verify that the MS does not exceed the conformance requirement for different coding schemes under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.16.4.2.4 Test method

14.16.4.2.4.1 Initial condition

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots which the MS is capable to support, The MS is transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces multiple interfering signals for DTS-2 or DTS-3 scenarios as appropriate for the test procedure.

These interferers are:

Identical interferer for DTS-2 and DTS-3:

- Co-channel 2 (I_{CoCh2}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2
- Adjacent 1 (I_{AdjCh1}): Adjacent channel interferer of type I1 as specified in TS 51.010 annex 5.2
- AWGN (I_{AWGN}): AWGN interferer of type I3 as specified in TS51.010 annex 5.2

DTS-2 specific interferer:

- Co-channel 1 (I_{CoCh1}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2

DTS-3 specific interferer:

- Co-channel 1 (I_{CoCh1}): Delayed co-channel interferer of type I4 as specified in TS 51.010 annex 5.2.

14.16.4.2.4.2 Test Procedure

14.16.4.2.4.3 DTS-2 Procedure

- a) The DTS-2 co-channel interferer signal I_{CoCh1} is configured according to DTS-2 configuration.
- b) The co-channel interferer signal I_{CoCh1} set to -80 dBm.
- c) The power levels of the interferers I_{CoCh2} , I_{AdjCh1} , and I_{AWGN} are set according to table 14.16.4.2.2-1. The power levels are defined relative to I_{CoCh1} .
- d) The fading characteristics of the wanted signal C1 and the interferer signals I_{CoCh1} , I_{CoCh2} , and I_{AdjCh1} are set to TU High. No FH applies.
- e) The SS transmits packets using CS-1 coding on all allocated timeslots.
- f) The SS sets the level of the wanted signal C1 1 dB above the value according to Table 14.16.4.2.5-1 and Table 14.16.4.2.5-2.
- g) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.
- h) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.16-2 the SS calculates the Block error ratio. The SS resets both counters.
- i) SS repeats the steps (e) to (h) for each of the coding schemes CS-2, CS-3 and CS-4.

14.16.4.2.4.4 DTS-3 Procedure

- a) The DTS-3 co-channel interferer signal I_{CoCh1} is configured according to DTS-3 configuration.
- b) The SS repeats the steps (b) to (i) identical to the DTS-2 procedure

14.16.4.2.5 Test requirement

The block error ratio, as calculated by the SS for different channels and under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 (table 2o, annex L) , shall be set according to the table below.

Table 14.16.4.2.5-1

| GSM 900 and GSM 850 | | | |
|---------------------|-------|--------------------|-------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH CS-1 | C/dBm | - 72,0 | -71,5 |
| PDTCH CS-2 | C/dBm | - 69,5 | -69,0 |
| PDTCH CS-3 | C/dBm | -67,0 | -66,5 |
| PDTCH CS-4 | C/dBm | -58,0 | -57,5 |

Table 14.16.4.2.5-2

| DCS 1 800 & PCS 1900 | | | |
|----------------------|--------|--------------------|--------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH CS-1 | C/dBm | - 73,0 | - 72,0 |
| PDTCH CS-2 | C /dBm | - 69,5 | - 69,0 |
| PDTCH CS-3 | C /dBm | - 67,5 | - 67,0 |
| PDTCH CS-4 | C /dBm | - 56,5 | - 56,0 |

14.16.4.2a Synchronous multiple interferers (DTS-2 / DTS-3) in TIGHTER configuration

14.16.4.2a.1 Definition

The DARP reference test scenarios DTS-2 and DTS-3 for multiple synchronous interferers define a set of interfering signals and the corresponding performance limits. These tests are a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted signals.

14.16.4.2a.2 Conformance requirement

A MS indicating support for TIGHTER Capability (see 3GPP TS 24.008) shall fulfil the requirements in table 2ad for co channel interference (C/I_c), table 2af for adjacent channel (200 kHz) interference (C/I_{a1}), and the additional requirements in table 2ae for wanted signals on GMSK modulated channels for the test scenarios defined in annex L.

The reference performance shall be:

- For packet switched channel (PDTCH) BLER: $\leq 10\%$

The values in Table 2ae are given as the C/I₁ ratio, where C is the power level of the wanted signal and I₁ is the power level of the dominant co-channel interferer (3GPP TS 45.005, annex L).

Table 14.16.4.2a.2-1: Reference Test Scenarios for synchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|--------|------------------------|
| DTS-2 | Co-channel 1 | 0 dB | none | no delay |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |
| DTS-3 | Co-channel 1 | 0 dB | random | -1 to +4 symbols |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |

3GPP TS 45.005; Annex L

Reference 3GPP TS 45.005, annex L, table 2ae (excerpt)

14.16.4.2a.3 Test purpose

To verify that the MS does not exceed the conformance requirement for different coding schemes under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

| GSM 900 and GSM 850 | | |
|-----------------------|------------|---------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH CS-1 | 6 dB | 6,5 dB |
| PDTCH CS-2 | 8,5 dB | 9 dB |
| PDTCH CS-3 | 11 dB | 11,5 dB |
| PDTCH CS-4 | 20 dB | 20,5 dB |

| DCS 1 800 & PCS 1900 | | |
|-----------------------|------------|-------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH CS-1 | 5 dB | 6 dB |
| PDTCH CS-2 | 8,5 dB | 9 dB |
| PDTCH CS-3 | 10,5 dB | 11 dB |
| PDTCH CS-4 | 21,5 dB | 22 dB |

14.16.4.2a.4 Test method

14.16.4.2a.4.1 Initial condition

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots which the MS is capable to support, The MS is transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces multiple interfering signals for DTS-2 or DTS-3 scenarios as appropriate for the test procedure.

These interferers are:

Identical interferer for DTS-2 and DTS-3:

- Co-channel 2 (I_{CoCh2}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2
- Adjacent 1 (I_{AdjCh1}): Adjacent channel interferer of type I1 as specified in TS 51.010 annex 5.2
- AWGN (I_{AWGN}): AWGN interferer of type I3 as specified in TS51.010 annex 5.2

DTS-2 specific interferer:

- Co-channel 1 (I_{CoCh1}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2

DTS-3 specific interferer:

- Co-channel 1 (I_{CoCh1}): Delayed co-channel interferer of type I4 as specified in TS 51.010 annex 5.2.

14.16.4.2a.4.2 Test Procedure

14.16.4.2a.4.3 DTS-2 Procedure

- a) The DTS-2 co-channel interferer signal I_{CoCh1} is configured according to DTS-2 configuration.
- b) The co-channel interferer signal I_{CoCh1} set to -80 dBm.

- c) The power levels of the interferers I_{CoCh2} , I_{AdjCh1} , and I_{AWGN} are set according to table 14.16.4.2a.2-1. The power levels are defined relative to I_{CoCh1} .
- d) The fading characteristics of the wanted signal C1 and the interferer signals I_{CoCh1} , I_{CoCh2} , and I_{AdjCh1} are set to TU High. No FH applies.
- e) The SS transmits packets using CS-1 coding on all allocated timeslots.
- f) The SS sets the level of the wanted signal C1 1 dB above the value according to Table 14.16.4.2a.5-1 and Table 14.16.4.2a.5-2.
- g) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the ACK/NACK Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink ACK/NACK as sent from the MS to the SS on the PACCH.
- h) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.16-2 the SS calculates the Block error ratio. The SS resets both counters.
- i) SS repeats the steps (e) to (h) for each of the coding schemes CS-2, CS-3 and CS-4.

14.16.4.2a.4.4 DTS-3 Procedure

- a) The DTS-3 co-channel interferer signal I_{CoCh1} is configured according to DTS-3 configuration.
- b) The SS repeats the steps (b) to (i) identical to the DTS-2 procedure

14.16.4.2a.5 Test requirement

The block error ratio, as calculated by the SS for different channels and under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2ae, , shall be set according to the table below.

Table 14.16.4.2a.5-1

| GSM 900 and GSM 850 | | | |
|---------------------|-------|--------------------|-------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH CS-1 | C/dBm | - 74,0 | -73,5 |
| PDTCH CS-2 | C/dBm | - 71,5 | -71,0 |
| PDTCH CS-3 | C/dBm | -69,0 | -68,5 |
| PDTCH CS-4 | C/dBm | -60,0 | -59,5 |

Table 14.16.4a.2.5-2

| DCS 1 800 & PCS 1900 | | | |
|----------------------|--------|--------------------|--------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH CS-1 | C/dBm | - 75,0 | - 74,0 |
| PDTCH CS-2 | C /dBm | - 71,5 | - 71,0 |
| PDTCH CS-3 | C /dBm | - 69,5 | - 69,0 |
| PDTCH CS-4 | C /dBm | - 58,5 | - 58,0 |

14.16.5 DARP Phase II GPRS tests

14.16.5.1 Synchronous single co-channel interferer (DTS-1)

14.16.5.1.1 Definition

The DARP phase II reference test scenario DTS-1 for a single synchronous co-channel interferer defines an interfering signal and corresponding performance limits. This test is a measure of the capability of the DARP phase II receivers to receive a wanted modulated signal without exceeding a given degradation due to the presence of this specific unwanted signal.

14.16.5.1.2 Conformance requirement

MS indicating support for Downlink Advanced Receiver Performance – phase II (see 3GPP TS 24.008) shall fulfil the requirements in table 2q for the test scenarios defined in annex N

The reference performance shall be:

- For packet switched channels (PDTCH) BLER: $\leq 10\%$

The values in table 2q are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex N).

3GPP TS 45.005; clause 6.3.

Reference Test Scenario for synchronous single co-channel interferer

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-1 | Co-channel 1 | 0 dB | none | no delay |

3GPP TS 45.005; Annex N.

| GSM 900 and GSM 850 | |
|-------------------------------------|----------|
| Propagation condition: TU50 (no FH) | |
| Correlation=0; AGI=0 dB | |
| PDTCH CS-1 | -12,5 dB |
| PDTCH CS-2 | -9,5 dB |
| PDTCH CS-3 | -8,0 dB |
| PDTCH CS-4 | 0,0 dB |

| GSM 1800 and GSM 1900 | |
|-------------------------------------|----------|
| Propagation condition: TU50 (no FH) | |
| Correlation=0; AGI=0 dB | |
| PDTCH CS-1 | -12,0 dB |
| PDTCH CS-2 | -9,0 dB |
| PDTCH CS-3 | -7,0 dB |
| PDTCH CS-4 | 4,5 dB |

3GPP TS 45.005; table 2q (excerpt for DTS-1).

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.16.5.1.3 Test purpose

To verify that the MS does not exceed conformance requirement for different coding schemes and under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.16.5.1.4 Test method

14.16.5.1.4.1 Initial condition

The SS is configured as defined in annex N.2 picture N.2.2 of 3GPP 45.005

The diversity parameter for the antenna correlation is set to 0 and the antenna gain imbalance (AGI) is set to 0 dB

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range on the maximum number of receive timeslots which the MS is capable to support. The power control level set to maximum power.

The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces an independent, uncorrelated interfering signal (I1). This unwanted signal is random, continuous and GSM-modulated and has no fixed relationship with the bit transitions of the wanted signal.

14.16.5.1.4.2 Procedure

- a) The co-channel interferer signal I1 (unwanted signal) is set to -70 dBm.
- b) The fading characteristic of the wanted signal C1 and the interferer signal I1 is set to TU High. No FH applies.
- c) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.
- d) The SS sets the level of the wanted signal 1dB above the value according the Table 14.16.5.1.5-1 and Table 14.16.5.1.5-2.
- e) The SS transmits the number of blocks with current coding scheme accordingly with table 14.16-2 and counts the BLER based on the content of the ACK/NACK Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink ACK/NACK as sent from the MS to the SS on the PACCH. The SS resets both counters.
- f) The SS repeats the steps (c) to (e) for each of the coding schemes CS-2, CS-3 and CS-4.

14.16.5.1.5 Test requirement

The block error ratio, as calculated by the SS for different channels under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2q shall be set according to the table below.

Table 14.16.5.1.5-1

| GSM 900 and GSM 850 | | |
|---------------------|-------|-------|
| PDTCH CS-1 | C/dBm | -82,5 |
| PDTCH CS-2 | C/dBm | -79,5 |
| PDTCH CS-3 | C/dBm | -78,0 |
| PDTCH CS-4 | C/dBm | -70,0 |

Table 14.16.5.1.5-2

| DCS 1 800 & PCS 1900 | | |
|----------------------|-------|-------|
| PDTCH CS-1 | C/dBm | -82,0 |
| PDTCH CS-2 | C/dBm | -79,0 |
| PDTCH CS-3 | C/dBm | -77,0 |
| PDTCH CS-4 | C/dBm | -65,5 |

14.16.5.2 Multiple interferers (DTS-2 / DTS-5)

14.16.5.2.1 Definition

The DARP phase II reference test scenarios DTS-2 and DTS-5 for multiple interferers define a set of interfering signals and the corresponding performance limits. These tests are a measure of the capability of the DARP phase II receivers to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted signals.

14.16.5.2.2 Conformance requirement

MS indicating support for Downlink Advanced Receiver Performance – phase II (see 3GPP TS 24.008) shall fulfil the requirements in table 2q for the test scenarios defined in annex N

The reference performance shall be:

- For packet switched channels (PDTCH) BLER: ≤ 10 %

The values in table 2q are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex N).

3GPP TS 45.005; clause 6.3.

Reference Test Scenarios for synchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-2 | Co-channel 1 | 0 dB | none | no delay |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |

Reference Test Scenario for asynchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay |
|---|--------------------|---------------------------------|------|------------------|
| DTS-5 | Co-channel 1 | 0 dB ^{*)} | none | 74 symbols |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |
| ^{*)} The power of the delayed interferer burst, averaged over the active part of the wanted signal burst. The power of the delayed interferer burst, averaged over the active part of the delayed interferer burst is 3 dB higher. | | | | |

3GPP TS 45.005; Annex N.

| GSM 900 and GSM 850 | | |
|-------------------------------------|-------|-------|
| Propagation condition: TU50 (no FH) | | |
| Correlation=0; AGI=0 dB | | |
| Channel type | C/I | |
| | DTS-2 | DTS-5 |
| PDTCH CS-1 | 0,5 | 0,5 |
| PDTCH CS-2 | 3,0 | 3,5 |
| PDTCH CS-3 | 5,0 | 5,5 |
| PDTCH CS-4 | 12,0 | 13,0 |

| GSM 1800 and PCS 1900 | | |
|-------------------------------------|-------|-------|
| Propagation condition: TU50 (no FH) | | |
| Correlation=0; AGI=0 dB | | |
| Channel type | C/I | |
| | DTS-2 | DTS-5 |
| PDTCH CS-1 | 0,0 | 0,0 |
| PDTCH CS-2 | 3,0 | 3,0 |
| PDTCH CS-3 | 4,5 | 5,0 |
| PDTCH CS-4 | 12,5 | 13,5 |

3GPP TS 45.005 table 2q (excerpt for DTS-2 and DTS-5)

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.16.5.2.3 Test purpose

To verify that the MS does not exceed the conformance requirement for different coding schemes under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.16.5.2.4 Test method

14.16.5.2.4.1 Initial condition

The SS is configured for a single input and dual output configuration (SIDO) as defined in annex N.2.2 picture N.2.2 of 3GPP 45.005

The diversity parameter for the antenna correlation is set to 0 and the antenna gain imbalance (AGI) is set to 0 dB

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots which the MS is capable to support, The MS is transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces multiple interfering signals for DTS-2 or DTS-5 scenarios as appropriate for the test procedure.

These interferers are:

Identical interferer types for DTS-2 and DTS-5:

- Co-channel 2 (I_{CoCh2}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2
- Adjacent 1 (I_{AdjCh1}): Adjacent channel interferer of type I1 as specified in TS 51.010 annex 5.2
- AWGN (I_{AWGN}): AWGN interferer of type I3 as specified in TS51.010 annex 5.2

DTS-2 specific interferer:

- Co-channel 1 (I_{CoCh1}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2

DTS-5 specific interferer:

- Co-channel 1 (I_{CoCh1}): Delayed co-channel interferer of type I5 as specified in TS 51.010 annex 5.2.

14.16.5.2.4.2 Test Procedure

14.16.5.2.4.2.1 DTS-2 Procedure

- a) The DTS-2 co-channel interferer signal I_{CoCh1} is configured according to the DTS-2 configuration.
- b) The co-channel interferer signal I_{CoCh1} set to -70 dBm.
- c) The power levels of the interferers I_{CoCh2} , I_{AdjCh1} , and I_{AWGN} are set according to table 14.16.5.2.21. The power levels are defined relative to I_{CoCh1} .
- d) The fading characteristics of the wanted signal C1 and the interferer signals I_{CoCh1} , I_{CoCh2} , and I_{AdjCh1} are set to TU High. No FH applies.
- e) The SS transmits packets using CS-1 coding on all allocated timeslots.
- f) The SS sets the level of the wanted signal C1 1 dB above the value according to table 14.16.5.2.5-1 and table 14.16.5.2.5-2.
- g) The SS transmits the number of blocks with current coding scheme accordingly with table 14.16-2 and counts the BLER based on the content of the ACK/NACK Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink ACK/NACK as sent from the MS to the SS on the PACCH. The SS resets both counters.
- h) The SS repeats the steps (e) to (g) for each of the coding schemes CS-2, CS-3 and CS-4.

14.16.5.2.4.2.2 DTS-5 Procedure

- a) The DTS-5 co-channel interferer signal I_{CoCh1} is configured according to DTS-5 configuration.
- b) The SS repeats the steps (b) to (h) identical to the DTS-2 procedure

14.16.5.2.5 Test requirement

The block error ratio calculated by the SS for different channels and under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2q, shall be set according to the table below.

Table 14.16.5.2.5-1

| GSM 900 and GSM 850 | | | |
|---------------------|-------|-----------------------|-------|
| Type of channel | | DARP II Test Scenario | |
| | | DTS-2 | DTS-5 |
| PDTCH CS-1 | C/dBm | -69,5 | -69,5 |
| PDTCH CS-2 | C/dBm | -67,0 | -66,5 |
| PDTCH CS-3 | C/dBm | -65,0 | -64,5 |
| PDTCH CS-4 | C/dBm | -58,0 | -57,0 |

Table 14.16.5.2.5-2

| DCS 1 800 & PCS 1900 | | | |
|----------------------|--------|-----------------------|-------|
| Type of channel | | DARP II Test Scenario | |
| | | DTS-2 | DTS-5 |
| PDTCH CS-1 | C/dBm | -70,0 | -70,0 |
| PDTCH CS-2 | C /dBm | -67,0 | -67,0 |
| PDTCH CS-3 | C /dBm | -65,5 | -65,0 |
| PDTCH CS-4 | C /dBm | -57,5 | -56,5 |

14.17

14.18 EGPRS receiver tests

Statistical testing of receiver BLER performance

Error Definition

Block Error Ratio (BLER):

The Block Error Ratio is the ratio of blocks received in error to the total number of received blocks, where a block is defined as received in error if the error detection functions in the receiver, operating in accordance with 3GPP TS 05.03, indicate an error as the result of the Block Check Sequence (BCS).

For USF the Block Error Ratio is the ratio of incorrectly interpreted USF to the total number of received USF.

Test criteria

In the receiver tests for circuit switched channels, test error rates have been defined in order not to pass MS with a performance worse than the specification by 1 dB, with tests to be performed at the sensitivity and interference levels defined in 3GPP TS 05.05. For circuit switched channels 3GPP TS 05.05 defines the error rates at a fixed sensitivity or interference level.

For packet switched channels 3GPP TS 05.05 defines the receive or interference level at which a fixed Block Error Ratio is met. Therefore, for EGPRS the receiver is tested with a 1 dB offset in the receive level and the interference level.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events not lower than 200 in AWGN channel and not lower than 600 in a multipath environment.

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14.18-1.

Table 14.18-1: Minimum test time according to propagation profile

| Propagation Conditions | GSM 400, GSM 700, GSM 850 and GSM 900 | | | | DCS 1 800 and PCS 1 900 | | | |
|------------------------|---------------------------------------|--------|----|----|-------------------------|--------|-----|----|
| | TUlow | TUhigh | HT | RA | TUlow | TUhigh | HT | RA |
| Min. test time (s) | 500 | 30 | 15 | 6 | 500 | 15 | 7,5 | 6 |

Table 14.18-2 details, for the different test conditions, the minimum number of blocks required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

Table 14.18-2: Test conditions

| Type of test | Type of sub-test | Propagation/frequency conditions | Specified BLER % | Minimum No of RLC blocks |
|--------------|------------------|----------------------------------|------------------|--------------------------|
| Sensitivity | PDTCH/MCS-1 to 4 | static | 10 | 2 000 |
| " | PDTCH/MCS-1 to 4 | TUhigh/no FH | 10 | 6 000 |

NOTE 1: For MCS-7, 8 and 9 the BLER of 10 % or 30 % is specified in the conformance requirements. For MCS-5 to 6 a BLER of 10 % is always applied.

NOTE 2: For PDTCH sub-tests under fading conditions the number of RLC blocks indicated above shall be transmitted on each downlink timeslot of the multislot configuration.

NOTE 3: For USF sub-tests under fading conditions, the number of RLC blocks indicated above shall be per uplink timeslot of the multislot configuration.

14.18.1 Minimum Input level for Reference Performance

14.18.1.1 Definition

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

14.18.1.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at input levels according to the table 14.18-3a; and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18-3b.

Table 14.18-3a: PDTCH Sensitivity Input Level for GMSK modulation

| Type of Channel | Propagation conditions | | | | | |
|--|------------------------|-------------------|----------------------|---------------|---------------|--------|
| | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) | |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| PDTCH/MCS-1 | dBm | -104 | -102,5 | -103 | -103 | -102 |
| PDTCH/MCS-2 | dBm | -104 | -100,5 | -101 | -100,5 | -100 |
| PDTCH/MCS-3 | dBm | -104 | -96,5 | -96,5 | -92,5 | -95,5 |
| PDTCH/MCS-4 | dBm | -101,5 | -91 | -91 | (note) | (note) |
| DCS 1 800 and PCS 1 900 | | | | | | |
| PDTCH/MCS-1 | dBm | -104 | -102,5 | -103 | -103 | -101,5 |
| PDTCH/MCS-2 | dBm | -104 | -100,5 | -101 | -100,5 | -99,5 |
| PDTCH/MCS-3 | dBm | -104 | -96,5 | -96,5 | -92,5 | -94,5 |
| PDTCH/MCS-4 | dBm | -101,5 | -90,5 | -90,5 | (note) | (note) |

NOTE: PDTCH/MCS-4 can not meet the reference performance for some propagation conditions.

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

| | |
|------------------------------------|-------------|
| GSM 400 small MS | +2 dB; |
| GSM 700, GSM 850, GSM 900 small MS | +2 dB; |
| DCS 1800 class 1 or 2 MS | +2/+4 dB**; |
| DCS 1800 class 3 MS | +2 dB; |
| PCS 1 900 class 1 or 2 MS | +2 dB. |

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

Table 14.18-3b: PDTCH Sensitivity Input Level for MS for 8-PSK modulation

| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
|--|-----|------------------------|----------------|-------------------|------------|--------------|
| Type of channel | | Propagation conditions | | | | |
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| PDTCH/MCS-5 | dBm | -98 | -93 | -94 | -93 | -92 |
| PDTCH/MCS-6 | dBm | -96 | -91 | -91,5 | -88 | -89 |
| PDTCH/MCS-7 | dBm | -93 | -84 | -84 | (note 2) | -83 (note 3) |
| PDTCH/MCS-8 | dBm | -90,5 | -83 (note 3) | -83 (note 3) | (note 2) | (note 2) |
| PDTCH/MCS-9 | dBm | -86 | -78,5 (note 3) | -78,5 (note 3) | (note 2) | (note 2) |
| DCS 1 800 and PCS 1 900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| PDTCH/MCS-5 | dBm | -98 | -93,5 | -93,5 | -93 | -89,5 |
| PDTCH/MCS-6 | dBm | -96 | -91 | -91 | -88 | -83,5 |
| PDTCH/MCS-7 | dBm | -93 | -81,5 | -80,5 | (note 2) | (note 2) |
| PDTCH/MCS-8 | dBm | -90,5 | -80 (note 3) | -80 (note 3) | (note 2) | (note 2) |
| PDTCH/MCS-9 | dBm | -86 | (note 2) | (note 2) | (note 2) | (note 2) |
| NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz. | | | | | | |
| NOTE 2: PDTCH for MCS-x can not meet the reference performance for some propagation conditions. | | | | | | |
| NOTE 3: Performance is specified at 30% BLER for some cases. | | | | | | |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM 400, GSM 700, GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 05.05, tables 1c; 3GPP TS 05.05, subclause 6.2

- The block error rate (BLER) performance for USF/MCS1 to 9 shall not exceed 1 % at input levels according to the tables 14.18-4a and 14.18-4b.

Table 14.18-4a: USF Sensitivity Input Level for GMSK modulation

| Type of channel | | Propagation conditions | | | | |
|--|-----|------------------------|----------------|-------------------|------------|------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -102,5 | -104 | -104 | -102,5 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -104 | -104 | -104 | -102,5 |

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

| | |
|---------------------------------------|-------------|
| GSM 400 small MS | +2 dB; |
| GSM 700, GSM 850 and GSM 900 small MS | +2 dB; |
| DCS 1800 class 1 or 2 MS | +2/+4 dB**; |
| DCS 1800 class 3 MS | +2 dB; |
| PCS 1 900 class 1 or 2 MS | +2 dB. |

- ** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

Table 14.18-4b: USF Sensitivity Input Level for 8-PSK modulation

| Type of Channel | Propagation conditions | | | | | |
|--|------------------------|----------------|-------------------|------------|------------|-----|
| | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) | |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -97,5 | -99 | -100 | -99 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -99 | -99 | -100 | -99 |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM 400, GSM 700, GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 05.05, table 1c; 3GPP TS 05.05, subclause 6.2

3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.
4. The reference sensitivity performance specified above need not be met in the following cases:

For MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB.

For MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

The interfering adjacent time slots shall be static with valid GSM signals in all cases.

3GPP TS 05.05, subclause 6.2.

5. For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1 % of the radio blocks for GMSK modulated signals and 1 % for 8-PSK modulated signals. This requirement shall be met for all input levels up to -40 dBm for GMSK modulated signals and up to -40 dBm for 8-PSK modulated signals.

3GPP TS 05.05, subclause 6.4

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.1.3 Test purpose

1. To verify that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of the Block Check Sequence indicating a Block Error.
2. To verify that the MS does not exceed conformance requirement 1 for PDTCH with different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and under HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.

6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

14.18.1.4 Method of test

Initial conditions

- NOTE 1: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}$ () to $35 \text{ dB}\mu\text{Vemf}$ (). Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.
- NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.
- NOTE 3: When frequency hopping is used under static conditions, the traffic channel may fall on any of the ARFCNs defined in clause 6. When frequency hopping is used under non-static conditions any ARFCNs shall be chosen.
- NOTE 4: The PSII message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSII is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched on an ARFCN in the Mid range. The power control parameter ALPHA (α) is set to 0. The SS shall transmit on the maximum number of receive timeslots. The SS commands the MS to transmit at maximum power.

Test procedure

For GMSK Modulation:

- a) The SS transmits packets under static conditions, using MCS-4 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-4 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-4 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 5: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with MCS-4 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using MCS-3 coding with RA/No FH, MCS-2 coding with HT/No FH and MCS-1 coding with TUhigh/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for MCS-4 coding only.

- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
- $P_0 = 14$ dB;
 - $BTS_PWR_CTRL_MODE = Mode A$;
 - $PR_MODE = B$.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters
- m) The SS repeats steps i) to l) under extreme test conditions using MCS-4 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

For 8-PSK Modulation:

- a) The SS transmits packets under static conditions, using MCS-8 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-8 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-8 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 6: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- d) Once the number of blocks transmitted with MCS-8 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using MCS-9 with static condition, MCS-7 with TUhigh/FH, MSC-6 with HT/No FH and MSC-5 with RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.

- g) The SS repeats steps b) to e) under extreme test conditions for MCS-8 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
 - $P_0 = 14$ dB;
 - $BTS_PWR_CTRL_MODE = Mode A$;
 - $PR_MODE = B$.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) under extreme test conditions using MCS-9 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-5 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

14.18.1.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step n) for both GMSK modulation and 8-PSK modulation the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level – P_b) then the MS is not required to fulfil 3GPP TS 05.05 requirements for the first 25 blocks addressed to this MS (3GPP TS 05.08, subclause 10.2.2).

14.18.1a Minimum Input level for Reference Performance in EGPRS2A Configuration

14.18.1a.1 Definition

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

14.18.1a.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/DAS5 to 12 shall not exceed 10 % or 30 % depending on Modulation and Coding Schemes at input levels according to the table 14.18.1a-1.

Table 14.18.1a-1: PDTCH Sensitivity Input Level for 8-PSK, 16-QAM and 32-QAM modulated signals (Normal symbol rate, BTTI and turbo-coding) (EGPRS2-A DL)

| GSM 900 and GSM 850 | | | | | | |
|-----------------------|-----|------------------------|--------------|-----------------|---------------|---------------|
| Type of channel | | Propagation conditions | | | | |
| | | static | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) | HT100 (no FH) |
| PDTCH/DAS-5 | dBm | [-100] | [-94] | [-94,5] | [-95,5] | [-92] |
| PDTCH/DAS-6 | dBm | [-98,5] | [-93] | [-94] | [-94] | [-90,5] |
| PDTCH/DAS-7 | dBm | [-97,5] | [-92] | [-92,5] | [-91,5] | [-88] |
| PDTCH/DAS-8 | dBm | [-95] | [-89,5] | [-90] | [-88,5] | [-82,5] |
| PDTCH/DAS-9 | dBm | [-94] | [-87] | [-87,5] | [-82,5] | [-84,5**] |
| PDTCH/DAS-10 | dBm | [-90] | [-83,5] | [-84] | [-82**] | [*] |
| PDTCH/DAS-11 | dBm | [-88] | [-78,5] | [-79] | [*] | [*] |
| PDTCH/DAS-12 | dBm | [-84] | [-76**] | [-76**] | [*] | [*] |
| DCS 1800 and PCS 1900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | static | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) | HT100 (no FH) |
| PDTCH/DAS-5 | dBm | (3) | [-94] | (3) | (3) | [-92] |
| PDTCH/DAS-6 | dBm | (3) | [-93,5] | (3) | (3) | [-90] |
| PDTCH/DAS-7 | dBm | (3) | [-92] | (3) | (3) | [-84] |
| PDTCH/DAS-8 | dBm | (3) | [-89] | (3) | (3) | [-88**] |
| PDTCH/DAS-9 | dBm | (3) | [-86] | (3) | (3) | [-80,5**] |
| PDTCH/DAS-10 | dBm | (3) | [-82,5] | (3) | (3) | [*] |
| PDTCH/DAS-11 | dBm | (3) | [-78,5**] | (3) | (3) | [*] |
| PDTCH/DAS-12 | dBm | (3) | [*] | (3) | (3) | [*] |

Performance is specified at 30% BLER for those cases identified with mark **.

NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TU50 (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 2: PDTCH for DAS-x can not meet the reference performance for some propagation conditions (*).

NOTE 3: The requirements for the DCS 1800 & PCS 1900 Static propagation condition are the same as for the GSM 850 & GSM 900 Static propagation condition, the requirements for DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition.

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

| MS, QPSK, 8-PSK, 16-QAM and 32-QAM modulated signals | |
|---|-------|
| for GSM 400, GSM 900, GSM 850 and GSM 700 small MS | 0 dB |
| for other GSM 400, GSM 900, GSM 850 and GSM 700 MS | -2 dB |
| for DCS 1 800 and PCS 1900 class 1 or class 2 MS | 0 dB |
| for other DCS 1 800 and PCS 1900 MS | -2 dB |

3GPP TS 45.005, table 11; 3GPP TS 45.005, subclause 6.2

- The block error rate (BLER) performance for USF/DAS5 to 12 shall not exceed 1 % at input levels according to the table 14.18.1a-1 and 14.18.1a-2.

Table 14.18.1a-2: USF Sensitivity Input Level for 8-PSK, 16-QAM and 32-QAM modulated Signals (Normal symbol rate, BTTI and turbo-coding) (EGPRS2-A DL)

| GSM 900 and GSM 850 | | | | | | |
|------------------------------|-------------------------------|---------------------|------------------------|----------------------|----------------------|-------|
| Type of channel | Propagation conditions | | | | | |
| | static | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) | HT100 (no FH) | |
| USF/DAS-5 to 7 | dBm | (4) | (4) | (4) | (4) | (4) |
| USF/DAS-8 to 9 | dBm | [tbd] | [tbd] | [tbd] | [tbd] | [tbd] |
| USF/DAS-10 to 12 | dBm | [tbd] | [tbd] | [tbd] | [tbd] | [tbd] |
| DCS 1800 and PCS 1900 | | | | | | |
| Type of channel | Propagation conditions | | | | | |
| | static | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) | HT100 (no FH) | |
| USF/DAS-5 to 7 | dBm | (3) | (4) | (3) | (3) | (4) |
| USF/DAS-8 to 9 | dBm | (3) | [tbd] | (3) | (3) | [tbd] |
| USF/DAS-10 to 12 | dBm | (3) | [tbd] | (3) | (3) | [tbd] |

Performance is specified at 30% BLER for those cases identified with mark **.

NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TU50 (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 2: PDTCH for DAS-x can not meet the reference performance for some propagation conditions (*).

NOTE 3: The requirements for the DCS 1800 & PCS 1900 Static propagation condition are the same as for the GSM 850 & GSM 900 Static propagation condition, the requirements for DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition.

NOTE 4: The requirements for USF/DAS-5 to 7 are the same as for USF/MCS-5 to 9.

3. The BLER shall not exceed the conformance requirements given in 1 and 2 under extreme conditions; 3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

4. The reference sensitivity performance specified above need not be met in the following cases:

For MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB.

For MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

The interfering adjacent time slots shall be static with valid GSM signals in all cases.

3GPP TS 45.005, subclause 6.2.

5. For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1 % of the radio blocks for 8-PSK modulated signals and [1 %] for 16-QAM and 32-QAM modulated signals. This requirement shall be met for all input levels up to -40 dBm for 8-PSK modulated signals, and up to [-40 dBm] for 16-QAM and 32-QAM modulated signals.

3GPP TS 45.005, subclause 6.4

3GPP TS 45.005 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.1a.3 Test purpose

1. To verify that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of the Block Check Sequence indicating a Block Error.

2. To verify that the MS does not exceed conformance requirement 1 for PDTCH with different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TU_{high}, HT and RA propagation conditions for the PDTCH, and under HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

14.18.1a.4 Method of test

Initial conditions

NOTE 1: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\)$ to $xx35 \text{ dB}\mu\text{Vemf}(\)$. Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used under static conditions, the traffic channel may fall on any of the ARFCNs defined in clause 6. When frequency hopping is used under non-static conditions any ARFCNs shall be chosen.

NOTE 4: The PSI1 message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSI1 is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

For 8-PSK, 16-QAM and 32-QAM modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched on an ARFCN in the Mid range. The power control parameter ALPHA (α) is set to 0. The SS shall transmit on the maximum number of receive timeslots. The SS commands the MS to transmit at maximum power.

Test procedure

For 8-PSK Modulation:

- a) The SS transmits packets under static conditions, using DAS-7 coding at a level of 1 dB above the level given in conformance requirement 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using DAS-7 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with DAS-7 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with DAS-7 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using DAS-6 with HT/No FH and DAS-5 with RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for DAS-7 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
 - $P_0 = 14$ dB;
 - $BTS_PWR_CTRL_MODE = Mode A$;
 - $PR_MODE = B$.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond to the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/DAS-5 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/ DAS-5 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) under extreme test conditions using DAS-7 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/DAS-5 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

For 16-QAM Modulation:

- a) The SS transmits packets under static conditions, using DAS-9 coding at a level of 1 dB above the level given in conformance requirement 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using DAS-9 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.

- c) The SS counts the number of blocks transmitted with DAS-9 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with DAS-9 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using DAS-8 with HT/No FH and RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for DAS-9 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
- P0 = 14 dB;
 - BTS_PWR_CTRL_MODE = Mode A;
 - PR_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/DAS-8 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/ DAS-8 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) under extreme test conditions using DAS-9 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/DAS-8 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

For 32-QAM Modulation:

- a) The SS transmits packets under static conditions, using DAS-12 coding at a level of 1 dB above the level given in conformance requirement 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using DAS-12 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the

SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.

- c) The SS counts the number of blocks transmitted with DAS-12 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with DAS-12 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using DAS-11 with HT/No FH and DAS-10 with RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for DAS-12 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
- P0 = 14 dB;
 - BTS_PWR_CTRL_MODE = Mode A;
 - PR_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/DAS-10 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/ DAS-10 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) under extreme test conditions using DAS-12 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/DAS-10 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

14.18.1a.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step n) for 8PSK, 16-QAM and 32-QAM modulation the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level – P_b) then the MS is not required to fulfil 3GPP TS 45.005 requirements for the first 25 blocks addressed to this MS (3GPP TS 05.08, subclause 10.2.2).

14.18.1b Minimum Input level for Reference Performance in TIGHTER configuration

14.18.1b.1 Definition

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

14.18.1b.2 Conformance requirement

For a MS indicating support for TIGHTER Capability (see 3GPP TS 24.008), the minimum input signal levels for which the reference performance shall be met are specified in table 1w, according to the propagation condition. The performance requirements for GSM 400 and GSM 700 systems are as for GSM 900 in table 1w, except that the GSM 400 MS speed is doubled from that of GSM 900, e.g. TU50 becomes TU100, and the GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60.

- The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at input levels according to the table 14.18.1b-3a; and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18.1b-3b.

Table 14.18.1b-3a: PDTCH Sensitivity Input Level for GMSK modulation

| Type of Channel | | Propagation conditions | | | | |
|---|-----|------------------------|----------------|-------------------|------------|------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| PDTCH/MCS-1 | dBm | -105,5 | -105 | -105,5 | -105,5 | -103 |
| PDTCH/MCS-2 | dBm | -105,5 | -103 | -103,5 | -103 | -101 |
| PDTCH/MCS-3 | dBm | -105,5 | -99 | -99 | -95 | -96,5 |
| PDTCH/MCS-4 | dBm | -103 | -93,5 | -93,5 | (note 2) | (note 2) |
| DCS 1 800 and PCS 1 900 | | | | | | |
| PDTCH/MCS-1 | dBm | (note 3) | -104,5 | -105,5 | -105,5 | -102,5 |
| PDTCH/MCS-2 | dBm | (note 3) | -102,5 | -103,5 | -103 | -100,5 |
| PDTCH/MCS-3 | dBm | (note 3) | -98,5 | -99 | -95 | -95,5 |
| PDTCH/MCS-4 | dBm | (note 3) | -92,5 | -93 | (note 2) | (note 2) |
| NOTE 2: PDTCH for MCS-x can not meet the reference performance for some propagation conditions. | | | | | | |
| NOTE 3: The requirements for the DCS 1800 & PCS 1900 Static propagation condition are the same as for the GSM 850 & GSM 900 Static propagation condition, the requirements for the GSM 850 & GSM 900 TU50 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition. | | | | | | |

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

| | |
|------------------------------------|-------------|
| GSM 400 small MS | +2 dB; |
| GSM 700, GSM 850, GSM 900 small MS | +2 dB; |
| DCS 1800 class 1 or 2 MS | +2/+4 dB**; |
| DCS 1800 class 3 MS | +2 dB; |
| PCS 1 900 class 1 or 2 MS | +2 dB. |

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 45.005, table 1w; 3GPP TS 45.005, subclause 6.2.

Table 14.18.1b-3b: PDTCH Sensitivity Input Level for MS for 8-PSK modulation

| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
|---------------------------------------|------------------------|----------------|-------------------|------------|------------|----------|
| Type of channel | Propagation conditions | | | | | |
| | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) | |
| PDTCH/MCS-5 | dBm | -101,5 | -97,5 | -98,5 | -99 | -97,5 |
| PDTCH/MCS-6 | dBm | -99,5 | -95,5 | -96 | -94 | -94,5 |
| PDTCH/MCS-7 | dBm | -96,5 | -88,5 | -88,5 | (note 2) | -88,5** |
| PDTCH/MCS-8 | dBm | -94 | -87,5** | -87,5** | (note 2) | (note 2) |
| PDTCH/MCS-9 | dBm | -89,5 | -83** | -83** | (note 2) | (note 2) |
| DCS 1 800 and PCS 1 900 | | | | | | |
| Type of channel | Propagation conditions | | | | | |
| | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) | |
| PDTCH/MCS-5 | dBm | (note 3) | -98,5 | -98,5 | -99 | -95 |
| PDTCH/MCS-6 | dBm | (note 3) | -96 | -96 | -94 | -89 |
| PDTCH/MCS-7 | dBm | (note 3) | -86,5 | -85,5 | (note 2) | (note 2) |
| PDTCH/MCS-8 | dBm | (note 3) | -85 ** | -85** | (note 2) | (note 2) |
| PDTCH/MCS-9 | dBm | (note 3) | (note 2) | (note 2) | (note 2) | (note 2) |

Performance is specified at 30% BLER for those cases identified with mark **.

NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 2: PDTCH for MCS-x cannot meet the reference performance for some propagation conditions.

NOTE 3: The requirements for the DCS 1800 & PCS 1900 Static propagation condition are the same as for the GSM 850 & GSM 900 Static propagation condition, the requirements for the GSM 850 & GSM 900 TU50 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition.

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM 400, GSM 700, GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 45.005, tables 1w; 3GPP TS 45.005, subclause 6.2

2. The block error rate (BLER) performance for USF/MCS1 to 9 shall not exceed 1 % at input levels according to the tables 14.18-4a and 14.18-4b.

Table 14.18-4a: USF Sensitivity Input Level for GMSK modulation

| Type of channel | Propagation conditions | | | | | |
|---------------------------------------|------------------------|----------------|-------------------|------------|------------|--------|
| | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) | |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -102,5 | -104 | -104 | -102,5 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -104 | -104 | -104 | -102,5 |

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

GSM 400 small MS

+2 dB;

| | |
|---------------------------------------|-------------|
| GSM 700, GSM 850 and GSM 900 small MS | +2 dB; |
| DCS 1800 class 1 or 2 MS | +2/+4 dB**; |
| DCS 1800 class 3 MS | +2 dB; |
| PCS 1 900 class 1 or 2 MS | +2 dB. |

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 45.005, table 1a; 3GPP TS 45.005, subclause 6.2.

Table 14.18-4b: USF Sensitivity Input Level for 8-PSK modulation

| Type of Channel | Propagation conditions | | | | | |
|--|------------------------|----------------|-------------------|------------|------------|-----|
| | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) | |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -97,5 | -99 | -100 | -99 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -99 | -99 | -100 | -99 |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM 400, GSM 700, GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 45.005, table 1c; 3GPP TS 45.005, subclause 6.2

- The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.
- The reference sensitivity performance specified above need not be met in the following cases:

For MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB.

For MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

The interfering adjacent time slots shall be static with valid GSM signals in all cases.

3GPP TS 45.005, subclause 6.2.

- For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1 % of the radio blocks for GMSK modulated signals and 1 % for 8-PSK modulated signals. This requirement shall be met for all input levels up to -40 dBm for GMSK modulated signals and up to -40 dBm for 8-PSK modulated signals.

3GPP TS 45.005, subclause 6.4

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.1b.3 Test purpose

- To verify that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of the Block Check Sequence indicating a Block Error.

2. To verify that the MS does not exceed conformance requirement 1 for PDTCH with different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and under HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

14.18.1b.4 Method of test

Initial conditions

NOTE 1: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\)$ to $35 \text{ dB}\mu\text{Vemf}(\)$. Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used under static conditions, the traffic channel may fall on any of the ARFCNs defined in clause 6. When frequency hopping is used under non-static conditions any ARFCNs shall be chosen.

NOTE 4: The PSII message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSII is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched on an ARFCN in the Mid range. The power control parameter ALPHA (α) is set to 0. The SS shall transmit on the maximum number of receive timeslots. The SS commands the MS to transmit at maximum power.

Test procedure

For GMSK Modulation:

- a) The SS transmits packets under static conditions, using MCS-4 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-4 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-4 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 5: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with MCS-4 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using MCS-3 coding with RA/No FH, MCS-2 coding with HT/No FH and MCS-1 coding with TUhigh/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for MCS-4 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
 - P0 = 14 dB;
 - BTS_PWR_CTRL_MODE = Mode A;
 - PR_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters
- m) The SS repeats steps i) to l) under extreme test conditions using MCS-4 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

For 8-PSK Modulation:

- a) The SS transmits packets under static conditions, using MCS-8 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-8 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-8 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 6: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- d) Once the number of blocks transmitted with MCS-8 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using MCS-9 with static condition, MCS-7 with TUhigh/FH, MSC-6 with HT/No FH and MSC-5 with RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for MCS-8 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
 - P0 = 14 dB;
 - BTS_PWR_CTRL_MODE = Mode A;
 - PR_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) under extreme test conditions using MCS-9 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-5 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

14.18.1b.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step n) for both GMSK modulation and 8-PSK modulation the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level – Pb) then the MS is not required to fulfil 3GPP TS 45.005 requirements for the first 25 blocks addressed to this MS (3GPP TS 45.008, subclause 10.2.2).

14.18.1c Minimum Input level for Reference Performance – in TIGHTER configuration

14.18.1c.1 Definition

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

14.18.1c.2 Conformance requirement

For a MS indicating support for TIGHTER Capability (see 3GPP TS 24.008), the minimum input signal levels for which the reference performance shall be met are specified in table 1w, according to the propagation condition. The performance requirements for GSM 400 and GSM 700 systems are as for GSM 900 in table 1w, except that the GSM 400 MS speed is doubled from that of GSM 900, e.g. TU50 becomes TU100, and the GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60.

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at input levels according to the table 14.18.1c-1; and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18.1c-1.

Table 14.18.1c-1: PDTCH Sensitivity Input Level for GMSK modulation

| Type of Channel | | Propagation conditions | | | | |
|--------------------------------|-----|------------------------|-------------------|----------------------|---------------|---------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 850 and GSM 900 | | | | | | |
| PDTCH/MCS-1 | dBm | -105,5 | -105 | -105,5 | -105,5 | -103 |
| PDTCH/MCS-2 | dBm | -105,5 | -103 | -103,5 | -103 | -101 |
| PDTCH/MCS-3 | dBm | -105,5 | -99 | -99 | -93,5 | -96,5 |
| PDTCH/MCS-4 | dBm | -103 | -93,5 | -93,5 | (note) | (note) |
| DCS 1 800 and PCS 1 900 | | | | | | |
| PDTCH/MCS-1 | dBm | -105,5 | -104,5 | -105,5 | -105,5 | -102,5 |
| PDTCH/MCS-2 | dBm | -105,5 | -102,5 | -103,3 | -103 | -100,5 |
| PDTCH/MCS-3 | dBm | -105,5 | -98,5 | -99 | -99,5 | -95,5 |
| PDTCH/MCS-4 | dBm | -103 | -92,5 | -93 | (note) | (note) |

NOTE: PDTCH/MCS-4 cannot meet the reference performance for some propagation conditions.

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

- GSM 400 small MS +2 dB;
- GSM 700, GSM 850, GSM 900 small MS +2 dB;
- DCS 1800 class 1 or 2 MS +2/+4 dB**;
- DCS 1800 class 3 MS +2 dB;
- PCS 1 900 class 1 or 2 MS +2 dB.

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 45.005, table 1w; 3GPP TS 45.005, subclause 6.2.

Table 14.18.1c-2: PDTCH Sensitivity Input Level for MS for 8-PSK modulation

| GSM 850 and GSM 900 | | | | | | |
|--|-----|-------------------------------|-----------------------|--------------------------|-------------------|-------------------|
| Type of channel | | Propagation conditions | | | | |
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| PDTCH/MCS-5 | dBm | -101,5 | -97,5 | -98,5 | -99 | -97,5 |
| PDTCH/MCS-6 | dBm | -99,5 | -95,5 | -96 | -94 | -94,5 |
| PDTCH/MCS-7 | dBm | -96,5 | -88,5 | -88,5 | (note 2) | -88,5 (note 3) |
| PDTCH/MCS-8 | dBm | -94 | -87,5 (note 3) | -87,5 (note 3) | (note 2) | (note 2) |
| PDTCH/MCS-9 | dBm | -89,5 | -83 (note 3) | -83 (note 3) | (note 2) | (note 2) |
| DCS 1 800 and PCS 1 900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| PDTCH/MCS-5 | dBm | -101,5 | -98,5 | -98,5 | -99 | -95 |
| PDTCH/MCS-6 | dBm | -99,5 | -96 | -96 | -94 | -89 |
| PDTCH/MCS-7 | dBm | -96,5 | -86,5 | -85,5 | (note 2) | (note 2) |
| PDTCH/MCS-8 | dBm | -94 | -85 (note 3) | -85 (note 3) | (note 2) | (note 2) |
| PDTCH/MCS-9 | dBm | -89,5 | (note 2) | (note 2) | (note 2) | (note 2) |
| NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz. | | | | | | |
| NOTE 2: PDTCH for MCS-x can not meet the reference performance for some propagation conditions. | | | | | | |
| NOTE 3: Performance is specified at 30% BLER for some cases. | | | | | | |

The input levels given in the above Table are applicable to Class 4 or Class 5 GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 45.005, tables 1w; 3GPP TS 45.005, subclause 6.2

- The block error rate (BLER) performance for USF/MCS1 to 9 shall not exceed 1 % at input levels according to the tables 14.18.1c-3 and 14.18.1c-4.

Table 14.18.1c-3: USF Sensitivity Input Level for GMSK modulation

| Type of channel | | Propagation conditions | | | | |
|--|-----|-------------------------------|-----------------------|--------------------------|-------------------|-------------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -102,5 | -104 | -104 | -102,5 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -104 | -104 | -104 | -102,5 |

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

- GSM 400 small MS +2 dB;
- GSM 700, GSM 850 and GSM 900 small MS +2 dB;
- DCS 1800 class 1 or 2 MS +2/+4 dB**;
- DCS 1800 class 3 MS +2 dB;
- PCS 1 900 class 1 or 2 MS +2 dB.

** For all DCS 1 800 class 1 and class 2 MS, a correction offset of +2dB shall apply for the reference sensitivity performance as specified in table 1a for the normal conditions defined in Annex D and an offset of +4 dB shall be used to determine all other MS performances.

3GPP TS 45.005, table 1a; 3GPP TS 45.005, subclause 6.2.

Table 14.18.1c-4: USF Sensitivity Input Level for 8-PSK modulation

| Type of Channel | | Propagation conditions | | | | |
|--|-----|------------------------|----------------|-------------------|------------|------------|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -97,5 | -99 | -100 | -99 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -99 | -99 | -100 | -99 |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM 400, GSM 700, GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 45.005, table 1c; 3GPP TS 45.005, subclause 6.2

3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.
4. The reference sensitivity performance specified above need not be met in the following cases:

For MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB.

For MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

The interfering adjacent time slots shall be static with valid GSM signals in all cases.

3GPP TS 45.005, subclause 6.2.

5. For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1 % of the radio blocks for GMSK modulated signals and 1 % for 8-PSK modulated signals. This requirement shall be met for all input levels up to -40 dBm for GMSK modulated signals and up to -40 dBm for 8-PSK modulated signals.

3GPP TS 45.005, subclause 6.4

3GPP TS 45.005 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.1c.3 Test purpose

1. To verify that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of the Block Check Sequence indicating a Block Error.
2. To verify that the MS does not exceed conformance requirement 1 for PDTCH with different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and under HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

14.18.1c.4 Method of test

Initial conditions

NOTE 1: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\)$ to $35 \text{ dB}\mu\text{Vemf}(\)$. Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used under static conditions, the traffic channel may fall on any of the ARFCNs defined in clause 6. When frequency hopping is used under non-static conditions any ARFCNs shall be chosen.

NOTE 4: The PSII message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSII is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched on an ARFCN in the Mid range. The power control parameter ALPHA (α) is set to 0. The SS shall transmit on the maximum number of receive timeslots. The SS commands the MS to transmit at maximum power.

Test procedure

For GMSK Modulation:

- a) The SS transmits packets under static conditions, using MCS-4 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-4 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-4 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 5: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- d) Once the number of blocks transmitted with MCS-4 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using MCS-3 coding with RA/No FH, MCS-2 coding with HT/No FH and MCS-1 coding with TUhigh/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for MCS-4 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:

- P0 = 14 dB;
- BTS_PWR_CTRL_MODE = Mode A;
- PR_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters
- m) The SS repeats steps i) to l) under extreme test conditions using MCS-4 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

For 8-PSK Modulation:

- a) The SS transmits packets under static conditions, using MCS-8 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-8 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-8 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 6: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- d) Once the number of blocks transmitted with MCS-8 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using MCS-9 with static condition, MCS-7 with TUhigh/FH, MSC-6 with HT/No FH and MSC-5 with RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for MCS-8 coding only.

- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
- $P_0 = 14$ dB;
 - $BTS_PWR_CTRL_MODE = Mode A$;
 - $PR_MODE = B$.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) under extreme test conditions using MCS-9 coding.
- n) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-5 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

14.18.1c.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step n) for both GMSK modulation and 8-PSK modulation the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level – P_b) then the MS is not required to fulfil 3GPP TS 45.005 requirements for the first 25 blocks addressed to this MS (3GPP TS 05.008, subclause 10.2.2).

14.18.2 Co-channel rejection

14.18.2.1 Definition

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.2.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at co-channel interference ratios (C/I_c) exceeding those according to the table 14.18-5a; and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at co-channel interference ratios (C/I_c) exceeding those according to the table 14.18-5b.

Table 14.18-5a: PDTCH Co-channel Interference Ratio for GMSK modulation

| Type of channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| PDTCH/MCS-1 | dB | 13 | 10,5 | 9,5 | 10 |
| PDTCH/MCS-2 | dB | 15 | 12,5 | 12 | 12 |
| PDTCH/MCS-3 | dB | 16,5 | 17 | 17 | 19 |
| PDTCH/MCS-4 | dB | 19 | 22 | 22 | (note) |
| DCS 1 800 and PCS 1 900 | | | | | |
| PDTCH/MCS-1 | dB | 13 | 10 | 9,5 | 10 |
| PDTCH/MCS-2 | dB | 15 | 12 | 12 | 12 |
| PDTCH/MCS-3 | dB | 16,5 | 17 | 18 | 19 |
| PDTCH/MCS-4 | dB | 19 | 23 | 23 | (note) |
| NOTE: PDTCH/MCS-4 can not meet the reference performance for some propagation condition. | | | | | |

3GPP TS 05.05, table 2a; 3GPP TS 05.05, subclause 6.3.

Table 14.18-5b: Co channel interference ratio for MS at reference performance for 8-PSK modulation

| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| Type of channel | | Propagation conditions | | | |
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 19,5 | 15,5 | 14,5 | 16,5 |
| PDTCH/MCS-6 | dB | 21,5 | 18 | 17,5 | 21 |
| PDTCH/MCS-7 | dB | 26,5 | 25 | 24,5 | (note 1) |
| PDTCH/MCS-8 | dB | 30,5 | 25,5 (note 2) | 25,5** | (note 1) |
| PDTCH/MCS-9 | dB | 25,5 (note 2) | 30,5 (note 2) | 30,5** | (note 1) |
| DCS 1800 and PCS 1 900 | | | | | |
| Type of channel | | Propagation conditions | | | |
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 19,5 | 15 | 15,5 | 16,5 |
| PDTCH/MCS-6 | dB | 21,5 | 18 | 18,5 | 21 |
| PDTCH/MCS-7 | dB | 26,5 | 27,5 | 28 | (note 1) |
| PDTCH/MCS-8 | dB | 30,5 | 29,5 (note 2) | 29 (note 2) | (note 1) |
| PDTCH/MCS-9 | dB | 25,5 (note 2) | (note 1) | (note 1) | (note 1) |
| NOTE 1: PDTCH/MCS-x can not meet the reference performance for some propagation condition. | | | | | |
| NOTE 2: Performance is specified at 30% BLER for some cases. | | | | | |

3GPP TS 05.05, table 2c and subclause 6.3.

- The block error rate (BLER) performance for USF/MCS1 to 9 shall not exceed 1 % at co-channel interference ratios (C/I_c) exceeding those according to the tables 14.18-6a and 14.18-6b.

Table 14.18-6a: USF Co-channel Interference Ratio for GMSK modulation

| Type of channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| USF/MCS-1 to 4 | dB | 18 | 11 | 9,5 | 9,5 |

| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | |
| USF/MCS-5 to 9 | dB | 17 | 11,5 | 9 |
| DCS 1 800 and PCS 1 900 | | | | |
| USF/MCS-5 to 9 | dB | 17 | 10 | 9 |

3GPP TS 05.05, Tables 2c.

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 for different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

14.18.2.4 Method of test

Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS transmits EGPRS RLC data blocks containing random data. In addition to these data blocks, the SS produces an independent, uncorrelated interfering signal (I1).

Specific PICS statements:

- Support of DARP Phase 1 (TSPC_DARP_Phase1)

PIXIT Statements:

-

Test procedure

For GMSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-4 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) If the MS does not support DARP phase 1 the SS repeats step c) to e) with the TUhigh/noFH fading condition
- g) The SS repeats the steps c) to e) for the coding schemes, MCS-2 with TUhigh/FH and for MCS-1 with RA/noFH and, if the MS does not support DARP phase 1, also the coding scheme MCS-3 with TUhigh/noFH.
- h) The SS establishes the normal test conditions, and sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-8 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TULow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for MCS-9 with TULow/NoFH, MCS-7 with TUhigh/noFH, MCS-6 with TUhigh/FH and MSC-5 with RA/noFH.
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

14.18.2.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, shall not exceed the conformance requirement.

14.18.2a Co-channel rejection in EGPRS2A

14.18.2a.1 Definition

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.2a.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/DAS 5 to 7 shall not exceed 10 % at input levels according to the table 14.18-5c; and for PDTCH/DAS 8 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18-5d; and for PDTCH/DAS 10 to 12 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18-5e.

Table 14.18-5c: Co channel interference ratio for MS at reference performance for 8-PSK modulation

| GSM 850 and GSM 900 | | | | | |
|------------------------|----|------------------------|----------------|-------------------|----------------|
| Type of channel | | Propagation conditions | | | |
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-5 | dB | [16,5] | [15] | [15] | [12,5] |
| PDTCH/DAS-6 | dB | [18] | [16] | [15,5] | 14,5] |
| PDTCH/DAS-7 | dB | [19,5] | [17] | [17] | [16,5] |
| DCS 1 800 and PCS 1900 | | | | | |
| Type of channel | | Propagation conditions | | | |
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-5 | dB | ⁽²⁾ | [15] | ⁽²⁾ | ⁽²⁾ |
| PDTCH/DAS-6 | dB | ⁽²⁾ | [16] | ⁽²⁾ | ⁽²⁾ |
| PDTCH/DAS-7 | dB | ⁽²⁾ | [17,5] | ⁽²⁾ | ⁽²⁾ |

Performance is specified at 30% BLER for those cases identified with mark ^{***}
Performance is not specified for those cases identified with mark ⁻

NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TU50 (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 2: The requirements for the DCS 1800 & PCS 1900 TU1.5 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TU3 (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TU3 (ideal FH), DCS 1800 & PCS 1900 TU1.5 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition.

NOTE 3: The requirements for USF/DAS-5 to 7 are the same as for USF/MCS-5 to 9.

3GPP TS 45.005, table 2s; 3GPP TS 45.005, subclause 6.3.

14.18.2a.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 for different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

14.18.2a.4 Method of test

Initial conditions

For 8-PSK, 16QAM, and 32 QAM modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS transmits EGPRS RLC data blocks containing random data. In addition to these data blocks, the SS produces an independent, uncorrelated interfering signal (I1).

Specific PICS statements:

-

PIXIT Statements:

-

Test procedure

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using DAS-7 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.

- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for, DAS-6 with TUhigh/FH and DAS-5 with RA/noFH.
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/DAS-7 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/DAS-7 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

For 16-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-9 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TULow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for, DAS-8 with TUhigh/FH
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/DAS-9 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

- k) Once the number of USF/DAS-9 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

For 32-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-12 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TULow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for, DAS-11 with TUhigh/FH and DAS-10 with RA/noFH.
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/DAS-12 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/DAS-12 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

14.18.2a.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, shall not exceed the conformance requirement.

14.18.2b Co-channel rejection – in TIGHTER configuration

14.18.2b.1 Definition

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.2b.2 Conformance requirement

- 1.If MS indicating support for TIGHTER Capability (see 3GPP TS 24.008) shall also indicate support for DARP - phase I (see 3GPP TS 24.008), and shall fulfil the requirements in table 2ad for co channel interference (C/I_c)1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at co-channel interference ratios (C/I_c) exceeding those according to the table 14.18.2b-1; and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at co-channel interference ratios (C/I_c) exceeding those according to the table 14.18.2b-2.

Table 14.18.2b-1: PDTCH Co-channel Interference Ratio for GMSK modulation

| Type of channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 850 and GSM 900 | | | | | |
| PDTCH/MCS-1 | dB | 9 | 6,5 | 5,5 | 8 |
| PDTCH/MCS-2 | dB | 11 | 8,5 | 8 | 10 |
| PDTCH/MCS-3 | dB | 12,5 | 13 | 13 | 17 |
| PDTCH/MCS-4 | dB | 15 | 18 | 18 | (note) |
| DCS 1 800 and PCS 1 900 | | | | | |
| PDTCH/MCS-1 | dB | 10 | 7,5 | 6 | 8 |
| PDTCH/MCS-2 | dB | 12 | 9,5 | 8,5 | 10 |
| PDTCH/MCS-3 | dB | 13,5 | 14 | 13,5 | 17 |
| PDTCH/MCS-4 | dB | 16 | 19 | 18,5 | (note) |
| NOTE: PDTCH/MCS-4 can not meet the reference performance for some propagation condition. | | | | | |

3GPP TS 45.005, table 2ad; 3GPP TS 45.005, subclause 6.3.

Table 14.18.2b-2: Co channel interference ratio for MS at reference performance for 8-PSK modulation

| GSM 850 and GSM 900 | | | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| Type of channel | | Propagation conditions | | | |
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 15,5 | 12 | 11 | 13,5 |
| PDTCH/MCS-6 | dB | 17,5 | 14,5 | 14,5 | 18 |
| PDTCH/MCS-7 | dB | 22,5 | 21,5 | 21 | (note 1) |
| PDTCH/MCS-8 | dB | 26,5 | 22 (note 2) | 22** | (note 1) |
| PDTCH/MCS-9 | dB | 21,5 (note 2) | 27 (note 2) | 27** | (note 1) |
| DCS 1800 and PCS 1 900 | | | | | |
| Type of channel | | Propagation conditions | | | |
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 16 | 11,5 | 11,5 | 13,5 |
| PDTCH/MCS-6 | dB | 18 | 14,5 | 14,5 | 18 |
| PDTCH/MCS-7 | dB | 23 | 24 | 24 | (note 1) |
| PDTCH/MCS-8 | dB | 27 | 26 (note 2) | 25 (note 2) | (note 1) |
| PDTCH/MCS-9 | dB | 22 (note 2) | (note 1) | (note 1) | (note 1) |
| NOTE 1: PDTCH/MCS-x can not meet the reference performance for some propagation condition. | | | | | |
| NOTE 2: Performance is specified at 30% BLER for some cases. | | | | | |

3GPP TS 45.005, table 2ad and subclause 6.3.

- The block error rate (BLER) performance for USF/MCS1 to 9 shall not exceed 1 % at co-channel interference ratios (C/I_c) exceeding those according to the tables 14.18.2b-3 and 14.18.2b-4.

Table 14.18.2b-3: USF Co-channel Interference Ratio for GMSK modulation

| Type of Channel | | Propagation conditions | | | |
|--|----|------------------------|-------------------|----------------------|---------------|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | |
| USF/MCS-1 to 4 | dB | 18 | 11 | 9,5 | 9,5 |
| DCS 1 800 and PCS 1 900 | | | | | |
| USF/MCS-1 to 4 | dB | 18 | 9,5 | 9,5 | 9,5 |

3GPP TS 45.005, tables 2a.

Table 14.18.2b-4: USF Co-channel Interference Ratio for 8-PSK modulation

| Type of channel | Propagation conditions | | | |
|--|------------------------|----------------|-------------------|------------|
| | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | |
| USF/MCS-5 to 9 | dB | 17 | 11,5 | 9 |
| DCS 1 800 and PCS 1 900 | | | | |
| USF/MCS-5 to 9 | dB | 17 | 10 | 9 |

3GPP TS 45.005, Tables 2c, 3GPP TS 45.005 subclause 2.

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.2b.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 for different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

14.18.2b.4 Method of test

Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS transmits EGPRS RLC data blocks containing random data. In addition to these data blocks, the SS produces an independent, uncorrelated interfering signal (I1).

Specific PICS statements:

-

PIXIT Statements:

-

Test procedure

For GMSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-4 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.060, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats the steps c) to e) for the coding schemes, MCS-2 with TUhigh/FH and for MCS-1 with RA/noFH.
- g) The SS establishes the normal test conditions, and sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- h) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- i) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- j) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-8 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TULow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for MCS-9 with TULow/NoFH, MCS-7 with TUhigh/noFH, MCS-6 with TUhigh/FH and MSC-5 with RA/noFH.
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

14.18.2b.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, shall not exceed the conformance requirement.

14.18.2c Co-channel rejection in EGPRS2A with TIGHTER configuration

14.18.2c.1 Definition

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal with additional TIGHTER requirements, both signals being at the nominal frequency of the receiver. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.2c.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/DAS 5 to 7 shall not exceed 10 % at input levels according to the table 14.18-5c; and for PDTCH/DAS 8 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18-5d; and for PDTCH/DAS 10 to 12 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18-5e.

Table 14.18-5c: Co channel interference ratio for MS at reference performance for 8-PSK modulation

| GSM 850 and GSM 900 | | | | | | |
|------------------------|----|------------------------|------------------|--------------|-----------------|-----------------------|
| Type of channel | | Propagation conditions | | | | |
| | | TU3 (no FH) | TU3 (ideal FH) | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) |
| PDTCH/DAS-5 | dB | [14,5] | (2) | [12] | [11,5] | [12,5] ⁽⁷⁾ |
| PDTCH/DAS-6 | dB | [16] | (2) | [13] | [12] | [14,5] ⁽⁷⁾ |
| PDTCH/DAS-7 | dB | [17,5] | (2) | [14] | [13,5] | [16,5] ⁽⁷⁾ |
| DCS 1 800 and PCS 1900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | TU1,5 (no FH) | TU1,5 (ideal FH) | TU50 (no FH) | TU50 (ideal FH) | RA130 (no FH) |
| PDTCH/DAS-5 | dB | (2) | (2) | [11,5] | (2) | (2) |
| PDTCH/DAS-6 | dB | (2) | (2) | [12,5] | (2) | (2) |
| PDTCH/DAS-7 | dB | (2) | (2) | [14] | (2) | (2) |

Performance is specified at 30% BLER for those cases identified with mark ^{***}

NOTE 1: The specification for SDCCH applies also for BCCH, AGCH, PCH, SACCH. The actual performance of SACCH, particularly for the C/I TU3 (no FH) and TU 1.5 (no FH) cases should be better.

NOTE 2: The requirements for the DCS 1800 & PCS 1900 TU1.5 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TU3 (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TU3 (ideal FH), DCS 1800 & PCS 1900 TU1.5 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition.

NOTE 3: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TU50 (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 4: FER for CCHs takes into account frames which are signalled as being erroneous (by the FIRE code, parity bits, or other means) or where the stealing flags are wrongly interpreted.

NOTE 5: PDTCH/CS-4, PDTCH/MCS-x, PDTCH/DAS-x and PDTCH/DBS-x cannot meet the reference performance for some propagation conditions (-).

NOTE 6: The TU50 no FH TIGHTER requirement for these TCH are specified as a fixed tightening of the reference interference performance listed in Table 2 by 10 dB for GSM 850 & 900 and by 9,5 dB for DCS 1800 and PCS 1900.

NOTE 7: The requirement is identical to the EGPRS2-A or EGPRS2-B requirement in Table 2s or Table 2u, respectively.

3GPP TS 45.005, table 2ad; 3GPP TS 45.005, subclause 6.3.

Table 14.18-5d: Co channel interference ratio for MS at reference performance for 16-QAM modulation

| GSM 850 and GSM 900 | | | | | | |
|--|----|------------------------|------------------|--------------|-----------------|---------------|
| Type of Channel | | Propagation conditions | | | | |
| | | TU3 (no FH) | TU3 (ideal FH) | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) |
| PDTCH/DAS-8 | dB | [19,5] | (2) | [16] | [15,5] | [17,5] |
| PDTCH/DAS-9 | dB | [21,5] | (2) | [19] | [19] | [22,5] |
| DCS 1 800 and PCS 1900 | | | | | | |
| Type of Channel | | Propagation conditions | | | | |
| | | TU1,5 (no FH) | TU1,5 (ideal FH) | TU50 (no FH) | TU50 (ideal FH) | RA130 (no FH) |
| PDTCH/DAS-8 | dB | (2) | (2) | [16] | (2) | (2) |
| PDTCH/DAS-9 | dB | (2) | (2) | [20] | (2) | (2) |
| Performance is specified at 30% BLER for those cases identified with mark ^{***} | | | | | | |
| NOTE 1: The specification for SDCCH applies also for BCCH, AGCH, PCH, SACCH. The actual performance of SACCH, particularly for the C/I TU3 (no FH) and TU 1.5 (no FH) cases should be better. | | | | | | |
| NOTE 2: The requirements for the DCS 1800 & PCS 1900 TU1.5 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TU3 (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TU3 (ideal FH), DCS 1800 & PCS 1900 TU1.5 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition. | | | | | | |
| NOTE 3: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TU50 (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz. | | | | | | |
| NOTE 4: FER for CCHs takes into account frames which are signalled as being erroneous (by the FIRE code, parity bits, or other means) or where the stealing flags are wrongly interpreted. | | | | | | |
| NOTE 5: PDTCH/CS-4, PDTCH/MCS-x, PDTCH/DAS-x and PDTCH/DBS-x cannot meet the reference performance for some propagation conditions (-). | | | | | | |
| NOTE 6: The TU50 no FH TIGHTER requirement for these TCH are specified as a fixed tightening of the reference interference performance listed in Table 2 by 10 dB for GSM 850 & 900 and by 9,5 dB for DCS 1800 and PCS 1900. | | | | | | |
| NOTE 7: The requirement is identical to the EGPRS2-A or EGPRS2-B requirement in Table 2s or Table 2u, respectively. | | | | | | |

3GPP TS 45.005, table 2ad; 3GPP TS 45.005, subclause 6.3.

Table 14.18-5e: Co channel interference ratio for MS at reference performance for 32-QAM modulation

| GSM 850 and GSM 900 | | | | | | |

| | | TU3 (no FH) | TU3 (ideal FH) | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) |
| USF/DAS-5 to 7 | dB | (3) | (3) | (3) | (3) | (3) |
| USF/DAS-8 to 9 | dB | 10,0 | (2) | 6,0 | 4,5 | 4,0 |
| USF/DAS-10 to 12 | dB | 10,0 | (2) | 7,0 | 4,5 | 4,0 |
| DCS 1 800 and PCS 1900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | TU1,5 (no FH) | TU1,5 (ideal FH) | TU50 (no FH) | TU50 (ideal FH) | RA130 (no FH) |
| USF/DAS-5 to 7 | dB | (3) | (3) | (3) | (3) | (3) |
| USF/DAS-8 to 9 | dB | (2) | (2) | 4,5 | (2) | (2) |
| USF/DAS-10 to 12 | dB | (2) | (2) | 5,5 | (2) | (2) |
| Performance is specified at 30% BLER for those cases identified with mark '***' | | | | | | |
| Performance is not specified for those cases identified with mark '-' | | | | | | |
| NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TU50 (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz. | | | | | | |
| NOTE 2: The requirements for the DCS 1800 & PCS 1900 TU1.5 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TU3 (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TU3 (ideal FH), DCS 1800 & PCS 1900 TU1.5 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition. | | | | | | |
| NOTE 3: The requirements for USF/DAS-5 to 7 are the same as for USF/MCS-5 to 9. | | | | | | |

3GPP TS 45.005, table 2s; 3GPP TS 45.005, subclause 6.3.

14.18.2c.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 for different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

14.18.2c.4 Method of test

Initial conditions

For 8-PSK, 16QAM, and 32 QAM modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS transmits EGPRS RLC data blocks containing random data. In addition to these data blocks, the SS produces an independent, uncorrelated interfering signal (I1).

Specific PICS statements:

-

PIXIT Statements:

-

Test procedure

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using DAS-7 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for, DAS-6 with TUhigh/FH and DAS-5 with RA/noFH.
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/DAS-7 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/DAS-7 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

For 16-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-9 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for, DAS-8 with TUhigh/FH
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.

- i) The SS sets the value of the USF/DAS-9 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/DAS-9 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

For 32-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-12 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.
- g) The SS repeats steps c) to e) for, DAS-11 with TUhigh/FH and DAS-10 with RA/noFH.
- h) The SS sets the fading function to TUhigh/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/DAS-12 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/DAS-12 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

14.18.2c.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, shall not exceed the conformance requirement.

14.18.3 Adjacent channel rejection

14.18.3.1 Definition

The adjacent channel selectivity is a measure of the capability of the receiver to receive wanted data packets without exceeding a given degradation due to the presence of an interfering signal (I1) in the adjacent channel. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.18.2.

14.18.3.2 Conformance requirement

1. For GMSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a1}) exceeding $C/I_c - 18\text{dB}$ where C/I_c is the co-channel interference ratio specified in table 14.18-5a for PDTCH and table 14.18-6a for USF channels.
 - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 %; 3GPP TS 05.05, subclause 6.2.
 - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 4 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.
- For 8-PSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a1}) specified in table 14.18-7a.
 - 1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Scheme; 3GPP TS 05.05, subclause 6.2.
 - 1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-5 to 9 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.

Table 14.18-7a: Adjacent channel interference ratio for MS at reference performance for 8-PSK modulation

| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
|---------------------------------------|----|------------------------|------------------|----------------|-------------------|------------|
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 2,5 | -2 | -1 | -2 | 1 |
| PDTCH/MCS-6 | dB | 5,5 | 0,5 | 2 | 1 | 6,5 |
| PDTCH/MCS-7 | dB | 10,5 | 8 | 10 | 9 | (note 1) |
| PDTCH/MCS-8 | dB | 15,5 | 9 (note 2) | 11 (note 2) | 10,5 (note 2) | (note 1) |
| PDTCH/MCS-9 | dB | 10 (note 2) | 12,5 (note 2) | 17 (note 2) | 15,5 (note 2) | (note 1) |
| USF/MCS-5 to 9 | dB | -1 | -8,5 | -8 | -9,5 | -9 |
| DCS 1 800 and PCS 1 900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 2,5 | -2 | -2 | -1,5 | 1 |
| PDTCH/MCS-6 | dB | 5,5 | 0,5 | 1,5 | 1,5 | 6,5 |
| PDTCH/MCS-7 | dB | 10,5 | 8 | 12,5 | 12 | (note 1) |
| PDTCH/MCS-8 | dB | 15,5 | 9 (note 2) | 16 (note 2) | 15,5 (note 2) | (note 1) |
| PDTCH/MCS-9 | dB | 10 (note 2) | 12,5 (note 2) | (note 1) | (note 1) | (note 1) |
| USF/MCS-5 to 9 | dB | -1 | -8,5 | -9 | -9,5 | -9 |

NOTE1: PDTCH for MCS-x can not meet the reference performance for some propagation conditions.
NOTE 2: Performance is specified at 30% BLER for some cases.

3GPP TS 05.05, table 2g and subclause 6.3.

2. For both GMSK and 8-PSK modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a2}) exceeding $C/I_c - 50\text{dB}$.
 - 2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 % for GMSK modulation; and for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 05.05, subclause 6.2.

2.2 For a TU_{high} faded wanted signal and a TU_{high} adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 9 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.

C/I_c is the co-channel interference ratio. For a PDTCH with GMSK modulation C/I_c is specified in table 14.18-5a; for a PDTCH with 8-PSK modulation C/I_c is specified in table 14.18-5b, for a USF with GMSK modulation C/I_c is specified in tables 14.18-6a; and for USF with 8-PSK modulation C/I_c is specified in table 14.18-6b. 3GPP TS 05.05, subclause 6.3.

3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.3.3 Test purpose

- 1 To verify that the conformance requirements 1.1, 1.2, 1.3 and 1.4 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TU_{high} at 200 kHz above and below the wanted signal frequency.
- 2 To verify that the conformance requirements 2.1 and 2.2 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TU_{high} at 400 kHz above and below the wanted signal frequency.
3. To verify that Conformance Requirements are met under extreme conditions.

14.18.3.4 Method of test

Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0. The SS transmits EGPRS RLC data blocks containing random data. In addition to the wanted test signal, the SS transmits an independent, uncorrelated interfering signal Standard Test Signal (I1). This unwanted signal is random, continuous and GMSK-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TU_{high}/noFH

Test procedure

For GMSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-1 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-2 to 4.
- i) The SS repeats steps a) to g) under extreme test conditions for MCS-4 coding scheme only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set at to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme USF/MCS-4.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-5 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-6 to 8 and for the coding scheme MCS-9 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme MCS-9 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme MCS-9.

14.18.3.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under TUhigh propagation condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

Testing of the conformance requirement for USF/MCS (1-9) can be done either with fixed minimum number of samples or based on the statistical test method that lead to an early pass/fail decision with test time significantly reduced for MS with BLER not on the limit.

14.18.3.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.3.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of BER/BLER performance are defined in Annex 7.

Minimum test time due to fading conditions has to be considered before checking the conformance limits. The minimum test time for the specific fading condition are specified in the table 14.18.3.5-1.

Table 14.18.3.5-1: Minimum test time due to TU high fading conditions

| TU high | | | | | | |
|-------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Frequency /MHz | 400 | 700 | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,75 | 0,43 | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 214 | 204 | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:34 | 00:03:24 | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The statistical testing of the conformance requirement is done based on table 14.18.3.5-2. The table shows the values for MS with a single slot configuration. For MS multi slot configuration the number of blocks has to be increased accordingly.

Table 14.18.3.5-2: Statistical limits for adjacent channel rejection

| GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1900 | | | | | | |
|---|-------------|-----------------------|--------------------|--------------------------|---------------------|----------------------------|
| Channel types | Block per s | Org. BLER requirement | Derived test limit | Target number of samples | Target test time /s | Target test time /hh:mm:ss |
| USF/MCS-1 to 9 | 50 | 0,01 | 0,01234 | 27958 | 559 | 00:09:19 |

14.18.3a Adjacent channel rejection in EGPRS2A configuration

14.18.3a.1 Definition

The adjacent channel selectivity is a measure of the capability of the receiver to receive wanted data packets without exceeding a given degradation due to the presence of an interfering signal (I1) in the adjacent channel. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.18.2.

14.18.3a.2 Conformance requirement

1. For 8-PSK modulation, u under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a1}) specified in table 14.18-7b.
 - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-5 to 7 shall not exceed 10 % depending on Coding Scheme; 3GPP TS 45.005, subclause 6.2.
 - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-5 to 7 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.
For 16-QAM modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a1}) specified in table 14.18-7c.
 - 1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-8 to 9 shall not exceed 10 % depending on Coding Scheme; 3GPP TS 45.005, subclause 6.2.
 - 1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-8 to 9 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.
For 32-QAM modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a1}) specified in table 14.18-7d.

1.5 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-10 to 12 shall not exceed 10 % or 30 % depending on Coding Scheme; 3GPP TS 45.005, subclause 6.2.

1.6 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-10 to 12 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.

Table 14.18-7b: Adjacent channel interference ratio at reference performance for 8-PSK modulated signals (EGPRS2-A DL)

| GSM 850 and GSM 900 | | | | | | |
|--|----|------------------------|------------------|----------------|-------------------|------------|
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-5 | dB | 3 | (2) | -2,0 | -3,0 | -3 |
| PDTCH/DAS-6 | dB | 3,5 | (2) | -0,5 | -1,5 | -1 |
| PDTCH/DAS-7 | dB | 4,5 | (2) | 1,5 | 0,5 | 2 |
| USF/DAS-5 to 7 | dB | (3) | (3) | (3) | (3) | (3) |
| DCS 1 800 and PCS 1900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-5 | dB | (2) | (2) | -2,5 | (2) | (2) |
| PDTCH/DAS-6 | dB | (2) | (2) | -0,5 | (2) | (2) |
| PDTCH/DAS-7 | dB | (2) | (2) | 1,5 | (2) | (2) |
| USF/DAS-5 to 7 | dB | (3) | (3) | (3) | (3) | (3) |
| Performance is specified at 30% BLER for those cases identified with mark '***' | | | | | | |
| Performance is not specified for those cases identified with mark '-' | | | | | | |
| NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz. | | | | | | |
| NOTE 2: The requirements for the DCS 1800 & PCS 1900 TUlow (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TUlow (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TUlow (ideal FH), DCS 1800 & PCS 1900 TUlow (ideal FH) and DCS 1800 & PCS 1900 TUhigh (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TUhigh (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA (no FH) propagation condition. | | | | | | |
| NOTE 3: The requirements for USF/DAS-5 to 7 are the same as for USF/MCS-5 to 9. | | | | | | |

3GPP TS 45.005, table 2w and subclause 6.3.

Table 14.18-7c: Adjacent channel interference ratio at reference performance for 16-QAM modulated signals (EGPRS2-A DL)

| GSM 850 and GSM 900 | | | | | | |
|------------------------|----|------------------------|------------------|----------------|-------------------|------------|
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-8 | dB | 7,5 | (2) | 4,5 | 4 | 5,5 |
| PDTCH/DAS-9 | dB | 9,0 | (2) | 7,5 | 7 | 14,5 |
| USF/DAS-8 to 9 | dB | [tbd] | (2) | [tbd] | [tbd] | [tbd] |
| DCS 1 800 and PCS 1900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-8 | dB | (2) | (2) | 5,0 | (2) | (2) |
| PDTCH/DAS-9 | dB | (2) | (2) | 9,0 | (2) | (2) |
| USF/DAS-8 to 9 | dB | (2) | (2) | [tbd] | (2) | (2) |

Performance is specified at 30% BLER for those cases identified with mark '***'
 Performance is not specified for those cases identified with mark '-'

NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 2: The requirements for the DCS 1800 & PCS 1900 TULow (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TULow (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TULow (ideal FH), DCS 1800 & PCS 1900 TULow (ideal FH) and DCS 1800 & PCS 1900 TUhigh (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TUhigh (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA (no FH) propagation condition.

3GPP TS 45.005, table 2w and subclause 6.3.

Table 14.18-7d: Adjacent channel interference ratio at reference performance for 32-QAM modulated signals (EGPRS2-A DL)

| GSM 850 and GSM 900 | | | | | | |
|------------------------|----|------------------------|------------------|----------------|-------------------|----------------|
| Type of channel | | Propagation conditions | | | | |
| | | TULow (no FH) | TULow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-10 | dB | 12,5 | ⁽²⁾ | 12 | 12 | 14,0** |
| PDTCH/DAS-11 | dB | 15,5 | ⁽²⁾ | 19 | 19,5 | - |
| PDTCH/DAS-12 | dB | 17,5 | ⁽²⁾ | 19,5** | 17,5** | - |
| USF/DAS-10 to 12 | dB | [tbd] | ⁽²⁾ | [tbd] | [tbd] | [tbd] |
| DCS 1 800 and PCS 1900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | TULow (no FH) | TULow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/DAS-10 | dB | ⁽²⁾ | ⁽²⁾ | 16,0 | ⁽²⁾ | ⁽²⁾ |
| PDTCH/DAS-11 | dB | ⁽²⁾ | ⁽²⁾ | 22,0** | ⁽²⁾ | ⁽²⁾ |
| PDTCH/DAS-12 | dB | ⁽²⁾ | ⁽²⁾ | - | ⁽²⁾ | ⁽²⁾ |
| USF/DAS-10 to 12 | dB | ⁽²⁾ | ⁽²⁾ | [tbd] | ⁽²⁾ | ⁽²⁾ |

Performance is specified at 30% BLER for those cases identified with mark '***'
 Performance is not specified for those cases identified with mark '-'

NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 2: The requirements for the DCS 1800 & PCS 1900 TULow (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TULow (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TULow (ideal FH), DCS 1800 & PCS 1900 TULow (ideal FH) and DCS 1800 & PCS 1900 TUhigh (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TUhigh (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA (no FH) propagation condition.

3GPP TS 45.005, table 2w and subclause 6.3.

2. For 8-PSK modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a2}) exceeding $C/I_c - 50$ dB. For 16-QAM and 32-QAM modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a2}) exceeding $C/I_c - 48$ dB.

2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-5 to 7 shall not exceed 10 % for 8PSK modulation; for PDTCH/DAS-8 to 9 shall not exceed 10 %; and for PDTCH/DAS-10 to 12 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 45.005, subclause 6.2.

2.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-5 to 12 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.

C/I_c is the co-channel interference ratio. For a PDTCH with 8PSK modulation C/I_c is specified in table 14.18-5c; for a PDTCH with 16-QAM modulation C/I_c is specified in table 14.18-5d; for a PDTCH with 32-QAM modulation C/I_c is specified in table 14.18-5e, for a USF with 8-PSK modulation C/I_c is specified in tables 14.18-6c; for USF with 16-QAM modulation C/I_c is specified in table 14.18-6d; and for USF with 32-QAM modulation C/I_c is specified in table 14.18-6d.

3GPP TS 45.005, subclause 6.3.

3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

3GPP TS 45.005 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.3a.3 Test purpose

- 1 To verify that the conformance requirements 1.1, 1.2, 1.3, 1.4, 1.5 and 1.6 are met with an allowance for the statistical significance of the test in the presence adjacent channel interferer under propagation condition TU_{high} at 200 kHz above and below the wanted signal frequency.
- 2 To verify that the conformance requirements 2.1 and 2.2 are met with an allowance for the statistical significance of the test in the presence of a adjacent channel interferer under propagation condition TU_{high} at 400 kHz above and below the wanted signal frequency.
3. To verify that Conformance Requirements are met under extreme conditions.

14.18.3a.4 Method of test

Initial conditions

For both 8-PSK, 16-QAM and 32-QAM modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0. The SS transmits EGPRS RLC data blocks containing random data. In addition to the wanted test signal, the SS transmits an independent, uncorrelated interfering signal Standard Test Signal (II). This unwanted signal is random, continuous and GMSK-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TU_{high}/noFH

Test procedure

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using DAS-5 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.060, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for the coding scheme DAS-7 and for the coding scheme DAS-6 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme DAS-6 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/DAS-5 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/DAS-5 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme DAS-6.

For 16-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-8 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.060, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes DAS-9 and for the coding scheme DAS-9 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme DAS-9 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/DAS-8 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/DAS-8 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme DAS-9.

For 32-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-10 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.060, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes DAS-12 and for the coding scheme DAS-11 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme DAS-11 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/DAS-10 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/DAS-10 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme DAS-11.

14.18.3a.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under TUhigh propagation condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

Testing of the conformance requirement for USF/DAS (5-12) can be done either with fixed minimum number of samples or based on the statistical test method that lead to an early pass/fail decision with test time significantly reduced for MS with BLER not on the limit.

14.18.3a.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.3a.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of BER/BLER performance are defined in Annex 7.

Minimum test time due to fading conditions has to be considered before checking the conformance limits. The minimum test time for the specific fading condition are specified in the table 14.18.3a.5-1.

Table 14.18.3a.5-1: Minimum test time due to TU high fading conditions

| TU high | | | | | | |
|-------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Frequency /MHz | 400 | 700 | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,75 | 0,43 | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 214 | 204 | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:34 | 00:03:24 | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The statistical testing of the conformance requirement is done based on table 14.18.3a.5-2. The table shows the values for MS with a single slot configuration. For MS multi slot configuration the number of blocks has to be increased accordingly.

Table 14.18.3a.5-2: Statistical limits for adjacent channel rejection

| GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1900 | | | | | | |
|---|-------------|-----------------------|--------------------|--------------------------|---------------------|----------------------------|
| Channel types | Block per s | Org. BLER requirement | Derived test limit | Target number of samples | Target test time /s | Target test time /hh:mm:ss |
| USF/MCS-1 to 9 | 50 | 0,01 | 0,01234 | 27958 | 559 | 00:09:19 |

14.18.3b Adjacent channel rejection for packet channels in TIGHTER configuration

14.18.3b.1 Definition

The adjacent channel selectivity is a measure of the capability of the receiver to receive wanted data packets without exceeding a given degradation due to the presence of an interfering signal (I1) in the adjacent channel. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.18.2.

14.18.3b.2 Conformance requirement

For a MS indicating support for TIGHTER Capability (see 3GPP TS 24.008), the requirements for adjacent channel performance for packet switched channels in the tables 2g, 2i, 2l, 2n, 2w and 2af, are also valid for GSM 400 with the exception that MS speed is doubled, e.g. TU50 becomes TU100. For GSM 700 the values in tables 2g, 2i, 2l, 2n, 2v, 2w and 2af, are valid with the exception that GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60. the requirements for adjacent channel performance for packet switched channels in table 2y and 2af are also valid for GSM 400 with the exception that MS speed is doubled, e.g. TU50 becomes TU100. For GSM 700 the values in table 2y and 2af are valid with the exception that GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60.

1. For GMSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia1) specified in table 14.18.3b-1.

Table 14.18.3b-1: Adjacent channel interference (C/Ia1) ratio for MS at reference performance for GMSK modulation (TIGHTER configuration)

| GSM 850 and GSM 900 | | | | | | |
|--|-------------|------------------------|------------------|----------------|-------------------|------------|
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-1 | dB | -14 | -17,5 | -16,5 | -18 | -17 |
| PDTCH/MCS-2 | dB | -12 | -14,5 | -14,5 | -15,5 | -15 |

| PDTCH/MCS-1 | dB | -14 | -17,5 | -17 | -18 | -16 |
| PDTCH/MCS-2 | dB | -12 | -15 | -15 | -15,5 | -14 |
| PDTCH/MCS-3 | dB | -10,5 | -10,5 | -10 | -9,5 | -7 |
| PDTCH/MCS-4 | dB | -8 | -5,5 | -4 | -4,5 | (note 1) |
| USF/MCS-1 to 4 | (Note 3) dB | 0 | -8 | -8,5 | -8,5 | -8,5 |
| NOTE1: PDTCH for MCS-x cannot meet the reference performance for some propagation conditions. | | | | | | |
| NOTE 2: Performance is specified at 30% BLER for some cases. | | | | | | |
| NOTE 3: For USF $C/I_{a1} = C/I_c - 18$ dB (TS 45.005 subclause 6.3.3) applies, where C/Ic is stated in table 2a of TS 45.005. No TIGHTER values for USF are specified in table 2af of TS 45.005. | | | | | | |

3GPP TS 45.005, table 2af and subclause 6.3.3.

1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 %; 3GPP TS 45.005, subclause 6.2.

1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 4 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.

For 8-PSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia1) specified in table 14.18.3b-2.

1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Scheme; 3GPP TS 45.005, subclause 6.2.

1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-5 to 9 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.

Table 14.18.3b-2: Adjacent channel interference ratio (C/Ia1) for MS at reference performance for 8-PSK modulation (TIGHTER configuration)

| GSM 850 and GSM 900 | | | | | | |
|--|----|------------------------|------------------|----------------|-------------------|------------|
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | -9 | -13,5 | -12,5 | -13,5 | -13,5 |
| PDTCH/MCS-6 | dB | -7 | -11 | -10,5 | -11,5 | -10 |

| USF/MCS-5 to 9 | dB | -1 | -8,5 | -9 | -9,5 | -9 |
| NOTE1: PDTCH for MCS-x can not meet the reference performance for some propagation conditions. | | | | | | |
| NOTE 2: Performance is specified at 30% BLER for some cases. | | | | | | |

3GPP TS 45.005, table 2af and subclause 6.3.3.

- 2 For both GMSK and 8-PSK modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia2) exceeding C/Ic - 50dB.

2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 % for GMSK modulation; and for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 45.005, subclause 6.2.

2.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 9 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.

C/Ic is the co-channel interference ratio. For a PDTCH with GMSK modulation C/Ic is specified in table 14.18-5a; for a PDTCH with 8-PSK modulation C/Ic is specified in table 14.18-5b, for a USF with GMSK modulation C/Ic is specified in tables 14.18-6a; and for USF with 8-PSK modulation C/Ic is specified in table 14.18-6b. 3GPP TS 45.005, subclause 6.3.

3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.3b.3 Test purpose

- 1 To verify that the conformance requirements 1.1, 1.2, 1.3 and 1.4 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 200 kHz above and below the wanted signal frequency.
- 2 To verify that the conformance requirements 2.1 and 2.2 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 400 kHz above and below the wanted signal frequency.
3. To verify that Conformance Requirements are met under extreme conditions.

14.18.3b.4 Method of test

Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0. The SS transmits EGPRS RLC data blocks containing random data. In addition to the wanted test signal, the SS transmits an independent, uncorrelated interfering signal Standard Test Signal (I1). This unwanted signal is random, continuous and GMSK-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUhigh/noFH

Test procedure

For GMSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-1 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-2 to 4.
- i) The SS repeats steps a) to g) under extreme test conditions for MCS-4 coding scheme only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme USF/MCS-4.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-5 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-6 to 8 and for the coding scheme MCS-9 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme MCS-9 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme MCS-9.

14.18.3b.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under TUhigh propagation condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

Testing of the conformance requirement for USF/MCS (1-9) can be done either with fixed minimum number of samples or based on the statistical test method that lead to an early pass/fail decision with test time significantly reduced for MS with BLER not on the limit.

14.18.3b.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.3b.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of BER/BLER performance are defined in Annex 7.

Minimum test time due to fading conditions has to be considered before checking the conformance limits. The minimum test time for the specific fading condition are specified in the table 14.18.3b-3.

Table 14.18.3b-3: Minimum test time due to TU high fading conditions

| TU high | | | | | | |
|-------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Frequency /MHz | 400 | 700 | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,75 | 0,43 | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 214 | 204 | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:34 | 00:03:24 | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The statistical testing of the conformance requirement is done based on table 14.18.3b-4. The table shows the values for MS with a single slot configuration. For MS multi slot configuration the number of blocks has to be increased accordingly.

Table 14.18.3b-4: Statistical limits for adjacent channel rejection

| GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1900 | | | | | | |
|---|-------------|-----------------------|--------------------|--------------------------|---------------------|----------------------------|
| Channel types | Block per s | Org. BLER requirement | Derived test limit | Target number of samples | Target test time /s | Target test time /hh:mm:ss |
| USF/MCS-1 to 9 | 50 | 0,01 | 0,01234 | 27958 | 559 | 00:09:19 |

14.18.3c Adjacent channel rejection in EGPRS2A configuration with TIGHTER configuration

14.18.3c.1 Definition

The adjacent channel selectivity is a measure of the capability of the receiver to receive wanted data packets without exceeding a given degradation due to the presence of an interfering signal (I1) in the adjacent channel. "Wanted signal" with additional TIGHTER requirements in this test is the signal generated by the transmitted RLC data blocks.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.18.2.

14.18.3c.2 Conformance requirement

1. For 8-PSK modulation, u under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia1) specified in table 14.18-7b and table 14.18-7e.
 - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-5 to 7 shall not exceed 10 % depending on Coding Scheme; 3GPP TS 45.005, subclause 6.2.
 - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-5 to 7 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.
For 16-QAM modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia1) specified in table 14.18-7c and table 14.18-7e.
 - 1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-8 to 9 shall not exceed 10 % depending on Coding Scheme; 3GPP TS 45.005, subclause 6.2.
 - 1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-8 to 9 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.
For 32-QAM modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia1) specified in table 14.18-7d and table 14.18-7e.
 - 1.5 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-10 to 12 shall not exceed 10 % or 30 % depending on Coding Scheme; 3GPP TS 45.005, subclause 6.2.
 - 1.6 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-10 to 12 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.

Table 14.18-7b: Adjacent channel interference ratio at reference performance for 8-PSK modulated signals (EGPRS2-A DL)

| GSM 850 and GSM 900 | | | | | | |
|------------------------|----|------------------------|------------------|----------------|-------------------|----------------|
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |

| USF/DAS-8 to 9 | dB | -6,0 | (2) | -14,0 | -15,5 | -16,0 |
| USF/DAS-10 to 12 | dB | -5,5 | (2) | -13,0 | -14,5 | -14,0 |
| DCS 1 800 and PCS 1900 | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | TU1,5 (no FH) | TU1,5 (ideal FH) | TU50 (no FH) | TU50 (ideal FH) | RA130 (no FH) |
| USF/DAS-5 to 7 | dB | (3) | (3) | (3) | (3) | (3) |
| USF/DAS-8 to 9 | dB | (2) | (2) | -14,0 | (2) | (2) |
| USF/DAS-10 to 12 | dB | (2) | (2) | -13,5 | (2) | (2) |

Performance is specified at 30% BLER for those cases identified with mark ^{***}

Performance is not specified for those cases identified with mark ⁻

NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TU50 (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz.

NOTE 2: The requirements for the DCS 1800 & PCS 1900 TU1.5 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 TU3 (no FH) propagation condition, the requirements for the GSM 850 & GSM 900 TU3 (ideal FH), DCS 1800 & PCS 1900 TU1.5 (ideal FH) and DCS 1800 & PCS 1900 TU50 (ideal FH) propagation conditions are the same as for the DCS 1800 & PCS 1900 TU50 (no FH) propagation condition, and the requirements for the DCS 1800 & PCS 1900 RA130 (no FH) propagation condition are the same as for the GSM 850 & GSM 900 RA250 (no FH) propagation condition.

NOTE 3: The requirements for USF/DAS-5 to 7 are the same as for USF/MCS-5 to 9.

3GPP TS 45.005, table 2w and subclause 6.3.

2. For 8-PSK modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a2}) exceeding $C/I_c - 50$ dB. For 16-QAM and 32-QAM modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a2}) exceeding $C/I_c - 48$ dB.

2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/DAS-5 to 7 shall not exceed 10 % for 8PSK modulation; for PDTCH/DAS-8 to 9 shall not exceed 10 %; and for PDTCH/DAS-10 to 12 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 45.005, subclause 6.2.

2.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/DAS-5 to 12 shall not exceed 1 %; 3GPP TS 45.005, subclause 6.2.

C/I_c is the co-channel interference ratio. For a PDTCH with 8PSK modulation C/I_c is specified in table 14.18-5c; for a PDTCH with 16-QAM modulation C/I_c is specified in table 14.18-5d; for a PDTCH with 32-QAM modulation C/I_c is specified in table 14.18-5e, for a USF with 8-PSK modulation C/I_c is specified in

tables 14.18-6c; for USF with 16-QAM modulation C/I_c is specified in table 14.18-6d; and for USF with 32-QAM modulation C/I_c is specified in table 14.18-6d.

3GPP TS 45.005, subclause 6.3.

3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

3GPP TS 45.005 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.3c.3 Test purpose

- 1 To verify that the conformance requirements 1.1, 1.2, 1.3, 1.4, 1.5 and 1.6 are met with an allowance for the statistical significance of the test in the presence adjacent channel interferer under propagation condition TU_{high} at 200 kHz above and below the wanted signal frequency.
- 2 To verify that the conformance requirements 2.1 and 2.2 are met with an allowance for the statistical significance of the test in the presence of a adjacent channel interferer under propagation condition TU_{high} at 400 kHz above and below the wanted signal frequency.
3. To verify that Conformance Requirements are met under extreme conditions.

14.18.3c.4 Method of test

Initial conditions

For both 8-PSK, 16-QAM and 32-QAM modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0. The SS transmits EGPRS RLC data blocks containing random data. In addition to the wanted test signal, the SS transmits an independent, uncorrelated interfering signal Standard Test Signal (I1). This unwanted signal is random, continuous and GMSK-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TU_{high}/noFH

Test procedure

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using DAS-5 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.060, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.

- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for the coding scheme DAS-7 and for the coding scheme DAS-6 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme DAS-6 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/DAS-5 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/DAS-5 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme DAS-6.

For 16-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-8 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.060, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.

- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes DAS-9 and for the coding scheme DAS-9 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme DAS-9 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/DAS-8 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/DAS-8 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme DAS-9.

For 32-QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-10 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.060, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.

- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes DAS-12 and for the coding scheme DAS-11 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme DAS-11 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/DAS-10 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/DAS-10 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme DAS-11.

14.18.3c.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under TUhigh propagation condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

Testing of the conformance requirement for USF/DAS (5-12) can be done either with fixed minimum number of samples or based on the statistical test method that lead to an early pass/fail decision with test time significantly reduced for MS with BLER not on the limit.

14.18.3c.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.3c.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of BER/BLER performance are defined in Annex 7.

Minimum test time due to fading conditions has to be considered before checking the conformance limits. The minimum test time for the specific fading condition are specified in the table 14.18.3c.5-1.

Table 14.18.3c.5-1: Minimum test time due to TU high fading conditions

| TU high | | | | | | |
|-------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Frequency /MHz | 400 | 700 | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,75 | 0,43 | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 214 | 204 | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:34 | 00:03:24 | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The statistical testing of the conformance requirement is done based on table 14.18.3a.5-2. The table shows the values for MS with a single slot configuration. For MS multi slot configuration the number of blocks has to be increased accordingly.

Table 14.18.3c.5-2: Statistical limits for adjacent channel rejection

| GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1900 | | | | | | |
|---|-------------|-----------------------|--------------------|--------------------------|---------------------|----------------------------|
| Channel types | Block per s | Org. BLER requirement | Derived test limit | Target number of samples | Target test time /s | Target test time /hh:mm:ss |
| USF/MCS-1 to 9 | 50 | 0,01 | 0,01234 | 27958 | 559 | 00:09:19 |

14.18.3d Adjacent channel rejection in DLMC configuration

14.18.3d.1 Definition

The adjacent channel selectivity is a measure of the capability of the receiver to receive wanted data packets without exceeding a given degradation due to the presence of an interfering signal (I1) in the adjacent channel. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.18.2.

14.18.3d.2 Conformance requirement

1. For GMSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a1}) exceeding $C/I_c - 18\text{dB}$ where C/I_c is the co-channel interference ratio specified in table 14.18-5a for PDTCH and table 14.18-6a for USF channels.
 - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 %; 3GPP TS 45.05, subclause 6.2.
 - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MS-C-1 to 4 shall not exceed 1 %; 3GPP TS 45.05, subclause 6.2.

For 8-PSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a1}) specified in table 14.18-7a.

- 1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Scheme; 3GPP TS 45.05, subclause 6.2.
 - 1.5 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MS-C-5 to 9 shall not exceed 1 %; 3GPP TS 45.05, subclause 6.2.
- 3GPP TS 45.05, table 2g and subclause 6.3.
- 2 For both GMSK and 8-PSK modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/I_{a2}) exceeding $C/I_c - 41\text{dB}$.
 - 2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 % for GMSK modulation; and for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 45.05, subclause 6.2.
 - 2.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MS-C-1 to 9 shall not exceed 1 %; 3GPP TS 45.05, subclause 6.2.

C/I_c is the co-channel interference ratio. For a PDTCH with GMSK modulation C/I_c is specified in table 14.18-5a; for a PDTCH with 8-PSK modulation C/I_c is specified in table 14.18-5b, for a USF with GMSK modulation C/I_c is specified in tables 14.18-6a; and for USF with 8-PSK modulation C/I_c is specified in table 14.18-6b. 3GPP TS 45.05, subclause 6.3.
 3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 45.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.
 - 4 In case of DLMC configuration the reference interference performance specified above for TU50 no FH applies. Adjacent channel interference requirements for other propagation conditions are not specified.

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.3d.3 Test purpose

- 1 To verify that the conformance requirements 1.1, 1.2, 1.3 and 1.4 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 200 kHz above and below the wanted signal frequency.
- 2 To verify that the conformance requirements 2.1 and 2.2 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 400 kHz above and below the wanted signal frequency.
3. To verify that Conformance Requirements are met under extreme conditions.

14.18.3d.4 Method of test

Initial conditions

For both GMSK and 8-PSK modulations, a downlink DL MC TBF is set up according to the generic procedure specified in clause 40 for packet switched with 2 ARFCN's in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0. The SS transmits EGPRS RLC data blocks containing random data. In addition to the wanted test signal, the SS transmits an independent, uncorrelated interfering signal Standard Test Signal (I1). This unwanted signal is random, continuous and GMSK-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUhigh/noFH

Test procedure

For GMSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-1 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-2 to 4.

- i) The SS repeats steps a) to g) under extreme test conditions for MCS-4 coding scheme only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme USF/MCS-4.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-5 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-6 to.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme MCS-9 only.

- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio 1dB above that specified in the conformance requirements.
- r) The SS repeats steps k) to q) under extreme test conditions for coding scheme MCS-9.

14.18.3d.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under TUhigh propagation condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

Testing of the conformance requirement for USF/MCS (1-9) can be done either with fixed minimum number of samples or based on the statistical test method that lead to an early pass/fail decision with test time significantly reduced for MS with BLER not on the limit.

14.18.3d.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.3d.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of BER/BLER performance are defined in Annex 7.

Minimum test time due to fading conditions has to be considered before checking the conformance limits. The minimum test time for the specific fading condition are specified in the table 14.18.3.5-1.

Table 14.18.3.5-1: Minimum test time due to TU high fading conditions

| TU high | | | | | | |
|-------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Frequency /MHz | 400 | 700 | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,75 | 0,43 | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 214 | 204 | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:34 | 00:03:24 | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The statistical testing of the conformance requirement is done based on table 14.18.3.5-2. The table shows the values for MS with a single slot configuration. For MS multi slot configuration the number of blocks has to be increased accordingly.

Table 14.18.3.5-2: Statistical limits for adjacent channel rejection

| GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1900 | | | | | | |
|---|-------------|-----------------------|--------------------|--------------------------|---------------------|----------------------------|
| Channel types | Block per s | Org. BLER requirement | Derived test limit | Target number of samples | Target test time /s | Target test time /hh:mm:ss |
| USF/MCS-1 to 9 | 50 | 0,01 | 0,01234 | 27958 | 559 | 00:09:19 |

14.18.4 Intermodulation rejection

14.18.4.1 Definition

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.4.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency in both GMSK and 8-PSK modulations

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 05.05, subclause 6.2.
2. The block error rate (BLER) performance for USF/MSC-1 to 9 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.
3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

14.18.4.3 Test purpose

1. To verify that the MS does not exceed the conformance requirements for different channels and coding schemes under the static condition with an allowance for the statistical significance of the test.
2. To verify that Conformance Requirements are met under extreme conditions.

14.18.4.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the Mid ARFCN range, power control level set to maximum. The power control parameter ALPHA (α) is set to 0.

The SS transmits EGPRS RLC data blocks containing random data. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level with appropriate correction value as specified in table 14.18-3a for GMSK modulation and table 14.18-3b for 8-PSK modulation for PDTCH channel and in tables 14.18-4a for GMSK modulation and 14.18-4b for 8-PSK modulation for USF channel.

In addition to the static wanted test signal, the SS transmits two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

Test procedure

For GMSK modulation:

- a) The SS transmits packets on PDTCH using MCS-4 coding to the MS on all allocated timeslots.

- b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats steps d) and e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.
- h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.
- i) The SS repeats steps a) to f) for each of the coding schemes MCS-1 to 3.
- j) Steps a) to h) are repeated under extreme test conditions for MCS-4 only.
- k) The SS establishes the normal test conditions. An uplink TBF shall be established.
- l) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS.
- m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- p) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- q) The SS repeats steps o) and p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN.
- s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.
- t) The SS repeats steps l) to s) under extreme test conditions for MCS-4.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-9 coding to the MS on all allocated timeslots.
- b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.

- c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats steps d) and e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.
- h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.
- i) The SS repeats steps a) to f) for each of the coding schemes MCS-5,6,7 and 8 with the receiver operating on an ARFCN in the Middle ARFCN range.
- j) The SS repeats steps a) to h) under extreme test conditions for MCS-9 only.
- k) The SS establishes the normal test conditions. An uplink TBF shall be established.
- l) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS.
- m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- p) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- q) The SS repeats steps o) and p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN
- s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.
- t) The SS repeats steps l) to s) under extreme test conditions for MCS-9 only.

Table 14.18-8: Intermodulation interfering test signal levels

| | GSM 400, GSM 700, T-GSM 810, GSM 850, GSM 900, PCS 1 900 | | DCS 1 800 | |
|---------------------------------------|---|----------|---------------|---------|
| | Small MS | Other MS | Class 1 and 2 | Class 3 |
| FIRST INTERFERER dB μ Vemf() | 64 | 74 | 64 | 68 |
| SECOND INTERFERER dB μ Vemf() | 63 | 63 | 64 | 68 |

NOTE: Some of the levels in table 14.18-8 are different to those specified in 3GPP TS 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

14.18.4.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under static condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

14.18.4a Intermodulation rejection in EGPRS2A configuration

14.18.4a.1 Definition

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.4a.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency in both GMSK and 8-PSK modulations

1. The block error rate (BLER) performance for PDTCH/DAS5 to 12 shall not exceed 10 % or 30 % depending on Coding Schemes.
3GPP TS 45.005, subclause 6.2.
2. The block error rate (BLER) performance for USF/DAS-5 to 12 shall not exceed 1 %
3GPP TS 45.005, subclause 6.2.
3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions
3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

14.18.4a.3 Test purpose

1. To verify that the MS does not exceed the conformance requirements for different channels and coding schemes under the static condition with an allowance for the statistical significance of the test.
2. To verify that Conformance Requirements are met under extreme conditions.

14.18.4a.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

Initial conditions

For 8-PSK, 16QAM and 32QAM modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the Mid ARFCN range, power control level set to maximum. The power control parameter ALPHA (α) is set to 0.

The SS transmits EGPRS RLC data blocks containing random data. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level with appropriate correction value as specified in table 14.18-3a for GMSK modulation and table 14.18.1a-1 for 8-PSK, 16QAM and 32QAM modulation for PDTCH channel and in tables 14.18-4a for GMSK modulation and 14.18.1a-2 for 8-PSK, 16QAM and 32QAM modulation for USF channel.

In addition to the static wanted test signal, the SS transmits two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

Test procedure

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using DAS-7 coding to the MS on all allocated timeslots.
- b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8a.

- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 44.060, clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats steps d) and e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.
- h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.
- i) The SS repeats steps a) to f) for each of the coding schemes DAS-5 and 6 with the receiver operating on an ARFCN in the Middle ARFCN range.
- j) The SS repeats steps a) to h) under extreme test conditions for DAS-7 only.
- k) The SS establishes the normal test conditions. An uplink TBF shall be established.
- l) The SS sets the value of the USF/DAS-7 such as to allocate the uplink to the MS.
- m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8a.

- o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

- p) Once the number of USF/DAS-7 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- q) The SS repeats steps o) and p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN
- s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.
- t) The SS repeats steps l) to s) under extreme test conditions for DAS-7 only.

For 16QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-9 coding to the MS on all allocated timeslots.
- b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8a.

- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 44.060, clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats steps d) and e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.
- h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.
- i) The SS repeats steps a) to f) for each of the coding schemes DAS- 8 with the receiver operating on an ARFCN in the Middle ARFCN range.
- j) The SS repeats steps a) to h) under extreme test conditions for DAS-9 only.
- k) The SS establishes the normal test conditions. An uplink TBF shall be established.
- l) The SS sets the value of the USF/DAS-9 such as to allocate the uplink to the MS.
- m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8a.

- o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

- p) Once the number of USF/DAS-9 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- q) The SS repeats steps o) and p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN
- s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.
- t) The SS repeats steps l) to s) under extreme test conditions for DAS-9 only.

For 32QAM Modulation:

- a) The SS transmits packets on PDTCH using DAS-12 coding to the MS on all allocated timeslots.
- b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 44.060, clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats steps d) and e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.
- h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.
- i) The SS repeats steps a) to f) for each of the coding schemes DAS-10 and 11 with the receiver operating on an ARFCN in the Middle ARFCN range.
- j) The SS repeats steps a) to h) under extreme test conditions for DAS-12 only.
- k) The SS establishes the normal test conditions. An uplink TBF shall be established.
- l) The SS sets the value of the USF/DAS-12 such as to allocate the uplink to the MS.
- m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8a.

- o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- p) Once the number of USF/DAS-12 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

- q) The SS repeats steps o) and p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN
- s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.
- t) The SS repeats steps l) to s) under extreme test conditions for DAS-12 only.

Table 14.18-8a: Intermodulation interfering test signal levels

| | GSM 400, GSM 700, T-GSM 810, GSM 850, GSM 900, PCS 1 900 | | DCS 1 800 | |
|---------------------------------------|---|----------|---------------|---------|
| | Small MS | Other MS | Class 1 and 2 | Class 3 |
| FIRST INTERFERER dB μ Vemf() | 64 | 74 | 64 | 68 |
| SECOND INTERFERER dB μ Vemf() | 63 | 63 | 64 | 68 |

NOTE: Some of the levels in table 14.18-8a are different to those specified in 3GPP TS 45.005 due to the consideration of the effect of modulation sideband noise from the second interferer.

14.18.4a.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under static condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

14.18.5 Blocking and spurious response

14.18.5.1 Definition

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.5.2 Conformance requirement

- The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 05.05 subclause 5.1.
- The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes and for USF/MCS1 to 9 shall not exceed 1 % when the following signals are simultaneously input to the receiver; 3GPP TS 05.05, subclause 6.2:
 - a useful signal at frequency f_0 , 3 dB above the reference sensitivity level specified in table 14.18-3a for GMSK modulation and table 14.18-3b for 8-PSK modulation for PDTCH channels; and in tables 14.18-4a for GMSK modulation and 14.18-4b for 8-PSK modulation for USF channel with correction values as specified in 3GPP TS 05.05 subclause 6.2;
 - a continuous, static sine wave unwanted signal at a level as in the table 14.18-9 below and at a frequency (f) which is an integer multiple of 200 kHz.

with the following exceptions, called spurious response frequencies:

- a) GSM 400: in band, for a maximum of three occurrences. 3GPP TS 05.05, subclause 5.1.

GSM 700, GSM 850 or GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group). 3GPP TS 05.05, subclause 5.1.

DCS 1 800 and PCS 1 900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group). 3GPP TS 05.05, subclause 5.1.

- b) out of band, for a maximum of 24 occurrences (which if below f_0 and grouped shall not exceed three contiguous occurrences per group). 3GPP TS 05.05, subclause 5.1.

where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dB μ V (emf) (i.e. -43 dBm). 3GPP TS 05.05, subclause 5.1.

14.18.5.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 05.05, are allowed to ensure a fair test of the MS.

14.18.5.4 Method of test

Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power. The ARFCN of the BCCH shall be the same - or at an offset of +/- 2 channels, than that of the ARFCN for the TCH.

The SS transmits EGPRS RLC data blocks containing random data.

In addition to the wanted Test Signal, the SS transmit a static unmodulated continuous interfering signal (Standard Test Signal I0).

Test procedure

For the ACK/NACK test steps the maximum number of supported time slots shall be used, and for the USF test steps the maximum supported symmetrical UL slot configuration shall be used.

For GMSK Modulation:

- a) The SS is set to produce a static GMSK wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in table 14.18-3a for PDTCH channel and in table 14.18-4a for USF channel with correction values as specified in 3GPP TS 05.05 subclause 6.2.
- b) The SS transmits packets on PDTCH using MCS-4 coding to MS on all allocated timeslots.
- c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

- i) The total frequency range formed by:

GSM 400 the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$
and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$.

GSM 700 the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$

and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$.

GSM 850 the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

P-GSM 900: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$

and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$

and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.

PCS 1 900: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$

and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$.

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

iii) The frequencies:

$mF_{10} + IF_1$;

$mF_{10} - IF_1$;

mFR ;

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

F_{10} - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$ - are the n intermediate frequencies

F_{10} , IF_1 , $IF_2 \dots IF_n$ - shall be declared by the manufacturer in the PIXIT statement 3GPP TS 51.010-1 annex 3.

e) The level of the unwanted signal is set according to table 14.18-9.

Table 14.18-9a: Level of unwanted signals

| FREQUENCY | GSM450 | | GSM480 | | GSM 900 | | DCS 1 800 | PCS 1 900 |
|--------------------------------------|---------------------------|----------|----------|----------|----------|----------|-----------|-----------|
| | Small MS | Other MS | Small MS | Other MS | Small MS | Other MS | | |
| | LEVEL IN dB μ Vemf() | | | | | | | |
| FR \pm 600 kHz to FR \pm 800 kHz | 70 | 75 | 70 | 75 | 70 | 75 | 70 | 70 |
| FR \pm 800 kHz to FR \pm 1,6 MHz | 70 | 80 | 70 | 80 | 70 | 80 | 70 | 70 |
| FR \pm 1,6 MHz to FR \pm 3 MHz | 80 | 90 | 80 | 90 | 80 | 90 | 80 | 80 |
| 457,6 MHz to FR - 3 MHz | 90 | 90 | - | - | - | - | - | - |
| FR + 3 MHz to 473,6 MHz | 90 | 90 | - | - | - | - | - | - |
| 486 MHz to FR - 3MHz | - | - | 90 | 90 | - | - | - | - |
| FR + 3MHz to 502 MHz | - | - | 90 | 90 | - | - | - | - |
| 915 MHz to FR - 3 MHz | - | - | - | - | 90 | 90 | - | - |

| 100 kHz to 831 MHz | - | - | 113 | - |
| > 886 MHz to 12,75 MHz | - | - | 113 | - |
| 100 kHz to < 849 MHz | - | - | - | 113 |
| > 914 MHz to 12,75 GHz | - | - | - | 113 |

NOTE 1: For E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to 915 MHz is relaxed to 108 dB μ Vemf(). 3GPP TS 05.05, subclause 5.1.

NOTE 2: a) For R-GSM 900 MS the level of the unwanted signal in the band 880 MHz to 915 MHz is relaxed to 108 dB μ Vemf(). 3GPP TS 05.05, subclause 5.1.

For ER-GSM MS the level of the unwanted signal in the band 880 MHz to 912 MHz is relaxed to 108 dB μ Vemf(). 3GPP TS 45.005, subclause 5.1.

For ER-GSM MS the level of the unwanted signal in the band 912 MHz to 915 MHz is relaxed to 101 dB μ Vemf(). 3GPP TS 45.005, subclause 5.1.

b) For R-GSM 900 small MS the level of the unwanted signal in the band 876 MHz to 915 MHz is relaxed to 106 dB μ Vemf(). 3GPP TS 05.05, subclause 5.1.

For ER-GSM small MS the level of the unwanted signal in the band 873 MHz to 912 MHz is relaxed to 106 dB μ Vemf(). 3GPP TS 45.005, subclause 5.1.

For ER-GSM small MS the level of the unwanted signal in the band 912 MHz to 915 MHz is relaxed to 99 dB μ Vemf(). 3GPP TS 45.005, subclause 5.1.

NOTE 3: a) For GSM 450 small MS the level of the unwanted signal in the band 450,4 MHz to 457,6 MHz is relaxed to 108 dB μ Vemf(). 3GPP TS 05.05, subclause 5.1.

b) For GSM 480 small MS the level of the unwanted signal in the band 478,8 MHz to 486 MHz is relaxed to 108 dB μ Vemf(). 3GPP TS 05.05, subclause 5.1.

f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

If a failure is indicated, it is noted and counted towards the allowed exemption total. In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels \pm 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

- h) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS.
- i) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 2: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- j) The level of the unwanted signal is set according to table 14.18-9.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

For 8-PSK Modulation:

- a) The SS is set to produce a static 8-PSK wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in table 14.18-3b for PDTCH channel and in table 14.18-4b for USF channel with correction values as specified in 3GPP TS 05.05 subclause 6.2;
- b) The SS transmits packets on PDTCH using MCS-9 coding to MS on all allocated timeslots.
- c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 3: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

- i) The total frequency range formed by:

GSM 400 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$.

GSM 700 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$.

GSM 850 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

P-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.

PCS 1 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$.

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

iii) The frequencies:

$mF_{lo} + IF_1$;

$mF_{lo} - IF_1$;

mFR ;

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

F_{lo} - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$ - are the n intermediate frequencies

F_{lo} , IF_1 , $IF_2 \dots IF_n$ - shall be declared by the manufacturer in the PIXIT statement 3GPP TS 51.010-1 annex 3.

e) The level of the unwanted signal is set according to table 14.18-9.

f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 4: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels $\pm 200 \text{ kHz}$ away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

h) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS.

j) The unwanted signal is of frequency FB . It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600 \text{ kHz}$ are excluded.

NOTE 5: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

k) The level of the unwanted signal is set according to table 14.18-9.

- l) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- m) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step l) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

14.18.5.5 Test requirements

The block error ratio as calculated by the SS for different channels and coding schemes shall not exceed the conformance requirement. Testing the conformance requirement can be done either in the classical way with a fixed minimum number of samples (refer to section 14.18.5.5.2) or using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with performance not on the limit (refer to section 14.18.5.5.1). Both methods are based on a bad DUT factor $M = 1.5$.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

The following exceptions are allowed:

- GSM 400:** A maximum of three failures in the band 457,6 MHz to 473,6 MHz for GSM450 and in the band 486,0 MHz to 502,0 MHz for GSM480
- A maximum of 24 in the combined bands 100 kHz to 457,6 MHz and 473,6 MHz to 12,75 GHz for GSM 450 and in the combined bands 100 kHz to 486,0 MHz and 502,0 MHz to 12,75 GHz for GSM 480 (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 710:** A maximum of six failures in the frequency band 678 MHz to 728 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 failures in the combined bands 100 kHz to 678 MHz and 728 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 750:** A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 810:** A maximum of six failures in the frequency band 831 MHz to 886 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 failures in the combined bands 100 kHz to 831 MHz and 886 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 850:** A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 900:** A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- DCS 1 800:** A maximum of twelve failures in the band 1 785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1 785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

PCS 1 900: A maximum of twelve failures in the band 1 910 MHz to 2 010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1 910 MHz and 2 010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.18.5.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBuVemf() and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using either the accelerated BLER method or the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

14.18.5.5.1 Statistical testing of blocking and spurious response performance with early decision

For more information on statistical testing of blocking and spurious response performance, especially the definition of limit lines refer to Annex 7.

Wrong decision risk F for one single error rate test:

$F_{\text{pass}} \neq F_{\text{fail}}$ As the blocking test case comprises of many BLER tests the wrong decision risk for a fail decision of one single error rate test must be smaller than the wrong decision risk for a pass decision to avoid an increased probability of an erroneous fail decision.

$$F_{\text{pass}} = 0.2\%$$

$$F_{\text{fail}} = 0.02\%$$

Wrong decision probability D per test step:

$$D_{\text{pass}} \neq D_{\text{fail}}$$

$$D_{\text{pass}} = 0.008\%$$

$$D_{\text{fail}} = 0.0008\%$$

Parameters for limit lines:

1. $D_{\text{pass}} = 0.008\%$ wrong decision probability per test step for early pass decision.

$D_{\text{fail}} = 0.0008\%$ wrong decision probability per test step for early fail decision.

2. $M = 1.5$ bad DUT factor

3. n_e number of (error) events.

4. n_s number of samples. The error rate is calculated from n_e and n_s .

Limit checking

For an early decision a minimum number of measured (error) events is necessary.

For an early pass decision $n_e \geq 1$

For an early fail decision $n_e \geq 8$

When the target test time has been reached the test is finished and a pass/fail decision can be made.

The statistical testing of the conformance requirement is done using table 14.18.5-1.

Table 14.18.5-1: Statistical test limits for blocking performance of EGPRS mobiles

| Blocking and spurious response for EGPRS mobiles | | | | | | |
|--|--------------|-------------|------------|-------------------|---------------|------------------|
| | | Orig. BLER | Derived | Target | Target | Target test time |
| | blocks per s | requirement | test limit | number of samples | test time (s) | (hh:mm:ss) |
| One time slot: | | | | | | |
| PDTCH/MCS-4 | 50 | 0,100000 | 0,125100 | 3221 | 64 | 00:01:04 |
| USF/MCS-4 | 50 | 0,010000 | 0,012510 | 32214 | 644 | 00:10:44 |
| PDTCH/MCS-9 | 50 | 0,100000 | 0,125100 | 3221 | 64 | 00:01:04 |
| USF/MCS-9 | 50 | 0,010000 | 0,012510 | 32214 | 644 | 00:10:44 |
| Two time slots: | | | | | | |
| PDTCH/MCS-4 | 100 | 0,100000 | 0,125100 | 3221 | 32 | 00:00:32 |
| USF/MCS-4 | 100 | 0,010000 | 0,012510 | 32214 | 322 | 00:05:22 |
| PDTCH/MCS-9 | 100 | 0,100000 | 0,125100 | 3221 | 32 | 00:00:32 |

14.18.5.5.2 Fixed testing of blocking and spurious response performance with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.5a Blocking and spurious response in EGPRS2A configuration

14.18.5a.1 Definition

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.5a.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 45.005 subclause 5.1.
2. The block error rate (BLER) performance for PDTCH/DAS-5 to 12 shall not exceed 10 % depending on Coding Schemes and for USF/DAS-5 to 12 shall not exceed 1 % when the following signals are simultaneously input to the receiver; 3GPP TS 45.005, subclause 6.2:
 - a useful signal at frequency f_0 , 3 dB above the reference sensitivity level specified in table 14.18.1a-1 for 8-PSK, 16QAM and 32QAM modulation for PDTCH channels; and in tables 14.18.1a-2 for 8-PSK 16QAM and 32QAM modulation for USF channel with correction values as specified in 3GPP TS 45.005 subclause 6.2;

- a continuous, static sine wave unwanted signal at a level as in the table 14.18-9a and 14.18.9b, and at a frequency (f) which is an integer multiple of 200 kHz.

with the following exceptions, called spurious response frequencies:

- a) GSM 400: in band, for a maximum of three occurrences. 3GPP TS 45.005, subclause 5.1.
 GSM 700, GSM 850 or GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group). 3GPP TS 45.005, subclause 5.1.
 DCS 1 800 and PCS 1 900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group). 3GPP TS 45.005, subclause 5.1.
- b) out of band, for a maximum of 24 occurrences (which if below f_0 and grouped shall not exceed three contiguous occurrences per group). 3GPP TS 45.005, subclause 5.1.

where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dB μ V (emf) (i.e. -43 dBm). 3GPP TS 45.005, subclause 5.1.

14.18.5a.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 45.005, are allowed to ensure a fair test of the MS.

14.18.5a.4 Method of test

Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power. The ARFCN of the BCCH shall be the same - or at an offset of +/- 2 channels, than that of the ARFCN for the TCH.

The SS transmits EGPRS RLC data blocks containing random data.

In addition to the wanted Test Signal, the SS transmit a static unmodulated continuous interfering signal (Standard Test Signal I0).

Test procedure

For the ACK/NACK test steps the maximum number of supported time slots shall be used, and for the USF test steps the maximum supported symmetrical UL slot configuration shall be used.

For 8-PSK Modulation:

- a) The SS is set to produce a static 8-PSK wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in table 14.18.1a-1 for PDTCH channel and in table 14.18.1a-2 for USF channel with correction values as specified in 3GPP TS 45.005 subclause 6.2;
- b) The SS transmits packets on PDTCH using DAS-5 coding to MS on all allocated timeslots.
- c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 1: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:

GSM 400 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$.

GSM 700 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$.

GSM 850 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

P-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.

PCS 1 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$.

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

iii) The frequencies:

$mF_{lo} + IF_1$;

$mF_{lo} - IF_1$;

mFR ;

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

F_{lo} - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$ - are the n intermediate frequencies

F_{lo} , IF_1 , $IF_2 \dots IF_n$ - shall be declared by the manufacturer in the PIXIT statement
3GPP TS 51.010-1 annex 3.

- e) The level of the unwanted signal is set according to table 14.18-9a and 14.18-9b.
- f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 44.060, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

- h) The SS sets the value of the USF/DAS-7 such as to allocate the uplink to the MS.
- j) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 3: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- k) The level of the unwanted signal is set according to table 14.18-9a and 14.18-9b.
- l) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- m) Once the number of USF/DAS-7 allocating the uplink for the MS as counted in step l) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

For 16QAM Modulation:

- a) The SS is set to produce a static 16QAM wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in table 14.18.1a-1 for PDTCH channel and in table 14.18.1a-2 for USF channel with correction values as specified in 3GPP TS 45.005 subclause 6.2;
- b) The SS transmits packets on PDTCH using DAS-8 coding to MS on all allocated timeslots.
- c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 4: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:
 - i) The total frequency range formed by:

GSM 400 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$.

GSM 700 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$.

GSM 850 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

P-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.

PCS 1 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$.

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

iii) The frequencies:

$mF_{lo} + IF_1$;

$mF_{lo} - IF_1$;

mFR ;

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

F_{lo} - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$ - are the n intermediate frequencies

F_{lo} , IF_1 , $IF_2 \dots IF_n$ - shall be declared by the manufacturer in the PIXIT statement
3GPP TS 51.010-1 annex 3.

e) The level of the unwanted signal is set according to table 14.18-9a and 14.18-9b.

f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 44.060, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 5: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

- h) The SS sets the value of the USF/DAS-9 such as to allocate the uplink to the MS.
- j) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 6: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- k) The level of the unwanted signal is set according to table 14.18-9a and 14.18-9b.
- l) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- m) Once the number of USF/DAS-9 allocating the uplink for the MS as counted in step l) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

For 32QAM Modulation:

- a) The SS is set to produce a static 32QAM wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in table 14.18.1a-1 for PDTCH channel and in table 14.18.1a-2 for USF channel with correction values as specified in 3GPP TS 45.005 subclause 6.2;
- b) The SS transmits packets on PDTCH using DAS-10 coding to MS on all allocated timeslots.
- c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 7: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

- i) The total frequency range formed by:

GSM 400 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$.

GSM 700 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$.

GSM 850 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

P-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.

PCS 1 900: the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$

and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$.

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

iii) The frequencies:

$mF_{lo} + IF_1$;

$mF_{lo} - IF_1$;

mFR ;

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

F_{lo} - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$ - are the n intermediate frequencies

F_{lo} , IF_1 , $IF_2 \dots IF_n$ - shall be declared by the manufacturer in the PIXIT statement
3GPP TS 51.010-1 annex 3.

e) The level of the unwanted signal is set according to table 14.18-9a and 14.18-9b.

f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 44.060, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 8: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels $\pm 200 \text{ kHz}$ away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

h) The SS sets the value of the USF/DAS-12 such as to allocate the uplink to the MS.

j) The unwanted signal is of frequency FB . It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR ± 600 kHz are excluded.

NOTE 9: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- k) The level of the unwanted signal is set according to table 14.18-9a and 14.18-9b.
- l) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- m) Once the number of USF/DAS-12 allocating the uplink for the MS as counted in step l) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

14.18.5a.5 Test requirements

The block error ratio as calculated by the SS for different channels and coding schemes shall not exceed the conformance requirement. Testing the conformance requirement can be done either in the classical way with a fixed minimum number of samples (refer to section 14.18.5a.5.2) or using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with performance not on the limit (refer to section 14.18.5a.5.1). Both methods are based on a bad DUT factor $M = 1.5$.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

The following exceptions are allowed:

GSM 400: A maximum of three failures in the band 457,6 MHz to 473,6 MHz for GSM450 and in the band 486,0 MHz to 502,0 MHz for GSM480

A maximum of 24 in the combined bands 100 kHz to 457,6 MHz and 473,6 MHz to 12,75 GHz for GSM 450 and in the combined bands 100 kHz to 486,0 MHz and 502,0 MHz to 12,75 GHz for GSM 480 (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 710: A maximum of six failures in the frequency band 678 MHz to 728 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 678 MHz and 728 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 750: A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 810: A maximum of six failures in the frequency band 831 MHz to 886 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 831 MHz and 886 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 850: A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

DCS 1 800: A maximum of twelve failures in the band 1 785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1 785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

PCS 1 900: A maximum of twelve failures in the band 1 910 MHz to 2 010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1 910 MHz and 2 010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.18.5a.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBuVemf() and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using either the accelerated BLER method or the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

14.18.5a.5.1 Statistical testing of blocking and spurious response performance with early decision

For more information on statistical testing of blocking and spurious response performance, especially the definition of limit lines refer to Annex 7.

Wrong decision risk F for one single error rate test:

$F_{\text{pass}} \neq F_{\text{fail}}$ As the blocking test case comprises of many BLER tests the wrong decision risk for a fail decision of one single error rate test must be smaller than the wrong decision risk for a pass decision to avoid an increased probability of an erroneous fail decision.

$$F_{\text{pass}} = 0.2\%$$

$$F_{\text{fail}} = 0.02\%$$

Wrong decision probability D per test step:

$$D_{\text{pass}} \neq D_{\text{fail}}$$

$$D_{\text{pass}} = 0.008\%$$

$$D_{\text{fail}} = 0.0008\%$$

Parameters for limit lines:

1. $D_{\text{pass}} = 0.008\%$ wrong decision probability per test step for early pass decision.

$D_{\text{fail}} = 0.0008\%$ wrong decision probability per test step for early fail decision.

2. $M = 1.5$ bad DUT factor

3. n_e number of (error) events.

4. n_s number of samples. The error rate is calculated from n_e and n_s .

Limit checking

For an early decision a minimum number of measured (error) events is necessary.

For an early pass decision $n_e \geq 1$

For an early fail decision $n_e \geq 8$

When the target test time has been reached the test is finished and a pass/fail decision can be made.

The statistical testing of the conformance requirement is done using table 14.18.5a-1.

Table 14.18.5a-1: Statistical test limits for blocking performance of EGPRS mobiles

| Blocking and spurious response for EGPRS mobiles | | | | | | |

14.18.5a.5.2 Fixed testing of blocking and spurious response performance with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.5b Blocking and spurious response in DLMC configuration

14.18.5b.1 Definition

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

14.18.5b.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 45.005 subclause 5.1.
2. In case of DLMC configuration, when MS is configured according to subclause 6.1a. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % and for USF/MCS1 to 4 shall not exceed 1 % when the following signals are simultaneously input to the receiver:- for GSM 850, GSM 900, DCS 1800 and PCS 1900 MS two useful signals, modulated with GMSK at frequencies f_0 and f_1 , located at
 - the maximum supported DLMC carrier frequency spacing as defined in table 6a-1 when the blocking signal is located in the out-of-band frequency range defined in tables 5.1-1a, 5.1-1c, 5.1-1d and 5.1-1e.
 - the maximum supported DLMC carrier frequency spacing and all lower carrier frequency spacings according to table 5.1-1i when the blocking signal is located in the in-band frequency range defined in tables 5.1-1a, 5.1-1c, 5.1-1d and 5.1-1e.

and at a signal level X dB above the input levels in table 1a, adjusted by the correction factors of table 6.2-4, where X is specified in table 5.1-5c;

In addition, for an MS indicating support for non-contiguous intra-band reception, and in case of DLMC configuration, the reference performance as specified in table 6.2-5 apply with the two useful signals at frequencies f_0 and f_1 located at a larger frequency spacing than the maximum supported DLMC carrier frequency spacing.

- a blocking signal that is either
 - a continuous, static sine wave signal at a frequency (f) which is an integer multiple of 200 kHz, when located between the useful signals, or when located in the out-of-band frequency range, and at a signal level as in table 5.1-5c or
 - a static signal at a frequency (f) modulated with 5 MHz W-CDMA according to 3GPP TS 25.101 annex C.4, when located outside the useful signals and
 - within the in-band frequency region, at an offset between the centre frequency of the blocking signal and the useful signal of 2,7 MHz or more in steps of 5 MHz up to the edges of the in-band frequency band, and
 - at a signal level as in table 5.1-5c.

with the following exceptions, called spurious response frequencies:

- a) GSM 900 MS and GSM 850 MS in band, for a maximum of one occurrence;
 - DCS 1 800 and PCS 1 900 MS in band, for a maximum of two occurrences;
- b) out of band, for a maximum of 24 occurrences (which if grouped shall not exceed three contiguous occurrences per group).

where the above performance shall be met when the blocking signal (f) is set to a level of $57+X$ dB μ V (emf) ($-56+X$ dBm) in the inband frequency range and 70 dB μ V (emf) (-43 dBm) in the out-of-band frequency range.

When more than one useful signal frequency is considered, the maximum number of allowed occurrences for the spurious response frequencies applies separately to each useful signal frequency.

In case of DLMC configuration, requirements for inter-band reception are only defined in the out-of-band frequency region for band combinations (GSM 850, PCS1900) and (GSM 900, DCS 1800). In this case, the requirements for each frequency band apply using one useful signal in each band.

An MS indicating support for DLMC shall in addition to DLMC specific performance requirements, comply to the requirements in Table 5.1-2a and Table 5.1-4.

NOTE: For testing effort reasons, in case of DLMC configuration, and a MS indicating support for DLMC inter-band reception, it may be considered sufficient to perform the test in the out-of-band frequency range only for the inter-band reception configuration.

Table 5.1-1i. Additional carrier frequency spacings for Downlink Multi Carrier when the blocking signal is located in the in-band frequency range.

| 0.8 MHz |
| 0.6 MHz |

14.18.5b.3 Test purpose

1. To verify that the in-band blocking performance is met without exceeding the total number of allowed in-band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 45.005, are allowed to ensure a fair test of the MS.

14.18.5b.4 Method of test

Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power. The ARFCN of the BCCH shall be the same - or at an offset of +/- 2 channels, than that of the ARFCN for the TCH.

The SS transmits EGPRS RLC data blocks containing random data.

In addition to the wanted Test Signals, the SS transmit a static unmodulated continuous interfering signal (Standard Test Signal I0). Or a static signal modulated with 5 MHz W-CDMA according to 3GPP TS 25.101 annex C.4

Test procedure

For the ACK/NACK test steps the maximum number of supported time slots shall be used, and for the USF test steps the maximum supported symmetrical UL slot configuration shall be used.

For GMSK Modulation:

- a) The SS is set to produce 2 static GMSK wanted signals and a static interfering signal at the same time. The two useful signals, modulated with GMSK at frequencies f_0 and f_1 , located at
- the maximum supported DLFC carrier frequency spacing as defined in 3GPP TS 45.005 table 6a-1 when the blocking signal is located in the out-of-band frequency range defined in 3GPP TS 45.005 tables 5.1-1a, 5.1-1c, 5.1-1d and 5.1-1e.
 - the maximum supported DLFC carrier frequency spacing and all lower carrier frequency spacings according to 3GPP TS 45.005 table 5.1-1i when the blocking signal is located in the in-band frequency range defined in 3GPP TS 45.005 tables 5.1-1a, 5.1-1c, 5.1-1d and 5.1-1e.

and at a signal level $X+1$ dB above the input levels in table 14.18.3a, where X is specified in 3GPP TS 45.005 table 5.1-5c for PDTCH channel and signal level $X+1$ dB above the input levels in table 14.18-4a for USF channel with correction values as specified in 3GPP TS 45.005 subclause 6.2.b) The SS transmits packets on PDTCH using MCS-4 coding to MS on all allocated timeslots.

- c) The unwanted signal is of frequency F_B . That is either
- a continuous, static sine wave signal at a frequency (f) which is an integer multiple of 200 kHz, when located between the useful signals, or when located in the out-of-band frequency range, and at a signal level as in table 14.18.5b-1, or
 - a static signal at a frequency (f) modulated with 5 MHz W-CDMA according to 3GPP TS 25.101 annex C.4, when located outside the useful signals and
 - within the in-band frequency region, at an offset between the centre frequency of the blocking signal and the useful signal of 2,7 MHz or more in steps of 5 MHz up to the edges of the in-band frequency band, and at a signal level as in table 14.18.5b-1

It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where F_B is an integer multiple of 200 kHz.

However, frequencies in the range $F_R \pm 600$ kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nF_B where $n = 2, 3, 4, 5$, etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

- i) The total frequency range formed by:

GSM 850 the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

P-GSM 900: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$
and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$
and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.

PCS 1 900: the frequencies between $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$
and $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$.

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies IF_1 , $IF_1 + 200$ kHz, $IF_1 - 200$ kHz.

iii) The frequencies:

$$mF_{10} + IF_1;$$

$$mF_{10} - IF_1;$$

$$mFR;$$

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

F_{10} - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$ - are the n intermediate frequencies

$F_{10}, IF_1, IF_2 \dots IF_n$ - shall be declared by the manufacturer in the PIXIT statement
3GPP TS 51.010-1 annex 3.

Table 14.18.5b-1: Blocking signal level requirements for MS in DLMC configuration

| Frequency band | | GSM 850, P- and E-GSM 900 small MS | | | | DCS 1 800 & PCS 1 900 MS | | | |
|----------------------------------|------------------------------------|---------------------------------------|-----|---------------------|-----|--------------------------|-----|---------------------|-----|
| | | X=3 dB | | X= 12 dB | | X = 3 dB | | X= 12 dB | |

| in-band, with blocking signal | - in-between the useful signals | 60 | -53 | 69 | -44 | 60 | -53 | 69 | -44 |
| | - outside the useful signals | 60 | -53 | 69 | -44 | 60 | -53 | 69 | -44 |
| | | 70 | -43 | 79 | -34 | 70 | -43 | 79 | -34 |
| | | 75 | -38 | 84 | -29 | 75 | -38 | 84 | -29 |
| out-of-band | (a) | 98 | -15 | - | - | 98 | -15 | - | - |
| | (b) | - | - | - | - | 86 | -27 | - | - |
| | (c) | - | - | - | - | 86 | -27 | - | - |
| | (d) | 98 | -15 | - | - | 98 | -15 | - | - |

NOTE 1: f refers to the interfering blocker signal, and fo and f1 refer to the wanted signals being considered.
NOTE 2: For definition of small MS, see subclause 1.1.
NOTE 3: X is the increase level above input level for reference performance as defined in subclause 5.1.2.

- f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 44.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

If a failure is indicated, it is noted and counted towards the allowed exemption total. In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

- h) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS.
- i) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range $FR \pm 600$ kHz are excluded.

NOTE 2: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- j) The level and configuration of the unwanted signal is set according to step c).
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels ± 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

14.18.5b.5 Test requirements

The block error ratio as calculated by the SS for different channels and coding schemes shall not exceed the conformance requirement. Testing the conformance requirement can be done either in the classical way with a fixed minimum number of samples (refer to section 14.18.5b.5.2) or using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with performance not on the limit (refer to section 14.18.5b.5.1). Both methods are based on a bad DUT factor $M = 1.5$.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

The following exceptions are allowed:

GSM 900 MS and GSM 850: MS in band, for a maximum of one occurrence;

DCS 1 800 and PCS 1 900: MS in band, for a maximum of two occurrences;

All Bands: out of band, for a maximum of 24 occurrences (which if grouped shall not exceed three contiguous occurrences per group), where the above performance shall be met when the blocking signal (f) is set to a level of $57+X$ dB μ V (emf) ($-56+X$ dBm) in the inband frequency range and 70 dB μ V (emf) (-43 dBm) in the out-of-band frequency range.

When more than one useful signal frequency is considered, the maximum number of allowed occurrences for the spurious response frequencies applies separately to each useful signal frequency. The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using either the accelerated BLER method or the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

14.18.5b.5.1 Statistical testing of blocking and spurious response performance with early decision

For more information on statistical testing of blocking and spurious response performance, especially the definition of limit lines refer to Annex 7.

Wrong decision risk F for one single error rate test:

$F_{\text{pass}} \neq F_{\text{fail}}$ As the blocking test case comprises of many BLER tests the wrong decision risk for a fail decision of one single error rate test must be smaller than the wrong decision risk for a pass decision to avoid an increased probability of an erroneous fail decision.

$$F_{\text{pass}} = 0.2\%$$

$$F_{\text{fail}} = 0.02\%$$

Wrong decision probability D per test step:

$$D_{\text{pass}} \neq D_{\text{fail}}$$

$$D_{\text{pass}} = 0.008\%$$

$$D_{\text{fail}} = 0.0008\%$$

Parameters for limit lines:

1. $D_{\text{pass}} = 0.008\%$ wrong decision probability per test step for early pass decision.
- $D_{\text{fail}} = 0.0008\%$ wrong decision probability per test step for early fail decision.
2. $M = 1.5$ bad DUT factor
3. n_e number of (error) events.
4. n_s number of samples. The error rate is calculated from n_e and n_s .

Limit checking

For an early decision a minimum number of measured (error) events is necessary.

For an early pass decision $n_e \geq 1$

For an early fail decision $n_e \geq 8$

When the target test time has been reached the test is finished and a pass/fail decision can be made.

The statistical testing of the conformance requirement is done using table 14.18.5-1.

Table 14.18.5-1: Statistical test limits for blocking performance of EGPRS mobiles

| Blocking and spurious response for EGPRS mobiles | | | | | | |
|--|--------------|-------------|------------|-------------------|---------------|------------------|
| | | Orig. BLER | Derived | Target | Target | Target test time |
| | blocks per s | requirement | test limit | number of samples | test time (s) | (hh:mm:ss) |
| One time slot: | | | | | | |
| PDTCH/MCS-4 | 50 | 0,100000 | 0,125100 | 3221 | 64 | 00:01:04 |
| USF/MCS-4 | 50 | 0,010000 | 0,012510 | 32214 | 644 | 00:10:44 |
| Two time slots: | | | | | | |
| PDTCH/MCS-4 | 100 | 0,100000 | 0,125100 | 3221 | 32 | 00:00:32 |
| USF/MCS-4 | 100 | 0,010000 | 0,012510 | 32214 | 322 | 00:05:22 |
| Three time slots | | | | | | |
| PDTCH/MCS-4 | 150 | 0,100000 | 0,125100 | 3221 | 21 | 00:00:21 |
| USF/MCS-4 | 150 | 0,010000 | 0,012510 | 32214 | 215 | 00:03:35 |
| Four time slots | | | | | | |
| PDTCH/MCS-4 | 200 | 0,100000 | 0,125100 | 3221 | 16 | 00:00:16 |
| USF/MCS-4 | 200 | 0,010000 | 0,012510 | 32214 | 161 | 00:02:41 |

14.18.5b.5.2 Fixed testing of blocking and spurious response performance with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit BLER given in table 14.18-2.

14.18.6 EGPRS Usable receiver input level range

14.18.6.1 Definition

The usable receiver input level range is the range of the radio frequency input level of a specified modulated signal over which bit error ratio stay between specified limits.

14.18.6.2 Conformance requirement

1. The receiver input level range requirements of 3GPP TS 05.05 subclause 6.1 for raw data bits of GMSK modulation under static and EQ propagation conditions shall be met:
 - 1.1 Under normal conditions.
 - 1.2 Under extreme conditions.
2. The receiver input level range requirements of 3GPP TS 05.05 subclause 6.1 for raw data bits of 8PSK modulation under static condition shall be met:
 - 2.1 Under normal conditions.
 - 2.2 Under extreme conditions.
3. The receiver input level range requirements of 3GPP TS 05.05 subclause 6.1 for raw data bits of 8PSK modulation with random frequency offset under static condition shall be met:
 - 3.1 Under normal conditions.
 - 3.2 Under extreme conditions.

14.18.6.3 Test purpose

1. To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

1.1 Under normal conditions.

1.2 Under extreme conditions.

14.18.6.4 Test Method

Initial Conditions

The MS is assumed to be EGPRS attached. The power control parameter ALPHA (α) is set to 0.

The SS establishes a downlink TBF on one timeslot.

The SS commands the MS to request an establishment of the TBF Uplink and to create a channel loop back after demodulation and before decoding. This is achieved by the EGPRS Switched Radio Loopback Mode (3GPP TS 04.14/44.014, subclause 5.5)

Test Procedure

For GMSK Modulation:

- a) The SS shall transmit the pseudo-random data using the standard GMSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be 20 dB above the Reference Sensitivity Level.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB μ Vemf().
- d) Step b) is repeated with the input level at the receiver input increased to the following values:
For GSM 400, GSM 700, T-GSM 810, GSM 850 and GSM 900: 98 dB μ Vemf().
For DCS 1 800 and PCS 1 900: 90 dB μ Vemf().
- e) The SS fading function is set to EQ.
- f) Step b) is repeated with the input level at the receiver input set to 20dB above the reference sensitivity level() and then increased to 73 dB μ Vemf().
- g) Steps a) to f) are repeated under extreme test conditions.

For 8PSK Modulation:

- a) The SS shall transmit the pseudo-random data using the standard 8PSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be -82 dBm, which level is subject to adjustment according to correction table in subclause 6.2. of 3GPP TS 05.05/45.005. For an EGPRS MS that only supports GMSK modulation in the uplink, a GMSK-modulated signal will be used for UL transmission.

- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB μ Vemf().
- d) Step b) is repeated with the input level at the receiver input increased to 87 dB μ Vemf().
- e) Steps a) to d) are repeated under extreme test conditions.

For 8PSK Modulation with random frequency offset:

- a) The SS shall transmit the pseudo-random data using the standard 8PSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be -82 dBm, which level is subject to adjustment according to correction table in subclause 6.2. of 3GPP TS 05.05/45.005. The 8-PSK modulated test signal is randomly offset, on a burst-by-burst basis, by a frequency offset of +/- 0,1ppm. For each burst, the sign of the frequency offset is chosen according to a 511-bit pseudo-random sequence, defined in ITU-T Recommendation O.153. For an EGPRS MS that only supports GMSK modulation in the uplink, a GMSK-modulated signal will be used for UL transmission.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB μ Vemf().
- d) Step a) to c) are repeated under extreme test conditions.

14.18.6.5 Test Requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14.18-10. This shall apply for any combination of normal and extreme test voltages and ambient temperature, for the different propagation conditions and for any level of input signal to the receiver.

Table 14.18-10: Limits for input level range

| | | | GSM 400, GSM 700, T-GSM 810, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1 900 | |
|---|---------------------|-----------------------------|--|------------------------|-------------------------|------------------------|
| Type of test signals | Type of measurement | Propagation Conditions | Test limit Error rate % | Minimum No. of samples | Test limit Error rate % | Minimum No. of samples |
| GMSK | BER | Static <= 73dB μ Vemf() | 0,012 | 1 640 000 | 0,012 | 1 640 000 |
| | | Static <= 98dB μ Vemf() | 0,122 | 164 000 | | |
| | | Static <= 90dB μ Vemf() | 3,25 | 120 000 | 0,122 | 164 000 |
| | | EQ | | | 3,25 | 60000 |
| 8PSK | BER | Static<= 73dB μ Vemf() | 0,012 | 1 640 000 | 0,012 | 1 640 000 |
| | | Static <= 87dB μ Vemf() | 0,122 | 164 000 | 0,122 | 164 000 |
| 8PSK with frequency offset within 0,1 ppm | BER | Static <= 73dB μ Vemf() | 0,012 | 1 640 000 | 0,122 | 164 000 |

14.18.6a EGPRS Usable receiver input level range in EGPRS2A Configuration

14.18.6a.1 Definition

The usable receiver input level range is the range of the radio frequency input level of a specified modulated signal over which bit error ratio stay between specified limits.

14.18.6a.2 Conformance requirement

- The receiver input level range requirements of 3GPP TS 45.005 subclause 6.1 for raw data bits of 8PSK modulation under static condition shall be met:

- 1.1 Under normal conditions.

- 1.2 Under extreme conditions.
- 2. The receiver input level range requirements of 3GPP TS 45.005 subclause 6.1 for raw data bits of 16-QAM modulation under static condition shall be met:
 - 3.1 Under normal conditions.
 - 3.2 Under extreme conditions.
- 3. The receiver input level range requirements of 3GPP TS 45.005 subclause 6.1 for raw data bits of 32-QAM modulation under static condition shall be met:
 - 5.1 Under normal conditions.
 - 5.2 Under extreme conditions.

14.18.6a.3 Test purpose

- 1. To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.
 - 1.1 Under normal conditions.
 - 1.2 Under extreme conditions.

14.18.6a.4 Test Method

Initial Conditions

The MS is assumed to be EGPRS attached. The power control parameter ALPHA (α) is set to 0.

The SS establishes a downlink TBF on one timeslot.

The SS commands the MS to request an establishment of the TBF Uplink and to create a channel loop back after demodulation and before decoding. This is achieved by the EGPRS Switched Radio Loopback Mode (3GPP TS 04.14/44.014, subclause 5.5)

Test Procedure

For 8PSK Modulation:

- a) The SS shall transmit the pseudo-random data using the standard 8PSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be -82 dBm, which level is subject to adjustment according to correction table in subclause 6.2. of 3GPP TS 45.005.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB μ V_{emf}().
- d) Step b) is repeated with the input level at the receiver input increased to 87 dB μ V_{emf}().
- e) Steps a) to d) are repeated under extreme test conditions.

For 16-QAM Modulation:

- a) The SS shall transmit the pseudo-random data using the standard 16QAM-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be -80 dBm, which level is subject to adjustment according to correction table in subclause 6.2. of 3GPP TS 45.005.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB μ Vemf().
- d) Step b) is repeated with the input level at the receiver input increased to 84 dB μ Vemf().
- e) Steps a) to d) are repeated under extreme test conditions.

For 32-QAM Modulation:

- a) The SS shall transmit the pseudo-random data using the standard 32QAM -modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be -77 dBm, which level is subject to adjustment according to correction table in subclause 6.2. of 3GPP TS 45.005. For an EGPRS MS that only supports 16QAM_modulation in the uplink, a 16QAM-modulated signal will be used for UL transmission.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB μ Vemf().
- d) Step b) is repeated with the input level at the receiver input increased to 84 dB μ Vemf().
- e) Steps a) to d) are repeated under extreme test conditions.

14.18.6a.5 Test Requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14.18-11. This shall apply for any combination of normal and extreme test voltages and ambient temperature, for the different propagation conditions and for any level of input signal to the receiver.

Table 14.18-11: Limits for input level range

| | | | GSM 400, GSM 700, T-GSM 810, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1 900 | |
|----------------------|---------------------|-----------------------------|--|------------------------|-------------------------|------------------------|
| Type of test signals | Type of measurement | Propagation Conditions | Test limit Error rate % | Minimum No. of samples | Test limit Error rate % | Minimum No. of samples |
| 8PSK | BER | Static<= 73dB μ Vemf() | 0,012 | 1 640 000 | 0,012 | 1 640 000 |
| | | Static <= 87dB μ Vemf() | 0,122 | 164 000 | 0,122 | 164 000 |
| 16-QAM | BER | Static<= 73dB μ Vemf() | 0,012 | 1 640 000 | 0,012 | 1 640 000 |
| | | Static <= 84dB μ Vemf() | 0,122 | 164 000 | 0,122 | 164 000 |
| 32-QAM | BER | Static<= 73dB μ Vemf() | 0,012 | 1 640 000 | 0,012 | 1 640 000 |
| | | Static <= 84dB μ Vemf() | 0,122 | 164 000 | 0,122 | 164 000 |

14.18.7 Incremental Redundancy Performance

14.18.7.1 Definition

In Incremental Redundancy RLC mode, soft information from multiple, differently punctured versions of an RLC data block may be used when decoding the RLC data block. This significantly increases the link performance.

14.18.7.2 Conformance requirement

An EGPRS capable MS shall, under the conditions stated in the table below, achieve a long-term throughput of 20 kbps per time slot (see NOTE) measured between LLC and RLC/MAC layer.

| | |
|---------------------------------|--|
| Propagation conditions | Static, input level -97.0 dBm |
| Modulation and Coding Scheme | MCS-9 |
| Acknowledgements polling period | 32 RLC data blocks |
| Roundtrip time | 120 ms |
| Number of timeslots | Maximum capability of the MS |
| Transmit window size | Maximum for the MS timeslot capability |

NOTE: This corresponds to an equivalent block error rate of approximately 0.66 using the prescribed MCS-9.

3GPP TS 05.05, subclause 6.7 (3GPP 45.005, subclause 6.7).

14.18.7.3 Test purpose

To verify that the EGPRS MS can operate in Incremental Redundancy RLC mode for a sufficiently long time and that it achieves a long-term throughput of 20 kbps per timeslot, measured between LLC and RLC/MAC layer, under the conditions defined in conformance requirement.

14.18.7.4 Method of test

The SS establishes a downlink TBF in Incremental Redundancy RLC mode, beginning on a Mid ARFCN Range, under the conditions defined in the conformance requirement. The downlink data transfer is proceeded with random payload data according to the Incremental Redundancy RLC mode procedures using MCS-9. The throughput between LLC and RLC/MAC layer is determined by the SS on the basis of the amount of successfully delivered LLC data, i.e. the amount of data bits in acknowledged RLC data blocks in the correct order without gaps representing LLC or higher layer data. The long-term throughput is determined until at least 6000 RLC data blocks have been send from RLC/MAC layer to the LLC layer within the MS. The test is repeated in Low and High ARFCN range.

If the END_OF_WINDOW bit in the ack/nack message is not set, the SS shall poll the MS for the next partial bitmap irrespective of the polling period.

If the MS is setting the MS OUT OF MEMORY BIT to 1 in the EGPRS Packet Downlink ACK/NACK message the SS should take care that only NACKED RLC data blocks are retransmitted with MCS 9 and if the MS sets again the MS OUT OF MEMORY BIT to 0 the SS can continue transmitting also new data with MCS 9.

Initial conditions

The SS establishes a downlink EGPRS TBF in Incremental Redundancy RLC mode according to the generic procedures defined in sect. 50, on a Mid ARFCN Range. For the TBF, the SS allocates the maximum number of timeslots according to the multislot capability of the MS under test, applies MCS-9 as the Modulation and Coding Scheme and the maximum RLC downlink window size the number of used time slots allows for the data transfer. The SS commands the MS to use maximum transmit power in the uplink, decreases the transmit power to -96 dBm in the downlink and preserves the fading conditions as static. The power control parameter ALPHA (α) is set to 0.

Procedure

- a) Using MSC-9 with Puncturing Scheme 1 (PS1), the SS continues the EGPRS TBF in the downlink by transmitting RLC data blocks with valid Block Sequence Numbers (BSN) within the RLC downlink window of maximum size according to MS's multislot class, and polls the MS for acknowledgements after every polling period of 32 RLC data blocks.
- b) The SS updates its associated acknowledge state array V(B) according to the ack/nack bitmap in the EGPRS Downlink Ack/Nack message transmitted by the MS as a response to polling and shifts the RLC downlink window accordingly.
- c) While continuing the transmission of further RLC data blocks with PS1, the SS retransmits, after a delay that corresponds to a round trip time of 120ms, all unacknowledged RLC data blocks with PS2 starting from the oldest unacknowledged RLC blocks.

- d) The SS repeats the steps a) to c). For retransmissions of RLC data blocks that have already been retransmitted with PS2, the SS applies PS3 for such blocks and further again PS1 and PS2 in cyclic manner if necessary.
- e) Steps a) to d) are repeated until at least 6000 RLC data blocks are transmitted from RLC to LLC layer within the MS, but never more than 18000 RLC data blocks from SS to MS.

NOTE: If the MS needs more than 18000 RLC data blocks received to send 6000 RLC blocks up to the LLC layer it will never fulfil the conformance requirements.

- f) The SS calculates the data throughput per time slot between RLC/MAC and LLC layers on the basis of successfully transmitted LLC-data during steps a) to e). For this the lower end of the RLC downlink window can be used to measure the progress of the transmission in terms of amount of data passed on to the LLC.

If n is the number of timeslots, x the position of the lower end of the RLC downlink window, and t is the duration from the beginning of the transmission of RLC data blocks to reaching the stop condition, then the average throughput per timeslot is $(x \cdot 592 \text{ bit}) / (n \cdot t)$.

- g) Steps a) to f) are repeated at Low and High ARFCN ranges.

Test requirements

The long-term throughput per time slot as a result of step f) of the test procedure shall equal or exceed 20kbps on low, mid and high ARFCN range.

14.18.7a Incremental Redundancy Performance in EGPRS2A configuration

14.18.7a.1 Definition

In Incremental Redundancy RLC mode, soft information from multiple, differently punctured versions of an RLC data block may be used when decoding the RLC data block. This significantly increases the link performance.

14.18.7a.2 Conformance requirement

An EGPRS2A capable MS shall, under the conditions stated in the table below, achieve a long-term throughput of 33 kbps per time slot measured between LLC and RLC/MAC layer.

| | |
|---------------------------------|--|
| Propagation conditions | Static, input level -94.0 dBm |
| Modulation and Coding Scheme | DAS-12 |
| Acknowledgements polling period | 32 RLC data blocks |
| Roundtrip time | 120 ms |
| Number of timeslots | Maximum capability of the MS |
| Transmit window size | Maximum for the MS timeslot capability |

3GPP 45.005, subclause 6.7

14.18.7a.3 Test purpose

To verify that the EGPRS2A MS can operate in Incremental Redundancy RLC mode for a sufficiently long time and that it achieves a long-term throughput of 33 kbps per timeslot, measured between LLC and RLC/MAC layer, under the conditions defined in conformance requirement.

14.18.7a.4 Method of test

The SS establishes a downlink TBF in Incremental Redundancy RLC mode, beginning on a Mid ARFCN Range, under the conditions defined in the conformance requirement. The downlink data transfer is proceeded with random payload data according to the Incremental Redundancy RLC mode procedures using DAS-12. The throughput between LLC and RLC/MAC layer is determined by the SS on the basis of the amount of successfully delivered LLC data, i.e. the amount of data bits in acknowledged RLC data blocks in the correct order without gaps representing LLC or higher layer data. The long-term throughput is determined until at least 6000 RLC data blocks have been send from RLC/MAC layer to the LLC layer within the MS. The test is repeated in Low and High ARFCN range.

If the END_OF_WINDOW bit in the ack/nack message is not set, the SS shall poll the MS for the next partial bitmap irrespective of the polling period.

If the MS is setting the MS OUT OF MEMORY BIT to 1 in the EGPRS2A Packet Downlink ACK/NACK message the SS should take care that only NACKED RLC data blocks are retransmitted with DAS 12 and if the MS sets again the MS OUT OF MEMORY BIT to 0 the SS can continue transmitting also new data with DAS 12.

Initial conditions

The SS establishes a downlink EGPRS2A TBF in Incremental Redundancy RLC mode according to the generic procedures defined in sect. 50, on a Mid ARFCN Range. For the TBF, the SS allocates the maximum number of timeslots according to the multislot capability of the MS under test, applies DAS-12 as the Modulation and Coding Scheme and the maximum RLC downlink window size the number of used time slots allows for the data transfer. The SS commands the MS to use maximum transmit power in the uplink, decreases the transmit power to -96 dBm in the downlink and preserves the fading conditions as static. The power control parameter ALPHA (α) is set to 0.

Procedure

- a) Using DAS-12 with Puncturing Scheme 1 (PS1), the SS continues the EGPRS2A TBF in the downlink by transmitting RLC data blocks with valid Block Sequence Numbers (BSN) within the RLC downlink window of maximum size according to MS's multislot class, and polls the MS for acknowledgements after every polling period of 32 RLC data blocks.
- b) The SS updates its associated acknowledge state array V(B) according to the ack/nack bitmap in the EGPRS2A Downlink Ack/Nack message transmitted by the MS as a response to polling and shifts the RLC downlink window accordingly.
- c) While continuing the transmission of further RLC data blocks with PS1, the SS retransmits, after a delay that corresponds to a round trip time of 120ms, all unacknowledged RLC data blocks with PS2 starting from the oldest unacknowledged RLC blocks.
- d) The SS repeats the steps a) to c). For retransmissions of RLC data blocks that have already been retransmitted with PS2, the SS applies PS3 for such blocks and further again PS1 and PS2 in cyclic manner if necessary.
- g) Steps a) to d) are repeated until at least 6000 RLC data blocks are transmitted from RLC to LLC layer within the MS, but never more than 18000 RLC data blocks from SS to MS.

NOTE: If the MS needs more than 18000 RLC data blocks received to send 6000 RLC blocks up to the LLC layer it will never fulfil the conformance requirements.

- h) The SS calculates the data throughput per time slot between RLC/MAC and LLC layers on the basis of successfully transmitted LLC-data during steps a) to e). For this the lower end of the RLC downlink window can be used to measure the progress of the transmission in terms of amount of data passed on to the LLC.

If n is the number of timeslots, x the position of the lower end of the RLC downlink window, and t is the duration from the beginning of the transmission of RLC data blocks to reaching the stop condition, then the average throughput per timeslot is $(x \cdot 592 \text{ bit}) / (n \cdot t)$.

- g) Steps a) to f) are repeated at Low and High ARFCN ranges.

Test requirements

The long-term throughput per time slot as a result of step f) of the test procedure shall equal or exceed 33kbps on low, mid and high ARFCN range.

14.18.8 DARP Phase 1 EGPRS tests

14.18.8.1 Synchronous single co-channel interferer (DTS-1)

14.18.8.1.1 Definition

The DARP reference test scenario DTS-1 for a single synchronous co-channel interferer defines an interfering signal and corresponding performance limits. This test is a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of this specific unwanted signals.

14.18.8.1.2 Conformance requirement

MS indicating support for Downlink Advanced Receiver Performance – phase I (see 3GPP TS 24.008) shall fulfil the requirements in table 2o for wanted signals on GMSK modulated channels under TU50 no FH propagation conditions and GMSK modulated interferers for the test scenarios defined in annex L. The reference performance shall be:

- For packet switched channels (PDTCH) BLER: $\leq 10\%$

The values in table 2o are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex L).

3GPP TS 45.005; clause 6.3.

Reference Test Scenarios for Synchronous single co-channel interferer

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-1 | Co-channel 1 | 0 dB | none | no delay |

3GPP TS 45.005; Annex L.

| GSM 900 and GSM 850 | |
|-----------------------|------------|
| Propagation condition | TU50 no FH |
| Type of channel | C/I |
| PDTCH MCS-1 | 3,5 dB |
| PDTCH MCS-2 | 5,5 dB |
| PDTCH MCS-3 | 11 dB |
| PDTCH MCS-4 | 18 dB |

| DCS 1 800 & PCS 1900 | |
|-----------------------|------------|
| Propagation condition | TU50 no FH |
| Type of channel | C/I |
| PDTCH MCS-1 | 3,5 dB |
| PDTCH MCS-2 | 6,5 dB |
| PDTCH MCS-3 | 11,5 dB |
| PDTCH MCS-4 | 19,5 dB |

3GPP TS 45.005; table 2o (extracts)

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; subclause 2

14.18.8.1.3 Test purpose

To verify that the MS does not exceed conformance requirement for different coding schemes and under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.18.8.1.4 Test method

14.18.8.1.4.1 Initial condition

A downlink TBF is established according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces an independent, uncorrelated interfering signal (I1). This unwanted signal is random, continuous and GSM-modulated and has no fixed relationship with the bit transitions of the wanted signal.

14.18.8.1.4.2 Procedure

- a) The co-channel interferer signal I1 (unwanted signal) is set to -80 dBm.
- b) The fading characteristic of the wanted signal C1 and the interferer signal I1 is set to TU High. No FH applies.
- c) The SS transmits packets using MCS-1 coding to the MS on all allocated timeslots.
- d) The SS sets the level of the wanted signal 1 dB above the value according to table 14.18.8.1.4.3-1 and table 14.18.8.1.4.3-2.
- e) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.
- f) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.18-2 the SS calculates the Block error ratio. The SS resets both counters.
- g) The SS repeats the steps (c) to f) for each of the coding schemes MCS-2, MCS-3 and MCS-4

14.18.8.1.4.3 Test requirement

The block error ratio, as calculated by the SS for different channels under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2ae shall be set according to the table 14.18.8.1.4.3-1 and 14.18.8.1.4.3-2.

Table 14.18.8.1.4.3-1

| GSM 900, T-GSM 810 and GSM 850 | | |
|--------------------------------|-------|--------|
| PDTCH MCS-1 | C/dBm | - 76,5 |
| PDTCH MCS-2 | C/dBm | - 74,5 |
| PDTCH MCS-3 | C/dBm | - 69,0 |
| PDTCH MCS-4 | C/dBm | - 62,0 |

Table 14.18.8.1.4.3-2

| DCS 1 800 & PCS 1900 | | |
|---------------------------------|-------|--------|
| PDTCH MCS-1 | C/dBm | - 76,5 |
| PDTCH MCS-2 | C/dBm | - 73,5 |
| PDTCH MCS-3 | C/dBm | - 68,5 |
| PDTCH MCS-4 | C/dBm | - 60,5 |

14.18.8.1a Synchronous single co-channel interferer (DTS-1) in TIGHTER configuration

14.18.8.1a.1 Definition

The DARP reference test scenario DTS-1 for a single synchronous co-channel interferer defines an interfering signal and corresponding performance limits. This test is a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of this specific unwanted signal.

14.18.8.1a.2 Conformance requirement

A MS indicating support for TIGHTER Capability (see 3GPP TS 24.008) shall fulfil the requirements in table 2ad for co channel interference (C/Ic), table 2af for adjacent channel (200 kHz) interference (C/Ia1), and the additional requirements in table 2ae for wanted signals on GMSK modulated channels for the test scenarios defined in annex L.

The reference performance shall be:

- For packet switched channels (PDTCH) BLER: ≤ 10 %

The values in table 2ae are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex L).

3GPP TS 45.005; sub clause 6.3.5

Reference Test Scenarios for Synchronous single co-channel interferer

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-1 | Co-channel 1 | 0 dB | none | no delay |

3GPP TS 45.005; Annex L.

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.18.8.1a.3 Test purpose

To verify that the MS does not exceed conformance requirement for different coding schemes and under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

| GSM 900 and GSM 850 | |
|----------------------------|------------|
| Propagation condition | TU50 no FH |
| Type of channel | C/I |
| PDTCH MCS-1 | -6dB |
| PDTCH MCS-2 | -4 dB |
| PDTCH MCS-3 | 1,5 dB |
| PDTCH MCS-4 | 8,5 dB |

| DCS 1 800 & PCS 1900 | |
|-----------------------|------------|
| Propagation condition | TU50 no FH |
| Type of channel | C/I |
| PDTCH MCS-1 | -5,5 dB |
| PDTCH MCS-2 | -3,5 dB |
| PDTCH MCS-3 | 2 dB |
| PDTCH MCS-4 | 9 dB |

3GPP TS 45.005; table 2ae (excerpt)

14.18.8.1a.4 Test method

14.18.8.1a.4.1 Initial condition

A downlink TBF is established according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces an independent, uncorrelated interfering signal (I1). This unwanted signal is random, continuous and GSM-modulated and has no fixed relationship with the bit transitions of the wanted signal.

14.18.8.1a.4.2 Procedure

- a) The co-channel interferer signal I1 (unwanted signal) is set to -80 dBm.
- b) The fading characteristic of the wanted signal C1 and the interferer signal I1 is set to TU High. No FH applies.
- c) The SS transmits packets using MCS-1 coding to the MS on all allocated timeslots.
- d) The SS sets the level of the wanted signal 1 dB above the value according to table 14.18.8.1a.4.3-1 and table 14.18.8.1a.4.3-2.
- e) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.
- f) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.18-2 the SS calculates the Block error ratio. The SS resets both counters.
- g) The SS repeats the steps (c) to f) for each of the coding schemes MCS-2, MCS-3 and MCS-4

14.18.8.1a.4.3 Test requirement

The block error ratio, as calculated by the SS for different channels under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2o shall be set according to the table 14.18.8.1a.4.3-1 and 14.18.8.1a.4.3-2.

Table 14.18.8.1a.4.3-1

| GSM 900, T-GSM 810 and GSM 850 | | |
|--------------------------------|-------|--------|
| PDTCH MCS-1 | C/dBm | - 86 |
| PDTCH MCS-2 | C/dBm | - 84 |
| PDTCH MCS-3 | C/dBm | - 78,5 |
| PDTCH MCS-4 | C/dBm | - 71,5 |

Table 14.18.8.1a.4.3-2

| DCS 1 800 & PCS 1900 | | |
|---------------------------------|-------|--------|
| PDTCH MCS-1 | C/dBm | - 85,5 |
| PDTCH MCS-2 | C/dBm | - 83,5 |
| PDTCH MCS-3 | C/dBm | - 78 |
| PDTCH MCS-4 | C/dBm | - 71 |

14.18.8.2 Synchronous single co-channel interferer (DTS-2 / DTS-3)

14.18.8.2.1 Definition

The DARP reference test scenarios DTS-2 and DTS-3 for multiple synchronous interferers define a set of interfering signals and the corresponding performance limits. These tests are a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted signals.

14.18.8.2.2 Conformance requirement

The block error rate (BLER) performance for PDTCH / CS-1 to CS-4 shall not exceed 10 % at the multiple interference ratios (C/I_c) according to table 14.18.8.2.2-1.

Table 14.18.8.2.2-1: Reference Test Scenarios for synchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|--------|------------------------|
| DTS-2 | Co-channel 1 | 0 dB | none | no delay |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |
| DTS-3 | Co-channel 1 | 0 dB | random | -1 to +4 symbols |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |

The values in table 14.18.8.2.2-2 and table 14.18.8.2.2-3 are given as the C/I ratio, where C is the power level of the wanted signal and I is the power level of the dominant co-channel interferer (3GPP TS 45.005, annex L).

Table 14.18.8.2.2-2

| GSM 900 and GSM 850 | | |
|----------------------------|------------|---------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH MCS-1 | 9,5 dB | 10,5 dB |
| PDTCH MCS-2 | 11 dB | 12 dB |
| PDTCH MCS-3 | 15 dB | 15,5 dB |
| PDTCH MCS-4 | 20 dB | 21 dB |

Table 14.18.8.2.2-3

| DCS 1 800 & PCS 1900 | | |
|-----------------------|------------|---------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH MCS-1 | 9 dB | 10 dB |
| PDTCH MCS-2 | 11 dB | 11,5 dB |
| PDTCH MCS-3 | 15 dB | 15,5 dB |
| PDTCH MCS-4 | 22 dB | 22,5 dB |

Reference 3GPP TS 45.005, annex L, table 2o

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.8.2.3 Test purpose

To verify that the MS does not exceed the conformance requirement for different PDTCH / MSC 1-4 coding schemes under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.18.8.2.4 Test method

14.18.8.2.4.1 Initial condition

A TBF is established according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots which the MS is capable to support, The MS is transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces multiple interfering signals for DTS-2 or DTS-3 scenarios as appropriate for the test procedure.

These interferers are:

Identical interferer for DTS-2 and DTS-3:

- Co-channel 2 (I_{CoCh2}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2
- Adjacent 1 (I_{AdjCh1}): Adjacent channel interferer of type I1 as specified in TS 51.010 annex 5.2
- AWGN (I_{AWGN}): AWGN interferer of type I3 as specified in TS51.010 annex 5.2

DTS-2 specific interferer:

- Co-channel 1 (I_{CoCh1}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2

DTS-3 specific interferer:

- Co-channel 1 (I_{CoCh1}): Delayed co-channel interferer of type I4 as specified in TS 51.010 annex 5.2.

14.18.8.2.4.2 Test procedure

14.18.8.2.4.3 DTS-2 procedure

- a) The DTS-2 co-channel interferer signal I_{CoCh1} is configured according to DTS-2 configuration.

- b) The co-channel interferer signal I_{CoCh1} set to -80 dBm.
- c) The power levels of the interferers I_{CoCh2} , I_{AdjCh1} , and I_{AWGN} are set according to table 14.18.8.2.2-1. The power levels are defined relative to I_{CoCh1} .
- d) The fading characteristics of the wanted signal C1 and the interferer signals I_{CoCh1} , I_{CoCh2} , and I_{AdjCh1} are set to TU High. No FH applies.
- e) The SS transmits packets using MCS-1 coding on all allocated timeslots.
- f) The SS sets the level of the wanted signal C1 1 dB above the level according to table 14.18.8.2.4.5-1 and table 14.18.8.2.4.5-2.
- g) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.
- h) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.18-2 the SS calculates the Block error ratio. The SS resets both counters.
- i) SS repeats the steps (e) to (h) for each of the coding schemes MCS-2, MCS-3 and MCS-4.

14.18.8.2.4.4 Test method

- a) The DTS-3 co-channel interferer signal I_{CoCh1} is configured according to DTS-3 configuration.
- b) The SS repeats the steps (b) to (h) identical to the DTS-2 procedure

14.18.8.2.4.5 Test requirement

The block error ratio, as calculated by the SS for different channels and under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 (table 2o, annex L) , shall be set according to the table below.

Table 14.18.8.2.4.5-1

| GSM 900, T-GSM 810 and GSM 850 | | | |
|--------------------------------|-------|--------------------|--------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH MCS-1 | C/dBm | - 70,5 | - 69,5 |
| PDTCH MCS-2 | C/dBm | - 69,0 | - 68,0 |
| PDTCH MCS-3 | C/dBm | - 65,0 | - 64,5 |
| PDTCH MCS-4 | C/dBm | - 60,0 | - 59,0 |

Table 14.18.8.2.4.5-2

| DCS 1 800 & PCS 1900 | | | |
|----------------------|--------|--------------------|--------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH MCS-1 | C/dBm | - 71,0 | - 70,0 |
| PDTCH MCS-2 | C /dBm | - 69,0 | - 68,5 |
| PDTCH MCS-3 | C /dBm | - 65,0 | - 64,5 |
| PDTCH MCS-4 | C /dBm | - 58,0 | - 57,5 |

14.18.8.2a Synchronous single co-channel interferer (DTS-2 / DTS-3) in TIGHTER configuration

14.18.8.2a.1 Definition

The DARP reference test scenarios DTS-2 and DTS-3 for multiple synchronous interferers define a set of interfering signals and the corresponding performance limits. These tests are a measure of the capability of the DARP receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted signals.

14.18.8.2a.2 Conformance requirement

A MS indicating support for TIGHTER Capability (see 3GPP TS 24.008) shall fulfil the requirements in table 2ad for co channel interference (C/I_c), table 2af for adjacent channel (200 kHz) interference (C/I_{a1}), and the additional requirements in table 2ae for wanted signals on GMSK modulated channels for the test scenarios defined in annex L.

The reference performance shall be:

- For packet switched channel (PDTCH) BLER: $\leq 10\%$

Reference Test Scenarios for synchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|--------|------------------------|
| DTS-2 | Co-channel 1 | 0 dB | none | no delay |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |
| DTS-3 | Co-channel 1 | 0 dB | random | -1 to +4 symbols |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |

3GPP TS 45.005; Annex L

The values in table 14.18.8.2a.2-2 and table 14.18.8.2a.2-3 are given as the C/I₁ ratio, where C is the power level of the wanted signal and I₁ is the power level of the dominant co-channel interferer (3GPP TS 45.005, annex L).

Reference 3GPP TS 45.005, annex L, table 2ae

3GPP TS 45.05 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.8.2a.3 Test purpose

To verify that the MS does not exceed the conformance requirement for different PDTCH / MSC 1-4 coding schemes under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

| GSM 900 and GSM 850 | | |
|-----------------------|------------|---------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH MCS-1 | 7,5 dB | 8,5 dB |
| PDTCH MCS-2 | 9 dB | 10 dB |
| PDTCH MCS-3 | 13 dB | 13,5 dB |
| PDTCH MCS-4 | 18 dB | 19 dB |

| DCS 1 800 & PCS 1900 | | |
|-----------------------|------------|---------|
| Propagation condition | TU50 no FH | |
| Type of channel | C/I | |
| | DTS-2 | DTS-3 |
| PDTCH MCS-1 | 7 dB | 8 dB |
| PDTCH MCS-2 | 9 dB | 9,5 dB |
| PDTCH MCS-3 | 13 dB | 13,5 dB |
| PDTCH MCS-4 | 20 dB | 20,5 dB |

14.18.8.2a.4 Test method

14.18.8.2a.4.1 Initial condition

A TBF is established according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots which the MS is capable to support, The MS is transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces multiple interfering signals for DTS-2 or DTS-3 scenarios as appropriate for the test procedure.

These interferers are:

Identical interferer for DTS-2 and DTS-3:

- Co-channel 2 (I_{CoCh2}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2
- Adjacent 1 (I_{AdjCh1}): Adjacent channel interferer of type I1 as specified in TS 51.010 annex 5.2
- AWGN (I_{AWGN}): AWGN interferer of type I3 as specified in TS 51.010 annex 5.2

DTS-2 specific interferer:

- Co-channel 1 (I_{CoCh1}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2

DTS-3 specific interferer:

- Co-channel 1 (I_{CoCh1}): Delayed co-channel interferer of type I4 as specified in TS 51.010 annex 5.2.

14.18.8.2a.4.2 Test procedure

14.18.8.2a.4.3 DTS-2 procedure

- a) The DTS-2 co-channel interferer signal I_{CoCh1} is configured according to DTS-2 configuration.
- b) The co-channel interferer signal I_{CoCh1} set to -80 dBm.
- c) The power levels of the interferers I_{CoCh2} , I_{AdjCh1} , and I_{AWGN} are set according to table 14.18.8.2a.2-1. The power levels are defined relative to I_{CoCh1} .
- d) The fading characteristics of the wanted signal C1 and the interferer signals I_{CoCh1} , I_{CoCh2} , and I_{AdjCh1} are set to TU High. No FH applies.
- e) The SS transmits packets using MCS-1 coding on all allocated timeslots.
- f) The SS sets the level of the wanted signal C1 1 dB above the level according to table 14.18.8.2a.4.5-1 and table 14.18.8.2a.4.5-2.

- g) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.
- h) Once the number of blocks transmitted with the current coding scheme as counted in step (e) reaches or exceeds the minimum number of blocks as given in table 14.18-2 the SS calculates the Block error ratio. The SS resets both counters.
- i) SS repeats the steps (e) to (h) for each of the coding schemes MCS-2, MCS-3 and MCS-4.

14.18.8.2a.4.4 Test method

- a) The DTS-3 co-channel interferer signal I_{CoCh1} is configured according to DTS-3 configuration.
- b) The SS repeats the steps (b) to (h) identical to the DTS-2 procedure

14.18.8.2a.4.5 Test requirement

The block error ratio, as calculated by the SS for different channels and under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 (table 2ae, annex L) , shall be set according to the table below.

Table 14.18.8.2a.4.5-1

| GSM 900, T-GSM 810 and GSM 850 | | | |
|---------------------------------------|-------|---------------------------|--------------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH MCS-1 | C/dBm | - 72,5 | - 71,5 |
| PDTCH MCS-2 | C/dBm | - 71,0 | - 70,0 |
| PDTCH MCS-3 | C/dBm | - 67,0 | - 66,5 |
| PDTCH MCS-4 | C/dBm | - 62,0 | - 61,0 |

Table 14.18.8.2a.4.5-2

| DCS 1 800 & PCS 1900 | | | |
|---------------------------------|--------|---------------------------|--------------|
| Type of channel | | DARP Test Scenario | |
| | | DTS-2 | DTS-3 |
| PDTCH MCS-1 | C/dBm | - 73,0 | - 72,0 |
| PDTCH MCS-2 | C /dBm | - 71,0 | - 70,5 |
| PDTCH MCS-3 | C /dBm | - 67,0 | - 66,5 |
| PDTCH MCS-4 | C /dBm | - 60,0 | - 59,5 |

14.18.9 DARP Phase II EGPRS tests

14.18.9.1 Synchronous single co-channel interferer (DTS-1)

14.18.9.1.1 Definition

The DARP phase II reference test scenario DTS-1 for a single synchronous co-channel interferer defines an interfering signal and corresponding performance limits. This test is a measure of the capability of the DARP phase II receivers to receive a wanted modulated signal without exceeding a given degradation due to the presence of this specific unwanted signal.

14.18.9.1.2 Conformance requirement

MS indicating support for Downlink Advanced Receiver Performance – phase II (see 3GPP TS 24.008) shall fulfil the requirements in table 2q for the test scenarios defined in annex N

The reference performance shall be:

- For packet switched channels (PDTCH) BLER: ≤ 10 %

The values in table 2q are given as the C/I ratio, where C is the power level of the wanted signal and I is the power level of the dominant co-channel interferer (Co-channel 1, see annex N).

3GPP TS 45.005; clause 6.3.

Reference Test Scenario for synchronous single co-channel interferer

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-1 | Co-channel 1 | 0 dB | none | no delay |

3GPP TS 45.005; Annex N.

| GSM 900 and GSM 850 | |
|--|----------|
| Propagation condition: TU50 (no FH) | |
| Correlation=0; AGI=0 dB | |
| PDTCH MCS-1 | -11,5 dB |
| PDTCH MCS-2 | -10,0 dB |
| PDTCH MCS-3 | -6,5 dB |
| PDTCH MCS-4 | -1,0 dB |

| GSM 1800 and GSM 1900 | |
|--|----------|
| Propagation condition: TU50 (no FH) | |
| Correlation=0; AGI=0 dB | |
| PDTCH MCS-1 | -10,5 dB |
| PDTCH MCS-2 | -8,5 dB |
| PDTCH MCS-3 | -4,5 dB |
| PDTCH MCS-4 | 2,0 dB |

3GPP TS 45.005; table 2q (excerpt for DTS-1).

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.18.9.1.3 Test purpose

To verify that the MS does not exceed conformance requirement for different coding schemes and under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.18.9.1.4 Test method

14.18.9.1.4.1 Initial condition

The SS is configured as defined in annex N.2 picture N.2.2 of 3GPP 45.005

The diversity parameter for the antenna correlation is set to 0 and the antenna gain imbalance (AGI) is set to 0 dB

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range on the maximum number of receive timeslots which the MS is capable to support. The power control level set to maximum power.

The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces an independent, uncorrelated interfering signal (I1). This unwanted signal is random, continuous and GSM-modulated and has no fixed relationship with the bit transitions of the wanted signal.

14.18.9.1.4.2 Procedure

- a) The co-channel interferer signal I1 (unwanted signal) is set to -70 dBm.
- b) The fading characteristic of the wanted signal C1 and the interferer signal I1 is set to TU High. No FH applies.
- c) The SS transmits packets using MCS-1 coding to the MS on all allocated timeslots.
- d) The SS sets the level of the wanted signal 1dB above the value according the Table 14.18.9.1.5-1 and Table 14.18.9.1.5-2.
- e) The SS transmits the number of blocks with current coding scheme accordingly with table 14.16-2 and counts the BLER based on the content of the ACK/NACK Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink ACK/NACK as sent from the MS to the SS on the PACCH. The SS resets both counters.
- f) The SS repeats the steps (c) to (e) for each of the coding schemes MCS-2 to MCS-4

14.18.9.1.5 Test requirement

The block error ratio, as calculated by the SS for different channels under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2q shall be set according to the table below.

Table 14.18.9.1.5-1

| GSM 900 and GSM 850 | | |
|---------------------|-------|-------|
| PDTCH MCS-1 | C/dBm | -81,5 |
| PDTCH MCS-2 | C/dBm | -80,0 |
| PDTCH MCS-3 | C/dBm | -76,5 |
| PDTCH MCS-4 | C/dBm | -71,0 |

Table 14.18.9.1.5-2

| DCS 1 800 & PCS 1900 | | |
|----------------------|-------|-------|
| PDTCH MCS-1 | C/dBm | -80,5 |
| PDTCH MCS-2 | C/dBm | -78,5 |
| PDTCH MCS-3 | C/dBm | -74,5 |
| PDTCH MCS-4 | C/dBm | -68,0 |

14.18.9.2 Synchronous single co-channel interferer (DTS-1b)

14.18.9.2.1 Definition

The DARP phase II reference test scenario DTS-1 for a single synchronous co-channel interferer defines an interfering signal and corresponding performance limits. This test is a measure of the capability of the DARP phase II receivers to receive a wanted modulated signal without exceeding a given degradation due to the presence of this specific unwanted signal.

14.18.9.2.2 Conformance requirement

MS indicating support for Downlink Advanced Receiver Performance – phase II (see 3GPP TS 24.008) shall fulfil the requirements in table 2q for the test scenarios defined in annex N

The reference performance shall be:

- For packet switched channels (PDTCH) BLER: ≤ 10 %

The values in table 2q are given as the C/I ratio, where C is the power level of the wanted signal and I is the power level of the dominant co-channel interferer (Co-channel 1, see annex N).

3GPP TS 45.005; clause 6.3.

Reference Test Scenario for synchronous single co-channel interferer

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-1b | Co-channel 1 8PSK | 0 dB | none | no delay |

3GPP TS 45.005; Annex N.

| GSM 900 and GSM 850 | |
|--|----------|
| Propagation condition: TU50 (no FH) | |
| Correlation=0; AGI=0 dB | |
| PDTCH MCS-5 | -6,5 dB |
| PDTCH MCS-6 | -4,0 dB |
| PDTCH MCS-7 | 1,5 dB |
| PDTCH MCS-8 | 1,5** dB |
| PDTCH MCS-9 | 6,0** dB |

| GSM 1800 and GSM 1900 | |
|--|-----------|
| Propagation condition: TU50 (no FH) | |
| Correlation=0; AGI=0 dB | |
| PDTCH MCS-5 | -6,0 dB |
| PDTCH MCS-6 | -3,5 dB |
| PDTCH MCS-7 | 3,0 dB |
| PDTCH MCS-8 | 5,0** dB |
| PDTCH MCS-9 | 12,0** dB |

NOTE: Performance is specified at 30% BLER for those cases identified with mark ‘**’

NOTE 1: DARP Test Scenario 1 (DTS-1) is similar to testing of co-channel interference for non-DARP receivers with essentially at least as stringent requirements under TU50noFH propagation conditions. DTS-1b utilizes an 8-PSK modulated interferer and is to be applied for MCS5-MCS9.

3GPP TS 45.005; table 2q (excerpt for DTS-1b).

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.18.9.2.3 Test purpose

To verify that the MS does not exceed conformance requirement for different coding schemes and under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.18.9.2.4 Test method

14.18.9.2.4.1 Initial condition

The SS is configured as defined in annex N.2 picture N.2.2 of 3GPP 45.005.

The diversity parameter for the antenna correlation is set to 0 and the antenna gain imbalance (AGI) is set to 0 dB

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range on the maximum number of receive timeslots which the MS is capable to support. The power control level set to maximum power.

The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces an independent, uncorrelated interfering signal (I1). This unwanted signal is random, continuous and GSM-modulated and has no fixed relationship with the bit transitions of the wanted signal.

14.18.9.2.4.2 Procedure

- a) The co-channel interferer signal I1 (unwanted signal) is set to -70 dBm.
- b) The fading characteristic of the wanted signal C1 and the interferer signal I1 is set to TU High. No FH applies.
- c) The SS transmits packets using MCS-5 coding to the MS on all allocated timeslots.
- d) The SS sets the level of the wanted signal 1dB above the value according the Table 14.18.9.2.5-1 and Table 14.18.9.2.5-2.
- e) The SS transmits the number of blocks with current coding scheme accordingly with table 14.16-2 and counts the BLER based on the content of the ACK/NACK Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink ACK/NACK as sent from the MS to the SS on the PACCH. The SS resets both counters.
- f) The SS repeats the steps (c) to (e) for each of the coding schemes MCS-6 to MCS-9

14.18.9.2.5 Test requirement

The block error ratio, as calculated by the SS for different channels under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2q shall be set according to the table below.

Table 14.18.9.2.5-1

| GSM 900 and GSM 850 | | |
|---------------------|-------|-------|
| PDTCH MCS-5 | C/dBm | -76,5 |
| PDTCH MCS-6 | C/dBm | -74,0 |
| PDTCH MCS-7 | C/dBm | -68,5 |
| PDTCH MCS-8 | C/dBm | -68,5 |
| PDTCH MCS-9 | C/dBm | -64,0 |

Table 14.18.9.2.5-2

| DCS 1 800 & PCS 1900 | | |
|----------------------|-------|-------|
| PDTCH MCS-5 | C/dBm | -76,0 |
| PDTCH MCS-6 | C/dBm | -73,5 |
| PDTCH MCS-7 | C/dBm | -67,0 |
| PDTCH MCS-8 | C/dBm | -65,0 |
| PDTCH MCS-9 | C/dBm | -58,0 |

14.18.9.3 Multiple interferers (DTS-2 / DTS-5)

14.18.9.3.1 Definition

The DARP phase II reference test scenarios DTS-2 and DTS-5 for multiple interferers define a set of interfering signals and the corresponding performance limits. These tests are a measure of the capability of the DARP phase II receivers to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted signals.

14.18.9.3.2 Conformance requirement

MS indicating support for Downlink Advanced Receiver Performance – phase II (see 3GPP TS 24.008) shall fulfil the requirements in table 2q for the test scenarios defined in annex N

The reference performance shall be:

- For packet switched channels (PDTCH) BLER: ≤ 10 %

The values in table 2q are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex N).

3GPP TS 45.005; clause 6.3.

Reference Test Scenarios for synchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay range |
|-------------------------|--------------------|---------------------------------|------|------------------------|
| DTS-2 | Co-channel 1 | 0 dB | none | no delay |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |

Reference Test Scenario for asynchronous multiple interferers

| Reference Test Scenario | Interfering Signal | Interferer relative power level | TSC | Interferer Delay |
|---|--------------------|---------------------------------|------|------------------|
| DTS-5 | Co-channel 1 | 0 dB ^{*)} | none | 74 symbols |
| | Co-channel 2 | -10 dB | none | no delay |
| | Adjacent 1 | 3 dB | none | no delay |
| | AWGN | -17 dB | - | - |
| ^{*)} The power of the delayed interferer burst, averaged over the active part of the wanted signal burst. The power of the delayed interferer burst, averaged over the active part of the delayed interferer burst is 3 dB higher. | | | | |

3GPP TS 45.005; Annex N.

| GSM 900 and GSM 850 | | |
|--|--------------|--------------|
| Propagation condition: TU50 (no FH) | | |
| Correlation=0; AGI=0 dB | | |
| Channel type | C/I | |

3GPP TS 45.005 table 2q (excerpt for DTS-2 and DTS-5)

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.18.9.3.3 Test purpose

To verify that the MS does not exceed the conformance requirement for different coding schemes under the propagation condition TU50/noFH with an allowance for the statistical significance of the test.

14.18.9.3.4 Test method

14.18.9.3.4.1 Initial condition

The SS is configured as defined in annex N.2 picture N.2.2 of 3GPP 45.005.

The diversity parameter for the antenna correlation is set to 0 and the antenna gain imbalance (AGI) is set to 0 dB

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots which the MS is capable to support, The MS is transmitting at maximum power. The power control parameter ALPHA (α) is set to 0.

The SS establish a downlink TBF.

The SS transmits Standard Test Signal C1 with TSC 0.

In addition to this wanted signal (C1), the SS produces multiple interfering signals for DTS-2 or DTS-5 scenarios as appropriate for the test procedure.

These interferers are:

Identical interferer types for DTS-2 and DTS-5:

- Co-channel 2 (I_{CoCh2}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2
- Adjacent 1 (I_{AdjCh1}): Adjacent channel interferer of type I1 as specified in TS 51.010 annex 5.2
- AWGN (I_{AWGN}): AWGN interferer of type I3 as specified in TS51.010 annex 5.2

DTS-2 specific interferer:

- Co-channel 1 (I_{CoCh1}): Synchronous co-channel interferer of type I1 as specified in TS 51.010 annex 5.2

DTS-5 specific interferer:

- Co-channel 1 (I_{CoCh1}): Delayed co-channel interferer of type I5 as specified in TS 51.010 annex 5.2.

14.18.9.3.4.2 Test Procedure

14.18.9.3.4.2.1 DTS-2 Procedure

- a) The DTS-2 co-channel interferer signal I_{CoCh1} is configured according to the DTS-2 configuration.
- b) The co-channel interferer signal I_{CoCh1} set to -70 dBm.
- c) The power levels of the interferers I_{CoCh2} , I_{AdjCh1} , and I_{AWGN} are set according to table 14.18.9.3.21. The power levels are defined relative to I_{CoCh1} .
- d) The fading characteristics of the wanted signal C1 and the interferer signals I_{CoCh1} , I_{CoCh2} , and I_{AdjCh1} are set to TU High. No FH applies.
- e) The SS transmits packets using MCS-1 coding on all allocated timeslots.
- f) The SS sets the level of the wanted signal C1 1 dB above the value according to table 14.18.9.3.5-1 and table 14.18.9.3.5-2.
- g) The SS transmits the number of blocks with current coding scheme accordingly with table 14.16-2 and counts the BLER based on the content of the ACK/NACK Description information element (see 3GPP TS 04.60, sub clause 12.3) in the Packet Downlink ACK/NACK as sent from the MS to the SS on the PACCH. The SS resets both counters.
- h) The SS repeats the steps (e) to (h) for each of the coding schemes MCS-2 to MSC-9.

14.18.9.3.4.2.2 DTS-5 Procedure

- a) The DTS-5 co-channel interferer signal I_{CoCh1} is configured according to DTS-5 configuration.
- b) The SS repeats the steps (b) to (i) identical to the DTS-2 procedure

14.18.9.3.5 Test requirement

The block error ratio calculated by the SS for different channels and under the TU High propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 table 2q, shall be set according to the table below.

Table 14.18.9.3.5-1

| GSM 900 and GSM 850 | | | |
|---------------------|-------|-----------------------|-------|
| Type of channel | | DARP II Test Scenario | |
| | | DTS-2 | DTS-5 |
| PDTCH MCS-1 | C/dBm | -69,0 | -68,5 |
| PDTCH MCS-2 | C/dBm | -67,5 | -67,5 |
| PDTCH MCS-3 | C/dBm | -64,0 | -64,0 |
| PDTCH MCS-4 | C/dBm | -59,0 | -57,5 |
| PDTCH MCS-5 | C/dBm | -63,0 | -62,0 |
| PDTCH MCS-6 | C/dBm | -61,0 | -59,5 |
| PDTCH MCS-7 | C/dBm | -56,5 | -55,0 |
| PDTCH MCS-8 | C/dBm | -50,0 | -49,5 |
| PDTCH MCS-9 | C/dBm | -46,5 | -43,5 |

Table 14.18.9.3.5-2

| DCS 1 800 & PCS 1900 | | | |
|----------------------|--------|-----------------------|-------|
| Type of channel | | DARP II Test Scenario | |
| | | DTS-2 | DTS-5 |
| PDTCH MCS-1 | C/dBm | -69,0 | -69,0 |
| PDTCH MCS-2 | C /dBm | -67,5 | -67,5 |
| PDTCH MCS-3 | C /dBm | -64,0 | -64,0 |
| PDTCH MCS-4 | C /dBm | -58,5 | -57,0 |
| PDTCH MCS-5 | C/dBm | -63,5 | -62,5 |
| PDTCH MCS-6 | C/dBm | -61,5 | -60,5 |
| PDTCH MCS-7 | C/dBm | -56,0 | -55,0 |
| PDTCH MCS-8 | C/dBm | -49,5 | -48,0 |
| PDTCH MCS-9 | C/dBm | -45,0 | -44,5 |

14.18.10 Latency Reductions

14.18.10.1 Minimum Input level for Reference Performance for PAN

14.18.10.1.1 Definition

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

14.18.10.1.2 Conformance requirement

1. The block error rate (BLER) performance of data blocks containing PAN for PDTCH/MCS mentioned in the table 14.18.10.1-1 shall not exceed 10 % of input levels according to the table 14.18.10.1-1.

Table 14.18.10.1-1: Input signal level (for MS) at reference performance for GMSK, and 8-PSK with PAN included; BTTI and RTTI (EGPRS DL)

| All GSM bands | |
|-----------------|----------------------------------|
| Type of channel | Propagation conditions Static |
| PDTCH/MCS -1 | [-104,0] dBm |
| PDTCH/MCS-2 | [-104,0] dBm |
| PDTCH/MCS-3 | [-101,5] dBm |
| PDTCH/MCS-5 | [-99,0] dBm |
| PDTCH/MCS-6 | [-97,0] dBm |
| PDTCH/MCS-7 | [-94,0] dBm |
| PDTCH/MCS-8 | [-90,5] dBm |

These limits are corrected by the following values for the following classes of MS:

| MS, GMSK modulated signals | |
|--|------------|
| for DCS 1 800 class 1 or class 2 MS | +2/+4 dB** |
| for DCS 1 800 class 3 MS | +2 dB |
| for GSM 400 small MS, GSM 900 small MS GSM 850 small MS and GSM 700 small MS | +2 dB |
| for other GSM 400, GSM 900 MS and GSM 850 MS and GSM 700 MS | 0 dB |
| for PCS 1900 class 1 or class 2 MS | +2 dB |
| for other PCS 1900 MS | 0 dB |
| MS, QPSK, 8-PSK, 16-QAM and 32-QAM modulated signals | |
| for GSM 400, GSM 900, GSM 850 and GSM 700 small MS | 0 dB |
| for other GSM 400, GSM 900, GSM 850 and GSM 700 MS | -2 dB |
| for DCS 1 800 and PCS 1900 class 1 or class 2 MS | 0 dB |
| for other DCS 1 800 and PCS 1900 MS | -2 dB |

3GPP TS 45.005, table 1o; 3GPP TS 45.005, subclause 6.2

2. The PAN error rate (incorrect decoding of PAN in downlink data blocks) at the mobile station shall not exceed 5% at input levels according to the table 14.18.10.1-2.

Table 14.18.10.1-2: Input signal level (for MS) at reference performance of PAN for GMSK and 8-PSK, (EGPRS DL) ; BTTI and RTTI

| All GSM bands | |
|------------------------|--------------------------------------|
| Type of Channel | Propagation conditions Static |
| PDTCH/MCS-1 to 3 | [-104,0] dBm |
| PDTCH/MCS-5 to 6 | [-101,5] dBm |
| PDTCH/MCS-7 | [-101,0] dBm |
| PDTCH/MCS-8 | [-100,5] dBm |

These limits are corrected by the following values for the following classes of MS:

| MS, GMSK modulated signals | |
|--|------------|
| for DCS 1 800 class 1 or class 2 MS | +2/+4 dB** |
| for DCS 1 800 class 3 MS | +2 dB |
| for GSM 400 small MS, GSM 900 small MS GSM 850 small MS and GSM 700 small MS | +2 dB |
| for other GSM 400, GSM 900 MS and GSM 850 MS and GSM 700 MS | 0 dB |
| for PCS 1900 class 1 or class 2 MS | +2 dB |
| for other PCS 1900 MS | 0 dB |
| MS, QPSK, 8-PSK, 16-QAM and 32-QAM modulated signals | |
| for GSM 400, GSM 900, GSM 850 and GSM 700 small MS | 0 dB |
| for other GSM 400, GSM 900, GSM 850 and GSM 700 MS | -2 dB |
| for DCS 1 800 and PCS 1900 class 1 or class 2 MS | 0 dB |
| for other DCS 1 800 and PCS 1900 MS | -2 dB |

3GPP TS 45.005, table 1r; 3GPP TS 45.005, subclause 6.2

3. The BLER performance and PAN error rate shall not exceed the conformance requirements given in 1 and 2 above under extreme conditions; 3GPP TS 45.005, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

3GPP TS 45.005 subclause 2:

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

14.18.10.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 for PDTCHs using different coding schemes and under static propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under static propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under static propagation conditions with an allowance for the statistical significance of the test.

14.18.10.1.4 Method of test

Initial conditions

NOTE 1: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}$ to $35 \text{ dB}\mu\text{Vemf}$. Surrounding cell signal levels and cell reselection parameters are set so that the MS will not attempt a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used under static conditions, the traffic channel may fall on any of the ARFCNs defined in clause 6. When frequency hopping is used under non-static conditions any ARFCNs shall be chosen.

Test procedure

- a) A downlink TBF with polled FANR enabled is established on an ARFCN in the mid-range using a BTTI configuration. The power control parameter ALPHA (α) is set to 0 and the SS commands the MS to transmit at maximum power. The SS allocates the maximum number of receive timeslots according to the MS's multislot class.
- b) The SS transmits downlink RLC data blocks addressing the MS using the MCS-3 coding scheme at a level 1 dB above the level given in conformance requirement 1. A PAN field is included in each downlink RLC data block. Note : The PAN field in the downlink RLC data blocks does not address the MS as the MS does not have an uplink TBF active.
- c) The SS polls the MS for (EGPRS) PACKET DOWNLINK ACK/NACK at a rate sufficient to prevent an RLC window stall condition in the MS.
- d) The SS re-transmits any downlink RLC data blocks NACKED by the MS in the (EGPRS) PACKET DOWNLINK ACK/NACK message. Note : The SS shall not repeat the re-transmission of any particular block without having ascertained reception or non-reception of the previous re-transmission by again polling the MS.
- e) The SS calculates the BLER performance as a percentage based on the number of re-transmitted downlink RLC data blocks (where each re-transmission instance counts as one sample) divided by the total number of downlink RLC data blocks transmitted (including all re-transmission instances) during the downlink TBF.
- f) The SS terminates the downlink TBF by sending a PACKET TBF RELEASE message.
- g) An uplink TBF with FANR enabled using BTTI USF Mode is established on an ARFCN in the mid-range using a BTTI configuration. The power control parameter ALPHA (α) is set to 0 and the SS commands the MS to transmit at maximum power. The SS allocates the maximum number of transmit timeslots according to the MS's multislot class. The SS commands the MS to send uplink RLC data blocks using the MCS-3 coding scheme.
- h) During the uplink TBF, the SS sends downlink RLC data blocks at a level 1 dB above the level given in conformance requirement 2 using the same MCS as used for the uplink TBF in which the SS periodically includes a PAN field in the time based format. The reported bitmap in the PAN field shall set all blocks to ACKED. The SS shall include the PAN field sufficiently often to cover all uplink RLC data blocks received without gaps, but shall not send PAN fields in which the reported bitmaps overlap. Note : The downlink RLC data blocks do not address the MS as the MS does not have a downlink TBF active.

- i) When including the PAN field, the SS shall note the set of uplink BSNs acknowledged by each PAN field. If the MS subsequently re-transmits one or more BSNs in any particular set, this counts as one error sample. The SS calculates the PAN error rate as a percentage based on the number of error samples divided by the number of PAN fields sent during the uplink TBF.
- j) The SS terminates the uplink TBF by sending a PACKET TBF RELEASE message.
- k) Steps a) to j) are repeated using the MCS-8 coding scheme in Steps b) and g).

14.18.10.1.5 Test requirements

The block error rate performance (BLER) as calculated by the SS for different MCSs under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

The PAN error rate as calculated by the SS under any combination of normal and extreme test voltages and ambient temperatures shall not exceed the conformance requirement.

14.19 DARP Phase II Speech bearer tests

14.19.1 TCH/FS

14.19.1.1 DTS-1

14.19.1.1.1 Definition

DARP Phase II, also referred as Mobile Station Receiver Diversity is a feature where the MS uses two receive antennas in order to improve performance under non-interfering and interfering scenarios.

The DARP Phase II reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the DARP Phase II receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.19.1.1.2 Conformance requirement

1. MS indicating support for Downlink Advanced Receiver Performance – phase II (see 3GPP TS 24.008) shall fulfil the requirements in table 2q for the test scenarios defined in annex N. The reference performance shall be:
 - For speech channels (TCH/FS, TCH/AFS_x, TCH/AHS_x) FER: $\leq 1\%$
2. The values in table 2q are given as the C/I1 ratio, where C is the power level of the wanted signal and I1 is the power level of the dominant co-channel interferer (Co-channel 1, see annex N). In addition for speech channels the residual class Ib BER and residual class II BER performance shall not exceed the specified values in table 2q at the corresponding C/I1.

The performance requirements for GSM 400 and GSM 700 systems are as for GSM 900 in table 2q, except that the GSM 400 MS speed is doubled from that of GSM 900, e.g. TU50 becomes TU100, and the GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60. 3GPP TS 45.005, subclause 6.3

For T-GSM 810 the requirements for GSM 900 shall apply, apart for those parameters for which a separate requirement exists.

3GPP TS 45.005; sub clause 2

14.19.1.1.3 Test purpose

To verify that the MS does not exceed the first conformance requirement for TCH/FS under propagation condition TU_{high} with an allowance for the statistical significance of the test.

To verify that the MS does not exceed the second conformance requirement for TCH/FS under propagation condition TU_{high} with an allowance for the statistical significance of the test.

14.19.1.1.4 Method of test

14.19.1.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the mid ARFCN range, power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36).

14.19.1.1.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. The interfering signal level is set to -70 dBm.

The fading characteristic of the wanted and the interfering signal is TUHigh. Antenna correlation is 0 and antenna gain imbalance is 0dB.

- b) The SS sets the level of the wanted signal to that indicated by C_{lev} in table 14.19.1-2 or 14.19.1-3.
- c) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the number of residual bit error events for the bits of the class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

Maximum/Minimum Duration of Test

Maximum: 10 minutes (GSM 400, GSM700, GSM850, GSM900), 10 minutes (DCS1800, PCS1900).

Minimum: 4 minutes (GSM 400, GSM700, GSM850, GSM900), 2 minutes (DCS1800, PCS1900).

14.19.1.1.5 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Wrong decision risk F for one single error rate test:

$$F_{pass} = F_{fail} = F \quad \text{and} \quad F = 0.2\%$$

Wrong decision probability D per test step:

$$D_{pass} = D_{fail} = D \quad \text{and} \quad D = 0.0085\%$$

Parameters for limit lines:

1. D = 0.000085 wrong decision probability per test step.
2. M = 1.5 bad DUT factor

- 3. n_e number of (error) events. This parameter is the x-ordinate in figure Annex 7 figure A7.1.3.1.
- 4. n_s number of samples. The error rate is calculated from n_e and n_s .

Limit checking

Before limit checking is valid the minimum test time due to fading needs to be considered:

Testing under multipath and interference conditions requires that at least 990 wavelengths are crossed with the speed given in the fading profile. This leads to a minimum test time depending on the frequency range. No early pass/fail decision is allowed until the minimum test time due to fading has elapsed.

Table 14.19.1-1: Minimum test times due to TU high fading conditions

| Full Rate 50 km/h | | | | | | | |
|--------------------|--------|---------|---------|---------|---------|---------|----------|
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | - | 0,35 | 0,33 | 0,17 | 0,16 | m |
| min test time | - | - | 201 | 190 | 95 | 90 | s |
| | - | - | 0:03:21 | 0:03:10 | 0:01:35 | 0:01:30 | hh.mm:ss |
| Full Rate 60 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | 0,43 | - | - | - | - | m |
| min test time | - | 204 | - | - | - | - | s |
| | - | 0:03:24 | - | - | - | - | hh.mm:ss |
| Full Rate 100 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | 0,75 | - | - | - | - | - | m |
| min test time | 214 | - | - | - | - | - | s |
| | 0:3:34 | - | - | - | - | - | hh.mm:ss |

If the minimum test time due to multipath conditions exceeds the target test time, then the test runs for the minimum test time due to multipath conditions and the decision is made by comparing the result with the “derived test limit”. In this case early pass/fail decisions are obsolete.

If the target test time exceeds the minimum test time due to multipath conditions early pass/fail decisions can be headed for in order to accelerate test execution.

For an early decision a minimum number of (error) events is necessary.

For an early pass decision $n_e \geq 1$ (inclusive artificial error)

For an early fail decision $n_e \geq 7$

When the target test time has been reached the test is finished and a pass/fail decision can be made.

The error rate measured in this test shall be tested according to the values given in tables 14.19.1-2 or 14.19.1-3.

14.19.2.1.3 Test purpose

To verify that the MS does not exceed the first conformance requirement for TCH/AFS under propagation condition TUhigh with an allowance for the statistical significance of the test.

To verify that the MS does not exceed the second conformance requirement for TCH/AFS under propagation condition TUhigh with an allowance for the statistical significance of the test for class Ib BER.

14.19.2.1.4 Method of test

14.19.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the mid ARFCN range, power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The multirate configuration indicates the use of a codec set limited to 12,2 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal), with training sequence code (TSC) = 0.

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36).

14.19.2.1.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. The interfering signal level is set to -70 dBm.

The fading characteristic of the wanted and the interfering signal is TUHigh. Antenna correlation is 0 and antenna gain imbalance is 0dB.

- b) The SS sets the level of the wanted signal to that indicated by C_{lev} in table 14.19.2-2 or 14.19.2-3.
- c) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- f) The SS uses a Channel Mode Modify procedure to change the active codec set to 7,4 kbit/s and steps b) to e) are repeated.
- g) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps b) to e) are repeated.

Maximum/Minimum Duration of Test

Maximum: 28 minutes (GSM 400, GSM700, GSM850, GSM900), 28 minutes (DCS1800, PCS1900).

Minimum: 11 minutes (GSM 400, GSM700, GSM850, GSM900), 5 minutes (DCS1800, PCS1900).

14.19.2.1.5 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7.

Wrong decision risk F for one single error rate test:

$$F_{\text{pass}} = F_{\text{fail}} = F \quad \text{and} \quad F = 0.2\%$$

Wrong decision probability D per test step:

$$D_{\text{pass}} = D_{\text{fail}} = D \quad \text{and} \quad D = 0.0085\%$$

Parameters for limit lines:

1. D = 0.000085 wrong decision probability per test step.
2. M = 1.5 bad DUT factor
3. ne number of (error) events. This parameter is the x-ordinate in figure A7.1.3.2.
4. ns number of samples. The error rate is calculated from ne and ns.

Limit checking

Before limit checking is valid the minimum test time due to fading needs to be considered:

Testing under multipath and interference conditions requires that at least 990 wavelengths are crossed with the speed given in the fading profile. This leads to a minimum test time depending on the frequency range. No early pass/fail decision is allowed until the minimum test time due to fading has elapsed.

Table 14.19.2-1: Minimum test times due to TU high fading conditions

| | | | | | | | |
|--------------------|--------|---------|---------|---------|---------|---------|----------|
| Full Rate 50 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | - | 0,35 | 0,33 | 0,17 | 0,16 | m |
| min test time | - | - | 201 | 190 | 95 | 90 | s |
| | - | - | 0:03:21 | 0:03:10 | 0:01:35 | 0:01:30 | hh.mm:ss |
| Full Rate 60 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | 0,43 | - | - | - | - | m |
| min test time | - | 204 | - | - | - | - | s |
| | - | 0:03:24 | - | - | - | - | hh.mm:ss |

If the target test time exceeds the minimum test time due to multipath conditions early pass/fail decisions can be headed for in order to accelerate test execution.

For an early decision a minimum number of (error) events is necessary.

For an early pass decision $ne \geq 1$ (inclusive artificial error)

For an early fail decision $ne \geq 7$

When the target test time has been reached the test is finished and a pass/fail decision can be made.

The error rate measured in this test shall be tested according to the values given in tables 14-63 or 14-64.

14.19.2.2.3 Test purpose

To verify that the MS does not exceed the first conformance requirement for TCH/AFS under propagation condition TU_{high} with an allowance for the statistical significance of the test.

To verify that the MS does not exceed the second conformance requirement for TCH/AFS under propagation condition TU_{high} with an allowance for the statistical significance of the test.

14.19.2.2.4 Method of test

14.19.2.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the mid ARFCN range, power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The multirate configuration indicates the use of a codec set limited to 7,4 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal), with training sequence code (TSC) = 0.

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36).

14.19.2.2.4.2 Procedure

- a) In addition to the wanted signal, the SS produces a further four interfering signals to produce scenario DTS-2.

A signal of type I1 using the same ARFCN as C1, with fading characteristics of TU_{high}, and signal level of -70 dBm.

A signal of type I1 using the same ARFCN as C1, with fading characteristics of TU_{high}, and signal level of -80 dBm.

A signal of type I1 using an ARFCN one higher than C1, with fading characteristics of TU_{high}, and signal level of -67 dBm.

A signal of type I3 using the same ARFCN as C1, and signal level of -87 dBm.

- b) The SS sets the level of the wanted signal to that indicated by C_{lev} in table 14.19.2.2-2 or 14.19.2.2-3, and sets the fading characteristic of the signal to TU_{high}. Antenna correlation is set to 0 and antenna gain imbalance is set to 0dB.
- c) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- f) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps b) to e) are repeated.
- g) The SS discontinues all interfering signals.
- h) In addition to the wanted signal, the SS produces a further four interfering signals to produce scenario DTS-5.

A signal of type I5 using the same ARFCN as C1, with fading characteristics of TUHigh, and signal level of -67 dBm.

A signal of type I1 using the same ARFCN as C1, with fading characteristics of TUHigh, and signal level of -80 dBm.

A signal of type I1 using an ARFCN one higher than C1, with fading characteristics of TUHigh, and signal level of -67 dBm.

A signal of type I3 using the same ARFCN as C1, and signal level of -87 dBm.

- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 12,2 kbit/s and steps b) to e) are repeated.

Maximum/Minimum Duration of Test

Maximum: 28 minutes (GSM 400, GSM700, GSM850, GSM900), 28 minutes (DCS1800, PCS1900).

Minimum: 10 minutes (GSM 400, GSM700, GSM850, GSM900), 5 minutes (DCS1800, PCS1900).

14.19.2.2.5 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7.

Wrong decision risk F for one single error rate test:

$$F_{\text{pass}} = F_{\text{fail}} = F \quad \text{and} \quad F = 0.2\%$$

Wrong decision probability D per test step:

$$D_{\text{pass}} = D_{\text{fail}} = D \quad \text{and} \quad D = 0.0085\%$$

Parameters for limit lines:

1. D = 0.000085 wrong decision probability per test step.
2. M = 1.5 bad DUT factor
3. ne number of (error) events. This parameter is the x-ordinate in figure A7.1.3.1.
4. ns number of samples. The error rate is calculated from ne and ns.

Limit checking

Before limit checking is valid the minimum test time due to fading needs to be considered:

Testing under multipath and interference conditions requires that at least 990 wavelengths are crossed with the speed given in the fading profile. This leads to a minimum test time depending on the frequency range. No early pass/fail decision is allowed until the minimum test time due to fading has elapsed.

Table 14.19.2.2-1: Minimum test times due to TU 50 fading conditions

| Full Rate 50 km/h | | | | | | | |
|--------------------|--------|---------|---------|---------|---------|---------|----------|
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | - | 0,35 | 0,33 | 0,17 | 0,16 | m |

14.19.3.1.4 Method of test

14.19.3.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the mid ARFCN range, power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The multirate configuration indicates the use of a codec set limited to 7,4 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal), with training sequence code (TSC) = 0.

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36).

14.19.3.1.4.2 Procedure

- a) In addition to the wanted signal, the SS produces one further interfering signal to produce scenario DTS-1.

A signal of type II using the same ARFCN as C1, with fading characteristics of TUHigh, and signal level of -70 dBm.

The fading characteristic of the wanted signal is TUHigh. Antenna correlation is 0 and antenna gain imbalance is 0dB.

- b) The SS sets the level of the wanted signal to that indicated by C_{lev} in table 14.19.3.1-2 or 14.19.3.1-3.
- c) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of the class Ib and II, by examining at least the minimum number of samples of consecutive bits of class Ib and II. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.
- f) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps b) to e) are repeated.

Maximum/Minimum Duration of Test

Maximum: 19 minutes (GSM 400, GSM700, GSM850, GSM900), 19 minutes (DCS1800, PCS1900).

Minimum: 14 minutes (GSM 400, GSM700, GSM850, GSM900), 7 minutes (DCS1800, PCS1900).

14.19.3.1.5 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7.

Wrong decision risk F for one single error rate test:

$$F_{pass} = F_{fail} = F \quad \text{and} \quad F = 0.2\%$$

Wrong decision probability D per test step:

$$D_{pass} = D_{fail} = D \quad \text{and} \quad D = 0.0085\%$$

Parameters for limit lines:

1. $D = 0.000085$ wrong decision probability per test step.

- 2. $M = 1.5$ bad DUT factor
- 3. n_e number of (error) events. This parameter is the x-ordinate in figure A7.1.3.2.
- 4. n_s number of samples. The error rate is calculated from n_e and n_s .

Limit checking

Before limit checking is valid the minimum test time due to fading needs to be considered:

Testing under multipath and interference conditions requires that at least 990 wavelengths are crossed with the speed given in the fading profile. This leads to a minimum test time depending on the frequency range. No early pass/fail decision is allowed until the minimum test time due to fading has elapsed.

Table 14.19.3.1-1: Minimum test times due to TU high fading conditions

| Half Rate 50 km/h | | | | | | | |
|--------------------|----------------|----------------|----------------|----------------|----------------|----------------|-----------------|
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | - | 0,35 | 0,33 | 0,17 | 0,16 | m |
| min test time | - | - | 403 | 380 | 190 | 180 | s |
| | - | - | 0:06:43 | 0:06:20 | 0:03:10 | 0:03:00 | hh.mm:ss |
| Half Rate 60 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | 0,43 | - | - | - | - | m |
| min test time | - | 408 | - | - | - | - | s |
| | - | 0:06:48 | - | - | - | - | hh.mm:ss |
| Half Rate 100 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | 0,75 | - | - | - | - | - | m |
| min test time | 428 | - | - | - | - | - | s |
| | 0:07:08 | - | - | - | - | - | hh.mm:ss |

If the minimum test time due to multipath conditions exceeds the target test time, then the test runs for the minimum test time due to multipath conditions and the decision is made by comparing the result with the “derived test limit”. In this case early pass/fail decisions are obsolete.

If the target test time exceeds the minimum test time due to multipath conditions early pass/fail decisions can be headed for in order to accelerate test execution.

For an early decision a minimum number of (error) events is necessary.

For an early pass decision $n_e \geq 1$ (inclusive artificial error)

For an early fail decision $n_e \geq 7$

When the target test time has been reached the test is finished and a pass/fail decision can be made.

The error rate measured in this test shall be tested according to the values given in tables 14.19.3.1-2 or 14.19.3.1-3.

14.19.3.2.3 Test purpose

To verify that the MS does not exceed the first conformance requirement for TCH/AHS under propagation condition TU_{High} with an allowance for the statistical significance of the test.

To verify that the MS does not exceed the second conformance requirement for TCH/AHS under propagation condition TU_{High} with an allowance for the statistical significance of the test.

14.19.3.2.4 Method of test

14.19.3.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the mid ARFCN range, power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The multirate configuration indicates the use of a codec set limited to 7,4 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal), with training sequence code (TSC) = 0.

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36).

14.19.3.2.4.2 Procedure

- a) In addition to the wanted signal, the SS produces a further four interfering signals to produce scenario DTS-2.
 - A signal of type I1 using the same ARFCN as C1, with fading characteristics of TU_{High}, and signal level of -70 dBm.
 - A signal of type I1 using the same ARFCN as C1, with fading characteristics of TU_{High}, and signal level of -80 dBm.
 - A signal of type I1 using an ARFCN one higher than C1, with fading characteristics of TU_{High}, and signal level of -67 dBm.
 - A signal of type I3 using the same ARFCN as C1, and signal level of -87 dBm.
- b) The SS sets the level of the wanted signal to that indicated by Clev in table 14.19.3.2-2 or 14.19.3.2-3, and sets the fading characteristic of the signal to TU_{High}. Antenna correlation is set to 0 and antenna gain imbalance is set to 0dB.
- c) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of the class Ib and II, by examining at least the minimum number of samples of consecutive bits of class Ib and II. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.
- f) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps b) to e) are repeated.

Maximum/Minimum Duration of Test

Maximum: 19 minutes (GSM 400, GSM700, GSM850, GSM900), 19 minutes (DCS1800, PCS1900).

Minimum: 14 minutes (GSM 400, GSM700, GSM850, GSM900), 7 minutes (DCS1800, PCS1900).

14.19.3.2.5 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7.

Wrong decision risk F for one single error rate test:

$$F_{\text{pass}} = F_{\text{fail}} = F \text{ and } F = 0.2\%$$

Wrong decision probability D per test step:

$$D_{\text{pass}} = D_{\text{fail}} = D \text{ and } D = 0.0085\%$$

Parameters for limit lines:

1. D = 0.000085 wrong decision probability per test step.
2. M = 1.5 bad DUT factor
3. ne number of (error) events. This parameter is the x-ordinate in figure A7.1.3.1.
4. ns number of samples. The error rate is calculated from ne and ns.

Limit checking

Before limit checking is valid the minimum test time due to fading needs to be considered:

Testing under multipath and interference conditions requires that at least 990 wavelengths are crossed with the speed given in the fading profile. This leads to a minimum test time depending on the frequency range. No early pass/fail decision is allowed until the minimum test time due to fading has elapsed.

Table 14.19.3.2-1: Minimum test times due to TU 50 fading conditions

| Half Rate 50 km/h | | | | | | | |
|--------------------|----------------|----------------|----------------|----------------|----------------|----------------|-----------------|
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | - | 0,35 | 0,33 | 0,17 | 0,16 | m |
| min test time | - | - | 403 | 380 | 190 | 180 | s |
| | - | - | 0:06:43 | 0:06:20 | 0:03:10 | 0:03:00 | hh.mm:ss |
| Half Rate 60 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | - | 0,43 | - | - | - | - | m |
| min test time | - | 408 | - | - | - | - | s |
| | - | 0:06:48 | - | - | - | - | hh.mm:ss |
| Half Rate 100 km/h | | | | | | | |
| Frequency | 0,4 | 0,7 | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | 0,75 | - | - | - | - | - | m |
| min test time | 428 | - | - | - | - | - | s |
| | 0:07:08 | - | - | - | - | - | hh.mm:ss |

If the minimum test time due to multipath conditions exceeds the target test time, then the test runs for the minimum test time due to multipath conditions and the decision is made by comparing the result with the “derived test limit”. In this case early pass/fail decisions are obsolete.

If the target test time exceeds the minimum test time due to multipath conditions early pass/fail decisions can be headed for in order to accelerate test execution.

For an early decision a minimum number of (error) events is necessary.

For an early pass decision $ne \geq 1$ (inclusive artificial error)

For an early fail decision $ne \geq 7$

When the target test time has been reached the test is finished and a pass/fail decision can be made.

The error rate measured in this test shall be tested according to the values given in tables 14.19.3.2-2 or 14.19.3.2-3.

Table 14.19.3.2-2: Statistical test limits for bands other than DCS 1800 and PCS 1900 TCH/AHS DARP Phase II DTS-2

| DTS-2 | | | | | | | | |
|------------------|----------|------------------------|--------------------|-----------------------|--------------------|--------------------------|----------------------|-----------------------------|

14.20 VAMOS speech bearer tests

14.20.1 TCH HS – VDTS-1, VDTS-2/3 and VDTS-4

14.20.1.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.1.2 Conformance requirement

- For AQPSK modulated speech channels (TCH/HS, TCH/AFSx, TCH/AHSx, TCH/EFS, TCH/WFSx – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + I_r, where I_r = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.
- For the adjacent (200 kHz) channel requirements of speech and control channels in VAMOS mode in downlink, the wanted input signal level of the AQPSK modulated signal shall be: -75 dBm + I_{ar}, where: I_{ar} = the adjacent channel (200 kHz) interference ratio according to tables 2aa, 2ab and 2ag for VAMOS I MS, VAMOS II MS and VAMOS III MS respectively for VDTS-4 (see subclause Q.1).

3GPP TS 45.005, subclause 6.3.4

- For half rate speech channels (TCH/HS, TCH/AHSx) FER: $\leq 1\%$

3GPP TS 45.005, subclause 6.2.1a

- The C/I1 values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I1 is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.1.3 Test purpose

To verify that the MS does not exceed the conformance requirements for TCH/H under propagation condition TU_{high} with an allowance for the statistical significance of the test.

14.20.1.4 Method of test

14.20.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/H with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +4 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.14.20.1.4.2 Procedure

- The fading function is set to TU_{high} for MS indicating VAMOS I or VAMOS II support and TU_{high}/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- In addition to the wanted signal, the SS produces a further interferer signal to produce scenario VDTS-1 according to TS 45.005 Q.1.
- The SS sets the level of the wanted signal to (-93+Ir)dBm that indicated by Ir in table 14.20.1-2 or 14.20.1-3 for VAMOS I or table 14.20.1-4 or 14.20.1-5 for VAMOS II or table 14.20.1-6 through 14.20.1-9 for VAMOS III.
- The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- The SS determines the number of residual bit error events for the bits of the class Ib and II, by examining at least the minimum number of samples of consecutive bits of class Ib and II. Bits are only taken from those frames not signalled as erased.
- The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.
- The SS repeats step c) to f) with SCPIR_DL values 0 dB and -4 dB.
- If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- The SS discontinues all interfering signals.

- j) In addition to the wanted signal, the SS produces a further four interfering signals to produce scenario VDTS-2 according to TS 45.005 Q.1.
- k) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- l) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- m) The SS discontinues all interfering signals.
- n) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-3 according to TS 45.005 Q.1.
- o) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- p) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- q) The SS discontinues all interfering signals.
- r) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-4 according to TS 45.005 Q.1.
- s) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- t) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- u) For MS indicating VAMOS III support, steps b) to t) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7)

14.20.1.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.1-1: Minimum test times due to TU high fading conditions

| Fading speed 50km/h | | | | |
|---------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 403 | 380 | 190 | 180 |
| hh:mm:ss | 00:06:43 | 00:06:20 | 00:03:10 | 00:03:00 |

The error rate measured in this test shall be tested according to the values given in table 14.20.1-2 to table 14.20.1-9 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14.20.1-2: Statistical test limits for GSM 850 and GSM 900 TCH/H (VAMOS I MS)

| VDTS1/ VDTS-2/3 and VDTS-4 | | | | | | | | |
|----------------------------|----------|---------------|--------------------|-----------------------|--------------------|--------------------------|----------------------|-----------------------------|
| 0.8 to 0.9GHz | | Ir (C/I) / dB | Samples per second | Orig. BER requirement | Derived test limit | Target number of samples | Target test time (s) | Target test time (hh:mm:ss) |

14.20.2 TCH EFS – VDTS-1, VDTS-2/3 and VDTS-4

14.20.2.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.2.2 Conformance requirement

- For AQPSK modulated speech channels (TCH/HS, TCH/AFS_x, TCH/AHS_x, TCH/EFS, TCH/WFS_x – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + I_r, where I_r = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.
- For the adjacent (200 kHz) channel requirements of speech and control channels in VAMOS mode in downlink, the wanted input signal level of the AQPSK modulated signal shall be: -75 dBm + I_{ar}, where: I_{ar} = the adjacent channel (200 kHz) interference ratio according to tables 2aa, 2ab and 2ag for VAMOS I MS, VAMOS II MS and VAMOS III MS respectively for VDTS-4 (see subclause Q.1).

3GPP TS 45.005, subclause 6.3.4

- For full rate speech channels (TCH/FS, TCH/AFS_x, TCH/EFS, TCH/WFS_x) FER: ≤ 1 %

3GPP TS 45.005, subclause 6.2.1a

- The C/I₁ values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I₁ is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.2.3 Test purpose

To verify that the MS does not exceed the conformance requirements for TCH/EFS under propagation condition TU_{high} with an allowance for the statistical significance of the test.

14.20.2.4 Method of test

14.20.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/H with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +4 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.2.4.2 Procedure

- a) The fading function is set to TU_{high} for MS indicating VAMOS I or VAMOS II support and TU_{high}/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- b) In addition to the wanted signal, the SS produces a further interferer signal to produce scenario VDTS-1 according to TS 45.005 Q.1.
- c) The SS sets the level of the wanted signal to (-93+I_r)dBm that indicated by I_r in table 14.20.2-2 or 14.20.2-3 for VAMOS I or table 14.20.2-4 or 14.20.2-5 for VAMOS II or table 14.20.2-6 through 14.20.2-9 for VAMOS III.
- d) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of the class Ib and II, by examining at least the minimum number of samples of consecutive bits of class Ib and II. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.
- g) The SS repeats step c) to f) with SCPIR_DL values 0 dB and -4 dB.
- h) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- i) The SS discontinues all interfering signals.
- j) In addition to the wanted signal, the SS produces a further four interfering signals to produce scenario VDTS-2 according to TS 45.005 Q.1.
- k) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- l) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- m) The SS discontinues all interfering signals.

- n) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-3 according to TS 45.005 Q.1.
- o) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- p) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- q) The SS discontinues all interfering signals.
- r) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-4 according to TS 45.005 Q.1.
- s) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- t) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- u) For MS indicating VAMOS III support, steps b) to t) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

14.20.2.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.2-1: Minimum test times due to TU high fading conditions

| Fading speed 50km/h | | | | |
|---------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The error rate measured in this test shall be tested according to the values given in table 14.20.2-2 to table 14.20.2-9 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14.20.2-2: Statistical test limits for GSM 850 and GSM 900 TCH/EFS (VAMOS I MS)

14.20.3 TCH AFS – VDTS-1, VDTS-2/3 and VDTS-4

14.20.3.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.3.2 Conformance requirement

- For AQPSK modulated speech channels (TCH/HS, TCH/AFS_x, TCH/AHS_x, TCH/EFS, TCH/WFS_x – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + I_r, where I_r = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.
- For the adjacent (200 kHz) channel requirements of speech and control channels in VAMOS mode in downlink, the wanted input signal level of the AQPSK modulated signal shall be: -75 dBm + I_{ar}, where: I_{ar} = the adjacent channel (200 kHz) interference ratio according to tables 2aa, 2ab and 2ag for VAMOS I MS, VAMOS II MS and VAMOS III MS respectively for VDTS-4 (see subclause Q.1).

3GPP TS 45.005, subclause 6.3.4

- For full rate speech channels (TCH/FS, TCH/AFS_x, TCH/EFS, TCH/WFS_x) FER: ≤1 %

3GPP TS 45.005, subclause 6.2.1a

The C/I values in tables 2aa and 2ab are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.3.3 Test purpose

To verify that the MS does not exceed the conformance requirements for TCH/AFS under propagation condition TUhigh, no hopping with an allowance for the statistical significance of the test.

14.20.3.4 Method of test

14.20.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The multirate configuration indicates the use of a codec set limited to 12.20 kbit/s.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +4 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.3.4.2 Procedure

- a) The fading function is set to TUhigh, no Hopping for MS indicating VAMOS I or VAMOS II support and TUhigh/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- b) In addition to the wanted signal, the SS produces a further interferer signal to produce scenario VDTS-1 according to TS 45.005 Q.1.
- c) The SS sets the level of the wanted signal to $(-93+I_r)$ dBm that indicated by I_r in table 14.20.3-2 or 14.20.3-3 for VAMOS I or table 14.20.3-4 or 14.20.3-5 for VAMOS II or table 14.20.3-6 through 14.20.3-9 for VAMOS III.
- d) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.
- g) The SS repeats step c) to f) with SCPIR_DL values 0 dB and -4 dB.
- h) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 4.75 kbit/s with SCPIR_DL value set to +4 dB and steps b) to h) are repeated.
- j) The SS discontinues all interfering signals.
- k) In addition to the wanted signal, the SS produces a further four interfering signals to produce scenario VDTS-2 according to TS 45.005 Q.1.
- l) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.

- m) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- n) The SS discontinues all interfering signals.
- o) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-3 according to TS 45.005 Q.1.
- p) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- q) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- r) The SS discontinues all interfering signals.
- s) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-4 according to TS 45.005 Q.1.
- t) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.u) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- u) For MS indicating VAMOS III support, steps b) to t) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

14.20.3.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.3-1: Minimum test times due to TU high fading conditions

| Fading speed 50km/h | | | | |
|---------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The error rate measured in this test shall be tested according to the values given in table 14.20.3-2 to table 14.20.3-9 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14.20.3-2: Statistical test limits for GSM 850 and GSM 900 TCH/AFS (VAMOS I MS)

14.20.4 TCH AHS – VDTS-1,VDTS-2/3 and VDTS-4

14.20.4.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.4.2 Conformance requirement

- For QPSK modulated speech channels (TCH/HS, TCH/AFSx, TCH/AHSx, TCH/EFS, TCH/WFSx – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: $-93 \text{ dBm} + I_r$, where I_r = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.
- For the adjacent (200 kHz) channel requirements of speech and control channels in VAMOS mode in downlink, the wanted input signal level of the AQPSK modulated signal shall be: $-75 \text{ dBm} + I_{ar}$, where: I_{ar} = the adjacent channel (200 kHz) interference ratio according to tables 2aa, 2ab and 2ag for VAMOS I MS, VAMOS II MS and VAMOS III MS respectively for VDTS-4 (see subclause Q.1).

3GPP TS 45.005, subclause 6.3.4

- For half rate speech channels (TCH/HS, TCH/AHSx) FER: $\leq 1 \%$

3GPP TS 45.005, subclause 6.2.1a

The C/I values in tables 2aa and 2ab are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.4.3 Test purpose

To verify that the MS does not exceed the conformance requirements for TCH/AHS under propagation condition TU_{high} with an allowance for the statistical significance of the test.

14.20.4.4 Method of test

14.20.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The multirate configuration indicates the use of a codec set limited to 4.75 kbit/s.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +4 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.4.4.2 Procedure

- a) The fading function is set to TU_{high} for MS indicating VAMOS I or VAMOS II support and TU_{high}/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- b) In addition to the wanted signal, the SS produces a further interferer signal to produce scenario VDTS-1 according to TS 45.005 Q.1.
- c) The SS sets the level of the wanted signal to $(-93+I_r)$ dBm that indicated by I_r in table 14.20.4-2 or 14.20.4-3 for VAMOS I or table 14.20.4-4 or 14.20.4-5 for VAMOS II or table 14.20.4-6 through 14.20.4-9 for VAMOS III.

- d) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of the class Ib and II, by examining at least the minimum number of samples of consecutive bits of class Ib and II. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.
- g) The SS repeats step c) to f) with SCPIR_DL values 0 dB and -4 dB.
- h) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 7.4 kbit/s with SCPIR_DL value set to +4 dB and steps c) to h) are repeated.
- j) The SS discontinues all interfering signals.
- k) In addition to the wanted signal, the SS produces a further four interfering signals to produce scenario VDTS-2 according to TS 45.005 Q.1.
- l) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- m) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- n) The SS discontinues all interfering signals.
- o) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-3 according to TS 45.005 Q.1.
- p) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- q) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- r) The SS discontinues all interfering signals.
- s) In addition to the wanted signal, the SS produces a further one interference signal to produce scenario VDTS-4 according to TS 45.005 Q.1.
- t) The SS repeats step c) to f) with SCPIR_DL values 4 dB, 0 dB and -4 dB.
- u) If the MS signals VAMOS II or VAMOS III support step c) to f) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- v) For MS indicating VAMOS III support, steps b) to u) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7)

14.20.4.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.4-1: Minimum test times due to TU high fading conditions

| Fading speed 50km/h | | | | |
|---------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 403 | 380 | 190 | 180 |
| hh:mm:ss | 00:06:43 | 00:06:20 | 00:03:10 | 00:03:00 |

The error rate measured in this test shall be tested according to the values given in table 14.20.4-2 to table 14.20.4-9 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14.20.4-2: Statistical test limits for GSM 850 and GSM 900 TCH/AHS (VAMOS I MS)

14.20.5 TCH WFS – VDTS-1, VDTS-2/3 and VDTS-4

14.20.5.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.5.2 Conformance requirement

- For AQPSK modulated speech channels (TCH/HS, TCH/AFS_x, TCH/AHS_x, TCH/EFS, TCH/WFS_x – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: $-93 \text{ dBm} + I_r$, where I_r = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.
- For the adjacent (200 kHz) channel requirements of speech and control channels in VAMOS mode in downlink, the wanted input signal level of the AQPSK modulated signal shall be: $-75 \text{ dBm} + I_{ar}$, where: I_{ar} = the adjacent channel (200 kHz) interference ratio according to tables 2aa, 2ab and 2ag for VAMOS I MS, VAMOS II MS and VAMOS III MS respectively for VDTS-4 (see subclause Q.1).

3GPP TS 45.005, subclause 6.3.4

- For full rate speech channels (TCH/FS, TCH/AFS_x, TCH/EFS, TCH/WFS_x) FER: $\leq 1\%$

3GPP TS 45.005, subclause 6.2.1a

- The C/I1 values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I1 is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.5.3 Test purpose

To verify that the MS does not exceed the conformance requirements for TCH/WFS under propagation condition TUhigh noFH with an allowance for the statistical significance of the test.

14.20.5.4 Method of test

14.20.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/WFS with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The multirate configuration indicates the use of a codec set limited to 6.60 kbit/s

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SS commands the MS to create traffic channel loop back signalling erased frames.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.5.4.2 Procedure

- The fading function is set to TUhigh noFH for MS indicating VAMOS I or VAMOS II support and TUhigh/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- The SS sets SCPIR_DL to +4 dB.
- In addition to the wanted signal, the SS produces a further interferer signal to produce scenario VDTS-1 according to TS 45.005 Q.1.
- The SS sets the level of the wanted signal to $(-93+I_r)$ dBm that indicated by I_r in tables 14.20.5-2 to 14.20.5-9 for VAMOS I MS or tables 14.20.5-10 to 14.20.5-17 for VAMOS II MS or table 14.20.5-18 through 14.20.5-33 for VAMOS III, depending on the used interfering scenario and frequency band.
- The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.

- h) The SS repeats step c) to g) with SCPIR_DL values 0 dB and -4 dB.
- i) If the MS signals VAMOS II or VAMOS III support step c) to g) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- j) The SS uses a Channel Mode Modify procedure to change the active codec set to 12.65 kbit/s and steps b) to i) are repeated
- k) The SS discontinues all interfering signals.
- l) In addition to the wanted signal, the SS produces further four interfering signals to simulate the scenario VDTS-2 according to TS 45.005 Q.1.
- m) The SS uses SCPIR_DL value 4dB, steps d) to i) are repeated.
- n) The SS discontinues all interfering signals.
- o) In addition to the wanted signal, the SS produces one interference signal to simulate scenario VDTS-3 according to TS 45.005 Q.1.
- p) The SS uses SCPIR_DL value 4dB, steps d) to i) are repeated.
- q) The SS discontinues all interfering signals.
- r) In addition to the wanted signal, the SS produces one interference signal to simulate scenario VDTS-4 according to TS 45.005 Q.1.
- s) The SS uses SCPIR_DL value 4dB, steps d) to i) are repeated.
- t) For MS indicating VAMOS III support, steps b) to s) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

14.20.5.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.5-1: Minimum test times due to TU high fading conditions

| Fading speed 50km/h | | | | |
|---------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 201 | 190 | 95 | 90 |
| hh:mm:ss | 00:03:21 | 00:03:10 | 00:01:35 | 00:01:30 |

The error rate measured in this test shall be tested according to the values given in table 14.20.5-2 to table 14.20.5-33 depending on the indicated VAMOS MS type.

Note: The statistical test procedure for FER is based on 50 frames per second

14.20.6 FACCH/F – VDTS-1

14.20.6.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.6.2 Conformance requirement

- For AQPSK modulated speech channels (TCH/HS, TCH/AFS_x, TCH/AHS_x, TCH/EFS, TCH/WFS_x – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + Ir, where Ir = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.

3GPP TS 45.005, subclause 6.3.4

- For signalling channels (FACCH/F, FACCH/H, SACCH) FER: ≤ 5 %

3GPP TS 45.005, subclause 6.2.1a

- The C/I1 values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I1 is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.6.3 Test purpose

To verify that the MS does not exceed the conformance requirements for FACCH/F under propagation condition TU_{high} with an allowance for the statistical significance of the test.

14.20.6.4 Method of test

14.20.6.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/F with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +4 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.6.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I_1 (unwanted signal). The modulation of I_1 shall be AQPSK and the SCPIR_DL shall be set to 0 dB (scenario VDTS-1). Signal I_1 is continuous and has no fixed relationship with the bit transitions of the wanted signal. The interfering signal level is set to -93 dBm and the fading characteristic of the wanted and the interfering signal is TUHigh noFH for MS indicating VAMOS I or VAMOS II support and TUhigh noFH/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- b) Depending of the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values, the SS sets the level of the wanted signal specified by C_{lev} in table 14.20.6-2 through 14.20.6-5.
- c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Each repeated L2 frame indicates a frame erasure event.
- d) The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.
- e) The SS repeats step b) to d) with SCPIR_DL values 0 dB and -4 dB.
- f) If the MS signals VAMOS II or VAMOS III support step b) to d) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- g) For MS indicating VAMOS III support, steps b) to f) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

14.20.6.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.6-1: Minimum test times due to TU high fading conditions

| Full Rate 50 km/h | | | | | |
|-------------------|----------|----------|----------|----------|----------|
| Frequency | 0,85 | 0,9 | 1,8 | 1,9 | GHz |
| Wavelength | 0,35 | 0,33 | 0,17 | 0,16 | m |
| min test time | 629 | 594 | 297 | 281 | s |
| | 00:10:29 | 00:09:54 | 00:04:57 | 00:04:41 | hh:mm:ss |

The error rate measured in this test shall be tested according to the values given in table 14-12.20.6-2 through 12.20.6-5 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

14.20.7 FACCH/H – VDTS-1

14.20.7.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.7.2 Conformance requirement

- For AQPSK modulated speech channels (TCH/HS, TCH/AFS_x, TCH/AHS_x, TCH/EFS, TCH/WFS_x – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + Ir, where Ir = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.

3GPP TS 45.005, subclause 6.3.4

- For signalling channels (FACCH/F, FACCH/H, SACCH) FER: $\leq 5\%$

3GPP TS 45.005, subclause 6.2.1a

- The C/I1 values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I1 is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.7.3 Test purpose

To verify that the MS does not exceed the conformance requirements for FACCH/H under propagation condition TUhigh with an allowance for the statistical significance of the test.

14.20.7.4 Method of test

14.20.7.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/H with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +4 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.7.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I_1 (unwanted signal). The modulation of I_1 shall be AQPSK and the SCPIR_DL shall be set to 0 dB (scenario VDTS-1). Signal I_1 is continuous and has no fixed relationship with the bit transitions of the wanted signal. The interfering signal level is set to -93 dBm and the fading characteristic of the wanted and the interfering signal is TUHigh noFH for MS indicating VAMOS I or VAMOS II support and TUhigh noFH/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- b) Depending of the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values, the SS sets the level of the wanted signal specified by C_{lev} in table 14.20.7-2 through 14.20.7-5.
- c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Each repeated L2 frame indicates a frame erasure event.
- d) The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/H frames.
- e) The SS repeats step b) to d) with SCPIR_DL values 0 dB and -4 dB
- f) If the MS signals VAMOS II or VAMOS III support step b) to d) shall be repeated with SCPIR_DL values -8 dB and -10 dB.
- g) For MS indicating VAMOS III support, steps b) to f) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

14.20.7.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.7-1: Minimum test times due to TU high fading conditions

| Fading speed 50km/h | | | | |
|---------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 629 | 594 | 297 | 281 |
| hh:mm:ss | 00:10:29 | 00:09:54 | 00:04:57 | 00:04:41 |

The error rate measured in this test shall be tested according to the values given in table 14-12.20.7-2 through 12.20.7-5 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14-12.20.7-2: Statistical test limits for FACCH/H (VAMOS I MS)

| VDTS-1 (GSM 900 / 850) | | | Samples | Orig. BER requirement | Derived test limit | Target number of samples | Target test time /s | Target test time (hh:mm:ss) |

14.20.8 SACCH – VDTS-1

14.20.8.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.8.2 Conformance requirement.

- For AQPSK modulated speech channels (TCH/HS, TCH/AFSx, TCH/AHSx, TCH/EFS, TCH/WFSx – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + Ir, where Ir = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.

3GPP TS 45.005, subclause 6.3.4

- For signalling channels (FACCH/F, FACCH/H, SACCH) FER: $\leq 5\%$

3GPP TS 45.005, subclause 6.2.1a

- The C/I1 values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I1 is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.8.3 Test purpose

To verify that the MS does not exceed the conformance requirement under TUhigh propagation condition with an allowance for the statistical significance of the test.

14.20.8.4 Method of test

14.20.8.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/F with an ARFCN in the Mid ARFCN range, power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +4 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.8.4.2 Procedure

- a) In addition to the wanted signal, the SS generates an independent, uncorrelated interfering signal, Standard Test Signal I_1 (unwanted signal). The modulation of I_1 shall be AQPSK and the SCPIR_DL shall be set to 0 dB (scenario VDTS-1). Signal I_1 is continuous and has no fixed relationship with the bit transitions of the wanted signal. The interfering signal level is set to -93 dBm and the fading characteristic of the wanted and the interfering signal is TUhigh noFH for MS indicating VAMOS I or VAMOS II support and TUhigh noFH/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- b) Depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values, the SS sets the level of the wanted signal specified by C_{lev} in table 14.20.8-3 through 14.20.8-6.
- c) Following the reception of the last burst of the MS UL SACCH corresponding to the second SACCH block of a SACCH interval, the SS shall compute the PCL value to use in the SS DL SACCH blocks for the next SACCH interval using Table 14.20.8-1.
 - i) The first two columns of Table 14.20.8-1 are inputs, the last column is a output.
 - ii) Last commanded PCL by SS refers to the PCL used in the DL SACCH L1 header of SACCH block N
 - iii) Corresponding reported MS PCL refers to the PCL reported in the UL SACCH L1 header of SACCH block N

- iv) Next commanded PCL by SS refers to the PCL that the SS will use in the DL SACCH L1 headers for SACCH block N+1.

Table 14.20.8-1: Power Control Level Used by SS

| Last commanded PCL by SS | Corresponding Reported MS PCL | Next commanded PCL by SS |
|--------------------------|-------------------------------|--------------------------|
| 7 | 7 | 8 |
| 7 | 8 | 9 |
| 7 | 9 | 8 |
| 8 | 7 | 9 |
| 8 | 8 | 9 |
| 8 | 9 | 7 |
| 9 | 7 | 8 |
| 9 | 8 | 7 |
| 9 | 9 | 7 |

- d) The SS compares the MS reported PCL in the uplink SACCH L1 header of the SACCH block against the expected PCL (based on the previously commanded PCL in the downlink SACCH L1 header taking into account round-trip delays). If the MS reported PCL in the uplink SACCH L1 header is different than the expected PCL, this will invoke a frame erasure event.
- e) The SS determines the frame erasure events during at least the minimum number of samples of SACCH frames.
- f) The SS repeats step b) to e) with SCPIR_DL values 0 dB and -4 dB
- g) For MS indicating VAMOS II or VAMOS III support step b) to e) are repeated with SCPIR_DL -8 dB and -10 dB.
- h) For MS indicating VAMOS III support, steps b) to g) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

14.20.8.5 Test Requirements

Testing should be performed using statistical methods that could lead to an early pass/fail decision with test time significantly reduced for MS with FER not on the limit.

For information on statistical testing refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.8-2: Minimum test times due to TU high fading conditions

| Full Rate @ 50km/h | | | | |
|--------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 4835 | 4566 | 2283 | 2163 |
| hh:mm:ss | 01:20:35 | 01:16:06 | 00:38:03 | 00:36:03 |

NOTE: Minimum test time calculation due to fading based on the 480ms schedule

The error rates measured shall not exceed the test limit error rate values given in table 14.20.8-3 through 14.20.8-6 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14.20.8-3: Limits for SACCH VDTS-1(VAMOS I MS)

14.20.9 Repeated FACCH/F – VDTS-1

14.20.9.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.9.2 Conformance requirement

- The reference performance for the Repeated Associated control channel performance in *VAMOS mode* shall be according to subclause 6.2.4.

3GPP TS 45.005 subclause 6.2.1a

- For Repeated Downlink FACCH and Repeated SACCH (see 3GPP TS 44.006), the minimum input signal level for which the reference performance shall be met is specified in table 1i, 1s, 1t, 1v and 1x, according to the propagation condition and type of equipment. The performance requirements for GSM 400 and GSM 700 systems are as for GSM 900 in table 1i, 1s, 1t, 1v and 1x, except that the GSM 400 MS speed is doubled from that of GSM 900, e.g. TU50 becomes TU100, and the GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60.

3GPP TS 45.005 subclause 6.2.4

- The reference performance for Repeated Downlink FACCH and Repeated SACCH shall be FER ≤ 5%.

3GPP TS 45.005 subclause 6.2.4

- When calculating FER, a FACCH frame and its repetition or a SACCH frame and its repetition respectively, shall be counted as one frame and a frame erasure shall be counted when neither the FACCH frame nor its repetition or neither the SACCH frame nor its repetition respectively, could be successfully decoded.

3GPP TS 45.005 subclause 6.2.4

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + Ir, where Ir is the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.

3GPP TS 45.005, subclause 6.3.4

- The C/I_1 values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I_1 is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.9.3 Test purpose

To verify that the MS does not exceed the conformance requirements for Repeated FACCH/F in a VDTS-1 configuration under propagation condition TUhigh with an allowance for the statistical significance of the test.

14.20.9.4 Method of test

14.20.9.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/F with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to +0 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS IIsu
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.pported (TSPC_VAMOS_Type 2)

14.20.9.4.2 Procedure

- In addition to the wanted signal, the SS generates an independent, uncorrelated interfering signal, Standard Test Signal I_1 (unwanted signal). The modulation of I_1 shall be AQPSK and the SCPIR_DL shall be set to 0 dB (scenario VDTS-1). Signal I_1 is continuous and has no fixed relationship with the bit transitions of the wanted signal. The interfering signal level is set to -93 dBm and the fading characteristic of the wanted and the interfering signal is TUhigh noFH for MS indicating VAMOS I or VAMOS II support and TUhigh noFH/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- Depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values, the SS sets the level of the wanted signal specified by C_{lev} in table 14.20.9-2 through 14.20.9-6.
- The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Each repeated L2 frame indicates a frame erasure event.
- The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.
- For MS indicating VAMOS III support, steps b) to d) are repeated with the SS fading function set in turn to TUhigh/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

14.20.9.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER is not on the limit.

For more information on statistical testing refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.9-1: Minimum test times due to TU high fading conditions

| TCH/F @ 50 km/h | | | | |
|-------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 604 | 570 | 285 | 270 |
| hh:mm:ss | 00:10:04 | 00:09:30 | 00:04:45 | 00:04:30 |

NOTE: Minimum test time calculation due to fading is based on the best rate 50/3 frame relation in table 14.20.9-4

The error rate measured in this test shall be tested according to the values given in table 14.20.9-2 through 14.20.9-6 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14.20.9-2: Statistical test limits for Repeated FACCH/F (VAMOS I MS)

| VDTS-1 (GSM 900 / 850) | | | Orig. BER requirement | Derived test limit | Target number of samples |
|--------------------------|--------------|---|-----------------------|--------------------|--------------------------|
| Channel | SCPIR _DL/dB | C _{lev} /dBm [-93] +I _r | | | |
| FACCH/F | 0 | -86 | 0.05 | 0.0617 | 5592 |

14.20.10 Repeated SACCH – VDTS-1

14.20.10.1 Definition

The VAMOS reference test scenarios define a set of interfering signals and corresponding performance limits. These tests are a measure of the capability of the VAMOS receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of these specific unwanted modulated signals.

14.20.10.2 Conformance requirement

- The reference performance for the Repeated Associated control channel performance in *VAMOS mode* shall be according to subclause 6.2.4.

3GPP TS 45.005 subclause 6.2.1a

- For Repeated Downlink FACCH and Repeated SACCH (see 3GPP TS 44.006), the minimum input signal level for which the reference performance shall be met is specified in table 1i, 1s, 1t, 1v and 1x according to the propagation condition and type of equipment. The performance requirements for GSM 400 and GSM 700 systems are as for GSM 900 in table 1i, 1s, 1t, 1v and 1x except that the GSM 400 MS speed is doubled from that of GSM 900, e.g. TU50 becomes TU100, and the GSM 700 MS speed is increased by a factor of 1.2, e.g. TU50 becomes TU60.

3GPP TS 45.005 subclause 6.2.4

- The reference performance for Repeated Downlink FACCH and Repeated SACCH shall be $FER \leq 5\%$.

3GPP TS 45.005 subclause 6.2.4

- When calculating FER, a FACCH frame and its repetition or a SACCH frame and its repetition respectively, shall be counted as one frame and a frame erasure shall be counted when neither the FACCH frame nor its repetition or neither the SACCH frame nor its repetition respectively, could be successfully decoded.

3GPP TS 45.005 subclause 6.2.4

- For AQPSK modulated speech channels (TCH/HS, TCH/AFS_x, TCH/AHS_x, TCH/EFS, TCH/WFS_x – in downlink), and their associated control channels, the applicable requirements are in tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS.

3GPP TS 45.005, subclause 6.3.2.1

- For AQPSK modulated speech channels and control channels in downlink, the wanted input signal level shall be: -93 dBm + Ir, where Ir = the interference ratio according to tables 2aa for VAMOS I MS, 2ab for VAMOS II MS and 2ag for VAMOS III MS for VDTS-1, VDTS-2 and VDTS-3 (see subclause Q.1) for speech and associated control channels in VAMOS mode in downlink.

3GPP TS 45.005, subclause 6.3.4

- The C/I1 values in tables 2aa, 2ab and 2ag are ratios of received powers expressed in dB; where C is the received power of the downlink signal using Normal burst for AQPSK (see 3GPP TS 45.002) and I1 is the received power of the dominant external interferer (Co-channel 1 in tables Q.1-1 to Q.1-3) for VDTS-1 to VDTS-3 or the received power of the adjacent channel interferer for VDTS-4 (Adjacent 1 in table Q.1-4).

3GPP TS 45.005, subclause Q.1

14.20.10.3 Test purpose

To verify that the MS does not exceed the conformance requirement under TU_{high} propagation condition with an allowance for the statistical significance of the test.

14.20.10.4 Method of test

For details on Repeated SACCH Layer 1 test method, please refer to Annex 10.

14.20.10.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/F with an ARFCN in the Mid ARFCN range, power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

The SCPIR_DL is set to 0 dB.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.10.4.2 Procedure

- a) In addition to the wanted signal, the SS generates an independent, uncorrelated interfering signal, Standard Test Signal I_1 (unwanted signal). The modulation of I_1 shall be AQPSK and the SCPIR_DL shall be set to 0 dB (scenario VDTS-1). Signal I_1 is continuous and has no fixed relationship with the bit transitions of the wanted signal. The interfering signal level is set to -93 dBm and the fading characteristic of the wanted and the interfering signal is TU_{High} noFH for MS indicating VAMOS I or VAMOS II support and TU_{High} noFH/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for MS indicating VAMOS III support.
- b) Depending of the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values, the SS sets the level of the wanted signal specified by C_{lev} in table 14.20.10-3 through 14.20.10-6.
- c) Following the reception of the last burst of the MS UL SACCH corresponding to the second SACCH block of a SACCH interval, the SS shall compute the PCL value to use in the SS DL SACCH blocks for the next SACCH interval using Table 14.20.10-1.
 - i) The first two columns of Table 14.20.10-1 are inputs, the last column is a output.
 - ii) Last commanded PCL by SS refers to the PCL used in the DL SACCH L1 header of SACCH block N
 - iii) Corresponding reported MS PCL refers to the PCL reported in the UL SACCH L1 header of SACCH block N
 - iv) Next commanded PCL by SS refers to the PCL that the SS will use in the DL SACCH L1 headers for SACCH block N+1.

Table 14.20.10-1: Power Control Level Used by SS

| Last commanded PCL by SS | Corresponding Reported MS PCL | Next commanded PCL by SS |
|--------------------------|-------------------------------|--------------------------|
| 7 | 7 | 8 |
| 7 | 8 | 9 |
| 7 | 9 | 8 |
| 8 | 7 | 9 |
| 8 | 8 | 9 |
| 8 | 9 | 7 |
| 9 | 7 | 8 |
| 9 | 8 | 7 |
| 9 | 9 | 7 |

- d) The SS compares the MS reported PCL in the uplink SACCH L1 header of the SACCH block against the expected PCL (based on the previously commanded PCL in the downlink SACCH L1 header taking into account round-trip delays). If the MS reported PCL in the uplink SACCH L1 header is different than the expected PCL, this will invoke a frame erasure event.
- e) The SS determines the frame erasure events during at least the minimum number of samples of SACCH frames.
- f) For MS indicating VAMOS III support, steps b) to e) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

14.20.10.5 Test Requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER not on the limit.

For information on statistical testing refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.10-2: Minimum test times due to TU50 fading conditions

| TCH/F @ 50 km/h | | | | |
|-------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 9676 | 9138 | 4569 | 4329 |
| hh:mm:ss | 02:41:16 | 02:32:18 | 01:16:09 | 01:12:09 |

NOTE: Minimum test time calculation due to fading is based on the 960 ms schedule for two SACCH frames

The error rates measured shall not exceed the test limit error rate values given in table 14.20.10-3 through 14.20.10-6 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

Table 14.20.10-3: Limits for Repeated SACCH VDTS-1(VAMOS I MS)

| VDTS-1 (GSM 900 / 850) | | | Samples | Orig. BER requirement | Derived test limit | Target number of samples | Target test time /s | Target test time (hh:mm:ss) |

14.20.11 Downlink DTX TCH / AHS in VAMOS configuration

14.20.2.1 Definition

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

14.20.11.2 Conformance requirement

- For speech channels in *VAMOS Mode*, and their associated control channels, the minimum input signal level for which the reference performance shall be met is specified in table 1s, 1t, 1u, 1v, 1x and 1y according to the propagation condition and type of equipment.
- For half rate speech channels (TCH/HS, TCH/AHSx) FER: $\leq 1\%$
- In addition for speech channels the residual class Ib BER and residual class II BER performance shall not exceed the specified values in table 1s, 1t, 1u, 1x, 1y and 1v at the corresponding signal level in dBm.

3GPP TS 45.005, subclause 6.2.1a

14.20.11.3 Test purpose

The purpose of this test case is to verify the VAMOS II or VAMOS III mobile receiver performance when the paired VAMOS subchannel user goes into and comes out of DTX and to verify that the MS does not exceed conformance requirements under propagation condition TU_{high} with no frequency hopping with an allowance for the statistical significance of the test.

14.20.11.4 Method of test

The test is performed according the VAMOS DTX test scenario in downlink specified in 3GPP 45.005 Q.6

14.20.11.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS 7.4 with an ARFCN in the mid ARFCN range. The power control level set to maximum power. RADIO_LINK_TIMEOUT is set to maximum.

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 form TSC set 2. The other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1.

DTX is set on the VAMOS subchannel 1 according to the probability ratio specified in 3GPP 45.005 Q.6

Specific PICS Statements:

- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

14.20.11.4.2 Procedure

- a) The fading profile for the wanted is set to TUHigh for VAMOS II MS and TUhigh/(Corr.=0, AGI=0 dB as per 3GPP TS 45.005 Annex Q.7) for VAMOS III MS.
- b) The SCPIR_DL is set to -10 dB.
- c) Depending on the network frequency the SS sets the signal level for the AQPSK- and GMSK modulated signal indicated in table 14.20.11-2
- d) The SS compares the modulation of the signal sent to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of the class Ib and II, by examining at least the minimum number of samples of consecutive bits of class Ib and II. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully if it is not signalled as erased.
- g) For MS indicating VAMOS III support, steps b) to f) are repeated with the SS fading function set in turn to TU high/(Corr.=0,7, AGI=-6 dB as per 3GPP TS 45.005 Annex Q.7).

14.20.11.4.3 Test requirements

Testing should be performed using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with FER/BER not on the limit.

For more information on statistical testing of BER/BLER performance, especially the definition of limit lines refer to Annex 7 (A7.1.3.2)

Before limit checking is valid the minimum test time due to fading needs to be considered:

Table 14.20.11-1: Minimum test times due to TU high fading conditions

| Fading speed 50km/h | | | | |
|---------------------|----------|----------|----------|----------|
| Frequency /MHz | 850 | 900 | 1800 | 1900 |
| Wave length / m | 0,35 | 0,33 | 0,17 | 0,16 |
| Min. Test time /s | 403 | 380 | 190 | 180 |
| hh:mm:ss | 00:06:43 | 00:06:20 | 00:03:10 | 00:03:00 |

The error rate measured in this test shall be tested according to the values given in table 14.20.11-3 to table 14.20.11-8 depending on the indicated VAMOS type and the relevant antenna correlation and antenna gain imbalance values.

NOTE: The wanted signal level are derived form calculation using 3GPP TS 45.005 table 1u for VAMOS II MS, 1y for VAMOS III MS and Annex Q.6 (VAMOS DTX scenario in downlink).

Table 14.20.11-2: Signal level for AQPSK and GMSK

| Frequency band | Signal level /dBm | |
|-----------------------|-------------------|--------|
| | AQPSK | GMSK |
| GSM 900 and GSM 850 | -86,15 | -96,65 |
| DCS 1800 and PCS 1900 | -85,15 | -95,65 |

15 Timing advance and absolute delay

15.1 GSM Timing advance and absolute delay

15.1.1 Definition

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

15.1.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of ± 1 bit period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of ± 1 bit period.

3GPP TS 05.10, subclause 6.4.

- 3) When the MS receives a new value of TA on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period, after the SACCH frame containing the new TA value.

3GPP TS 05.10, subclause 6.5.

- 4) The MS shall signal the used TA to the BS, in the L1 header of the uplink SACCH message.

3GPP TS 05.10, subclause 6.4, 3GPP TS 04.04, subclause 7.2.

15.1.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that the MS implements a new timing advance value as signalled on the SACCH as in the requirement.
- 5) To verify that the MS sends the TA used on the uplink SACCH as in the requirement.

15.1.4 Method of test

15.1.4.1 Initial conditions

The SS sends "MAXRETRANS = 7" and "TX-INTEGGER = 3" on the BCCH.

The MS is brought into MM state "idle, updated".

15.1.4.2 Procedure

- a) The SS pages the MS after 10 s.
- b) The SS does not respond to the first 7 CHANNEL REQUEST messages from the MS. The SS responds to the 8th CHANNEL REQUEST from the MS on the RACH by sending an IMMEDIATE ASSIGNMENT message, with TA set to 0.
- c) The SS continues to set up a call according to the generic call set up procedure.
- d) The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

For GSM 400 MS, the SS signals the TA values 35, 70, 105, 140, 175, 210, 219, and one random value other than these values to the MS in consecutive SACCH blocks.

The SS determines the TA value set in the L1 header on the uplink SACCH for each timing advance.

The SS measures the absolute delay for all bursts.

15.1.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of ± 1 bit period:

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new timing advance at the first TDMA frame belonging to the next reporting period after the SACCH frame containing the new TA value.

The TA field in the uplink SACCH L1 header shall contain to the most recently ordered TA value.

15.2 Void

15.3 Void

15.4 Void

15.5 Void

15.6 GPRS Timing advance and absolute delay

15.6.1 Definition

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

The timing advance procedure is used to derive the correct value for timing advance that the MS has to use for the uplink transmission of radio blocks.

The timing advance procedure comprises two parts:

- initial timing advance estimation;

- continuous timing advance update.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

15.6.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of ± 1 bit period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of ± 1 bit period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 bit periods on timeslots $TN = 0$ and 4, and 156 bit periods on timeslots with $TN = 1, 2, 3, 5, 6$ and 7, rather than 156.25 bit periods on all timeslots. In case of a packet switched multislot configuration the common timebase shall be derived from all timeslots monitored by the MS. In this case, the MS may assume that the BTS uses a timeslot length of 156.25 bit periods on all timeslots

3GPP TS 05.10, subclause 6.4.

- 3) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Within the packet resource assignments (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using TA=0.

3GPP TS 05.10, subclause 6.5.2.

- 4) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.

3GPP TS 05.10, subclause 6.5.2.

- 5) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Upon initiation of the continuous timing advance procedure the MS shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 6) For an MS in Packet transfer mode, except MS class A in dedicated mode:

The network may request the MS to send 4 access bursts to calculate a new TA value. For this purpose the network sets the system information element CONTROL_ACK_TYPE to indicate that the MS is to respond with a PACKET_CONTROL_ACKNOWLEDGEMENT consisting of 4 access bursts (see 3GPP TS 04.60), and sends a PACKET_POLLING_REQUEST to the MS. In this case, the MS shall transmit 4 consecutive access bursts on the assigned resources.

3GPP TS 05.10, subclause 6.5.2.

- 7) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), the MS shall use the included TA value until it receives a new value on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 8) For an MS in Packet idle mode, except MS class A in dedicated mode:

If the MS receive a packet downlink assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by a Packet Power Control/Timing Advance message, the MS shall start the packet transfer after the TA value is received on the PACCH.

3GPP TS 05.10, subclause 6.5.2.

- 9) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, the MS shall not use the continuous timing advance procedure.

3GPP TS 05.10, subclause 6.5.2.

- 10) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives a new or updated TA value on the downlink PTCCH or downlink PACCH, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA value.

3GPP TS 05.10, subclause 6.9.

NOTE: A MS class A in dedicated mode has to follow the procedures described in 3GPP TS 05.10 subclause 6.5.1.

15.6.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, when it receives an updated value of TA from the BTS on the downlink PTCCH, uses the last received TA value for the uplink transmission, respecting conformance requirement 10.
- 5) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, upon initiation of the continuous timing advance procedure shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.
- 6) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet polling message as defined in conformance requirement 6, sends 4 access bursts on a network assigned uplink resource.
- 7) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), uses the included TA value until it receives a new value on PTCCH.
- 8) To verify that an MS in Packet idle mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet downlink assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure or a Packet Power Control/Timing Advance message, it starts the packet transfer after the TA value is received from the SS.
- 9) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, does not use the continuous timing advance procedure.

15.6.4 Method of test

15.6.4.1 Initial conditions

The test shall be run under the default GPRS conditions defined in clause 40.

The SS sets the System Information 1 parameter CONTROL_ACK_TYPE to "0".

The MS is brought into packet idle mode.

The MS shall be PDP context activated.

NOTE: The Test Requirements (15.6.5) are based on a One Phase Packet Access protocol, see 3GPP TS 04.60.

15.6.4.2 Procedure

- a) The SS pages MS on the PCH. The SS measures the receive/transmit delay for each burst. The SS then sends a Packet Access Reject message.
- b) The MS is made to send a Channel Request by triggering the MS to send a minimum of 6000 octets. The SS transmits a packet resource assignment to the MS with a valid TAI. The SS transmits a TA value on the PTCCH for this TAI which is neither 0 nor 1. The SS measures the receive/transmit delay for several bursts, using the conditions defined in Conformance requirement 10).
- c) The SS transmits a number of different TA values on the PTCCH for the TAI assigned to the MS. The SS also changes the TA values on the PTCCH for the other TAI in such a way that there is no correlation between TA values. The SS measures the receive/transmit delay for several bursts, using the conditions defined in Conformance requirement 10).
- d) The SS transmits a new TA value, different by more than 1 from the previously transmitted one, in such a way that the MS can only correctly receive the last (4th) occurrence of the new TA value. The SS measures the receive/transmit delay for several bursts after the 4th (and correctly received) TA transmission, using the conditions defined in Conformance requirement 10).
- e) The MS is made to send a Channel Request by triggering the MS to send a minimum of 6000 octets. The SS responds with a Packet Queuing Notification. The SS sends a Packet Polling, addressing the MS with its TFI. The SS measures the receive/transmit delay for each of the 4 access bursts after the Packet Polling message is sent.
- f) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX, TIMING_ADVANCE_TIMESLOT_NUMBER, and TIMING_ADVANCE_VALUE. As part of the subsequent continuous timing advance update procedure, the SS sends a timing advance value on the downlink PTCCH for the MS, that is different from the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for several bursts, once after the Packet Uplink Assignment is sent, and once after the MS should be using the updated TA, using the conditions defined in Conformance requirement 10).
- g) The MS is brought back to Packet idle mode. The SS sends a Immediate Assignment to the MS with no valid Timing Advance included. The SS polls the MS by sending an RLC Block. The SS waits 2 seconds and then sends a PACKET POWER CONTROL/TIMING ADVANCE message with valid timing advance information. The SS sends further RLC Blocks. The SS measures the receive/transmit delay for several bursts.
- h) The MS is made to send a Packet Channel Request by triggering the MS to send a minimum of 6000 octets. The SS sends a Packet Uplink Assignment to the MS with TIMING_ADVANCE_VALUE set to a value different from the last one ordered on the PTCCH, and the TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER fields not present. The SS continues to transmit TA values on the PTCCH. These shall be different from the TA value TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for several bursts, once after the transmission of the Packet Uplink Assignment, and once after the SS transmits the new TA using the continuous update procedure for the TAI chosen in step g), using the conditions defined in Conformance requirement 10).

15.6.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of ± 1 bit period.

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

In step a) the MS shall transmit an access burst on the RACH.

In step b) the MS shall send access bursts on the PTCCH on the subchannel defined by the TAI with TA = 0.

In step c) the MS shall use the updated TA values.

In step d) the MS shall use the updated TA value.

In step e) the MS shall transmit 4 access bursts.

In step f) the MS shall use the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment first, and change to the Timing Advance value transmitted on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step g) the MS shall not transmit on the allocated resources before it received a Timing Advance value via a PACKET POWER CONTROL/TIMING ADVANCE message on the downlink PACCH.

In step h) the last TA value received from the SS is the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment.

15.7 ECSD Timing advance and absolute delay

15.7.1 Definition

Timing advance (TA) is a time offset in symbols as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

NOTE: For normal bursts for GMSK modulation, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For normal bursts for 8-PSK modulation, the common burst reference point is defined to be the transition from symbol 13 to symbol 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

15.7.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of ± 1 symbol period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of ± 1 symbol period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 symbol periods on timeslots TN = 0 and 4, and 156 symbol periods on timeslots with TN = 1, 2, 3, 5, 6 and 7, rather than 156,25 symbol periods on all timeslots. In case of a circuit switched multislot configuration, the common timebase shall be derived from the main channel and the TA values received on other channels shall be neglected.

3GPP TS 05.10, subclause 6.4.

- 3) When the MS receives a new value of TA on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period, after the SACCH frame containing the new TA value.

3GPP TS 05.10, subclause 6.5.1

- 4) The MS shall signal the used TA to the BS, in the L1 header of the uplink SACCH message.

3GPP TS 05.10, subclause 6.5.1, 3GPP TS 04.04, subclause 7.2.

15.7.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that the MS implements a new timing advance value as signalled on the SACCH as in the requirement.
- 5) To verify that the MS sends the TA used on the uplink SACCH as in the requirement.
- 6) To verify that a multislot capable MS operates in accordance with the conformance requirement 2.

15.7.4 Method of test

Initial conditions

The SS sends "MAXRETRANS = 7" and "TX-INTEGGER = 3" on the BCCH.

The MS is brought into MM state "idle, updated".

Procedure

- a) The SS pages the MS after 10 s.
- b) The SS does not respond to the first 7 CHANNEL REQUEST messages from the MS. The SS responds to the 8th CHANNEL REQUEST from the MS on the RACH by sending an IMMEDIATE ASSIGNMENT message, with TA set to 0.
- c) The SS continues to set up a call according to the generic call set up procedure for ECSD. In the case of a multislot capable MS, the call is set up according to the generic call set up procedure for multislot configuration for ECSD and the SS commands the MS to operate with maximum number of both uplink and downlink timeslots according to the multislot class of the MS. In the case of class A ECSD MS, 8-PSK modulated channels shall be used in the downlink. In the case of class B ECSD MS, GMSK modulated channels shall be used in the downlink and 8-PSK modulated channels in the uplink.
- d) The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

For GSM 400 MS, the SS signals the TA values 35, 70, 105, 140, 175, 210, 219, and one random value other than these values to the MS in consecutive SACCH blocks.

In the case of a multislot capable MS, the TA values defined above are signalled on the main channel of the multislot configuration, and on the subchannels TA values different from those ones are signalled.

The SS determines the TA value set in the L1 header on the uplink SACCH for each timing advance.

The SS measures the absolute delay for all bursts.

15.7.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of ± 1 symbol period:

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new timing advance at the first TDMA frame belonging to the next reporting period after the SACCH frame containing the new TA value.

The TA field in the uplink SACCH L1 header shall contain to the most recently ordered TA value.

The multislot capable MS shall use a common TA value for all uplink channels, derived from the main downlink channel of the multislot configuration. The TA value in the uplink SACCH L1 header shall be that one.

15.8 EGPRS timing advance and absolute delay

15.8.1 Definition

Timing advance (TA) is a time offset in symbols as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

The timing advance procedure is used to derive the correct value for timing advance that the MS has to use for the uplink transmission of radio blocks.

The timing advance procedure comprises two parts:

- initial timing advance estimation;
- continuous timing advance update.

NOTE: For normal bursts for GMSK modulation, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For normal bursts for 8-PSK modulation, the common burst reference point is defined to be the transition from symbol 13 to symbol 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

15.8.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of ± 1 symbol period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of ± 1 symbol period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 symbol periods on timeslots $TN = 0$ and 4, and 156 symbol periods on timeslots with $TN = 1, 2, 3, 5, 6$ and 7, rather than 156.25 symbol periods on all timeslots. In case of a packet switched multislot configuration the common timebase shall be derived from all timeslots monitored by the MS. In this case, the MS may assume that the BTS uses a timeslot length of 156.25 symbol periods on all timeslots

3GPP TS 05.10, subclause 6.4.

- 3) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Within the packet resource assignments (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using TA=0.

3GPP TS 05.10, subclause 6.5.2.

- 4) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.

3GPP TS 05.10, subclause 6.5.2.

- 5) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Upon initiation of the continuous timing advance procedure the MS shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 6) For an MS in Packet transfer mode, except MS class A in dedicated mode:

The network may request the MS to send 4 access bursts to calculate a new TA value. For this purpose the network sets the system information element CONTROL_ACK_TYPE to indicate that the MS is to respond with a PACKET_CONTROL_ACKNOWLEDGEMENT consisting of 4 access bursts (see 3GPP TS 04.60), and sends a PACKET_POLLING_REQUEST to the MS. In this case, the MS shall transmit 4 consecutive access bursts on the assigned resources.

3GPP TS 05.10, subclause 6.5.2.

- 7) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), the MS shall use the included TA value until it receives a new value on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 8) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receive a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, the MS shall start the packet transfer after the TA value is received on the PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 9) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, the MS shall not use the continuous timing advance procedure.

3GPP TS 05.10, subclause 6.5.2.

- 10) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives a new or updated TA value on the downlink PTCCH or downlink PACCH, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA value.

3GPP TS 05.10, subclause 6.9.

NOTE: A MS class A in dedicated mode has to follow the procedures described in 3GPP TS 05.10 subclause 6.5.1.

15.8.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts in accordance with the conformance requirement 2.
- 4) To verify that an MS in Packet transfer mode, except for an MS Class A in dedicated mode, when it receives an updated value of TA from the BTS on the downlink PTCCH, uses the last received TA value for the uplink transmission, respecting conformance requirement 10.

- 5) To verify that an MS in Packet transfer mode, except for an MS Class A in dedicated mode, upon initiation of the continuous timing advance procedure shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.
- 6) To verify that an MS in Packet transfer mode, except for an MS Class A in dedicated mode, if it receives a packet polling message as defined in conformance requirement 6, sends 4 access bursts on a network assigned uplink resource.
- 7) To verify that an MS in Packet transfer mode, except for an MS Class A in dedicated mode, if it receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), uses the included TA value until it receives a new value on PTCCH.
- 8) To verify that an MS in Packet transfer mode, except for an MS Class A in dedicated mode, if it receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, it starts the packet transfer after the TA value is received on the PTCCH respecting conformance requirement 10.
- 9) To verify that an MS in Packet transfer mode, except for an MS Class A in dedicated mode, if it receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, does not use the continuous timing advance procedure.

15.8.4 Method of test

Initial conditions

The SS sets the System Information parameter CONTROL_ACK_TYPE to "0".

The MS is GPRS Attached and PDP context activated.

NOTE:

EGPRS PACKET CHANNEL REQUEST shall be used in the following cases

- a. If Release of EGPRS supported is Release 4 or above.
- b. If Support of EGPRS Packet Access enhancement is True for a R99 MS.

CHANNEL REQUEST shall be used if support of EGPRS Packet Access enhancement is False for a R99 MS.

Procedure

- a) The SS pages MS on the PCH. The SS measures the receive/transmit delay for each burst. MS may send EGPRS PACKET CHANNEL REQUEST or CHANNEL REQUEST (See note). The SS then completes the uplink TBF to receive the Page response.
- b) The MS is made to send an EGPRS Packet Channel Request / Channel Request by triggering the MS to send a minimum of 6000 octets. The SS transmits a packet resource assignment to the MS with a valid TAI and EGPRS channel coding command as MCS-5. The SS transmits a TA value on the PTCCH for this TAI which is neither 0 nor 1. The SS measures the receive/transmit delay for each burst.
- c) The SS transmits a number of different TA values on the PTCCH for the TAI assigned to the MS. The SS also changes the TA values on the PTCCH for the other TAI in such a way that there is no correlation between TA values. The SS measures the receive/transmit delay for each burst.
- d) The SS transmits a new TA value, different by more than 1 from the previously transmitted one, in such a way that the MS can only correctly receive the last (4th) occurrence of the new TA value. The SS measures the receive/transmit delay for each burst. The uplink TBF is terminated.
- e) The MS is made to send an EGPRS Packet Channel Request / Channel Request by triggering the MS to send a minimum of 6000 octets. The SS sends a Packet Polling addressing the MS with its TFI. The SS measures the receive/transmit delay for each of the 4 access.

- f) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX, TIMING_ADVANCE_TIMESLOT_NUMBER, TIMING_ADVANCE_VALUE and EGPRS channel coding command as MCS-5. As part of the subsequent continuous timing advance update procedure, the SS sends a timing advance value on the downlink PTCCH for the MS, that is different from the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for several bursts, once before the MS should be using the updated TA and once after the MS should be using the updated TA, using the conditions defined in Conformance requirement 10).
- g) The MS is brought back to Packet idle mode. The SS sends a Packet Downlink Assignment to the MS with no valid Timing Advance included. The SS polls the MS by sending an RLC Block coded with MCS-5. The SS waits 2 seconds and then sends a PACKET POWER CONTROL/TIMING ADVANCE message with valid timing advance information. The SS sends further RLC Blocks. The SS measures the receive/transmit delay for several bursts.
- h) The MS is made to send an EGPRS Packet Channel Request / Channel Request by triggering the MS to send a minimum of 6000 octets. The SS sends a Packet Uplink Assignment to the MS with TIMING_ADVANCE_VALUE set to a value different from the last one ordered on the PTCCH, EGPRS channel coding command as MCS-5 and the TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER fields not present. The SS continues to transmit TA values on the PTCCH. These shall be different from the TA value TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for several bursts once after the transmission of the Packet Uplink Assignment, and once after the SS transmits the new TA using the continuous update procedure for the TAI chosen in step g), using the conditions defined in Conformance requirement 10).

15.8.4.3 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of ± 1 symbol period.

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

In step a) the MS shall transmit an access burst on the RACH.

In step b) the MS shall send access bursts on the PTCCH on the subchannel defined by the TAI with TA = 0.

In step c) the MS shall use the updated TA values.

In step d) the MS shall use the updated TA value.

In step e) the MS shall transmit 4 access bursts.

In step f) the MS shall use the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment first, and change to the Timing Advance value transmitted on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step g) the MS shall not transmit Normal Bursts on the allocated resources before it received a Timing Advance value via a PACKET POWER CONTROL/TIMING ADVANCE message on the downlink PACCH.

In step h) the last TA value received from the SS is the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment.

15.9 Timing Advance whilst in DTM

15.9.1 Conformance requirements

A MS class A in dedicated or dual transfer mode shall the procedures described in sub-clause 6.5.1.

When the MS receives a new value of TA from the BTS on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period (as defined in 3GPP TS 05.08), after the SACCH frame

containing the new TA value. On channels used for a voice group call, the TA value sent by the BTS applies only to an MS currently allocated the uplink.

The MS shall signal the used TA to the BTS on the SACCH.

A mobile station in DTM shall disable the timing advance features for the GPRS side:

- the mobile station shall inhibit the transmission of timing advance access bursts;
- the mobile station shall ignore the reception of GPRS timing advance messages, if any.

References

3GPP TS 05.10/45.010 sub-clauses 6.5.2, 6.5.1

3GPP TS 03.55 sub-clauses 5.1

15.9.2 Test purpose

To verify that the MS disregards any PS timing advance information that it receives and only uses CS TA information.

15.9.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

Specific PICS Statement(s):

- DTM/GPRS Multislot Class 5 (TSPC_DTM_GPRS_Multislot_Class_5)
- DTM/GPRS Multislot Class 9 (TSPC_DTM_GPRS_Multislot_Class_9)

PIXIT Statements:

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data and sends a DTM REQUEST message to the SS. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resources in a timeslot adjoining the CS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. Once the SS has verified that the MS is correctly sending RLC data blocks to the SS, the SS starts to vary the TA ordered by both PS and CS signalling.

The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

The SS then signals the TA values of 10, 20, 30, 40, 50 on the PS domain to the MS.

The SS then sends a PACKET POWER / TIMING ADVANCE message to the MS, ordering the MS to change the TA to a random value (different from previous value) and verifies that the MS does not change the TA of transmissions.

Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of ± 1 bit period:

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new CS TA at the first opportunity, but shall not change the TA of the MS for any TA received in signalling on the PTCCH

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1 | MS | | MS in state U10 of Call on Timeslot N (chosen arbitrarily) with Channel Type = TCH/F. |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 3k octets. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | PACKET ASSIGNMENT | Assigning uplink resources on timeslot $(N \pm 1) \text{ MOD } 8$. Including timing advance index (arbitrarily chosen) |
| 5 | MS<->SS | { Uplink data transfer } | Macro – 1k octets |
| 5A | | | The SS schedules the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks. The SS then schedules the TA values of 10, 20, 30, 40, 50 on the downlink PTCCH. After scheduling each TA value on PTCCH/D, assign a valid USF to receive uplink RLC data block. |
| 6 | SS->MS | PACKET POWER / TIMING ADVANCE | |
| 7 | MS->SS | RLC UPLINK DATA | |
| 8 | MS->SS | RLC UPLINK DATA | |
| 9 | SS | | Verifies that MS has not implemented the TA ordered in the PACKET POWER / TIMING ADVANCE message. |
| 10 | | { Uplink Data Transfer } | Macro - Completion of the Data. |

Specific Message Contents:

PACKET POWER CONTROL/TIMING ADVANCE message:

| | |
|--|--|
| MESSAGE_TYPE | 000101 |
| Global Packet Timing Advance - {0 1<TIMING_ADVANCE_VALUE>} - TIMING_ADVANCE_VALUE - {0 1<TIMING_ADVANCE_INDEX>} <TIMING_ADVANCE_TIMESLOT_NUMBER> | 1 Random value (different from previous value) 0 (no TIMING_ADVANCE_INDEX) |

16 Reception time tracking speed

16.1 Definition

Reception time tracking speed is the speed at which the MS adapts its transmit time to a change in the timing of the received signal.

16.2 Conformance requirement

If the MS determines that the timing difference with signals received from the BS exceeds $2\ \mu\text{s}$, the MS shall adjust its timebase in steps of $1/4$ bit period, in intervals not less than 1 s and not greater than 2 s until the timing difference is less than $1/2$ bit period at 3 dB below reference sensitivity and 3 dB less carrier to interference ratio than the reference interference ratios.

3GPP TS 05.10, subclauses 6 and 6.2.

16.3 Test purpose

- 1) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under TUHigh propagation conditions at 2 dB above reference sensitivity level().
- 2) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under RA propagation conditions at 2 dB above reference sensitivity level().

NOTE: This test is performed at a level higher than in the conformance requirement because of test implementation problems.

16.4 Method of test

16.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS sets TUHigh.

16.4.2 Procedure

- a) After 10 s the SS sets the input signal level to 2 dB above reference sensitivity level().
- b) For the last second before step c) the SS takes an average receive/transmit delay of all bursts in that 1 s.
- c) The SS increases the delay of the transmitted signal to the MS by a 2 bit step (about $7,4\ \mu\text{s}$) and keeps this delay for 20 s.
- d) The SS measures the absolute receive/transmit delay for each burst.
- e) The SS increases the input signal level to 5 dB above reference sensitivity level() and sets propagation condition RA.
- f) The SS repeats steps a) to d).

16.5 Test requirement

The MS shall adjust the timing of its transmit burst back to the correct receive/transmit timing delay. All burst timings shall be within the shaded part of figure 16.1.

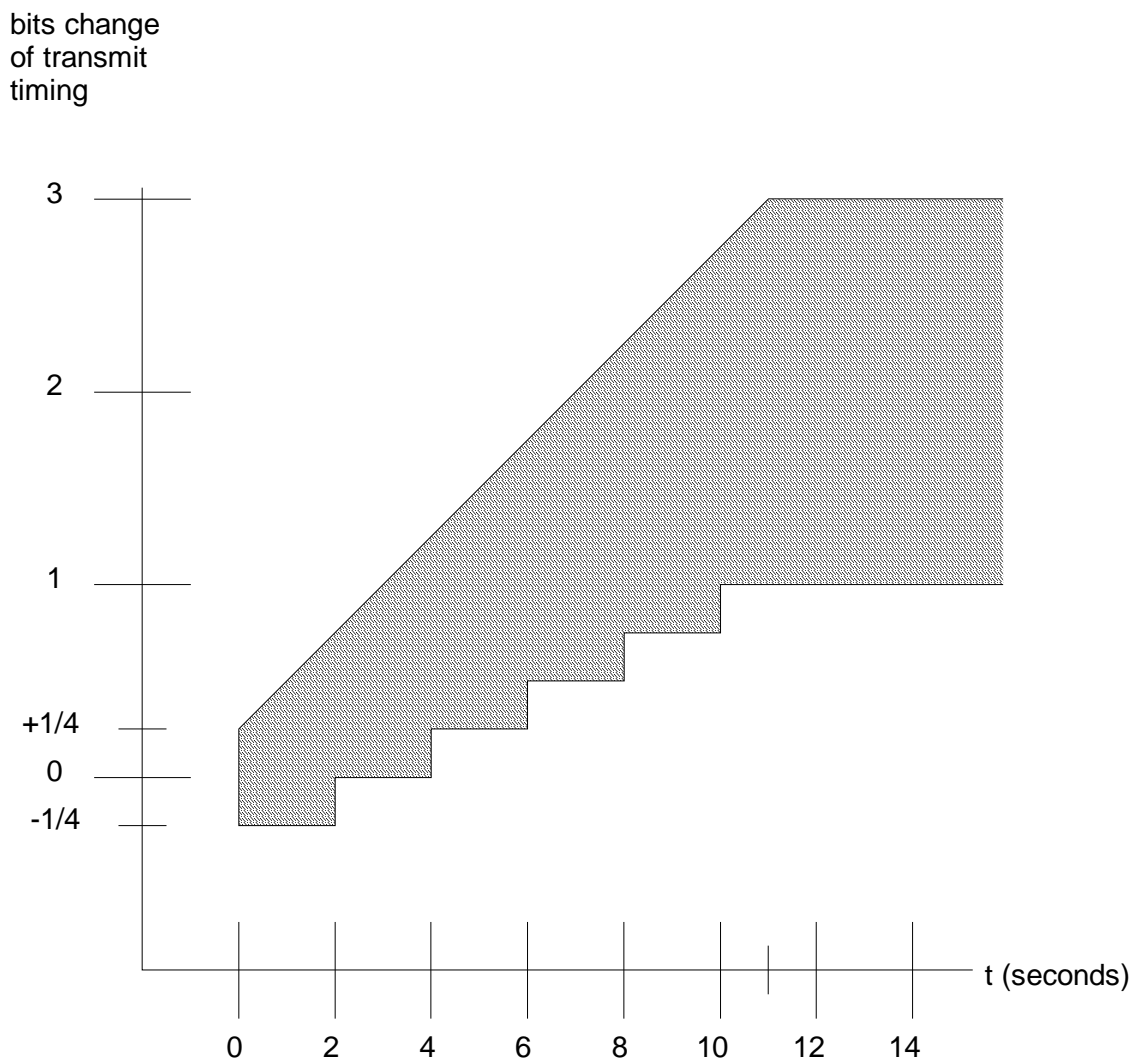

Figure 16.1

NOTE: $t = 0$ is the time at which the SS makes the transmission timing step change in c) of subclause 16.4.2.

17 Access times during handover

17.1 Intra cell channel change

17.1.1 Definition

The access times are:

- the time between either receipt by the MS of the last timeslot of the message block containing an ASSIGNMENT COMMAND or HANDOVER COMMAND and the time it has to be ready to transmit on the new channel; and

- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

For E-GSM 900, R-GSM 900 and ER-GSM 900 MS this test is performed in the P-GSM band (see table 3.3 P-GSM 900ARFCN ranges).

17.1.2 Conformance requirement

- 1) When for an intracell channel change, the MS receives an ASSIGNMENT COMMAND command or a HANDOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the command.

3GPP TS 05.10, subclause 6.8.

- 2) For an intracell channel change, the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

3GPP TS 05.10, subclause 6.8.

17.1.3 Test purpose

- 1) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 120 ms of the last timeslot containing the ASSIGNMENT COMMAND.
- 2) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 20 ms of the last complete speech/data frame or message block sent on the old channel.

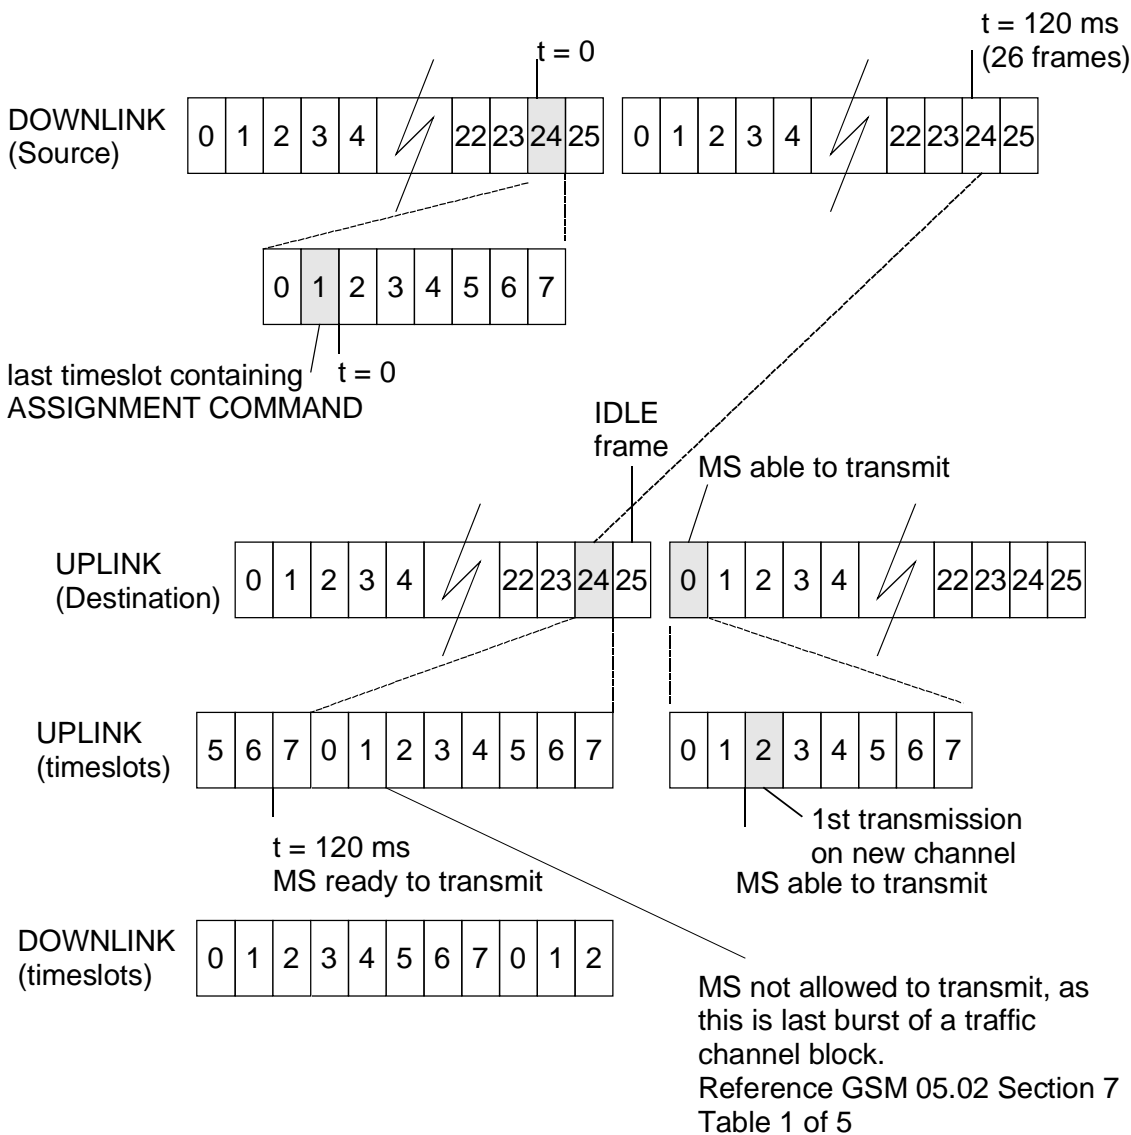

17.1.4 Method of test

17.1.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Low ARFCN range on timeslot 1.

17.1.4.2 Procedure

- a) The SS sends an ASSIGNMENT COMMAND to the MS allocating a channel in the high ARFCN range on timeslot 2, and with a power command of 7. These old and new carriers have a relative frequency tolerance of 0, and a relative timing tolerance of 1/4 bit.
- b) The SS, after it has sent the ASSIGNMENT COMMAND, measures the reception time of bursts received on the new channel, and the time at which transmission ceases on the old channel.

Timing difference between Downlink and Uplink is 3 timeslots.

Relative timing difference between the 2 carriers is a 1/4 bit period.

Maximum time to first transmission on the new channel is 131 ms (120ms + 2 frames + 3 timeslots + 1/4 bit period)

Figure 17-1: Access time - Intra cell channel change (Test Requirement 1)

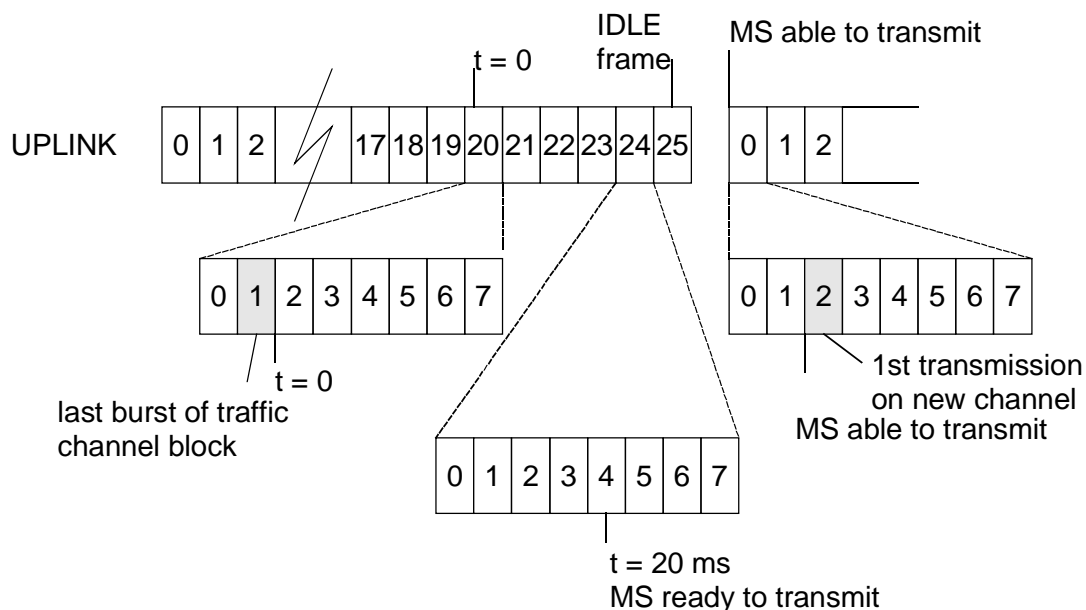

Figure 17-2: Access time - Intra cell channel change (Test Requirement 2)

17.1.5 Test requirement

- 1) The MS shall transmit its first burst on the new channel within 131 ms from the last timeslot of the message block containing the ASSIGNMENT COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the beginning of a new downlink burst on timeslot 2, which will be the last burst of a traffic channel block. The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the 3 timeslot shift between up and downlink, and the 1/4 bit relative timing tolerance between the carriers, means that the MS may first transmit on the new channel after 131 ms (120 ms + 2 frames + 3 timeslots + 1/4 bit period). See figure 17-1.

- 2) The MS shall transmit its first burst on the new channel within 27,7 ms from the last complete speech or data frame or message block sent on the old channel.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. The next frame could be an IDLE frame and the MS would then transmit in the following frame. This equates to 6 frames so in the worst case, including the 1/4 bit relative timing tolerance between the carriers, the MS may take 27,7 ms before starting transmissions on the new channel.

17.2 Inter cell handover

17.2.1 Definition

The access times are:

- the time between receipt by the MS of the last timeslot of the message block containing a HANDOVER COMMAND and the time it has to be ready to transmit on the new channel; and
- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

17.2.2 Conformance requirement

- 1) When the MS receives a HANDOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the HANDOVER COMMAND.

3GPP TS 05.10, subclause 6.8

- 2) The time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

3GPP TS 05.10, subclause 6.8.

- 3) When the MS receives a new TA value in response to a handover access burst, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA.

3GPP TS 05.10, subclause 6.9.

- 4) The MS shall use a TA value of 0 for the handover access bursts sent.

3GPP TS 05.10, subclause 6.6.

17.2.3 Test purpose

- 1) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANDOVER COMMAND, will be ready to transmit on the new channel within 120 ms of the last timeslot containing the HANDOVER COMMAND.
- 2) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANDOVER COMMAND, will be ready to transmit on the new channel within 20 ms of the last complete speech or data frame or message block sent on the old channel.
- 3) To verify that the MS, when it receives a new TA value in response to a handover access burst, is ready to transmit using the new TA value within 50 (40+10) ms of the end of the last timeslot of the message block containing the new TA value.

Note: The required response time of 40 ms is increased by 10 ms to take the time into account when the next opportunity to transmit the updated values occurs, also considering a possible idle frame.

- 4) To verify that the MS uses a TA value of 0 for the handover access burst sent.

17.2.4 Method of test

17.2.4.1 Initial conditions

The SS establishes two non-synchronized cells, A and B, under ideal radio conditions. A is the old cell and B is the target for the handover.

The SS uses two traffic channels with the following properties:

| Band | Cell A | | | Cell B | | |
|-----------|--------|-------|-------------|--------|-------|-------------|
| | TN | ARFCN | Offset (Hz) | TN | ARFCN | Offset (Hz) |
| GSM 450 | 2 | 259 | +240 | 0 | 293 | -240 |
| GSM 480 | 2 | 306 | +260 | 0 | 340 | -260 |
| GSM 710 | 2 | 438 | +244 | 0 | 511 | -244 |
| GSM 750 | 2 | 438 | +250 | 0 | 511 | -250 |
| T-GSM 810 | 2 | 438 | +244 | 0 | 511 | -244 |
| GSM 850 | 2 | 128 | +252 | 0 | 251 | -252 |
| GSM 900 | 2 | 1 | +267 | 0 | 124 | -267 |
| DCS 1800 | 2 | 512 | +320 | 0 | 885 | -320 |
| PCS 1900 | 2 | 512 | +366 | 0 | 810 | -366 |

NOTE 1: In each band, Cell A uses the lowest and Cell B the highest allowed carrier. For GSM710 and T-GSM810 the ARFCNs above are based on the values below (see 3GPP TS 45.005, 3GPP TS 44.018) to achieve the same result.

| Parameter | 3GPP TS 04.08 / 3GPP TS 44.018 reference | Abbr. | Normal Setting |
|-----------|--|-------|----------------|
|-----------|--|-------|----------------|

| Parameter | 3GPP TS 04.08 / 3GPP TS 44.018 reference | Abbr. | Normal Setting |
|-------------------------------|--|-------|--|
| GSM_Band (4 bit field) | 10.5.2.11b | - | 0110 – GSM 710 Or 0111 – T-GSM 810 |
| ARFCN_FIRST | 10.5.2.11b | - | 1 |
| BAND_OFFSET | 10.5.2.11b | - | 438 |
| ARFCN_RANGE | 10.5.2.11b | - | 90 |

NOTE 2: The offset is representing worst cases:

for Doppler shift due to a velocity chosen according to the band:

| Band | Velocity (kph) |
|-----------------------------|----------------|
| GSM 450, GSM 480 | 500 |
| GSM 710, GSM 750 | 300 |
| T-GSM 810, GSM 850, GSM 900 | 250 |
| DCS 1800, PCS 1900 | 130 |

and a frequency inaccuracy of 0,05 ppm.

The BCCH for the two cells have the following differences in timing:

| | |
|----------------|-----|
| Timer T1 | 50; |
| Timer T2 | 15; |
| Timer T3 | 40; |
| 1/4 bit number | 17; |
| Timeslots | 2. |

The SS sets up a call according to the generic call set up procedure on the channel in cell A.

17.2.4.2 Procedure

- The SS sends a HANOVER COMMAND on the main DCCH on cell A ordering the MS to go to the channel in cell B. The power command is set to 7.
- After the SS has sent HANOVER COMMAND it measures the reception time of bursts received on the new channel and the time at which transmission ceases on the old channel.
- The SS also measures the absolute transmit/receive delay for the access bursts on the new channel.
- The SS sends the PHYSICAL INFORMATION with TA set to 50. The SS then measures the reception time and absolute delay of the bursts transmitted on the new cell.

17.2.5 Test requirement

- The MS shall transmit its first burst on cell B within 142,6 ms from the last timeslot of the message block containing the HANOVER COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the end of the last burst of a downlink traffic channel block on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2,5 frames before the end of the last burst of a downlink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the three timeslot shift between up and downlink, and the 17 1/4 bit periods timing difference between the two carriers, means that the MS may first transmits on the new channel after 142,6 ms (120 ms + 2,5 frames + 2 frames + 3 timeslots + 17 1/4 bit periods).

- 2) The MS shall transmit its first burst on cell B within 39,2 ms from the last complete speech or data frame or message block sent on cell A.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2 frames before the end of the last burst of an uplink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. This equates to 8,5 frames so in the worst case the MS may take 39,2 ms between cessation of transmission on the old channel and transmission beginning on the new channel.

- 3) The MS shall transmit using the TA value in the PHYSICAL INFORMATION within 50 ms from the end of the last timeslot of the message block containing the new TA value.
- 4) The measured absolute delay for the access bursts in steps c) and d) shall equal 3 timeslots (=45/26 ms), with an absolute tolerance of ± 1 bit.

18 Temporary reception gaps

18.1 Temporary reception gaps, single slot

18.1.1 Definition

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

18.1.2 Conformance requirement

- 1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.

3GPP TS 05.10, subclauses 6.1 and 6.7.

- 2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.

3GPP TS 05.10, subclause 6.4.

- 3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.

3GPP TS 05.10, subclause 6.7.

18.1.3 Test purpose

- 1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.
- 2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of ± 1 bit period.
- 3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods, the MS transmission timing may have drifted resulting in an error not greater than $\pm 6,048 \mu\text{s}$ (0,2 ppm of 63 SACCH blocks).

18.1.4 Method of test

18.1.4.1 Initial conditions

The SS signals RADIO_LINK_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure.

18.1.4.2 Procedure

- a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks.

NOTE: This gives the maximum temporary reception gap.

- b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.
- c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.
- d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.

18.1.5 Test requirement

- 1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.
- 2) At the start of the first reception gap the MS receive/transmit delay timing shall be 3 timeslots \pm 1 bit.

NOTE: The SS determines the error from the first measurement of MS transmission frequency and timing.

- 3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.
- 4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than $\pm 6,048 \mu\text{s}$.

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

18.2 Temporary reception gaps in HSCSD multislots configurations

18.2.1 Definition

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

18.2.2 Conformance requirement

- 1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.

3GPP TS 05.10, subclauses 6.7 and 6.1.

- 2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.

3GPP TS 05.10, subclause 6.4.

- 3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.

3GPP TS 05.10, subclause 6.7.

18.2.3 Test purpose

- 1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods on the main multislot channel, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.
- 2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of ± 1 bit period.
- 3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods on the main multislot channel, the MS transmission timing may have drifted resulting in an error not greater than $\pm 6,048 \mu\text{s}$ (0,2 ppm of 63 SACCH blocks).
- 4) To verify that, during a temporary loss of more than 64 SACCH block periods on other than the main channel in symmetric configuration, the MS meet the requirements 1, 2 and 3.

18.2.4 Method of test

18.2.4.1 Initial conditions

The SS signals RADIO_LINK_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure for multislot HSCSD.

The SS commands the MS to operate in a highest possible asymmetric configuration, with a maximum number of downlink timeslots.

18.2.4.2 Procedure

- a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks of the main channel.
NOTE: This gives the maximum temporary reception gap.
- b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.
- c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.
- d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks of the main channel. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.
- e) SS signals RADIO_LINK_TIMEOUT=64 and commands the MS to operate in a highest possible symmetric multislot configuration, with a maximum number of uplink timeslots.
- f) For a symmetric multislot configuration steps a) and b) are repeated with the exception that a 69 SACCH blocks are removed from a channel other than the main channel.

18.2.5 Test requirement

- 1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.
- 2) The receive/transmit delay timing shall be 3 timeslots ± 1 bit.

- 3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.
- 4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than $\pm 6,048 \mu\text{s}$.
- 5) During the last reception gap, the MS shall maintain transmission.

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

19 Channel release after unrecoverable errors

NOTE: It is not possible to explicitly verify the correct functioning of all aspects of the radio link failure algorithm in the MS. Therefore 3 tests are used to implicitly verify correct implementation.

19.1 Channel release after unrecoverable errors - 1

19.1.1 Definition

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

19.1.2 Conformance requirement

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

3GPP TS 05.08, subclause 5.2.

- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

3GPP TS 05.08, subclause 5.2.

- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.

3GPP TS 05.08, subclause 5.2.

- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see 3GPP TS 04.08 / 3GPP TS 44.018) has been established.

3GPP TS 05.08, subclause 5.2.

19.1.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.
- 4) To verify that the MS declares RADIO_LINK_FAILURE, and clears the RR connection when S = 0.

19.1.4 Method of test

19.1.4.1 Initial conditions

The SS sends a default value for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

19.1.4.2 Procedure

- a) A MS terminated call is set up according to the generic call set up procedure. The SS sends a randomly chosen value N for the parameter RADIO_LINK_TIMEOUT on SACCH (System Information Type 6). This must be different than that sent on the BCCH.
- b) The SS sends 32 error free SACCH messages, followed by N SACCH messages that contain unrecoverable errors, and then continuously sends error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

- c) The SS repeats steps a) to b).

19.1.5 Test requirement

After receiving the N SACCH messages with unrecoverable errors, the MS shall abort the RR-connection, i.e. there is no more MS activity on the SACCH channel.

19.2 Channel release after unrecoverable errors - 2

19.2.1 Definition

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

19.2.2 Conformance requirement

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

3GPP TS 05.08, subclause 5.2.

- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

3GPP TS 05.08, subclause 5.2.

- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.

3GPP TS 05.08, subclause 5.2.

- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see 3GPP TS 04.08 / 3GPP TS 44.018) has been established.

3GPP TS 05.08, subclause 5.2.

19.2.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.

- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.

19.2.4 Method of test

19.2.4.1 Initial conditions

The SS sends a default value for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

19.2.4.2 Procedure

- a) A MS terminated call is set up according to the generic call set up procedure. The SS sends a randomly chosen value N for the parameter RADIO_LINK_TIMEOUT on SACCH (System Information Type 6). This must be different than that sent on the BCCH.
- b) The SS sends 2 SACCH messages with unrecoverable errors followed by one error free SACCH message. This step is repeated 64 times.
- c) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to b).

19.2.5 Test requirement

The MS shall not abort the RR-connection.

19.3 Channel release after unrecoverable errors - 3

19.3.1 Definition

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

19.3.2 Conformance requirements

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

3GPP TS 05.08, subclause 5.2.

- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

3GPP TS 05.08, subclause 5.2.

- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.

3GPP TS 05.08, subclause 5.2.

- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see 3GPP TS 04.08 / 3GPP TS 44.018) has been established.

3GPP TS 05.08, subclause 5.2.

19.3.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.
- 4) To verify that the MS declares RADIO_LINK_FAILURE, and clears the RR connection when S = 0.

19.3.4 Method of test

19.3.4.1 Initial conditions

The SS sends a default value for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE_ESTABLISHMENT is not allowed.

19.3.4.2 Procedure

- a) A MS terminated call is set up according to the generic call set up procedure. The SS sends a randomly chosen value N for the parameter RADIO_LINK_TIMEOUT on SACCH (System Information Type 6) . This must be different than that sent on the BCCH.
- b) The SS sends 32 error free SACCH messages, followed by 3 SACCH messages with unrecoverable errors, and the sends 1 error free SACCH message. This step is repeated N - 2 times.
- c) The SS shall continuously send error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

- d) The SS repeats steps a) to c).

19.3.5 Test requirement

After receiving the $3 \times (N - 2)$ erroneous SACCH messages the MS shall abort the RR-connection, i.e. there is no more activity on the SACCH channel.

20 Cell selection and reselection

In the following paragraphs some explanatory text is given concerning the nature of the tests in this clause and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this clause cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. Each of these cell control channels are non-combined with SDCCHs. For tests in section 20.1 to 20.21, it is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For all other tests, unless explicitly stated otherwise, it is assumed that the SS can simultaneously transmit 7 BCCH or PBCCH carriers and monitor all RACH and PRACH channels for Cell Selection Testing and all adjacent RACH and PRACH channels for Cell Reselection. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an E-GSM mobile station at least one of the carriers is in the extension band and one of the carriers is in the primary band. Note: For an MS supporting Stored List Cell Selection it is necessary to ensure that the SIM does not contain any of the ARFCN's used by each individual Test, otherwise the Test Purpose will not be met as the MS will apply different rules compared to Normal Cell Selection. This can be achieved by either editing the SIM card or initially updating the MS in a cell with no BA in the list. This must apply to all tests in section 20.

Unless otherwise stated in the method of test, in all of the tests of this clause:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.2.2.2.
- The default values of the system information data fields given in table 20.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be ± 6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be ± 3 dB for the signal levels used in the tests of this clause, except for subclause 20.20, where the relative accuracy is assumed to be ± 5 dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for subclause 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this clause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is ± 10 % except for PENALTY_TIME where it is ± 2 s. In the tests of this clause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is ± 2 % and the SS tolerance on power level ± 1 dB.

Table 20.1: Default values of the system information fields

| Parameter | 3GPP TS 04.08 / 3GPP TS 44.018 reference | Abbr. | Normal Setting |
|--------------------------|--|-------|---|
| Cell channel description | 10.5.2.1 | - | Any values |
| MAX retrans | 10.5.2.29 | - | 1 |
| TX-integer | 10.5.2.29 | - | Any value |
| CELL_BAR_QUALIFY | 10.5.2.35 | CBQ | 0 |
| CELL_BAR_ACCESS | 10.5.2.29 | CBA | 0 (not barred) |
| AC CN | 10.5.2.29 | AC | All 0 |
| RE | 10.5.2.29 | RE | 0 (re-establishment allowed) |
| NCC | 10.5.2.2 | NCC | Any value |
| Cell Identity | 10.5.1.1 | - | Any value |

| PCS 1900 | 512, 568, 602, 641, 662, 696, 727, 754 | SI2 (PCS 1900 cell) & SI2ter (other band cell) |

Table 20.1c: MNC values

| Band | MNC value |
|-------------------------|-----------|
| GSM400, GSM900, DCS1800 | 01 |
| Otherwise | 011 |

For GSM 710 and T-GSM 810 Bands ARFCNs are defined using Dynamic Mapping: Information about dynamic mapping is provided by System Information type 15 or Packet System Information type 8 if PBCCH exists, and optionally by System Information type 14. The required parameters are as defined in Table 20.1d.

Table 20.1d: ARFCNs for GSM710, T-GSM 810

| Parameter | 3GPP TS 04.08 / 3GPP TS 44.018 reference | Abbr. | Normal Setting |
|------------------------|--|-------|--|
| GSM_Band (4 bit field) | 10.5.2.11b | - | 0110 – GSM 710 Or 0111 – T-GSM 810 |
| ARFCN_FIRST | 10.5.2.11b | - | 1 |
| BAND_OFFSET | 10.5.2.11b | - | 438 |
| ARFCN_RANGE | 10.5.2.11b | - | 90 |

Unless otherwise specified all tests in clauses 20.1 to 20.15 are applicable for all MSs supporting the bands identified in Table 20.1a

20.1 Cell selection

20.1.1 Definition

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

20.1.2 Conformance requirement

1. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 s of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
 - 2.1 (i) It should be a cell of the selected PLMN
 - 2.2 (ii) It should not be "barred" (see subclause 3.5.1)
 - 2.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6.
3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; 3GPP TS 03.22, subclause 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter $C1$, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.

20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that:
 - 2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
 - 2.2 The MS does not select a cell which is "barred".
 - 2.3 The MS does not select a cell with $C1 < 0$.
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with $C1 < 0$.

20.1.4 Method of test

20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|---------------------------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 48 / -65 | 38 / -75 | 43 / -70 | 33 / -80 | 28 / -85 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -67 | -90 | -88 | -98 | |
| MNC | | | See Table 20.1c 002 | | | |
| MCC | | | | | | |
| C1 | 25 | -8 | 20 | 8 | 13 | |
| C2 | 25 | -8 | 20 | 8 | 13 | |

For an E-GSM MS carrier 2 and carrier 4 ARFCNs are chosen in the E-GSM band, carrier 1 and carrier 3 ARFCNs in the P-GSM band.

20.1.4.2 Procedure

- The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- The MS is switched on.
- The MS is switched off.
- The SS monitors carriers 1 and 3 for RA requests from the MS.
- The MS is switched on.

20.1.5 Test requirements

- After step b), the first response from the MS shall be on carrier 4 within 33 s. There shall be no response from the MS on carrier 2.
- After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 s.

20.2 Cell selection with varying signal strength values

20.2.1 Definition

For definition see conformance requirement.

20.2.2 Conformance requirement

- The MS shall:

The MS shall search all RF channels within its bands of operation, take readings of received RF signal level on each RF channel, and calculate the RLA_C for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period.

3GPP TS 05.08 / 3GPP TS 45.008, subclause 6.2.

1.1 The MS shall search all RF channels within its bands of operation, take readings of received RF signal level on each RF channel, and calculate the RLA_C for each.

1.2 The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, ...

1.3 the measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities termed the "received level averages" (RLA_C), shall be unweighted averages of the received signal levels measured in dBm..

GSM 05.08 / 3GPP TS 45.008, subclause 6.1.

20.2.3 Test purpose

1. To verify that:
 - 1.1 The MS meets conformance requirement 1.1.
 - 1.2 The MS meets conformance requirement 1.2.
 - 1.3 The MS meets conformance requirement 1.3.
2. To verify that the MS meets conformance requirement 2.

20.2.4 Method of test

20.2.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 23 / -90 | 58 / -55 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 13 / -100 | 13 / -100 | | | | |
| C1 | 10 | 53 | | | | |

For an E-GSM MS carrier 1 ARFCN is chosen in the E-GSM band.

Specific PICS Statements:

-

PIXIT statements:

- averaging time T_{av}

20.2.4.2 Procedure

- a) The SS transmits on carriers 1 and 2. After a period of $b \times T_{av}$ carrier 2 reduces its transmit level to -85 dBm (28 dBμV emf()). After a further period of $a \times T_{av}$, carrier 2 increases its transmit level again to -55 dBm (58 dBμV emf()). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

T_{av} is the averaging time declared by the manufacturer.

The parameters a and b are chosen according to the following rules:

$$(a + b) \times T_{av} > T_{av}$$

$$0 < a \times T_{av} < 2/3 \times T_{av}$$

$$0,5 \times T_{av} < b \times T_{av} < T_{av}$$

In the equations $<$ and $>$ means at least one TDMA frame less or greater than the given value.

While satisfying the conditions given above:

- a is chosen to be as close as possible to 2/3.
- b is chosen to be as close as possible to 0,5.
- b) The MS is switched on.
- c) The SS monitors all RA requests from MS on carriers 1 and 2.

20.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 s.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

20.3 Basic cell reselection

20.3.1 Definition

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

20.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

1.1 (iii) The cell camped on (current serving cell) has become barred.

1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; 3GPP TS 03.22, subclause 4.5.

NOTE 1: Criterion (i) is tested in subclause 20.8 (Cell reselection when $C1(\text{serving cell}) < 0$ for 5 s).

NOTE 2: Criterion (ii) is tested subclause 20.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in subclause 20.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

2.1 (ii) It should not be "barred".

2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator.
3GPP TS 03.22, subclause 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in subclause 20.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection;
3GPP TS 05.08, subclause 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
 - ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except;
 - a) in the case of the new cell being in a different location area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds; or
 - b) in case of a cell reselection occurring within the previous 15 seconds in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5 dB for a period of 5 seconds.

This indicates that it is a better cell.

3GPP TS 05.08 / 3GPP TS 45.008, subclause 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.

20.3.3 Test purpose

1. To verify that:
 - 1.1 The MS meets conformance requirement 1.1.
 - 1.2 The MS meets conformance requirement 1.2.
2. To verify that:
 - 2.1 The MS does not reselect a cell which is barred.
 - 2.2 The MS does not reselect a cell which has a $C1 < 0$.
3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are not used.
4. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area.
5. To verify that the MS decodes the CELL_BAR_ACCESS and CELL_BAR_QUALIFY parameters from the BCCH every 30 s.

20.3.4 Method of test

20.3.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-------------------------------------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43 / -70 | 33 / -80 | 43 / -70 | 35 / -78 | 38 / -75 | |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 | -67 | |
| CRH | 10 dB | | | | | |
| LAC | | | different from other carriers | | | |
| CBA | | | | 1 | | |
| CBQ | | | | 0 | | |
| C1 | 15 | 10 | 20 | 7 | -8 | |
| C2 | 15 | 10 | 20 | 7 | -8 | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

20.3.4.2 Procedure

- a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dB μ Vemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.
- e) The MS is switched off.
- f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.
- g) The MS is switched on.
- h) After 33 s, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.
- i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 s. (The MS should reselect and camp onto carrier 1).
- j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.
- k) The SS increases the level of carrier 3 to 53 dB μ Vemf (C2 increases to 30 dB.).

20.3.5 Test requirements

- 1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 s.
- 2) In step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.

NOTE 1: 5 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 18,4 s, allow 20 s.

- 3) In step h), the MS shall respond on carrier 1 within 50 s of setting CBA=1 on carrier 2.

NOTE 2: 33 s for the MS to read the BCCH of carrier 2 (30 s + 10 %), 15 s for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 s.

- 4) After step j), there shall be no response from the MS within 50 s.
- 5) After step k), the MS shall respond on carrier 3 within 20 s.

20.4 Cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters

20.4.1 Definition

void

20.4.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

20.4.3 Test purpose

1. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are used.
2. To verify DCS 1 800 MS correctly calculate the C2 parameter when the POWER_OFFSET parameter is present.

20.4.4 Method of test

20.4.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 43 / -70 | 48 / -65 | 48 / -65 | | |
| RXLEV_ACCESS_MIN (dBm) | -80 | -100 | -85 | -85 | | |
| PT | | 11111 | 40 s | 60 s | | |
| CRO | | 16 dB | 20 dB | 20 dB | | |
| TO | | | 20 dB | 20 dB | | |
| K = 1 | | | | | | |
| C1 | 20 | 30 | 20 | 20 | | |
| C2 | 20 | 14 | 20 - > 40 | 20 - > 40 | | |
| K = 2 (DCS1800 Class 3 MS only) | | | | | | |
| POWER_OFFSET | 0 | 2 | 6 | 6 | | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

Specific PICS statements:

- Support of DCS Power Class 3 (TSPC_Type_DCS_Class3)

PIXIT Statements:

-

20.4.4.2 Procedure

For testing of all types of MS, the test procedure is performed for execution counter K = 1. For testing of DCS 1 800 Class 3 MS, the test procedure is performed for execution counter K = 1 and 2:

On execution counter K = 1, the POWER_OFFSET Parameter is not present.

On execution counter K = 2, the POWER_OFFSET parameter is present.

- a) The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS increases the level of carrier 2 to 54 dB μ Vemf (C2 becomes 25 dB).
- d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 s (The MS should reselect and camp onto carrier 2).
- e) The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

20.4.4.3 Requirements

For execution counter $K = 1$ and $K = 2$.

- 1) After step b), there shall be no response from the MS on carrier 2 within 50 s.
- 2) After step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.
- 3) After step e), there shall be no response from the MS on carrier 3 within 38 s of activating the carriers but, the MS shall respond on carrier 3 within 90 s. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 s set by penalty timer on carrier 3 less 2 s tolerance. Maximum time, total of 33 s to read BCCH of carrier 3, 42 s for expiry of penalty timer on carrier 3, 15 s for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 s.

20.5 Cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

20.5.1 Definition

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

Test purpose 2 is not applicable for P-GSM MS. This is reflected in initial conditions step d).

Test purpose 4 is only applicable to an E-GSM MS. This is reflected in initial conditions step f), test procedures d) and e) and test requirements clause 3).

20.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. 3GPP TS 05.08, subclause 6.4.
2. Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. 3GPP TS 05.08, subclause 6.6.1.
3. Mobile stations shall treat all ARFCNs in the set $\{0, 1, 2 \dots 1023\}$ as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.1b.
4. An E-GSM MS shall correctly decodes parameters transmitted in the system information type 2 ter message. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.34.

20.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.
2. To verify that E-GSM, DCS 1 800 and PCS 1 900 MS decode parameters transmitted in the system information type 2 bis message.
3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.
4. To verify that an E-GSM mobile correctly decode parameters transmitted in the system information type 2 ter message.

20.5.4 Method of test

20.5.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 (note) | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|---------------|---------------------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 53 / -60 | 32 / -81 | 40 / -73 | OFF | OFF | OFF |
| RXLEV_ACCESS_MI N (dB μ V emf() / dBm) | 23 / -90 | 23 / -90 | 30 / -83 | | | |
| BS_AG_BLK_RES PT | 1 | 1 0 | 1 0 | | | |
| CRO TO | | 16 dB 0 dB | 10 dB 0 dB | | | |
| C1 | 30 | 9 | 10 | | | |
| C2 | 30 | 25 | 20 | | | |
| NOTE: Carrier 3 is off for P-GSM, DCS 1800 and PCS 1 900 MS. Carrier 3 is only required for E-GSM MS. | | | | | | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test and the ARFCNs specified in d) below.

- b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.1a.
- c) The cell reselection parameters PENALTY_TIME, CELL_RESELECT_OFFSET and TEMPORARY_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.
- d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 990 and 995. The ARFCN of carrier 2 is transmitted in the SI2 message only for an MS supporting only P-GSM..
- e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

- BS_PA_MFRMS = 4;
 - IMSI mod 1000 = 12;
 - FN carrier 1 = FN carrier 2-21, for simultaneously transmitted frames.
- f) For an E-GSM MS, the SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

20.5.4.2 Test Procedure

- a) The SS activates the channels. The MS is not paged on carrier 1.
- b) The MS is switched on.
- c) After 50 s, the SS increases the level of carrier 2 to $42 \text{ dB}\mu\text{Vemf}()$.
- d) For an E-GSM MS only, when the SS receives a response on carrier 2, the SS stops paging on that carrier and after 30 s, the SS increases the level of carrier 3 to $60 \text{ dB}\mu\text{Vemf}()$.

20.5.5 Test Requirements

- 1) After step b), there shall be no response from the MS on carrier 2. For an E-GSM MS there shall also be no response on carrier 3.
- 2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 20 s.
- 3) After increasing the level of carrier 3 in step d), an E-GSM mobile shall respond on carrier 3 within 20 s.

20.6 Cell reselection timings

20.6.1 Definition

void

20.6.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - 1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s.
 - 1.2 Cell reselection for any other reason (see 3GPP TS 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 s if another suitable cell can be found.
- 3GPP TS 05.08, subclause 6.6.2.

20.6.3 Test purpose

1. To verify that:
 - 1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 s.
 - 1.2 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 s when another suitable cell exists.

20.6.4 Method of test

20.6.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|--|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level (dB μ V emf() / dBm) | 56 / -57 | 46 / -67 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 29 / -84 | 33 / -80 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|--|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level (dB μ V emf() / dBm) | 51 / -62 | 41 / -72 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 24 / -89 | 28 / -85 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 5 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 s.

20.6.4.2 Procedure

- a) The SS activates the channels. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 50 s, the SS starts paging continuously on carriers 1 and 2 for 20 s. The SS monitors carriers 1 and 2 for RA requests from the MS.
- d) The SS stops paging on carriers 1 and 2 and waits for 20 s. (The MS should revert to carrier 1 due to cell reselection.)
- e) The SS starts paging continuously on carrier 2.
- f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.
- g) The SS increases the transmit level of carrier 2 by 20 dB and waits for the MS to access on carrier 2.

20.6.5 Test requirements

- 1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on either carrier shall not occur within 4,5 s of the second RA request on that carrier.
- 2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.
- 3) After step g), the MS shall respond on carrier 2.

20.7 Priority of cells

20.7.1 Definition

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

20.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; 3GPP TS 03.22, subclause 3.5.2.1.
- 2.

Table 1a: Parameters affecting cell priority for cell selection

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|------------------|-----------------|-------------------------|-----------------------------|
| 0 | 0 | normal | normal |
| 0 | 1 | barred | barred |
| 1 | 0 | low | normal (see note 2) |
| 1 | 1 | low | normal (see note 2) |

3GPP TS 05.08, table 1.a.

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:
 - the cell belongs to the MS HPLMN;
 - the MS is in cell test operation mode;
 - the CELL_BAR_ACCESS is set to "1";
 - the CELL_BAR_QUALIFY is set to "0";
 - the Access Control class 15 is barred.

3GPP TS 05.08, table 1.a.

20.7.3 Test purpose

1. To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.
2. To verify that the MS takes into account CELL_BAR_ACCESS and CELL BAR _QUALIFY when performing cell selection and reselection.
3. To verify that the MS meets conformance requirement 3.

20.7.4 Method of test

20.7.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 33 / -80 | 43 / -70 | 33 / -80 | 23 / -90 | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 3 / -110 | 23 / -90 | 13 / -100 | 13 / -100 | | |
| CBA | 0 | 1 | 1 | 0 | | |
| CBQ | 1 | 1 | 0 | 0 | | |
| Access class 15 | barred | barred | barred | barred | | |
| C1 | 30 | 20 | 20 | 10 | | |

20.7.4.2 Procedure

- a) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.
- b) The MS is switched on.
- c) The MS is switched off. The SS deactivates the carriers.
- d) The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

- e) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.
- f) The MS is switched on.

20.7.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.
- 2) After step f), the first response from the MS shall be on carrier 3 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.

20.8 Cell reselection when C1 (serving cell) < 0 for 5 s

20.8.1 Definition

void

20.8.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high. 3GPP TS 05.08, subclause 6.6.2.
2. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - i) The path loss criterion parameter C1 (see subclause 3.6) indicates that the path loss to the cell has become too high. 3GPP TS 03.22, subclause 4.5.

20.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the MS meets conformance requirement 2.

20.8.4 Method of test

20.8.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 43 / -70 | 23 / -90 | | | | |
| CRO | 30 dB | | | | | |
| TO | 0 | | | | | |
| PT | 0 | | | | | |
| C1 | 20 | 10 | | | | |
| C2 | 50 | 10 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

20.8.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dBμV emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dBμV emf(). (C1 becomes -10 dB and C2, 20 dB during this period).
- d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dBμV emf()

20.8.5 Test requirements

- 1) After step b), there shall be no access on carrier 1 or carrier 2, within 50 s.
- 2) After step c), there shall be no access on carrier 2 within 30 s.
- 3) After step d), the MS shall access on carrier 2 within 20 s.

20.9 Running average of the surrounding cell BCCH carrier signal levels

20.9.1 Definition

void

20.9.2 Conformance requirement

1. Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received signal level (RLA_C) in the preceding 5 to:
 - Max. {5, ((5 × N + 6) DIV 7) * BS_PA_MFRMS / 4};

seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS_PA_MFRMS is defined in 3GPP TS 45.002; 3GPP TS 45.008, subclause 6.6.1.

2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period. 3GPP TS 05.08 / 3GPP TS 45.008, subclause 6.6.1

20.9.3 Test purpose

1. To verify that if the MS calculates a received level average (over 5 s) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.
2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

20.9.4 Method of test

20.9.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

BS_PA_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 s.

20.9.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 s and continues to do so until the end of the test.
- d) The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66 dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

20.9.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 s.
- 2) After step c), there shall be no access from the MS on carrier 1 or 2 within 25 s.

NOTE: Any potential access on is likely to occur within 20 s.

- 3) After step d), the MS shall access on carrier 2 within 20 s.

20.10 Running average of the serving cell BCCH carrier signal level

20.10.1 Definition

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

20.10.2 Conformance requirement

- For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The RLA_C shall be a running average determined using samples collected over a period of 5 s to Max {5s, five consecutive paging blocks of that MS}. New sets of RLA_C values shall be calculated as often as possible.; 3GPP TS 45.008, subclause 6.6.1.

20.10.3 Test purpose

- To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

20.10.4 Method of test

20.10.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf) / dBm) | 63 / -50 | 39 / -74 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf) / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 40 | 16 | | | | |
| C2 | 40 | 16 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

20.10.4.2 Procedure

- The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- The MS is switched on.
- After 50 s the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 s.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

- The SS increases the level of carrier 2 to -56 dBm.

20.10.5 Test requirement

- After step c), the MS shall not access on carrier 2, within 25 s.
- After step d), the MS shall access on carrier 2, within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

20.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list

20.11.1 Definition

void

20.11.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; 3GPP TS 05.08, subclause 6.6.1.
2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 s; 3GPP TS 05.08, subclause 6.6.1.

20.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.

20.11.4 Method of test

20.11.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf ()/dBm) | 53 / -60 | 48 / -65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 / -80 | 38 / -75 |
| RXLEV_ACCESS_MIN | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 s. Hence 5 s is also the updating time of the list of six strongest neighbour carriers.

20.11.4.2 Procedure

- a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 60 s, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

20.11.5 Test requirements

- 1) The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 s to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 s (+10 %)), 33 s to read BCCH, 15 s for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 s.

20.12 Decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

20.12.1 Definition

void

20.12.2 Conformance requirement

1. The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.3.

20.12.3 Test purpose

1. To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

20.12.4 Method of test

20.12.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.12.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.12.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2.

20.13 Decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers

20.13.1 Definition

-20.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 s, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.3.

20.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

20.13.4 Method of test

20.13.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.13.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.13.5 Test requirements

- 1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 s for check of BSIC on carrier 2, 33 s for decode of BCCH of carrier 2, 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 s.

20.14 Emergency calls

20.14.1 Definition

-

20.14.2 Conformance requirement

1. In this mode, only emergency calls may be made

3GPP TS 45.008, subclause 6.8.

2. When in the limited service state (see 3GPP TS 43.022) the aim is to gain normal service rapidly and the following tasks shall be performed, depending on the conditions, as given in the table below:

- a) The MS shall monitor the received signal level of all RF channels within its bands of operation, and search for a BCCH carrier which has $C1 > 0$ and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity.

3GPP TS 45.008, subclause 6.8.

3. c) The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of 3GPP TS 43.022, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used.

3GPP TS 45.008, subclause 6.8.

20.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.
2. To verify that the MS selects a cell with $C1 > 0$ and $CBA = 0$ when no suitable cells of the selected PLMN are available.
3. To verify that the MS, when performing cell reselection in the limited service state, uses $CELL_RESELECT_HYSTERESIS = 0$.

20.14.4 Method of test

20.14.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|----------------------|-------------|-------------|-----------|-----------|-----------|
| RF signal level (dB μ V emf) / dBm) | 38 / -75 | 33 / -80 | 33 / -80 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf) / dBm) | 23 / -90 | 43 / -70 | 23 / -90 | | | |
| CELL_BAR_ACCESS MCC,MNC | 1 (barred) forbidden | 0 forbidden | 0 forbidden | | | |
| CELL_RESELECT_HYST | 0 | 0 | 14 dB | | | |
| C1 | 15 | -10 | 10 | | | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

20.14.4.2 Procedure

- a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test. In order to prevent the MS from answering to paging only idle-paging is sent on all channels.

- b) The MS is switched on.
- c) 50 s after switch on, an emergency call is initiated on the MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE 1: The MS should reselect to carrier 1 because it should not take into account the CELL_RESELECT_HYST value of 14 but use 0 instead.

- e) After 345 s an emergency call is initiated on the MS.

NOTE 2: 330 s to detect change of BCCH data, 15 s to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

20.14.5 Test requirements

- 1) In step c), the first access by the MS shall be on carrier 3.
- 2) In step e), the first access from the MS shall be on carrier 1.

20.15 Cell reselection due to MS rejection "LA not allowed"

20.15.1 Definition

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

20.15.2 Conformance requirement

- 1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, 3GPP TS 03.22, subclause 3.3.
- 2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, 3GPP TS 03.22, subclause 3.5.4.
- 3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, 3GPP TS 03.22, subclause 4.4.2
- 4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, 3GPP TS 03.22, subclause 3.3 and figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.15.3 Test purpose

- 1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2,3 and 4.
- 2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.
- 3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:

Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter). 3GPP TS 03.22, subclauses 3.4 and 4.5.

4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, 3GPP TS 03.22, subclause 3.3 and figure 4.

20.15.4 Method of test

20.15.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 54 / -59 | 44 / -69 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 53 / -60 | 35 / -78 | 29 / -84 | | | |
| CRH | 14 | 0 | 10 | | | |
| LAC | H1111 | H2222 | H1111 | | | |
| ATT | 1 | 1 | 1 | | | |
| C1 | 10 | 19 | 15 | | | |
| C2 | 10 | 19 | 15 | | | |

20.15.4.2 Procedure

- The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 and 3 until step e) has been completed. Only idle-paging is sent on all channels.
- The MS is switched on.
- When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed".
- 30 s after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1: C2 of carrier 3 > C2 of carrier 1. Carriers 1 and 3 belong to the same LA.

- The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

- 10 s after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dBμV emf().

NOTE 3: C2 of carrier 2 = 30, now larger than C2 of carrier 3 + CRH.

- The SS shall accept any LU on carrier 2.

20.15.5 Test requirements

- After step b), the MS shall respond on carrier 1 within 33 s.
- In step d), the MS shall access on carrier 3 with a channel request message, within 15 s of being commanded to set up the emergency call.
- After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

20.16 Downlink signalling failure

20.16.1 Definition

See conformance requirement.

20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to $90/N$ where N is the BS_PA_MFRMS parameter for that cell (see 3GPP TS 05.02).
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, (however never beyond the nearest integer to $90/N$).
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, 3GPP TS 03.22, subclause 4.5 (ii) and 3GPP TS 05.08, subclause 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS_PA_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in 3GPP TS 04.08 / 3GPP TS 44.018. The MS is required to attempt to decode a message every time its paging subchannel is sent.

20.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to $90/N$). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

20.16.4 Method of test

20.16.4.1 Initial conditions

Two BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf() / dBm) | 43 / -70 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | 10 | | | | |

NOTE: The DSC counter will have a value 18 ($90/5$).

20.16.4.2 Procedure

- a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.

- b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see 3GPP TS 05.03, subclauses 4.3 and 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 30 s.
- d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to < 0 and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30 s.

20.16.5 Test requirements

- 1) There shall be no access to carrier 2 in test steps a) and c).
- 2) The MS shall access on carrier 2 at test step e) within 15 s.

20.17 Cell selection if no suitable cell found in 10 s

20.17.1 Definition

See conformance requirement.

20.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 s, the cell selection algorithm of 3GPP TS 03.22 shall be performed, 3GPP TS 05.08, subclause 6.6.2.

20.17.3 Test purpose

To verify that the MS fulfils the conformance requirement.

20.17.4 Method of test

20.17.4.1 Initial conditions

One BCCH carrier is established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf() / dBm) | 43 / -70 | OFF | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | | | | | |

20.17.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on carrier 1.
- b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dB μ V emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dB μ V emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1).
- c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 s to rxlev averages, 5 s for C1 < 0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

20.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

20.18 Cell reselection due to MS rejection "Roaming not allowed in this LA"

20.18.1 Definition

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

20.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, 3GPP TS 03.22; subclause 3.1.
2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, 3GPP TS 03.22; subclause 4.3.3 L3, 3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.4.4.7.
3. The MS can only perform camping on a suitable cell, which:
 - should not be in an LA which is in the list of "forbidden LAs for roaming" 3GPP TS 03.22, subclause 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.
2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.
3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI > LAI1.

20.18.4 Method of test

20.18.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|--------------------------|--------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 63 / -50 | 53 / -60 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| MNC | MNC <> | MNC <> | | | | |
| MCC | HPLMN MCC of HPLMN | HPLMN MCC of HPLMN | | | | |
| CRH | 0 | 0 | | | | |
| LAC | H1111 | H2222 | | | | |
| ATT | 1 | 1 | | | | |
| C1 | 40 | 30 | | | | |
| C2 | 40 | 30 | | | | |

20.18.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on all carriers.
- b) The SS monitors all RA requests from MS on carriers 1 and 2.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".
- d) The SS shall accept any LU on carrier 2.
- e) The SS monitors all RA requests from MS on carriers 1 to 2.

20.18.5 Test requirements

- 1) The MS should respond on carrier 1 within 33 s of switch on.
- 2) After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 s from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.1) should be adequate.

- 3) After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

20.19 Cell selection on release of SDCCH and TCH

20.19.1 Definition

Void.

20.19.2 Conformance requirement

1. When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30 s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS shall store the page and respond once the full

BCCH data has been decoded, provided that the cell is not barred and the MSs access class is allowed.
3GPP TS 05.08, subclause 6.7.

20.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

20.19.4 Method of test

20.19.4.1 Initial conditions

- a) Parameters changed from default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBmV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBmV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| BS_PA_MFRMS | 2 | 2 | | | | |
| ATT | 1 | | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

- b) Carrier 1 is configured to have a combined control channel.
- c) Carrier 2 is configured to have a non combined control channel.

20.19.4.2 Test procedure

- a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.
- b) The MS is switched on.
- c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 s but within 1 second of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.
- d) When the MS responds to paging, the SS establishes a call on a traffic channel.
- e) The SS increases the level of carrier 2 to 63 dBmV emf().
- f) After 10 s the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.
- g) After a further 10 s, the SS clears down the call. After 0,5 s but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

20.19.5 Test requirements

- 1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 s.
- 2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

20.20 Multiband cell selection and reselection

20.20.1 Multiband cell selection and reselection / Cell Selection

20.20.1.1 Definition

Multiband cell selection is a process in which a multiband MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on, irrespective of frequency band. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

20.20.1.2 Conformance requirement

1. The MS shall search all RF channels within its bands of operation, take readings of received RF signal level on each RF channel, and calculate the RLA_C for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period.

A multi band MS shall search all channels within its bands of operation as specified above. The number of channels searched will be the sum of channels on each band of operation.

3GPP TS 45.008, subclause 6.2.

2. ... the MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 s of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1.
3. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
 - 3.1 (i) It should be a cell of the selected PLMN
 - 3.2 (ii) It should not be "barred" (see subclause 3.5.1)
 - 3.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6.

3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection

4. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; 3GPP TS 03.22, subclause 3.2.1.
5. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.

20.20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the MS meets conformance requirement 2 in a multiband environment.
3. To verify that:
 - 3.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
 - 3.2 The MS does not select a cell which is "barred".
 - 3.3 The MS does not select a cell with $C1 < 0$.
4. To verify that the MS selects suitable cells in descending order of received signal strength, irrespective of frequency band.

5. To verify that the MS does not select a cell with $C1 < 0$.

20.20.1.4 Method of test

20.20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|--------------------|-----------|--------------------|-----------|
| RF Signal Level (dBmV emf() / dBm) | 48 / -65 | 36 / -77 | 43 / -70 | 33 / -80 | 23 / -90 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -69 | -90 | -88 | -98 | |
| MNC | | | See Table 20.1c | | See Table 20.1c | |
| MCC | | | 002 | | | |
| MS_TXPWR_MAX_CCH | 7 | 7 | | 7 | | |
| C1 | 25 | -8 | 20 | 8 | 8 | |
| C2 | 25 | -8 | 20 | 8 | 8 | |

Carrier 1, carrier 2 and carrier 4 ARFCNs are chosen in the lower band, carrier 3 and carrier 5 ARFCNs in the higher band.

20.20.1.4.2 Procedure

- a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The MS is switched off.
- d) The SS monitors carriers 1 and 3 for RA requests from the MS.
- e) The MS is switched on.
- f) The MS is switched off.
- g) The SS is reconfigured and sets MCC of carrier 3 to 001 (same as the other carriers).
- h) The SS activates the carriers and monitors carriers 3, 4 and 5 for RA requests from the MS.
- i) The MS is switched on.
- j) The MS is switched off.
- k) For multiband MS supporting three or more bands all valid combinations of two bands shall be tested using the steps from a) to j). The valid combinations are indicated in sub-clause 26.11.6 Multiband signalling / Default messages contents.

20.20.1.4.3 Specific PICS statement(s)

- Support for stored list cell selection Yes/No (TSPC_AddInfo_StoredListCellSel)

20.20.1.4.4 PIXIT Statements

-

20.20.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 s. If the MS supports stored list cell selection MS may be also on carrier 5. There shall be no response from the MS on carrier 2.
- 2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 s.

- 3) After step i), the first response from the MS shall be on carrier 3 within 33 s. If the MS supports stored list cell selection the first response may be also on carrier 4 or carrier 5.

20.20.2 Multiband cell selection and reselection / Cell reselection

20.20.2.1 Definition

While camped on a cell of the selected PLMN the multiband MS may need to select a different cell (irrespective of frequency band used) in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

20.20.2.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; 3GPP TS 05.08, subclause 6.6.1.
2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 s; 3GPP TS 05.08, subclause 6.6.1.
3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

20.20.2.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.
3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, and PENALTY_TIME parameters are used to give different priorities to different frequency bands.

20.20.2.4 Method of test

20.20.2.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBmV emf ()/dBm) | 53 / -60 | 48 / -65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 / -80 | 43 / -70 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| PT | | | | | | | 11111 |
| CRO | | | | | | | 20 dB |
| MS_TXPWR_MAX_CCH | 7 | 7 | 7 | | | | |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 40 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 20 |

Carrier 1, 2 and 3 ARFCNs are chosen in the lower band, carrier 4, 5, 6 and 7 ARFCNs in the higher band.

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 s. Hence 5 s is also the updating time of the list of six strongest neighbour carriers.

20.20.2.4.2 Procedure

- a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 60 s, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.
- d) The MS is switched off.
- e) The SS is reconfigured and sets $PT = 0$ and $CRO = 0$ on carrier 7 (thus increasing $C2$ to 40 dB).
- f) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- g) The MS is switched on.
- h) After 60 s, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.
- i) 20 s after receiving an RA request on carrier 7 the SS sets $PT = 11111$ and $CRO = 20$ dB on carrier 7 (thus decreasing $C2$ to 20dB), stops paging on carrier 7, and pages the MS continuously on carrier 1. The SS monitors carrier 1 for RA requests from the MS.
- j) The MS is switched off.
- k) For multiband MS supporting three or more bands all valid combinations of two bands shall be tested using the steps from a) to j). The valid combinations are indicated in sub-clause 26.11.6 Multiband signalling / Default messages contents.

20.20.2.5 Test requirements

- 1) After step c) there shall be no response from the MS on carrier 7 within 55 s of activating carrier 7.
- 2) After step h) the MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 s to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 s (+10 %)), 33 s to read BCCH, 15 s for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 s.

- 3) After step i) the MS shall access on carrier 1 within 55 s of setting PT and CRO on carrier 7.

20.21 R-GSM or ER-GSM cell selection and reselection

In the following paragraphs some explanatory text is given concerning the nature of the tests in this subclause and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this subclause cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an R-GSM or ER-GSM mobile station at least one of the carriers is chosen respectively between ARFCN 955-974 or ARFCN 940-974 and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this subclause:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.2.2.2.
- The default values of the system information data fields given in table 20.21.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.21.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be ± 6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be ± 3 dB for the signal levels used in the tests of this subclause, except for subclause 20.20, where the relative accuracy is assumed to be ± 5 dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for subclause 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this subclause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is ± 10 % except for PENALTY_TIME where it is ± 2 s. In the tests of this subclause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is ± 2 % and the SS tolerance on power level ± 1 dB.

Table 20.21.1: Default values of the system information fields

| Parameter | 3GPP TS 04.08 / 3GPP TS 44.018 reference | Abbr. | Normal Setting |
|--------------------------|--|-------|---|
| Cell channel description | 10.5.2.1 | - | Any values |
| MAX retrans | 10.5.2.29 | - | 1 |
| TX-integer | 10.5.2.29 | - | Any value |
| CELL_BAR_QUALIFY | 10.5.2.35 | CBQ | 0 |
| CELL_BAR_ACCESS | 10.5.2.29 | CBA | 0 (not barred) |
| AC CN | 10.5.2.29 | AC | All 0 |
| RE | 10.5.2.29 | RE | 0 (re-establishment allowed) |
| NCC | 10.5.2.2 | NCC | Any value |

20.21.1 R-GSM or ER-GSM cell selection

20.21.1.1 Definition

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

20.21.1.2 Conformance requirement

- ... the MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 s of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1.
- There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
 - It should be a cell of the selected PLMN.
 - It should not be "barred" (see subclause 3.5.1).
 - (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6.
3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

- Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; 3GPP TS 03.22, subclause 3.2.1.
- The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.

20.21.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that:
 - 2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
 - 2.2 The MS does not select a cell which is "barred".
 - 2.3 The MS does not select a cell with $C1 < 0$.
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with $C1 < 0$.

20.21.1.4 Method of test

20.21.1.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|--------------------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 48 / -65 | 38 / -75 | 43 / -70 | 33 / -80 | 28 / -85 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -67 | -90 | -88 | -98 | |
| MNC | | | See Table 20.1c | | | |
| MCC | | | 002 | | | |
| C1 | 25 | -8 | 20 | 8 | 13 | |
| C2 | 25 | -8 | 20 | 8 | 13 | |

Carrier 2 and carrier 4 are chosen between ARFCN 955 - 974. Carrier 1 is chosen between 975 - 1 023, 0; and carrier 3 remains in the P-GSM band.

NOTE: If MS supports the ER-GSM Band, then the carriers 2 is chosen between ARFCN 940 - 954. and carrier 4 is chosen between ARFCN 955 - 974.

20.21.1.4.2 Procedure

- a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The MS is switched off.
- d) The SS monitors carriers 1 and 3 for RA requests from the MS.
- e) The MS is switched on.

20.21.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 s. There shall be no response from the MS on carrier 2.
- 2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 s.

20.21.2 R-GSM or ER-GSM cell selection with varying signal strength values

20.21.2.1 Definition

For definition see conformance requirement.

20.21.2.2 Conformance requirement

1. The MS shall:

The MS shall search all RF channels within its bands of operation, take readings of received RF signal level on each RF channel, and calculate the RLA_C for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period.

3GPP TS 05.08 / 3GPP TS 45.008, subclause 6.2.

1.1 The MS shall search all RF channels in the system (194 ARFCNs for R-GSM and ER -GSM), take readings of received RF signal strength on each RF channel, and calculate the received level average for each.

1.2 The averaging is based on at least five measurement samples per RF carrier spread over T_{av} (3 s to 5 s).

1.3 The measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities termed the "received level averages" (RLA_C), shall be unweighted averages of the received signal levels measured in dBm.

3GPP TS 05.08 / 3GPP TS 45.008, subclause 6.1.

20.21.2.3 Test purpose

1. To verify that:

1.1 The MS meets conformance requirement 1.1.

1.2 The MS meets conformance requirement 1.2.

1.3 The MS meets conformance requirement 1.3.

2 To verify that the MS meets conformance requirement 2.

20.21.2.4 Method of test

20.21.2.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 23 / -90 | 58 / -55 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 13 / -100 | 13 / -100 | | | | |
| C1 | 10 | 53 | | | | |

Carrier 1 is chosen between ARFCN 955 - 974.

NOTE: If MS supports the ER-GSM Band, then the carrier 1 is chosen between ARFCN 940 - 974.

Specific PICS Statements:

-

PIXIT statements:

- averaging time T_{av}

20.21.2.4.2 Procedure

- a) The SS transmits on carriers 1 and 2. After a period of $b \times T_{av}$ carrier 2 reduces its transmit level to -85 dBm (28 dB μ V emf()). After a further period of $a \times T_{av}$, carrier 2 increases its transmit level again to -55 dBm (58 dB μ V emf()). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

T_{av} is the averaging time declared by the manufacturer.

The parameters a and b are chosen according to the following rules:

$$(a + b) \times T_{av} > T_{av}$$

$$0 < a \times T_{av} < 2/3 \times T_{av}$$

$$0,5 \times T_{av} < b \times T_{av} < T_{av}$$

In the equations $<$ and $>$ means at least one TDMA frame less or greater than the given value.

While satisfying the conditions given above:

a is chosen to be as close as possible to $2/3$.

b is chosen to be as close as possible to $0,5$.

- b) The MS is switched on.
c) The SS monitors all RA requests from MS on carriers 1 and 2.

20.21.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 s.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

20.21.3 R-GSM or ER-GSM basic cell reselection

20.21.3.1 Definition

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

20.21.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - 1.1 (iii) The cell camped on (current serving cell) has become barred.
 - 1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; 3GPP TS 03.22, subclause 4.5.

NOTE 1: Criterion (i) is tested in subclause 20.21.8 (Cell reselection when $C1(\text{-serving cell}) < 0$ for 5 s).

NOTE 2: Criterion (ii) is tested subclause 20.21.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in subclause 20.21.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

2.1 (ii) It should not be "barred".

2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator.
3GPP TS 03.22, subclause 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in subclause 20.21.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection;
3GPP TS 05.08, subclause 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.

ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s. This indicates that it is a better cell. 3GPP TS 05.08, subclause 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.

20.21.3.3 Test purpose

1. To verify that:

1.1 The MS meets conformance requirement 1.1.

1.2 The MS meets conformance requirement 1.2.

2. To verify that:

2.1 The MS does not reselect a cell which is barred.

2.2 The MS does not reselect a cell which has a $C1 < 0$.

3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are not used.

4. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area.

5. To verify that the MS decodes the CELL_BAR_ACCESS and CELL_BAR_QUALIFY parameters from the BCCH every 30 s.

20.21.3.4 Method of test

20.21.3.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-------------------------------------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43 / -70 | 33 / -80 | 43 / -70 | 38 / -75 | 38 / -75 | |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 | -67 | |
| CRH | 10 dB | | | | | |
| LAC | | | different from other carriers | | | |
| CBA | | | | 1 | | |
| CBQ | | | | 0 | | |
| C1 | 15 | 10 | 20 | 10 | -8 | |
| C2 | 15 | 10 | 20 | 10 | -8 | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

NOTE: If the MS supports the ER-GSM Band, the SI2bis (using the ER-GSM) should be used.

20.21.3.4.2 Procedure

- a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dB μ Vemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.
- e) The MS is switched off.
- f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.
- g) The MS is switched on.
- h) After 33 s, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.
- i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 s. (The MS should reselect and camp onto carrier 1).
- j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.
- k) The SS increases the level of carrier 3 to 53 dB μ Vemf (C2 increases to 30 dB).

20.21.3.5 Test requirements

- 1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 s.
- 2) In step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.

NOTE 1: 5 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 18,4 s, allow 20 s.

- 3) In step h), the MS shall respond on carrier 1 within 50 s of setting CBA=1 on carrier 2.

NOTE 2: 33 s for the MS to read the BCCH of carrier 2 (30 s + 10 %), 15 s for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 s.

- 4) After step j), there shall be no response from the MS within 50 s.
- 5) After step k), the MS shall respond on carrier 3 within 20 s.

20.21.4 R-GSM or ER-GSM cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters

20.21.4.1 Definition

Void.

20.21.4.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

20.21.4.3 Test purpose

1. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are used.
2. To verify DCS 1 800 MS correctly calculate the C2 parameter when the POWER_OFFSET parameter is present.

20.21.4.4 Method of test

20.21.4.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 43 / -70 | 48 / -65 | 48 / -65 | | |
| RXLEV_ACCESS_MIN (dBm) | -80 | -100 | -85 | -85 | | |
| PT | | 11111 | 40 s | 60 s | | |
| CRO | | 16 dB | 20 dB | 20 dB | | |
| TO | | | 20 dB | 20 dB | | |
| K = 1 | | | | | | |
| C1 | 20 | 30 | 20 | 20 | | |
| C2 | 20 | 14 | 20 -> 40 | 20 -> 40 | | |
| K = 2 (DCS1800 Class 3 MS only) | | | | | | |
| POWER_OFFSET | 0 | 2 | 6 | 6 | | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

NOTE: If the MS supports the ER-GSM Band, the SI2bis (using the ER-GSM) should be used.

20.21.4.4.2 Procedure

For testing of GSM MS, the test procedure is performed for execution counter K = 1.

For testing of DCS 1 800 MS, the test procedure is performed for execution counter K = 1 and 2:

On execution counter K = 1, the POWER_OFFSET Parameter is not present.

On execution counter K = 2, the POWER_OFFSET parameter is present.

- a) The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.
- b) The MS is switched on.

- c) The SS increases the level of carrier 2 to 54 dB μ V_{emf} (C2 becomes 25 dB).
- d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 s (The MS should reselect and camp onto carrier 2).
- e) The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

20.21.4.4.3 Requirements

For execution counter $K = 1$ and $K = 2$.

- 1) After step b), there shall be no response from the MS on carrier 2 within 50 s.
- 2) After step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.
- 3) After step e), there shall be no response from the MS on carrier 3 within 38 s of activating the carriers but, the MS shall respond on carrier 3 within 90 s. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 s set by penalty timer on carrier 3 less 2 s tolerance. Maximum time, total of 33 s to read BCCH of carrier 3, 42 s for expiry of penalty timer on carrier 3, 15 s for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 s.

20.21.5 R-GSM or ER-GSM cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

20.21.5.1 Definition

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

20.21.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. 3GPP TS 05.08, subclause 6.4.
2. Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. 3GPP TS 05.08, subclause 6.6.1.
3. Mobile stations shall treat all ARFCNs in the set $\{0, 1, 2 \dots 1\ 023\}$ as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.1b.
4. The MS shall correctly decodes parameters transmitted in the system information type 2 ter message. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.34.

20.21.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.
2. To verify that the MS decodes parameters transmitted in the system information type 2 bis message.
3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.
4. To verify that the MS correctly decodes parameters transmitted in the system information type 2 ter message.

20.21.5.4 Method of test

20.21.5.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf) / dBm) | 53 / -60 | 32 / -81 | 40 / -73 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf) / dBm) | 23 / -90 | 23 / -90 | 30 / -83 | | | |
| BS_AG_BLKES_RES PT | 1 | 1 | 1 | | | |
| CRO | | 16 dB | 10 dB | | | |
| TO | | 0 dB | 0 dB | | | |
| C1 | 30 | 9 | 10 | | | |
| C2 | 30 | 25 | 20 | | | |

- b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.21.1 with carrier 3 chosen between ARFCN 955 - 974.

NOTE: If the MS supports the ER-GSM Band, the carrier 3 is chosen between ARFCN 940 - 974.

- c) The cell reselection parameters PENALTY_TIME, CELL_RESELECT_OFFSET and TEMPORARY_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.
- d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 958, 963, 990 and 995. The ARFCN of carrier 2 is not transmitted in the SI2 message.
- e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

- BS_PA_MFRMS = 4;
 - IMSI mod 1000 = 12;
 - FN carrier 1 = FN carrier 2-21, for simultaneously transmitted frames.
- f) The SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

20.21.5.4.2 Test Procedure

- a) The SS activates the channels. The MS is not paged on carrier 1.
- b) The MS is switched on.
- c) After 50 s, the SS increases the level of carrier 2 to 42 dB μ Vemf().
- d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and after 30 s, the SS increases the level of carrier 3 to 60 dB μ Vemf().

20.21.5.5 Test Requirements

- 1) After step b), there shall be no response from the MS on carrier 2. There shall also be no response on carrier 3.
- 2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 33 s.

- 3) After increasing the level of carrier 3 in step d), the mobile shall respond on carrier 3 within 35 s.

20.21.6 R-GSM or ER-GSM cell reselection timings

20.21.6.1 Definition

Void.

20.21.6.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - 1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s.
 - 1.2 In case ii) above, cell reselection shall not take place if there was a cell reselection within the previous 15 s.
 - 1.3 Cell reselection for any other reason (see 3GPP TS 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 s if another suitable cell can be found.

3GPP TS 05.08, subclause 6.6.2.

20.21.6.3 Test purpose

1. To verify that:
 - 1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 s.
 - 1.2 The MS meets conformance requirement 1.2 with an allowance for the uncertainty of the test.
 - 1.3 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 s when another suitable cell exists.

20.21.6.4 Method of test

20.21.6.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|--|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level (dB μ V emf() / dBm) | 56 / -57 | 46 / -67 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 29 / -84 | 33 / -80 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 51 / -62 | 41 / -72 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 24 / -89 | 28 / -85 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE 1: If the MS supports the ER-GSM Band, the SI2bis (using the ER-GSM) should be used.

NOTE 2: With 5 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 s.

20.21.6.4.2 Procedure

- a) The SS activates the channels. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 50 s, the SS starts paging continuously on carriers 1 and 2 for 20 s. The SS monitors carriers 1 and 2 for RA requests from the MS.
- d) The SS stops paging on carriers 1 and 2 and waits for 20 s. (The MS should revert to carrier 1 due to cell reselection.)
- e) The SS starts paging continuously on carrier 2.
- f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.
- g) The SS increases the transmit level of carrier 2 by 20dB and waits for the MS to access on carrier 2. The SS records the time t from the increase in the level of carrier 2 to the first response from the MS.
- h) The SS stops paging on carrier 2 and decreases the transmit level of carrier 2 back to the original value.
- j) The SS waits 20 s. (The MS should revert to carrier 1 due to cell reselection.)
- k) The SS increases the transmit level of carrier 2 by 20 dB. After $t+2$ s, the SS starts paging continuously on carrier 1 and reduces the level of carrier 2 back to the original level.

20.21.6.5 Test requirements

- 1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on carrier 1 shall not occur within 4,5 s of the second RA request on carrier 1.
- 2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.
- 3) After step g), the MS shall respond on carrier 2.
- 4) In step k), there shall be no response on carrier 1 within 11 s after the level of carrier 2 is reduced back to the original level.

NOTE: The 11 s is derived from (t+15) seconds minimum cell reselection timer minus (t+2) seconds from the start of step k) up to the reduction of the level of carrier 2. A further 2 s are subtracted to cover for any uncertainty introduced by the RA process occurring after step g).

20.21.7 R-GSM or ER-GSM priority of cells

20.21.7.1 Definition

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

20.21.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; 3GPP TS 03.22, subclause 3.5.2.1.
- 2.

Table 1a: Parameters affecting cell priority for cell selection

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|------------------|-----------------|-------------------------|-----------------------------|
| 0 | 0 | normal | normal |
| 0 | 1 | barred | barred |
| 1 | 0 | low | normal (see note 2) |
| 1 | 1 | low | normal (see note 2) |

3GPP TS 05.08, table 1.a.

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:
 - the cell belongs to the MS HPLMN;
 - the MS is in cell test operation mode;
 - the CELL_BAR_ACCESS is set to "1";
 - the CELL_BAR_QUALIFY is set to "0";
 - the Access Control class 15 is barred.

3GPP TS 05.08, table 1.a.

20.21.7.3 Test purpose

1. To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.
2. To verify that the MS takes into account CELL_BAR_ACCESS and CELL BAR _QUALIFY when performing cell selection and reselection.
3. To verify that the MS meets conformance requirement 3.

20.21.7.4 Method of test

20.21.7.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf) / dBm) | 33 / -80 | 43 / -70 | 33 / -80 | 23 / -90 | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf) / dBm) | 3 / -110 | 23 / -90 | 13 / -100 | 13 / -100 | | |
| CBA | 0 | 1 | 1 | 0 | | |
| CBQ | 1 | 1 | 0 | 0 | | |
| Access class 15 | barred | barred | barred | barred | | |
| C1 | 30 | 20 | 20 | 10 | | |

20.21.7.4.2 Procedure

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.
- The MS is switched on.
- The MS is switched off. The SS deactivates the carriers.
- The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.
- The MS is switched on.

20.21.7.5 Test requirements

- After step b), the first response from the MS shall be on carrier 4 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.
- After step f), the first response from the MS shall be on carrier 3 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.

20.21.8 R-GSM or ER-GSM cell reselection when C1 (serving cell) < 0 for 5 s

20.21.8.1 Definition

Void.

20.21.8.2 Conformance requirement

- At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high. 3GPP TS 05.08, subclause 6.6.2.
- While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - The path loss criterion parameter C1 (see subclause 3.6) indicates that the path loss to the cell has become too high.; 3GPP TS 03.22, subclause 4.5.

20.21.8.3 Test purpose

- To verify that the MS meets conformance requirement 1.
- To verify that the MS meets conformance requirement 2.

20.21.8.4 Method of test

20.21.8.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 63 / -50 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 43 / -70 | 23 / -90 | | | | |
| CRO | 30 dB | | | | | |
| TO | 0 | | | | | |
| PT | 0 | | | | | |
| C1 | 20 | 10 | | | | |
| C2 | 50 | 10 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

20.21.8.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB μ V emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dB μ V emf(). (C1 becomes -10 dB and C2, 20 dB during this period).
- d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB μ V emf().

20.21.8.5 Test requirements

- 1) After step b), there shall be no access on carrier 1 or carrier 2, within 50 s.
- 2) After step c), there shall be no access on carrier 2 within 30 s.
- 3) After step d), the MS shall access on carrier 2 within 20 s.

20.21.9 R-GSM or ER-GSM running average of the surrounding cell BCCH carrier signal levels

20.21.9.1 Definition

Void.

20.21.9.2 Conformance requirement

1. Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received level in the preceding 5 to:
 - Max. $\{5, ((5 \times N + 6) \text{ DIV } 7) \times \text{BS_PA_MFRMS} / 4\}$
 - seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS_PA_MFRMS is defined in 3GPP TS 05.02; 3GPP TS 05.08, subclause 6.6.1.

2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period.; 3GPP TS 05.08, subclause 6.6.1

20.21.9.3 Test purpose

1. To verify that if the MS calculates a received level average (over 5 s) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.
2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

20.21.9.4 Method of test

20.21.9.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

BS_PA_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

Note: If the MS supports the ER-GSM Band, the SI2bis (using the ER-GSM) should be used.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 s.

20.21.9.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 s and continues to do so until the end of the test.
- d) The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

20.21.9.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 s.
- 2) After step c), there shall be no access from the MS on carrier 1 or 2 within 25 s.

NOTE: Any potential access on is likely to occur within 20 s.

- 3) After step d), the MS shall access on carrier 2 within 20 s.

20.21.10R-GSM or ER-GSM running average of the serving cell BCCH carrier signal level

20.21.10.1 Definition

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

20.21.10.2 Conformance requirement

1. For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The receive level average shall be a running average determined using samples collected over a period of 5 s or five consecutive paging blocks of that MS, whichever is the greater period. New receiving level average values shall be calculated as often as possible. 3GPP TS 05.08, subclause 6.6.1.

20.21.10.3 Test purpose

1. To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

20.21.10.4 Method of test

20.21.10.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf) / dBm | 63 / -50 | 39 / -74 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf) / dBm | 23 / -90 | 23 / -90 | | | | |
| C1 | 40 | 16 | | | | |
| C2 | 40 | 16 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

20.21.10.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) After 50 s the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 s.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

- d) The SS increases the level of carrier 2 to -56 dBm.

20.21.10.5 Test requirement

- 1) After step c), the MS shall not access on carrier 2, within 25 s.
- 2) After step d), the MS shall access on carrier 2, within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

20.21.11 R-GSM or ER-GSM Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list

20.21.11.1 Definition

Void.

20.21.11.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; 3GPP TS 05.08, subclause 6.6.1.
2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 s; 3GPP TS 05.08, subclause 6.6.1.

20.21.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.

20.21.11.4 Method of test

20.21.11.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf ()/dBm) | 53 / -60 | 48 / -65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 / -80 | 38 / -75 |
| RXLEV_ACCESS_MIN | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

Note: If the MS supports the ER-GSM Band, the SI2bis (using the ER-GSM) should be used.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 s. Hence 5 s is also the updating time of the list of six strongest neighbour carriers.

20.21.11.4.2 Procedure

- a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 60 s, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

20.21.11.5 Test requirements

- 1) The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 s to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 s (+10 %)), 33 s to read BCCH, 15 s for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 s.

20.21.12 R-GSM or ER-GSM decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

20.21.12.1 Definition

Void.

20.21.12.2 Conformance requirement

1. The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.21.3.

20.21.12.3 Test purpose

1. To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

20.21.12.4 Method of test

20.21.12.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.21.12.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.21.12.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2.

20.21.13 R-GSM or ER-GSM decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers

20.21.13.1 Definition

Void.

20.21.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 s, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.21.3.

20.21.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

20.21.13.4 Method of test

20.21.13.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.21.13.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.21.13.5 Test requirements

- 1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 s for check of BSIC on carrier 2, 33 s for decode of BCCH of carrier 2, 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 s.

20.21.14 R-GSM or ER-GSM emergency calls

20.21.14.1 Definition

-

20.21.14.2 Conformance requirement

1. When in a limited service state, the MS shall be able to initiate emergency calls; 3GPP TS 05.08, subclause 6.8.
2. When in a limited service state and if not camped on a cell, the MS shall monitor the signal strength of all 194 RF channels, and search for a BCCH carrier which has $C1 > 0$ and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; 3GPP TS 05.08, subclause 6.8.
3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of 3GPP TS 03.22, subclauses 4.5 and 3.7, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used; 3GPP TS 05.08, subclause 6.8.

20.21.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.
2. To verify that the MS selects a cell with $C1 > 0$ and $CBA = 0$ when no suitable cells of the selected PLMN are available.
3. To verify that the MS, when performing cell reselection in the limited service state, uses CELL_RESELECT_HYSTERESIS = 0.

20.21.14.4 Method of test

20.21.14.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-------------------------|----------------|----------------|-----------|-----------|-----------|
| RF signal level (dB μ V emf() / dBm) | 38 / -75 | 33 / -80 | 33 / -80 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 23 / -90 | 43 / -70 | 23 / -90 | | | |
| CELL_BAR_ACCESS MCC,MNC | 1 (barred) forbidden | 0 forbidden | 0 forbidden | | | |
| CELL_RESELECT_HYST | 0 | 0 | 14 dB | | | |
| C1 | 15 | -10 | 10 | | | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

20.21.14.4.2 Procedure

- a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test.
- b) The MS is switched on.
- c) 50 s after switch on, an emergency call is initiated on the MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE 1: The MS should reselect to carrier 1 because it should not take into account the CELL_RESELECT_HYST value of 14 but use 0 instead.

e) After 345 s an emergency call is initiated on the MS.

NOTE 2: 330 s to detect change of BCCH data, 15 s to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

20.21.14.5 Test requirements

- 1) In step c), the first access by the MS shall be on carrier 3.
- 2) In step e), the first access from the MS shall be on carrier 1.

20.21.15 R-GSM or ER-GSM cell reselection due to MS rejection "LA not allowed"

20.21.15.1 Definition

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

20.21.15.2 Conformance requirement

1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, 3GPP TS 03.22, subclause 3.3.
2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, 3GPP TS 03.22, subclause 3.5.4.
3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, 3GPP TS 03.22, subclause 4.4.2
4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, 3GPP TS 03.22, subclause 3.3 and figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.21.15.3 Test purpose

1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2, 3 and 4.
2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.
3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:

Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter). 3GPP TS 03.22, subclauses 3.4 and 4.5.
4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, 3GPP TS 03.22, subclause 3.3 and figure 4.

20.21.15.4 Method of test

20.21.15.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 63 / -50 | 54 / -59 | 44 / -69 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 53 / -60 | 35 / -78 | 29 / -84 | | | |
| CRH | 14 | 0 | 10 | | | |
| LAC | H1111 | H2222 | H1111 | | | |
| ATT | 1 | 1 | 1 | | | |
| C1 | 10 | 19 | 15 | | | |
| C2 | 10 | 19 | 15 | | | |

20.21.15.4.2 Procedure

- a) The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 and 3 until step e) has been completed. Only idle-paging is sent on all channels.
- b) The MS is switched on.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed".
- d) 30 s after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1: C2 of carrier 3 > C2 of carrier 1. Carriers 1 and 3 belong to the same LA.

- e) The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

- f) 10 s after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dB μ V emf().

NOTE 3: C2 of carrier 2 = 30, now larger than C2 of carrier 3 + CRH.

- g) The SS shall accept any LU on carrier 2.

20.21.15.5 Test requirements

- 1) After step b), the MS shall respond on carrier 1 within 33 s.
- 2) In step d), the MS shall access on carrier 3 with a channel request message, within 15 s of being commanded to set up the emergency call.
- 3) After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

20.21.16 R-GSM or ER-GSM downlink signalling failure

20.21.16.1 Definition

See conformance requirement.

20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to $90/N$ where N is the BS_PA_MFRMS parameter for that cell (see 3GPP TS 05.02).
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1,(however never beyond the nearest integer to $90/N$).
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, 3GPP TS 03.22, subclause 4.5 (ii) and 3GPP TS 05.08, subclause 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS_PA_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in 3GPP TS 04.08 / 3GPP TS 44.018. The MS is required to attempt to decode a message every time its paging subchannel is sent.

20.21.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to $90/N$). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

20.21.16.4 Method of test

20.21.16.4.1 Initial conditions

Two BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf() / dBm) | 43 / -70 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | 10 | | | | |

NOTE: The DSC counter will have a value 18 ($90/5$).

20.21.16.4.2 Procedure

- a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.
- b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see 3GPP TS 05.03, subclauses 4.3 and 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 30 s.

- d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to < 0 and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30 s.

20.21.16.5 Test requirements

- 1) There shall be no access to carrier 2 in test steps a) and c).
- 2) The MS shall access on carrier 2 at test step e) within 15 s.

20.21.17 R-GSM or ER-GSM cell selection if no suitable cell found in 10 s

20.21.17.1 Definition

See conformance requirement.

20.21.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 s, the cell selection algorithm of 3GPP TS 03.22 shall be performed, 3GPP TS 05.08; subclause 6.6.2.

20.21.17.3 Test purpose

To verify that the MS fulfils the conformance requirement.

20.21.17.4 Method of test

20.21.17.4.1 Initial conditions

One BCCH carrier is established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf() / dBm) | 43 / -70 | OFF | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | | | | | |

20.21.17.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on carrier 1.
- b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dB μ V emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dB μ V emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1).
- c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 s to rxlev averages, 5 s for C1 < 0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

20.21.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

20.21.18 R-GSM or ER-GSM cell reselection due to MS rejection "Roaming not allowed in this LA"

20.21.18.1 Definition

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

20.21.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, 3GPP TS 03.22, subclause 3.1.
2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, 3GPP TS 03.22; subclause 4.3.3 L3, 3GPP TS 04.08 / 3GPP TS 24.008; subclause 4.4.4.7.
3. The MS can only perform camping on a suitable cell, which:
 - should not be in an LA which is in the list of "forbidden LAs for roaming" 3GPP TS 03.22, subclause 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.21.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.
2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.
3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI <> LAI1.

20.21.18.4 Method of test

20.21.18.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|--------------|--------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 63 / -50 | 53 / -60 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| MNC | MNC <> HPLMN | MNC <> HPLMN | | | | |
| MCC | MCC of HPLMN | MCC of HPLMN | | | | |
| CRH | 0 | 0 | | | | |
| LAC | H1111 | H2222 | | | | |
| ATT | 1 | 1 | | | | |
| C1 | 40 | 30 | | | | |
| C2 | 40 | 30 | | | | |

20.21.18.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on all carriers.
- b) The SS monitors all RA requests from MS on carriers 1 and 2.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".
- d) The SS shall accept any LU on carrier 2.
- e) The SS monitors all RA requests from MS on carriers 1 to 2.

20.21.18.5 Test requirements

- 1) The MS should respond on carrier 1 within 33 s of switch on.
- 2) After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 s from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.21.1) should be adequate.

- 3) After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

20.21.19R-GSM or ER-GSM cell selection on release of SDCCH and TCH

20.21.19.1 Definition

20.21.19.2 Conformance requirement

1. When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30 s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS shall store the page and respond once the full BCCH data has been decoded, provided that the cell is not barred and the MSs access class is allowed.
3GPP TS 05.08, subclause 6.7.

20.21.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

20.21.19.4 Method of test

20.21.19.4.1 Initial conditions

- a) Parameters changed from default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBmV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBmV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| BS_PA_MFRMS | 2 | 2 | | | | |
| ATT | 1 | | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

- b) Carrier 1 is configured to have a combined control channel.
 c) Carrier 2 is configured to have a non combined control channel.

20.21.19.4.2 Test procedure

- a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.
 b) The MS is switched on.
 c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 s but within 1 s of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.
 d) When the MS responds to paging, the SS establishes a call on a traffic channel.
 e) The SS increases the level of carrier 2 to 63 dBmV emf().
 f) After 10 s the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.
 g) After a further 10 s, the SS clears down the call. After 0,5 s but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

20.21.19.5 Test requirements

- 1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 s.
- 2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

20.22 GPRS Cell Selection and Reselection

The absolute accuracy of the MS signal level measurements is assumed to be ± 6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C31, C32 values and 0.

The relative RF accuracy of the MS signal level measurements is assumed to be ± 3 dB for the signal levels used in the tests of this subclause. A difference of at least 5 dB is allowed for cases of discrimination between C1 and C31 and C32 values on different carriers.

NOTE 1: The accuracy of MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this subclause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is $\pm 10\%$ except for PENALTY_TIME where it is ± 2 s. In the tests of this subclause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is $\pm 2\%$ and the SS tolerance on power level ± 1 dB.

The MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08 and therefore tests defined in clause 20 of TS 51.010 apply.

The support of GPRS shall be indicated in SYSTEM INFORMATION TYPE 3 message. In addition, the support of GPRS shall be indicated in either SYSTEM INFORMATION TYPE 4 or SYSTEM INFORMATION TYPE 7 and 8 messages. If GPRS is supported, SYSTEM INFORMATION TYPE 13 message shall be sent. SI 13 message shall not be sent if GPRS is not supported (3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.2.2.1. Additional requirements for the broadcast of system information in a cell supporting GPRS are specified in 3GPP TS 04.60. The GPRS support is indicated by the presence of the field GPRS Indicator in the SI Rest Octets (3GPP TS 04.08 / 3GPP TS 44.018, subclauses 10.5.2.34; 10.5.2.35, 10.5.2.36 and 10.5.2.37).

The following definitions are applicable to tests 20.22.1 to 20.22.31:

- Carrier X supports GPRS : the SS includes the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.
- The SS enables GPRS on carrier X : the SS starts including the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.
- The SS disables GPRS on carrier X : the SS stops including the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.

Unless otherwise stated in the method of test, in all of the tests of this subclause:

- The SIM is in the idle updated state in the default registration area with a TMSI and PTMSI assigned at the beginning of each test.
- By default idle paging is transmitted on the PCH according to 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.2.2.2.
- Where MS paging is specified within a test, TMSI is to be used on CCCH
- The Scheduling of System Information should be such that a complete set of consistent SI messages, including SI13 were applicable, can be decoded within 8 multiframe (8×51 frames).
- The MS is configured to automatically attach to GPRS at switch on by using the PICS/PIXIT Statement "Automatic GPRS attach procedure at switch on or power on Yes/No" as in GPRS Attach procedure tests (see subclause 44.2.1). For MS that does attach at power on, the SS shall accept access request with cause 'one phase access' in determining test verdict where applicable.
- The network simulation settings as specified in section 40 shall be applied unless otherwise stated in section 20.22.

Table 20.22.1: Default values of the system information or Packet Measurement Order fields

| Parameter | 3GPP TS 04.60 reference | Abbr. | Normal Setting |
|-----------------------|-------------------------|-------|--|
| PRIORITY_CLASS | 11.2.20 | PC | 1 |
| HCS_THR | 11.2.20 | HT | -110dBm |
| GPRS_RESELECT_OFFSET | 11.2.20 | GRO | 0 dB |
| NC_REPORTING_PERIOD_I | 11.2.23 | RP | 61.44s |
| NETWORK_CONTROL_ORDER | 11.2.23 | NCO | NC0 |
| CELL_RESELECT_HYST | 11.2.20 | CRH | 0 dB |
| GPRS_TEMPORARY_OFFSET | 11.2.20 | GTO | 0 db |
| GPRS_PENALTY_TIME | 11.2.20 | GPT | 10s |
| GPRS_MS_TXPWR_MAX_CCH | 11.2.20 | GMTMC | Max. output power of MS |
| GPRS_RXLEV_ACCESS_MIN | 11.2.20 | GRAM | -90 dBm |
| BA(GPRS) ARFCN | 11.2.20 | BA | All 0 except values in Table 20.22.1a (broadcast in in SYSTEM INFORMATION TYPE 2 and 2bis.) |

Table 20.22.1a: ARFCNs for Single Band Tests

| Band | ARFCNs |
|-----------|--|
| GSM 450 | 259, 263, 269, 275, 279, 283, 287, 292 |
| GSM 480 | 306, 310, 316, 322, 326, 330, 334, 339 |

20.22.6 Void

20.22.7 Void

20.22.8 Cell selection when the best cell does not support GPRS

20.22.8.1 Definition

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. The support of GPRS is not a condition to select a cell. Once the MS is camped on a cell, access to the network is allowed.

20.22.8.2 Conformance requirement

1. ... the MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes a valid SIM with PIN disabled and ideal radio conditions

3GPP TS 05.08 / 3GPP TS 45.008, subclause 6.1.

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

2.1 (i) It should be a cell of the selected PLMN;

2.2 (ii) It should not be "barred" (see subclause 3.5.1);

2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming";

2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6. 3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, 3GPP TS 03.22, subclause 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, 3GPP TS 05.08, subclause 6.4.

20.22.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1. even when one of the other cells supports GPRS.
2. To verify that:
 - 2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.
 - 2.2 The MS does not select a cell which is "barred".
 - 2.4 The MS does not select a cell with $C1 < 0$.
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with $C1 < 0$.

20.22.8.4 Method of test

20.22.8.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Cell A | Cell B | Cell C | Cell D | Cell E |
|------------------------|-----------|-----------|--------------------|-----------|-----------|
| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
| Channel Type Carried | BCCH | BCCH | BCCH | BCCH | BCCH |
| RF Signal Level (dBm) | -75 | -80 | -70 | -60 | -70 |
| GPRS Support | N | Y | N | N | N |
| CBA | 0 | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 | -60 |
| GPRS_RXLEV_ACCESS_MIN | -- | -- | -- | -- | -- |
| MNC | Default | Default | See Table 20.1c | Default | Default |
| MCC | Default | Default | 002 | Default | Default |
| C1 | 15 | 10 | 20 | 30 | -10 |

NOTE 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

NOTE 2: Carrier 2 supports GPRS without PBCCH channel in the cell.

NOTE 3: Carriers 1, 3, 4 and 5 do not support GPRS.

20.22.8.4.2 Procedure

- a) The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.
- b) The MS is switched on.

20.22.8.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 1 within 33 s. There shall be no response from the MS on any other carrier.

20.22.9 Cell reselection when the best cell does not support GPRS

20.22.9.1 Definition

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. The target cell should be reselected despite it does not support GPRS.

20.22.9.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - 1.1 (iii) The cell camped on (current serving cell) has become barred.
 - 1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; 3GPP TS 03.22, subclause 4.5.

NOTE 1: Criterion (i) is tested in subclause 20.8 (Cell reselection when $C1(\text{serving cell}) < 0$ for 5 s).

NOTE 2: Criterion (ii) is tested subclause 20.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in subclause 20.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

- 2.1 (ii) It should not be "barred".
- 2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. 3GPP TS 03.22, subclause 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in subclause 20.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.
4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.

- ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except in the case of the new cell being in a different location area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds. This indicates that it is a better cell. 3GPP TS 05.08, subclause 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.

20.22.9.3 Test purpose

20.22.9.3.1 Test purpose for procedure 1

1. To verify that:
 - 1.1 The MS meets conformance requirement 1.1.
 - 1.2 The MS meets conformance requirement 1.2.
2. To verify that:
 - 2.1 The MS does not reselect a cell which is barred.
 - 2.2 The MS does not reselect a cell which has a C1 < 0.
 - 2.3 The MS does reselect a cell even if does not support GPRS.
 - 2.4 The MS keeps camping on the serving cell despite it does not support GPRS and there is a non-serving suitable cell with a lower C2 that supports GPRS.
 - 2.5 The MS does not attempt to attach to GPRS when camping on a cell that does not support GPRS despite there is a non-serving suitable cell with a lower C2 that supports GPRS.
3. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area or if MS in Ready State, whether this cell supports GPRS or not.

Method of test for procedure 1

Initial Condition

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| Channel Type Carried | BCCH | BCCH | BCCH | BCCH |
| RF Signal Level (dB μ V emf) / dBm) | 43 / -70 | 33 / -80 | 38 / -75 | 38 / -75 |
| GPRS Support | Y | N | N | N |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -85 | -67 |
| CRH | 10 dB | Default | Default | Default |
| LAC | Default | Default | Default | Default |
| CBA | Default | Default | 1 | Default |
| CBQ | Default | Default | 0 | Default |
| C1 | 15 | 10 | 10 | -8 |
| C2 | 15 | 10 | 10 | -8 |

NOTE 1: Carrier 1 support GPRS without PBCCH channel in the cell.

NOTE 2: Carriers 2, 3 and 4 do not support GPRS.

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

Procedure

- a) The SS activates carriers 1, 2, 3 and 4 with paging enabled on Carriers 2, 3 and 4.

- b) The MS is switched on.
- c) The MS should select and camp onto carrier 1 and complete the GPRS Attach procedure (Ready Timer deactivated).
- d) The SS disables GPRS on carrier 1 and enables GPRS on carrier 2.
- e) The SS enables GPRS on carrier 1 and disables GPRS on carrier 2.
- f) The level of carrier 2 is increased to 43 dB μ V_{emf} (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- g) The level of carrier 2 is increased to 53 dB μ V_{emf} (C2 becomes 30 dB), and the SS monitors carrier 2 for RA requests from the MS.

Test requirements

- 1) After step c), there shall be no response from the MS on carriers 2, 3, or 4 within 50 s.

NOTE 1: 33 s for the MS to read the BCCH of carrier 2 (30 s + 10 %), 15 s for the MS to reselect another cell, since the MS already has a running average on carrier 1, allow 50 s.

- 2) After step d), there shall be no response from the MS on carriers 2, 3, or 4 within 345 s.

NOTE 2: 330 s for the MS to read the BCCH of carrier 2 (300 s + 10 %), 15 s for the MS to reselect another cell, since the MS already has a running average on carrier 1.

- 3) After step e), there shall be no response from the MS on carriers 2, 3, or 4 within 345 s.

- 4) After step f), there shall be no response from the MS on carriers 2, 3, or 4 within 50 s.

- 5) In step g), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.

NOTE 3: 5 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 18,4 s, allow 20 s.

20.22.9.3.2 Test purpose for procedure 2

- 2.1 To verify that the MS does not camp on a barred cell.

- 4. To verify that the MS decodes the CELL_BAR_ACCESS parameter from the BCCH every 30 s.

Method of test for procedure 2

Initial Condition

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-------------------------------|-----------|
| Channel Type Carried | BCCH | BCCH | BCCH | BCCH |
| RF Signal Level (dB μ V _{emf}) / dBm | 38 / -75 | 43 / -70 | 43 / -70 | 38 / -75 |
| GPRS Support | N | Y | Y | N |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 |
| LAC | Default | Default | different from other carriers | Default |
| CBA | Default | Default | 1 | 1 |
| CBQ | Default | Default | Default | 0 |
| C1 | 10 | 20 | 20 | 10 |
| C2 | 10 | 20 | 20 | 10 |

NOTE 1: Carrier 2 and 3 support GPRS without PBCCH channel in the cell.

NOTE 2: Carriers 1 and 4 do not support GPRS.

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

Procedure

- a) The SS activates all carriers with paging enabled on Carriers 1, 3 and 4. The MS is switched on. The MS should select and camp onto carrier 2 and complete the GPRS Attach procedure (Ready Timer deactivated).
- b) After 33 s, the SS sets CBA = 1 on carrier 2.

Test requirements

- 1) In step b), the MS shall access Carrier 1 within 50 s of setting CBA=1 on carrier 2.

20.22.10 Void

20.22.11 Void

20.22.12 Cell Selection on "LA Not Allowed"

20.22.12.1 Definition

-

20.22.12.2 Conformance requirement

If the MS has received the cause "LA Not Allowed" it shall ignore this fact when selecting a cell to camp on (3GPP TS 03.22, subclause 3.2.1).

20.22.12.3 Test purpose

To verify that the MS does not reject a cell because the cell is a part of the LA for which it has received the cause "LA Not Allowed".

NOTE: During GPRS Attach, the MS receives an ATTACH REJECT message with cause 'LA not allowed'. The MS shall then camp on any acceptable cell and shall be able to make emergency calls.

20.22.12.4 Method of test

Initial conditions

| Parameter | Cell 1 | Cell 2 |
|-------------------------|---------|---------|
| Channel Type carried | BCCH | BCCH |
| RF Signal Level (dBm) | -60 | -75 |
| Serving Cell Parameters | | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 |
| CELL_BAR_ACCESS | 0 | 1 |
| LAC | Default | Default |
| C1 | 30 | 15 |

NOTE: Serving Cell Parameters are coded and transmitted on the specified Channel Type

20.22.12.4.2 Procedure

- a) The SS activates all the Carriers.
- b) MS is Switched on.
- c) The SS sends an Attach Reject Message on Cell 1 with cause as "LA not allowed".
- d) The MS is manually commanded to set up an emergency call.

20.22.12.5 Test Requirements

- 1) After Step b) the response shall be on Cell 1.
- 2) In step d), the MS shall access on Cell 1 with a channel request message, within 15 s of being commanded to set up the emergency call.

NOTE: Cell 2 is barred and hence it is not suitable for Camping.

20.22.13 Void

20.22.14 Void

20.22.15 Cell Reselection/ ready state / no reselection

20.22.15.1 Definition

-

20.22.15.2 Conformance requirement

At least every 5 s, the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non-serving cells (if necessary). 3GPP TS 05.08 subclause 6.6.2.

The MS shall then check whether:

- i) the path loss criterion (C1) for the current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s except:
 - a) in the case of a new cell being in a different Location Area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s.

20.22.15.3 Test purpose

To verify that the MS does not reselect because of a C2 criteria when GMM is in ready state (MS GPRS attached) and when the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB for a period of less than 5 s.

NOTE: The serving cell C2 decreases before mobile is out of ready state with the following conditions.

- a) $C2(\text{Serving}) + \text{CELL_RESELECT_HYSTERESIS} > C2(\text{Adjacent})$.
- b) $C2(\text{Serving}) + \text{CELL_RESELECT_HYSTERESIS} < C2(\text{Adjacent})$ for < 5 s.

20.22.15.4 Method of Test

Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Cell 1 | Cell 2 |
|------------------------|------------|----------|
| | Carrier1 | Carrier2 |
| Channel Type carried | BCCH | BCCH |
| RF Signal Level (dBm) | -55 to -75 | -60 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 |
| CRH | 10 | Default |
| C2 | 35 to 15 | 30 |

NOTE 1: MS must be configured to Initiate GPRS Attach on Power On.

NOTE 2: Cell reselection criteria from the above parameters:

$$[C2(s)+CRH = 25] < [C2(n) = 30]$$

for a period of less than 5 s, where 's' denotes the serving cell and 'n' denotes the non-serving cell. After 5 s, C2 of serving cell goes back to the original higher value.

$$[C2(s)+CRH = 45] > [C2(n) = 30]$$

NOTE 3: Each Cell Supports GPRS without PBCCH

20.22.15.4.2 Procedure

- The SS activates both carriers. The MS is paged continuously on Carrier 2.
- MS is switched on.
- The SS completes the GPRS Attach procedure (Ready Timer deactivated).
- The C2 value for carrier 1 is decreased by 20 dB for < 5 s.

20.22.15.5 Test requirements

- The MS shall camp on carrier 1 within 33 s after step b), and initiate the GPRS Attach procedure.
- The MS is in GMM Ready State after step c).
- After step d) there shall be no access on Carrier 2 for 50s.

20.22.16 Cell Reselection/ ready state/ Reselection and Cell update procedure

20.22.16.1 Definition

-

20.22.16.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(3GPP TS 05.08 subclause 6.6.2).

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

- The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
 - in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the

serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or

- b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 s.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routing area update is executed instead of a cell update (3GPP TS 03.60 subclause 6.9.11).

20.22.16.3 Test purpose

- To verify that the MS reselects an adjacent cell because of a C2 criteria when GMM is in ready state (MS GPRS attached) and when the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB for a period of 5 s.
- To verify that the MS performs the cell update procedure (when the cell is in the same Routing Area) and $C2(\text{Serving}) + \text{CELL_RESELECT_HYSTERESIS} < C2(\text{Adjacent})$ for at least 5 s.

20.22.16.4 Method of Test

Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Cell 1 | Cell 2 |
|------------------------|------------|----------|
| | Carrier1 | Carrier2 |
| Channel Type carried | BCCH | BCCH |
| RF Signal Level (dBm) | -60 to -75 | -65 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 |
| CRH (dB) | 6 | Default |
| C2 | 30 to 15 | 25 |

NOTE 1: Cell reselection criteria from the above parameters:

$$[C2(s) = 15] < [C2(n) = 25] \text{ for a period } > 5 \text{ s.}$$

$$[C2(s) + \text{CRH} = 21] < [C2(n) = 25] \text{ for a period } > 5 \text{ s.}$$

NOTE 2: Each Cell Supports GPRS without PBCCH

Procedure

- The SS activates both carriers.
- MS is switched on.
- The SS completes the GPRS Attach procedure (Ready Timer deactivated). The SS waits 20s.
- The C2 value for carrier 1 is decreased by 15 dB.

20.22.16.5 Test requirements

- The MS shall camp on carrier 1 within 33 s after step b) and initiate a GPRS Attach procedure.
- The MS is in GMM ready state after step c).
- After step d) the MS shall initiate the Cell Update procedure on Carrier 2 within 22s.

NOTE 1: Time allowed includes 5.9s to perform running average on Carrier 1 (based on BS_PA_MFRMS of 5), 5s to update C2, 5s to check the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS, 2.4s to decode BCCH carrier, 1s for reselection and 10% timer tolerance.

20.22.17 C2 reselection in another RA - no cell reselection

20.22.17.1 Definition

-

20.22.17.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(3GPP TS 05.08 subclause 6.6.2)

At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether:

- 1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- 2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
 - a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
 - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 s.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routing area update is executed instead of a cell update (3GPP TS 03.60 subclause 6.9.11).

20.22.17.3 Test purpose

To verify that the MS does not reselecting an adjacent cell when the cell is in a routing area different from the serving cell's one and when the C2 value for the adjacent cell does not exceed the C2 value of the serving cell for a period of 5 s by at least CRH dB.

20.22.17.4 Method of Test

Initial Conditions

| Parameter | Cell 1 | Cell 2 | Cell 3 | Cell 4 |
|------------------------|------------|----------|----------|----------|
| | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
| Channel Type carried | BCCH | BCCH | BCCH | BCCH |
| RF Signal (dBm) | -60 to -80 | -65 | -75 | -75 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 | -100 |
| CRH (dB) | +10 | Default | Default | Default |
| C1 | 40 to 20 | 35 | 25 | 25 |
| C2 | 40 to 20 | 35 | 25 | 25 |

NOTE 1: Carrier 1 and carrier 3 are in same routing area, carrier 2 and carrier 4 are in different routing area from carriers 1 and 3.

NOTE 2: Each Cell Supports GPRS without PBCCH

20.22.17.4.2 Procedure

- a) The SS activates all carriers. The MS is continuously paged on Carriers 2, 3 and 4.
- b) MS is switched ON.
- c) The SS shall complete the GPRS attach procedure (Ready timer deactivated). The SS waits 20s.
- d) Decrease the RF level of Carrier 1 such that the following conditions are met for a period of less than 5 s.
 - $C2(\text{adjacent}) > C2(\text{Serving});$
 - $C2 + CRH(\text{serving cell}) < C2(\text{adjacent cell}).$

20.22.17.5 Test requirements

- 1) MS shall camp on Carrier 1 after step b) and initiate a GPRS attach procedure within 33s.
- 2) The MS is in GMM ready state after step c).
- 3) After step d) there shall be no access on Carriers 2, 3 or 4 for 50s.

20.22.18 C2 reselection in another Routing Area - Routing Area Update

20.22.18.1 Definition

-

20.22.18.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(3GPP TS 05.08 subclause 6.6.2)

At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether:

- 1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- 2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
 - a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERSIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
 - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5 dB for a period of 5 s.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routing area update is executed instead of a cell update (3GPP TS 03.60 subclause 6.9.11).

20.22.18.3 Test purpose

1. To Verify that when the MS is in ready state, the MS reselects an adjacent cell when the cell is in a routing area different from the serving cell's one and when the C2 value for the adjacent cell exceed the C2 value of the serving cell for a period of 5 s by at least CRH dB.
2. To verify that the MS performs the Normal Routing Area Update procedure.

20.22.18.4 Method of Test

Initial Conditions:

| | Cell 1 | Cell 2 | Cell 3 | Cell 4 |
|------------------------|------------|----------|----------|----------|
| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
| Channel Type carried | BCCH | BCCH | BCCH | BCCH |
| RF Signal (dBm) | -60 to -80 | -65 | -75 | -75 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 | -100 |
| CRH (dB) | +10 | Default | Default | Default |
| C1 | 40 to 20 | 35 | 25 | 25 |
| C2 | 40 to 20 | 35 | 25 | 25 |

NOTE 1: Carrier 1 and carrier 3 are in same routing area.

NOTE 2: Carrier 2 and carrier 4 are in different routing area from carrier 1 and carrier 3.

NOTE 3: Each Cell Supports GPRS without PBCCH

20.22.18.4.2 Procedure

- a) The SS activates all carriers.
- b) MS is switched ON.
- c) SS Completes the GPRS attach procedure (Ready timer deactivated).
- d) The RF level of Carrier 1 is decreased to -80 dBm such that the following condition is met:
 - $C2(\text{serving}) + CRH < C2(\text{adjacent cell})$.

20.22.18.5 Test requirements

- 1) MS shall camp on Carrier 1 after step b) and initiate a GPRS attach procedure within 33s.
- 2) The MS is in GMM ready state after step c). The SS waits 20s.
- 3) After step d) the MS shall reselect to carrier 2 within 22s. The MS shall initiate the Routing Area Update procedure.

NOTE 1: Time allowed includes 5.9s to perform running average on Carrier 1 (based on BS_PA_MFRMS of 5), 5s to update C2, 5s to check the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS, 2.4s to decode BCCH carrier, 1s for reselection and 10% timer tolerance.

20.22.19 Borders between routing areas - reselection of a GPRS cell in a homogenous network

20.22.19.1 Definition

-

20.22.19.2 Conformance requirement

The MS is required to perform the following measurements (see 3GPP TS 03.22) to ensure that the path loss criterion to the serving cell is acceptable.

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether:

- 1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- 2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
 - a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS (CRH) dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
 - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 s.

This indicates that it is a better cell.

Reference: 3GPP TS 05.08, section 6.6.2.

20.22.19.3 Test purpose

To Verify that the MS does not reselect a cell in a different routing area when another one is suitable in the same routing area even if C2 is lower.

20.22.19.4 Method of Test

Initial Conditions

| Parameter | Cell 1 | Cell 2 | Cell 3 | Cell 4 |
|------------------------|------------|----------|----------|----------|
| | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
| Channel Type carried | BCCH | BCCH | BCCH | BCCH |
| RF Signal (dBm) | -60 to -75 | -65 | -70 | -80 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 | -100 |
| CRH | +14 | Default | +14 | Default |
| C1 | 40 to 25- | 35 | 30 | 20 |
| C2 | 40 to 25- | 35 | 30 | 20 |

NOTE 1: Carrier 1 and carrier 3 are in same routing area.

NOTE 2: Carrier 2 and carrier 4 are in different routing area then carrier 1 and carrier 3.

NOTE 3: Each Cell Supports GPRS without PBCCH

NOTE 4: The Ready Timer length should be set to 0 so that the MS immediately enters the GMM Standby State on completion of the GPRS Attach (ref. 03.60, 6.2.1).

20.22.19.4.2 Procedure

- a) The SS activates all carriers. The MS is paged continuously on Carriers 2, 3 and 4.
- b) MS is switched ON.
- c) The SS completes the GPRS attach procedure.
- d) The RF level of Carrier 1 is decreased such that C1 is 25 for 5 s.

20.22.19.5 Test requirements

- 1) The MS shall camp on carrier 1 after step b) and initiate the GPRS attach procedure.

- 2) The MS is in GMM Standby State after Step c).
- 3) After step d) the MS shall reselect to carrier 3 as:

$$(C2(\text{Carrier 1}) + \text{CRH} = 39) > (C2(\text{Carrier 2}) = 35)$$

$$(C2(\text{Carrier 1}) = 25) < (C2(\text{Carrier 3}) = 30)$$

The MS should respond to Paging on Carrier 3 only within 30s.

NOTE: Time allowed includes 18.75s running average of neighbour cells (based on max BA list of 20 specified in 20.22 for an E-GSM MS), 5s to update C2, 2.4s to decode BCCH, 1s to reselect and 10% tolerance. Allow 30s.

20.22.20 Void

20.22.21 Void

20.22.22 Cell Reselection with cells in different Routing area

20.22.22.1 Definition

-

20.22.22.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
 - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion $C31 \geq 0$; or
 - All cells, if no cells fulfill the criterion $C31 \geq 0$;
 - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbor cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
 - GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set;
 - GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
 - RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.

- GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

20.22.22.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area. When the MS is in the Standby or ready state, on triggering of a reselection, when it considers a suitable cell which happens to be in a different Routing Area, the C32 value of the new cell must be reduced by RARH for comparison.

20.22.22.4 Method of test

Initial conditions

| Parameter | Cell 1 | Cell 2 | Cell 3 |
|-----------------------------|------------|----------|----------|
| | Carrier1 | Carrier2 | Carrier3 |
| Channel Type carried | BCCH | BCCH | BCCH |
| RF Signal (dBm) | -60 to -80 | -65 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 |
| RA COLOUR | 001 | 010 | 001 |
| RARH (dB) | 10 | Default | Default |
| GPRS_PRIORITY_CLASS | | 0 | 0 |
| GPRS_HCS_THR | | -90 | -90 |
| C1 | 30 to 10 | 25 | 20 |
| C31 | 0 | 25 | 20 |
| C32 | 30 to 10 | 15 | 20 |

NOTE 1: The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

NOTE 2: The value of RXLEV_ACCESS_MIN is obtained from the SI messages for reselection. NOTE 3: When a neighbouring cell belongs to a different RA, RARH value is deduced from its C32 value during reselection, if the MS is in Standby or Ready state. In absence of PBCCH, when RARH is not available, CRH (from SI messages on BCCH) is used instead (3GPP TS 05.08 subclause 10.1.1).

NOTE 3: GPRS reselection parameters for carrier 1 shall be converted from the idle mode cell reselection parameters received on System Information 4 on BCCH according to 3GPP TS 05.08 table 3a.

20.22.22.4.2 Procedure

- All the carriers are activated and MS is switched ON. The MS is paged continuously on Carriers 2 and 3.
- SS completes the GPRS Attach procedure. (Ready Timer is set to default.)
- Send GPRS reselection parameters through Packet Measurement Order message.
- SS waits until MS goes into Standby Mode (expiry of Ready Timer). The RF level of carrier 1 is reduced to -80dBm, hence Reselection is triggered.

20.22.22.5 Test Requirements

- After step a) the MS camps on Carrier 1 and initiates the GPRS Attach procedure.
- After step d) the MS should respond on Carrier 3 within 11s.

NOTE 1: Time allowed includes 5.9s to perform running average on Carrier 1 (based on BS_PA_MFRMS of 5), 2.4s to decode BCCH carrier, 1s for reselection and 10% timer tolerance.

20.22.27 Void

20.22.28 Void

20.22.29 Packet Measurement order procedure / Downlink transfer / Normal case/ 3G cell reselection dedicated parameters

20.22.29.1 Conformance requirement

For a multi-RAT MS, cells or frequencies with other radio access technologies may be included in 3G Cell Reselection list (see 3GPP TS 04.18). The network controls the measurements for reselection of these cells by the parameter Q_{search_I} broadcast on BCCH. Q_{search_I} defines a threshold and also indicates whether these measurements shall be performed when RLA_C (see subclause 6.6.1) of the serving cell is below or above the threshold. These measurements may be performed less frequently than measurements of GSM cells as described in subclause 6.6.1, in order to conserve MS power.

The MS shall be able to identify and select a new best UTRAN cell on a frequency, which is part of the 3G Cell Reselection list, within 30 seconds after it has been activated under the condition that there is only one UTRAN frequency in the list and under good radio conditions. For test purposes the following radio conditions can be used: Serving GSM cell at $RXLEV = -70$ dBm, with 6 GSM neighbours at $RXLEV = -75$ dBm. Then either an UTRAN FDD neighbour cell or an UTRAN TDD neighbour cell is switched on. The radio conditions for the UTRAN FDD cell are as follows (see TS 25.101 for definitions):

| Parameter | Unit | UTRAN FDD Cell |
|-----------------------|--------------|-------------------|
| CPICH_Ec/lor | dB | -10 |
| PCCPCH_Ec/lor | dB | -12 |
| SCH_Ec/lor | dB | -12 |
| PICH_Ec/lor | dB | -15 |
| DPCH_Ec/lor | dB | $-\infty$ |
| OCNS_Ec/lor | dB | -0.94 |
| \hat{I}_{or}/I_{oc} | dB | 10 |
| I_{oc} | dBm/3.84 MHz | -70 |
| CPICH_Ec/lo | dB | -10.4 |
| CPICH RSCP | dBm | -70 |
| FDD_Qoffset | Integer | 5 (-12dB) |
| FDD_Qmin | Integer | 7 (-12 dB) |
| Q_{search_I} | Integer | 7 (search always) |
| Propagation Condition | AWGN | |

The radio conditions for the UTRAN TDD cell (3.84 Mcps) are as follows (see 3GPP TS 25.123 for definitions and for the values of the remaining configuration parameters):

| Parameter | Unit | UTRA TDD Cell (3.84 Mcps) | |
|-------------------------|---------|------------------------------|-------|
| Timeslot Number | | 0 | 8 |
| P-CCPCH_Ec/lor | dB | -3 | |
| SCH_Ec/lor | dB | -9 | -9 |
| SCH_t _{offset} | Integer | 0 | 0 |
| PICH_Ec/lor | dB | | -3 |
| OCNS_Ec/lor | dB | -3.12 | -3.12 |
| PCCPCH RSCP | dBm | -70 | -70 |
| TDD_Qoffset | Integer | 5 (-90dBm) | |
| Qsearch_I | Integer | 7 (search always) | |
| Propagation Condition | AWGN | | |

NOTE: On timeslot 8 the P-CCPCH is not transmitted; on that timeslot, the PCCPCH RSCP defines the power level of the beacon channel.

The radio conditions for the UNTRAN TDD cell (1.28 Mcps) are as follows:

| Parameter | Unit | LCR TDD Cell (1.28 Mcps) |
|-----------------------|---------|-----------------------------|
| PCCPCH_Ec/lor | dB | -3 |
| PICH_Ec/lor | dB | -3 |
| OCNS_Ec/lor | dB | -3.12 |
| PCCPCH RSCP | dBm | -70 |
| TDD_Qoffset | Integer | 5 (-90dBm) |
| Qsearch_I | Integer | 7 (search always) |
| Propagation Condition | AWGN | |

The allowed time is increased by 30 seconds for each additional UTRAN frequency in the 3G Cell Reselection list. However, multiple UTRAN cells on the same frequency in the list do not increase the allowed time.

A multi-RAT MS shall be able to monitor 64 UTRAN cells, divided into (depending on the MS capability):

- FDD cells on up to 3 FDD frequencies, with a maximum of 32 cells per frequency; and/or
- TDD cells on up to 3 TDD frequencies with a maximum of 32 cells per frequency.

The MS shall attempt to read and store UTRAN predefined configurations using the rules defined in 3GPP TS 25.331 with the following exceptions:

- The MS shall build a list of at most 16 predefined configurations, read from the BCCH of the identified UTRAN cells of equivalent PLMNs.
- After PLMN selection (see 3GPP TS 23.122), the MS shall delete any old list of predefined configurations and as soon as possible attempt to read the predefined configurations from one identified UTRAN cell of the selected PLMN or of an equivalent PLMN.
- The MS shall attempt to update the list of predefined configurations every 60 minutes.

In case of a conflict with GSM tasks, the GSM tasks take precedence.

NOTE: Instead of reading new predefined configurations from a PLMN, the MS may use previously received predefined configurations for that PLMN according to the rules in 3GPP TS 25.331.

The MS shall report the list of predefined configurations in the UTRAN CLASSMARK CHANGE message (see 3GPP TS 04.18).

References

3GPP TS 05.08, subclause 6.6.4

20.22.29.2 Test Purpose

To verify that the 3G search parameters and neighbour cell description are correctly used by the MS in order to reselect a 3G cell.

To verify that the individual parameters are used by the MS instead of broadcast 3G cell reselection parameters when the MS receives a PACKET MEASUREMENT ORDER message.

20.22.29.3 Method of test

Initial conditions

System Simulator:

1 GSM/GPRS cell, operating in NC0, 1 UTRAN neighbour cell.

| Parameter | Unit | Cell 1 (GSM) |
|-----------------|------|--------------|
| Test Channel | | 1 |
| RF Signal Level | dBm | -70 |

For MS supporting FDD:

| Parameter | Unit | Cell 2 (UTRAN) |
|----------------|----------------------|----------------|
| Test Channel | | 1 |
| CPICH_Ec (FDD) | dBm / 3.84 MHz | OFF to -70 |

For MS supporting TDD:

| Parameter | Unit | Cell 2 (UTRAN) |
|-----------------|----------------------|----------------|
| Test Channel | | 1 |
| PCCPCH_Ec (TDD) | dBm / 1.28 MHz | OFF to -70 |

- 3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of UTRAN Cell.
- 3GPP TS 34.123-3, subclause 8.3.2 shall be referenced for configuring channels on UTRAN Cell.
- Qrxlevmin value for Cell 2 (UTRAN) is set to -115 dBm in SIB3 and SIB 4 (see specific message contents).

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

Specific PICS statements:

- Support of UTRAN FDD (TSPC_Type_UTRAN_FDD)
- Support of UTRAN TDD (TSPC_Type_UTRAN_TDD)

Foreseen final state of the MS

- MS is in Packet Idle mode.

Test procedure

The GSM/GPRS cell operates in NC0. The MS is brought into downlink packet transfer mode on GSM carrier. The SS sends a PACKET MEASUREMENT ORDER message, setting Qsearch_P to "Never". The SS activates UTRAN carrier with higher RF signal strength than GSM carrier. The MS shall stay camping in the cell of Carrier 1. During the transfer, the SS sends a PACKET MEASUREMENT ORDER message, setting 3G search to "Always".

The GPRS 3G Cell Reselection list includes UTRAN frequencies.

If the UTRAN operates in FDD mode, the MS then reselects (see TS 25.304) a UTRAN FDD cell when its measured RSCP value exceeds the value of RLA_P for the serving cell by the value FDD_GPRS_Qoffset for a period of 5 seconds and the UTRAN cell measured Ec/No value is equal or greater than the value FDD_Qmin, where FDD_Qmin and FDD_Qoffset are broadcast on BCCH of the serving cell.

If the UTRAN operates in TDD mode, the MS then reselects a UTRAN TDD cell when its measured RSCP value exceeds the value of TDD_Qoffset.

The UTRAN neighbour cell is suitable and the parameters required to determine if it is suitable are broadcast on BCCH of the UTRAN cell.

Maximum duration of the test

3 minutes

Expected Sequence

This sequence is performed for each UTRAN mode the MS supports.

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|---|
| 1 | MS | | The MS is GPRS attached and has activated a PDP context (see PICS) on GSM carrier. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment with correct TLLI. Triggers the MS to monitor the assigned PDCH. With a valid RRBP. |
| 3 | MS -> SS | PACKET CONTROL ACK | MS acknowledges on PACCH the IMMEDIATE ASSIGNMENT |
| 4 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH of GSM carrier PMO message contains Qsearch_P set to "Never". Note: NETWORK_CONTROL_ORDER still indicates NC0 |
| 5 | SS->MS | Void | SS sends downlink data, |
| 6 | | | |
| 7 | | | |
| 8 | | | For FDD: Activate UTRAN carrier setting the CPICH Ec level to -70 dBm / 3.84 MHz For TDD: Activate UTRAN carrier setting the PCCPCH Ec level to -70 dBm / 1.28 MHz. Repetition of step 5 for 15 secs during which TBF is maintained |
| 9 | SS->MS | PACKET MEASUREMENT ORDER | The SS verifies that no RRC CONNECTION REQUEST is received from the MS Sent on PACCH of GSM carrier; the PMO message contains Qsearch_P set to "Always". Note: NETWORK_CONTROL_ORDER still indicates NC0 |
| 10 | | | Repetition of step 5 for 30 secs during which TBF is maintained. Check that after 15s, the MS does not camp any more on the GSM cell: the MS stops sending PACKET DOWNLINK ACK/NACK messages when requested. |
| 11 | MS -> SS | RRC CONNECTION REQUEST | Verify that the MS has reselected the UTRAN carrier. The SS verifies that the time between the end of Step 9 and the RRC CONNECTION REQUEST is between 5 secs and 30 secs. |

20.22.30 Cell Reselection/usage of BA(GPRS)

20.22.30.1 Cell Reselection/usage of BA(GPRS)/ Most suitable cell not in BA(GPRS)

20.22.30.1.1 Conformance requirement

Whilst in packet idle mode (see 03.64) an MS shall continuously monitor all BCCH carriers as indicated by the BA(GPRS) list and the BCCH carrier of the serving cell. References

3GPP TS 05.08, subclause 10.1.1.1

20.22.30.1.2 Test Purpose

To verify that the MS uses the BA(GPRS) list for the reselection and measurement. If the most suitable cell is not in the BA(GPRS) list, then it is not considered for the reselection.

20.22.30.1.3 Method of test

Initial conditions

| Parameter | Cell A | Cell B | Cell C |
|------------------------|-----------|---------|----------|
| Channel Type Carried | BCCH | BCCH | BCCH |
| RF Signal Level (dBm) | -60 | -70 | -70 |
| RXLEV_ACCESS_MIN (dBm) | -85 | -85 | -85 |
| NETWORK_CONTROL_ORDER | NC2 | NC0 | NC0 |
| NC_REPORTING_PERIOD_I | 3.84 sec | Default | Default |
| C1 | 25 to -10 | 15 | 15 to 35 |
| C32 | 25 to -10 | 15 | 15 to 35 |

NOTE 1: All cells support GPRS. Network Control Reporting information is broadcasted using the SI2 Quarter.

NOTE 2: Cell C is not a part of BA(GPRS) - i.e. NC frequency List of PMO and BA(BCCH) -, Cell B is part of BA(GPRS) on Cell A

Procedure

- a) The SS activates all Cells.
- b) MS is switched ON.
- c) The MS shall complete the GPRS attach procedure on Cell A (Ready Timer deactivated).
- d) SS increases the signal strength of Cell C to -50dBm.
- e) SS receives measurement report till the measurements of Cell B are included in it.
- f) SS sends a PACKET MEASUREMENT ORDER changing the NC mode to NC0.
- g) SS reduces the signal strength of Cell A to -95 dBm.

20.22.30.1.4 Test Requirements

- 1) MS shall camp on Cell A after step b) and initiate the attach procedure.
- 2) In step e), MS should not include the measurements of Cell C in the measurement reports. This is checked up to Max{5s, 5 consecutive paging blocks of that MS} to ensure the MS has completed the running average measurements of the neighbour cells.
- 3) In step f), SS checks that the MS stays on Cell A, and does not reselect to Cell C, even though Cell C is better than Cell A for a period of 5s + Max{5s, 5 consecutive paging blocks of the MS}.
- 4) In step g), the MS shall respond on Cell B even though the Cell C is better than Cell B for reselection, as Cell C is not a part of BA(GPRS). The response should be within the time given in the note below.

NOTE: Time allowed includes Max{5s, 5 consecutive paging blocks of the MS} for MS to determine C32 of Cell C is greater than Cell A, 2 seconds to decode BCCH and 1 sec for re-selection.

20.22.30.2 Cell Reselection / usage of BA(GPRS) / Change of BA(GPRS)

20.22.30.2.1 Conformance requirement

Whilst in packet idle mode (see 03.64) an MS shall continuously monitor all BCCH carriers as indicated by the BA(GPRS) list and the BCCH carrier of the serving cell.

References

3GPP TS 05.08, subclause 10.1.1.1.

20.22.30.2.2 Test Purpose

To verify that if the BA(GPRS) list is changed in the broadcast, MS uses the new BA(GPRS).

20.22.30.2.3 Method of test

Initial conditions

| Parameter | Cell A | Cell B | Cell C |
|------------------------|----------|---------|---------|
| Channel Type Carried | BCCH | BCCH | BCCH |
| RF Signal Level (dBm) | -60 | -70 | -70 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 |
| NETWORK_CONTROL_ORDER | NC2 | NC0 | NC0 |
| NC_REPORTING_PERIOD_I | 3.84 sec | Default | Default |
| C1 | 30 | 20 | 20 |
| C32 | 30 | 20 | 20 |

NOTE 1: All cells support GPRS. Network Control Reporting information is broadcasted using the SI2 Quarter.

NOTE 2: Cell C is not a part of BA(GPRS) - i.e. NC frequency List of PMO and BA(BCCH) - , Cell B is part of BA(GPRS) on Cell A.

Procedure

- a) The SS activates all Cells.
- b) MS is switched ON.
- c) The SS shall complete the GPRS attach procedure on Cell A(Ready Timer deactivated).
- d) The SS increases the signal strength of Cell C to -50dBm.
- e) SS receives NC measurement report till the measurements of Cell B are included in the PACKET MEASUREMENT REPORT.
- f) SS changes the broadcast information to include Cell C as a part of the BA(GPRS) on Cell A.
- g) SS receives NC measurement report till the measurements of Cell B and Cell C are included in the PACKET MEASUREMENT REPORT.
- h) SS sends a PACKET MEASUREMENT ORDER changing the NC mode to NC0. PACKET MEASUREMENT ORDER must be sent within NC_REPORTING_PERIOD_I from receiving latest PACKET MEASUREMENT REPORT.

20.22.30.2.4 Test Requirements

- 1) MS shall camp on Cell A after step b) and initiate the attach procedure.
- 2) In step e), MS should not include the measurements of Cell C in the measurement reports. This is verified up to Max{5s, 5 consecutive paging blocks of that MS} to ensure the MS has completed the running average measurements of the neighbour cells.
- 3) In step g), SS checks that the MS stays on Cell A for a minimum period of 8 * 51 Multiframes (complete update of BCCH content) + Max{5s, 5 consecutive paging blocks of the MS} (for MS to update running average) + 5s (to give erroneous MS time to reselect including the periodical SI13 decoding to identify BCCH_CHANGE_MARK change and the following SI update).
- 4) After step h), the MS shall respond on Cell C within the time given in the note below.

Note: Time allowed includes Max{5s, 5 consecutive paging blocks of the MS} for MS to determine C32 of cell C is greater than cell A, 2 seconds to decode BCCH and 1 sec for re-selection.

20.22.30.3 Cell Reselection/usage of BA(GPRS)/ Measurement on first 32 entries.

20.22.30.3.1 Conformance requirement

Whilst in packet idle mode (see 03.64) an MS shall continuously monitor all BCCH carriers as indicated by the BA(GPRS) list and the BCCH carrier of the serving cell.

The GSM Neighbour Cell list may contain up to 96 GSM Neighbour Cells. The total number of GSM frequencies to measure shall not exceed 32. If the list includes more than 32 frequencies, the MS shall only measure the 32 frequencies with the lowest indices.

References

3GPP TS 05.08, subclause 10.1.1.1

3GPP TS 04.60, subclause 5.6.3.2

20.22.30.3.2 Test Purpose

To verify that if the BA(GPRS) includes more than 32 frequencies in that case MS shall only measure the 32 frequencies with lowest indices.

20.22.30.2.3 Method of test

Initial conditions

| Parameter | Cell A | Cell B | Cell C |
|------------------------|----------|---------|---------|
| Channel Type Carried | BCCH | BCCH | BCCH |
| RF Signal Level (dBm) | -60 | -70 | -70 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 |
| NETWORK_CONTROL_ORDER | NC2 | NC0 | NC0 |
| NC_REPORTING_PERIOD_I | 3.84 sec | Default | Default |
| C1 | 30 | 20 | 20 |
| C32 | 30 | 20 | 20 |

NOTE 1: All cells support GPRS. Network Control Reporting information is broadcasted using the SI2 Quarter.

NOTE 2: Cell B is 32nd while Cell C is 33rd in the BA(GPRS) - i.e. BA(BCCH) - on Cell A.

Procedure

- a) The SS activates all Cells.
- b) MS is switched ON.
- c) The MS shall complete the GPRS attach procedure (Ready Timer deactivated) on Cell A.
- d) SS receives 25 NC measurement reports in idle mode.

20.22.30.3.4 Test Requirements

- 1) After step b) MS shall camp on Cell A and initiate the attach procedure.
- 2) In step d), SS checks that the MS includes measurements of Cell B in the PACKET MEASUREMENT REPORT while the measurements of Cell C are not included in any of the measurement reports.

20.22.31 Network controlled cell reselection / Transfer mode

20.22.31.1 Network controlled cell reselection / Downlink transfer / Normal case/ Location and Routing Area Update/ NMO I

20.22.31.1.1 Conformance requirement

When a cell reselection is initiated by the network for an individual mobile station, the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

To initiate a combined routing area updating procedure the MS sends the message ROUTING AREA UPDATE REQUEST to the network, starts timer T3330 and changes to state GMM-ROUTING-UPDATING-INITIATED and MM LOCATION UPDATING PENDING. The value of the update type IE in the message shall indicate "combined RA/LA updating". If for the last attempt to update the registration of the location area a MM specific procedure was performed, the value of the update type IE in the ROUTING AREA UPDATE REQUEST message shall indicate "combined RA/LA updating with IMSI attach". Furthermore the MS shall include the TMSI status IE if no valid TMSI is available.

20.22.31.1.2 References

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

20.22.31.1.3 Test Purpose

To test the behaviour of the MS when the network triggers a Packet Cell Change Order to a cell belonging to another routing area, whereas the network mode of operation I is active, i.e:

To verify that the MS switches to the new cell under network control.

To verify that the MS performs the Combined Routing Area Update procedure.

20.22.31.1.4 Method of test

Initial conditions

System simulator:

All 3 Cells should be activated.

Parameters changed from the default values in table 20.22.1.

| Parameter | Cell A | Cell B | Cell C |
|---------------------------|---------|---------|----------------------|
| Channel Type Carried | BCCH | BCCH | BCCH |
| RF Signal Level (dBm) | -60 | -80 | -70 |
| RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 |
| NETWORK_CONTROL_ORDER | NC2 | NC2 | NC2 |
| NC_REPORTING_PERIOD_T (s) | 0,96 | -- | 0,96 |
| Network Mode of Operation | NMO 1 | NMO 1 | NMO 1 |
| RAC | Default | Default | Different to default |
| LAC | Default | Default | Different to default |
| C1 | 40-20 | 20-40 | 30 |
| C32 | 40-20 | 20-40 | 30 |

20.22.31.1.5 void

20.22.31.1.6 Foreseen final state of the MS

- MS is in Transfer mode on Cell C.

20.22.31.1.7 Test procedure

- a) The MS is switched on and completes GPRS Attach procedure (ready timer deactivated) on Cell A. MS is PDP context activated and brought into packet transfer mode.
- b) The RF level of Cell A is reduced to -80 dBm. (C32 becomes 20).
- c) The SS waits 15 s after the RF level of Cell A is reduced before sending Packet Cell Change Order, with the IMMEDIATE_REL bit set to FALSE, to the MS to select Cell C. The MS shall complete a combined RA/LA update procedure on Cell C.
- d) The RF level of Cell B is increased to -60 dBm. (C32 becomes 40).
- e) The SS waits 15 s after increasing the RF level of Cell B to ensure no RA update takes place on Cells A or B.

NOTE: During the TBF, T3158 may expire and thus PACKET MEASUREMENT REPORT could be sent at any time while the downlink transfer is in progress. The SS shall be prepared for this.

20.22.31.1.8 Test Requirements

- 1) After step b) there should be no response (RA update or cell update) on Cell B or C.
- 2) After step c) there should be a response on Cell C. Since the LA update is combined with the RA update, there should be no LA update on Cell C.

Note: Time allowed includes 2 seconds to decode BCCH and 5 sec for re-selection.

- 3) After step d) there should be no response on Cell A or B.

Note: Time allowed includes max(1 second, 1 paging block of the MS) + 2 seconds to decode BCCH + 1s for reselection + 1s tolerance.

20.22.31.1.9 Maximum duration of the test

4 minutes

20.22.31.2 Network controlled cell reselection / Downlink transfer / Normal case/ Location and Routing Area Update/ NMO II

20.22.31.2.1 Conformance requirement

When a cell reselection is initiated by the network for an individual mobile station, the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

To initiate the normal routing area updating procedure, the MS sends the message ROUTING AREA UPDATE REQUEST to the network, starts timer T3330 and changes to state GMM-ROUTING-AREA-UPDATING-INITIATED. The message ROUTING AREA UPDATE REQUEST shall contain the P-TMSI signature when received within a previous ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message.

If the routing area updating request has been accepted by the network, a ROUTING AREA UPDATE ACCEPT message shall be sent to the MS. The network may assign a new P-TMSI and/or a new P-TMSI signature for the MS. If a new P-TMSI and/or P-TMSI signature have been assigned to the MS, it/they shall be included in the ROUTING AREA UPDATE ACCEPT message together with the routing area identification.

If the network operates in mode II or III, then a GPRS-attached MS that has the capability to be simultaneously GPRS-attached and IMSI-attached shall perform the (non-combined) Routing Area Update procedures, and either:

- access the non-GPRS common control channels for CS operation (the way that CS operation is performed in parallel with GPRS operation is an MS implementation issue outside the scope of the present document); or
- if CS operation is not desired, depending on system information that defines whether or not explicit detach shall be used, either:
 - avoid all CS signalling (in which case the MS may be implicitly IMSI detached after a while); or
 - perform an explicit IMSI detach via the non-GPRS common control channels (if the MS was already IMSI-attached).

20.22.31.2.2 References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

3GPP TS 03.60, subclause 6.5

20.22.31.2.3 Test Purpose

To test the behaviour of the MS when the network triggers a Packet Cell Change Order to a cell belonging to another routing area, whereas the network mode of operation II is active, i.e:

To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.

To verify that the MS switches to the new cell under network control.

To verify that the MS performs separate Normal Location and Routing Area Update procedures.

20.22.31.2.4 Method of test

Initial conditions

System simulator:

Parameters changed from the default values in table 20.22.1.

| Parameter | Cell A | Cell B | Cell C |
|---------------------------|-----------|-----------|----------------------|
| | Carrier 1 | Carrier 2 | Carrier 3 |
| Channel Type Carried | BCCH | BCCH | BCCH |
| RF Signal Level (dBm) | -60 | -80 | -70 |
| Serving Cell Parameters | | | |
| RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 |
| NETWORK_CONTROL_ORDER | NC2 | NC2 | NC2 |
| NC_REPORTING_PERIOD_T (s) | 0,96 | -- | 0,96 |
| Network Mode of Operation | NMO 2 | NMO 2 | NMO 2 |
| RAC | Default | Default | Different to default |
| LAC | Default | Default | Different to default |
| C1 | 40-20 | 20-40 | 30 |
| C32 | 40-20 | 20-40 | 30 |

20.22.31.2.5 void

20.22.31.2.6 Foreseen final state of the MS

- MS is in Transfer mode on carrier 3.

20.22.31.2.7 Test procedure

- a) The MS is switched on and completes GPRS Attach procedure (ready timer deactivated) on carrier 1. MS is PDP context activated and brought into packet transfer mode.
- b) The RF level of carrier 1 is reduced to -80 dBm. (C32 becomes 20).
- c) The SS waits 15 s after the RF level of carrier 1 is reduced before sending Packet Cell Change Order, with the IMMEDIATE_REL bit set to FALSE, to the MS to select carrier 3. The MS shall complete Routing Area Update procedure and Location Update procedure on carrier 3.
- d) The RF level of carrier 2 is increased to -60 dBm. (C32 becomes 40).
- e) The SS waits 15 s after increasing the RF level of carrier 2 to ensure no RA update takes place on carriers 1 and 2.

NOTE: During the TBF, T3158 may expire and thus PACKET MEASUREMENT REPORT could be sent at any time while the downlink transfer is in progress. The SS shall be prepared for this.

20.22.31.2.8 Test Requirements

- 1) After step b) there should be no response on carriers 2 or 3.
- 2) After step c) there should be a response on carrier 3 (the order in which the LA and RA updates occur is not the subject of this test).

Note: Time allowed includes 2 seconds to decode BCCH and 5 sec for re-selection.

20.22.31.2.9 Maximum duration of the test

4 minutes

20.23 Void

20.24 SoLSA Cell Selection and Reselection

All GSM test cases presented in 3GPP TS 11.10 clause 20 are applicable for SoLSA ME with or without LSA SIM. Nevertheless, if LSA SIM are used, it must be checked that no LSA subscription matches the information broadcast by the cell. Otherwise, test cases dealing with cell reselection would fail.

The cell re-selection tests defined in the following sections apply to the SoLSA MS if an LSA support exists in the serving cell. Otherwise the SoLSA MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. Each of these cell control channels are non-combined with SDCCHs. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any SoLSA MS all the carriers are in its supported band(s) of operation. For an E-GSM mobile station at least one of the carriers is in the extension band and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this subclause:

- The SS is continuously paging the SoLSA MS on all carriers at the start of the test and does not respond to RACH requests from the SoLSA MS. Where a test specifies that the SoLSA MS is not paged on a particular carrier, only idle paging is transmitted according to 3GPP TS 04.18, subclause 3.2.2.2.
- The default values of the system information data fields given in table 20.24.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.24.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the SoLSA MS signal level measurements is assumed to be ± 6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C2 or C4 values and 0.

The relative accuracy of the SoLSA MS signal level measurements is assumed to be ± 3 dB for the signal levels used in the tests of this subclause. A difference of at least 5 dB is allowed for cases of discrimination between C1, C2 or C4 values on different carriers.

NOTE 1: The accuracy of SoLSA MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this subclause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is ± 10 % except for PENALTY_TIME where it is ± 2 s. In the tests of this subclause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is ± 2 % and the SS tolerance on power level ± 1 dB.

NOTE 3: Additional to the abbreviations and definitions in 3GPP TR 21.905 the following definitions are used within this subclause.

Definitions

| | |
|-----------------|---|
| LSA cell | A cell in which SoLSA features are possible |
| LSA only SIM | A SIM with LSA only access |
| LSA SIM | A SIM with SoLSA files |
| Normal LSA cell | An LSA cell which is not an LSA exclusive access cell |
| Normal LSA SIM | An LSA SIM which is not an LSA only SIM |
| SoLSA ME | An ME supporting SoLSA |
| SoLSA MS | A SoLSA ME with LSA SIM |

| PCS1900 | 512, 543, 568, 589, 602, 641, 662, 683, 696, 711, 732, 754, 794 | SI2 |

Table 20.24.1b: ARFCNs for Multiband Tests

| Band | ARFCNs | broadcast in SYSTEM INFORMATION type |
|-----------|--|---|
| GSM 450 | 259, 263, 269, 275, 279, 283, 287, 292 | SI2 (GSM 450 cell) & SI2ter (other band cell) |
| GSM 480 | 306, 310, 316, 322, 326, 330, 334, 339 | SI2 (GSM 480 cell) & SI2ter (other band cell) |
| GSM 710 | 441, 452, 461, 477, 493, 511 | SI2 (GSM 710 cell) & SI2ter (other band cell) |
| GSM 750 | 441, 452, 461, 477, 493, 511 | SI2 (GSM 750 cell) & SI2ter (other band cell) |
| T-GSM 810 | 441, 452, 461, 477, 493, 511 | SI2 (T-GSM 810 cell) & SI2ter (other band cell) |
| GSM 850 | 136, 152, 170, 177, 185, 193, 207, 251 | SI2 (GSM 850 cell) & SI2ter (other band cell) |
| GSM 900 | 3, 18, 41, 49, 62, 70, 92, 124 | SI2 (GSM 900 cell) & SI2ter (other band cell) |
| DCS 1800 | 512, 568, 602, 662, 696, 732, 794, 870 | SI2 (DCS 1800 cell) & SI2ter (other band cell) |
| PCS 1900 | 512, 568, 602, 662, 696, 732, 794 | SI2 (PCS 1900 cell) & SI2ter (other band cell) |

Default values of the SIM card

The "LSA only access indicator" byte of file EF_{SAI} on the SIM card shall be disabled unless otherwise stated (see subclause 20.24).

General initial conditions:

1. Following LSA shall be defined in the fields of the EF_{SLL} (3GPP TS 11.11, subclause 10.4.1.2) and in the LSA descriptor files (GSM 11.11, subclause 10.4.1.3) on the SIM card used for testing.

| | LSA ID | CI | LAC | LAC + CI | PLMN code (see NOTE) | LSA Priority | Idle mode support | LSA indication for idle mode |
|------|--------------|------------|-----|-------------------|----------------------|--------------|-------------------|------------------------------|
| LSA1 | 54 66.001 | | | | HPLMN | 0 | On | Off |
| LSA2 | 66.000 | | | | HPLMN | 0 | Off | On |
| LSA3 | 9.000.000 | | | 2 + [250..254] | HPLMN | 8 | On | On |
| LSA4 | 9.000.001 | | | | HPLMN | 8 | Off | Off |
| LSA5 | 30.000 | [256..260] | | | HPLMN | 15 | On | On |
| LSA6 | 5 | | 1 | | HPLMN | 7 | On | On |
| LSA7 | 100 | | 10 | 3 + 500 | HPLMN | 0 | On | On |
| LSA8 | 9.000.001 | | | | VPLMN | 15 | On | On |
| LSA9 | 54 | | | | VPLMN | 8 | On | On |

NOTE: VPLMN is a set of values for MCC and MNC for the LSA which shall not be in the list of the forbidden PLMNs on the SIM card.

2. List of values, that shall not be found in the SIM card, in order to be sure that the SoLSA MS is not subscribed to the LSA defined by the current carrier.

| | LSA ID | CI | LAC | LAC + CI |
|-----------|------------|--------------|-----|------------------|
| LSA value | [250..255] | [5000..5005] | 5 | 5 + [5000..5005] |

3. The initial condition "escape PLMN" is set to "Yes" in the following tables of this subclause, in case of testing with an LSA exclusive access cell.

General Remark

1) Elementary File EF_{SLL} (3GPP TS 11.11, subclause 10.4.1.2)

The information regarding 'idle mode support' and 'LSA indication for idle mode' is contained on the SIM card, in the Elementary File EF_{SLL} SoLSA LSA List (identifier '4F31') and, more precisely, in the 'Configuration Parameters' byte.

File EF_{SLL} is represented in the table below, from 3GPP TS 11.11, subclause 10.4.1.2.

Each LSA is described by one record that is linked to an LSA Descriptor file. Each record contains information of the PLMN, priority of the LSA, information about the subscription and may also contain a text string and/or an icon that identifies the LSA to the user. The text string can be edited by the user.

| Identifier: '4F31' | | Structure: linear fixed | | Optional | |
|-----------------------------|----------------------------------|-------------------------|----------------------|----------|--|
| Record length: X + 10 bytes | | | Update activity: low | | |
| Access Conditions: | | | | | |
| READ | | CHV1 | | | |
| UPDATE | | CHV1 | | | |
| INVALIDATE | | ADM | | | |
| REHABILITATE | | ADM | | | |
| Bytes | Description | M/O | Length | | |
| 1 to X | LSA name | O | X bytes | | |
| X+1 | Configuration parameters | M | 1 byte | | |
| X+2 | RFU | M | 1 byte | | |
| X+3 | Icon Identifier | M | 1 byte | | |
| X+4 | Priority | M | 1 byte | | |
| X+5 to X+7 | PLMN code | M | 3 bytes | | |
| X+8 to X+9 | LSA Descriptor File Identifier | M | 2 byte | | |
| X+10 | LSA Descriptor Record Identifier | M | 1 byte | | |

- Configuration parameters

Contents: Icon qualifier, control of idle mode support and control of LSA indication for idle mode.

Coding:

Idle mode support:

Contents: The idle mode support is used to indicate whether the ME shall favour camping on the LSA cells in idle mode.

- b3 = 0: Idle mode support disabled
- b3 = 1: Idle mode support enabled

LSA indication for idle mode:

Contents: The LSA indication for idle mode is used to indicate whether or not the ME shall display the LSA name when the ME is camped on a cell within the LSA.

- b4 = 0: LSA indication for idle mode disabled
- b4 = 1: LSA indication for idle mode enabled

- Priority

Contents: Priority of the LSA which gives the ME the preference of this LSA relative to the other LSAs.

Coding:

'0' is lowest priority, 'F' is highest.

- PLMN code

Contents: MCC + MNC for the LSA.

Coding: according to 3GPP TS 04.08 [15] / 3GPP TS 24.008 and EF_{LocI}.

- LSA Descriptor File Identifier:

Contents: these bytes identify the EF which contains the LSA Descriptors forming the LSA.

Coding: byte X+8: high byte of the LSA Descriptor file;
 byte X+9: low byte of the LSA Descriptor file.

- LSA Descriptor Record Identifier:

Contents: this byte identifies the number of the first record in the LSA Descriptor file forming the LSA.

Coding: binary.

2) Elementary Files "LSA Descriptor File" (3GPP TS 11.11, subclause 10.4.1.3)

The information regarding the LSA identification is contained on the SIM card in the LSA descriptor files, more precisely in the byte 'LSA descriptor type and number' (see table below, from 3GPP TS 11.11, subclause 10.4.1.3).

Residing under DF_{SoLSA}, there may be several LSA Descriptor files. These EFs contains one or more records again containing LSA Descriptors forming the LSAs. LSAs can be described in four different ways. As a list of LSA IDs, as a list of LAC + CIs, as a list of CIs or as a list of LACs. As the basic elements (LSA ID, LAC + CI, CI and LAC) of the four types of lists are of different length, they can not be mixed within one record.

Different records may contain different kinds of lists within the EFs.

| Identifier: '4FXX' | | Structure: linear fixed | | Optional | |
|----------------------------|--------------------------------|-------------------------|----------------------|----------|--|
| Record length: n*X+2 bytes | | | Update activity: low | | |
| Access Conditions: | | | | | |
| READ | | CHV1 | | | |
| UPDATE | | ADM | | | |
| INVALIDATE | | ADM | | | |
| REHABILITATE | | ADM | | | |
| Bytes | Description | M/O | Length | | |
| 1 | LSA descriptor type and number | M | 1 byte | | |
| 2 to X+1 | 1 st LSA Descriptor | M | X bytes | | |
| X+2 to 2X+1 | 2 nd LSA Descriptor | M | X bytes | | |
| | | | | | |
| (n-1)*X+2 to n*X+1 | n th LSA Descriptor | M | X bytes | | |
| n*X+2 | Record Identifier | M | 1 byte | | |

- LSA descriptor type and number:

Contents: The LSA descriptor type gives the format of the LSA descriptor and the number of valid LSA Descriptors within the record.

Coding:

The bit 1 and bit 2 of the first byte of the LSA descriptor file identify the LSA descriptor type.

- LSA descriptor type:

Contents: Gives the format of the LSA Descriptors.

b2, b1: 00: LSA ID. identification of the LSA is done by means of the LSA ID
 01: LAC + CI identification of the LSA is done by means of the LAC + CI

- 10: CI identification of the LSA is done by means of the CI
- 11: LAC identification of the LSA is done by means of the LAC

3) Elementary File EF_{SAI} (3GPP TS 11.11, subclause 10.4.1.1)

This EF contains the 'LSA only access indicator'. This EF shall always be allocated if DF_{SoLSA} is present.

If the indicator is set, the network will prevent terminated and/or originated calls when the MS is camped in cells that are not included in the list of allowed LSAs in EF_{SLL}. Emergency calls are, however, always allowed.

The EF also contains a text string which may be displayed when the MS is out of the served area(s).

| | | | | | |
|------------------------|---------------------------------|------------------------|----------------------|----------|---------|
| Identifier: '4F30' | | Structure: transparent | | Optional | |
| File size: X + 1 bytes | | | Update activity: low | | |
| Access Conditions: | | | | | |
| READ | | CHV1 | | | |
| UPDATE | | ADM | | | |
| INVALIDATE | | ADM | | | |
| REHABILITATE | | ADM | | | |
| Bytes | Description | | | M/O | Length |
| 1 | LSA only access indicator | | | M | 1 byte |
| 2 to X+1 | LSA only access indication text | | | M | X bytes |

- LSA only access indicator

Contents: indicates whether the MS is restricted to use LSA cells only or not.

Coding:

- LSA only access indication text

Contents: text to be displayed by the ME when it's out of LSA area.

20.24.1 SoLSA Cell Selection suitable cell

20.24.1.1 Definition

SoLSA Cell selection is a process in which a SoLSA MS, whenever a new PLMN is selected, attempts to find a "suitable cell" of that PLMN to camp on. Two methods of searching for a "suitable cell" are possible, normal cell selection and stored list cell selection. The process ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the SoLSA MS is camped on a cell, access to the network is allowed.

20.24.1.2 Conformance requirement

1. The SoLSA MS shall be able to select the strongest "suitable cell" and be able to respond to paging on that cell within 30 s of switch on. This requires a valid normal LSA SIM with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1. And it requires a list of LSAs for the subscriber stored on the SIM; 3GPP TS 11.11, subclause 10.4.1.2.

NOTE 1: For camping on an LSA cell the LSA subscription is not necessary except for camping on an LSA exclusive access cell; 3GPP TS 03.73, subclause 11.4.2.

NOTE 2: There should be no extra delay in cell selection procedure; 3GPP TS 02.43, subclause 4.2.2.

2. There are various requirements that a cell must satisfy before a SoLSA MS can perform normal camping on it:

2.1 (i) It should be a cell of the selected PLMN.

2.2 (ii) It should not be "barred".

2.3 (iv) The radio path loss between SoLSA MS and BTS must be below a threshold set by the PLMN operator.

2.4 (v) It should not be an LSA exclusive access cell to which the SoLSA MS does not subscribe.

3GPP TS 03.22, subclause 3.2.1.

NOTE 3: Criteria (iii) is not applicable for Cell Selection.

3. Initially the SoLSA MS looks for a cell which satisfies these 5 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a "suitable cell" is found, the SoLSA MS camps on it; 3GPP TS 03.22, subclause 3.2.1.
4. The SoLSA MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.
5. The LSA identification shall be stored on the SIM card in the LSA descriptor files. LSAs can be described in four different ways; 3GPP TS 11.11, subclause 10.4.1.3:
 - as a list of LSA IDs (3 bytes);
 - as a list of LAC + CIs (4 bytes);
 - as a list of CIs (2 bytes);
 - as a list of LACs (2 bytes); or
 - as a combination of the lists above.

20.24.1.3 Test purpose

The SoLSA MS shall be able to select a "suitable cell" according to the normal cell selection criteria. The identification of the LSA is done by using the LSA ID, the CI, the LAC or the LAC + CI.

20.24.1.4 Method of tests

20.24.1.4.1 SoLSA Cell Selection suitable cell / LSA identified by LSA ID

20.24.1.4.1.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 66.001 | 66.001 | 66.001 | 66.001 |
| LAC | 5 | 5 | 5 | 5 |
| CI | 5.000 | 5.001 | 5.002 | 5.003 |
| Matching LSA on SIM | LSA1 | LSA1 | LSA1 | - |
| Escape PLMN | No | No | No | No |

- c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g)

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 66.001 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5.000 | 5.001 | 5.002 | |
| Matching LSA on SIM | - | LSA1 | - | |
| Escape PLMN | Yes | Yes | No | |

20.24.1.4.1.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SoLSA MS is switched off.
- d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
- e) The SoLSA MS is switched on.
- f) The SoLSA MS is switched off.
- g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- h) The SoLSA MS is switched on.
- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB μ V / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

20.24.1.4.1.3 void

20.24.1.4.1.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

NOTE 1: 33 s for cell selection, 10 s for communicating the data between SIM and ME, 5 s for search of a matching LSA on SIM: allow 50 s.

- 2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE 2: Any potential access is likely to occur within 50 s.

- 3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s (carrier 1 is not fulfilling conformance requirement 2.4).
- 4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

20.24.1.4.2 SoLSA Cell Selection suitable cell / LSA identified by LAC + CI

20.24.1.4.2.1 Initial conditions

- a) Identification of the LSA by means of LAC + CI (see subclause 20.24. General remark 2).

b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 250 | 250 | 250 | 250 |
| LAC | 2 | 2 | 2 | 2 |
| CI | 250 | 251 | 252 | 253 |
| Matching LSA on SIM | LSA3 | LSA3 | LSA3 | - |
| Escape PLMN | No | No | No | No |

c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g).

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 250 | 250 | |
| LAC | 2 | 2 | 5 | |
| CI | 5000 | 250 | 251 | |
| Matching LSA on SIM | - | LSA3 | - | |
| Escape PLMN | Yes | Yes | No | |

20.24.1.4.2.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SoLSA MS is switched off.
- d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
- e) The SoLSA MS is switched on.
- f) The SoLSA MS is switched off.
- g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- h) The SoLSA MS is switched on.
- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB μ V / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

20.24.1.4.2.3 void

20.24.1.4.2.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE: Any potential access is likely to occur within 50 s.

3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s.

4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

20.24.1.4.3 SoLSA Cell Selection suitable cell / LSA identified by CI

20.24.1.4.3.1 Initial conditions

- a) Identification of the LSA by means of CI (see subclause 20.24. General remark 2).
 b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 250 | 250 | 250 | 250 |
| LAC | 5 | 5 | 5 | 5 |
| CI | 257 | 258 | 259 | 260 |
| Matching LSA on SIM | LSA5 | LSA5 | LSA5 | - |
| Escape PLMN | No | No | No | No |

- c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g).

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 250 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5.000 | 258 | 5.001 | |
| Matching LSA on SIM | - | LSA5 | - | |
| Escape PLMN | Yes | Yes | No | |

20.24.1.4.3.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.
 b) The SoLSA MS is switched on.
 c) The SoLSA MS is switched off.
 d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
 e) The SoLSA MS is switched on.
 f) The SoLSA MS is switched off.
 g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
 h) The SoLSA MS is switched on.

- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB μ V / -80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

20.24.1.4.3.3 void

20.24.1.4.3.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.
- 2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE: Any potential access is likely to occur within 50 s.

- 3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s.
- 4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

20.24.1.4.4 SoLSA Cell Selection suitable cell / LSA identified by LAC

20.24.1.4.4.1 Initial conditions

- a) Identification of the LSA by means of LAC (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 250 | 250 | 250 | 250 |
| LAC | 1 | 1 | 1 | 1 |
| CI | 5.000 | 5.001 | 5.002 | 5.003 |
| Matching LSA on SIM | LSA6 | LSA6 | LSA6 | - |
| Escape PLMN | No | No | No | No |

- c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g).

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 250 | 250 | |
| LAC | 5 | 1 | 5 | |
| CI | 5.000 | 5.001 | 5.002 | |
| Matching LSA on SIM | - | LSA6 | - | |
| Escape PLMN | Yes | Yes | No | |

20.24.1.4.4.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.

- b) The SoLSA MS is switched on.
- c) The SoLSA MS is switched off.
- d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
- e) The SoLSA MS is switched on.
- f) The SoLSA MS is switched off.
- g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- h) The SoLSA MS is switched on.
- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB μ V / -80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

20.24.1.4.4.3 void

20.24.1.4.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.
- 2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE: Any potential access is likely to occur within 50 s.

- 3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s.
- 4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

20.24.2 SoLSA Cell (Re)Selection Emergency Call

20.24.2.1 Definition

-

20.24.2.2 Conformance requirement

- 1. The SoLSA MS shall be able to initiate emergency calls when no "suitable cells" of the selected PLMN are available, but at least one acceptable cell is available. The SoLSA MS is in limited service state.
An LSA exclusive access cell is "suitable" only if the LSA of the cell is one of the allowed LSA according to the SIM. Emergency calls are always allowed if no cells are found suitable; 3GPP TS 03.73, subclause 11.4.2.
- 2. When in a limited service state and if not camped on a cell, the MS shall monitor the received signal level of all RF channels within its band of operation, and search for a BCCH carrier which has C1 > 0 and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; 3GPP TS 05.08, subclause 6.8.
- 3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of 3GPP TS 03.22, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used.

20.24.2.3 Test purpose

- 1. To verify that the SoLSA MS shall be able to initiate emergency calls when no "suitable cells" of selected PLMN are available, but at least one acceptable cell is available. The available cells are:

- a) LSA exclusive access cells of the selected PLMN with no LSA subscription.
 - b) Normal LSA cell of forbidden PLMN.
2. To verify that the MS selects a cell with $C1 > 0$ and $CBA = 0$ when no suitable cells of the selected PLMN are available.
 3. To verify that the MS, when performing cell reselection in the limited service state, uses $CELL_RESELECT_HYSTERESIS = 0$, 3GPP TS 05.08, subclause 6.8.

20.24.2.4 Method of test

20.24.2.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.24.1; further initial conditions for LSA exclusive access cell.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|------------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 38/ -75 | 23 / -90 | 33 / -80 | OFF |
| RXLEV_ACCESS_MIN (dBm) | -90 | -80 | -90 | |
| CBA | 1 (barred) | 0 | 0 | |
| MCC, MNC | Home PLMN | Home PLMN | Home PLMN | |
| CRH (dB) | 0 | 0 | 14 | |
| C1 | 15 | -10 | 10 | |
| LSA_ID | 250 | 251 | 252 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | - | - | |
| Escape PLMN | Yes | Yes | Yes | |

- b) Parameters changed from the default values in table 20.24.1; further initial conditions for normal LSA cell.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|------------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 38/ -75 | 23 / -90 | 33 / -80 | OFF |
| RXLEV_ACCESS_MIN (dBm) | -90 | -80 | -90 | |
| CBA | 1 (barred) | 0 | 0 | |
| MCC, MNC | forbidden | forbidden | forbidden | |
| CRH (dB) | 0 | 0 | 14 | |
| C1 | 15 | -10 | 10 | |
| LSA_ID | 250 | 251 | 252 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | - | - | |
| Escape PLMN | No | No | No | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and which is in the SIM's forbidden PLMN list.

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a);
- using initial conditions b).

20.24.2.4.2 Test Procedure

- a) The SS activates the carriers. The SS monitors carriers 1, 2 and 3 for RA requests for the duration of the test.
- b) The SoLSA MS is switched on.
- c) 60 s after switch on, an emergency call is initiated on the SoLSA MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE 1: The MS should reselect carrier 1 because it should not take into account the CRH value of 14 but use 0 instead.

e) After 350 s an emergency call is initiated on the SoLSA MS.

NOTE 2: 330 s to detect change of BCCH data on neighbour cell, 15 s to perform reselection of carrier 1 since the SoLSA MS already has a running average on carrier 1, 5 s for search of a matching LSA on SIM.

20.24.2.4.3 void

20.24.2.4.4 Test requirements

- 1) In step c), the first access of the SoLSA MS shall be on carrier 3.
- 2) In step e), the first access of the SoLSA MS shall be on carrier 1.

20.24.3 SoLSA Cell Reselection / idle mode support enabled

General Remark

The identification of the LSA is done by means of the LSA ID, see General Remark 2) in subclause 20.24.

20.24.3.1 General conformance requirement

1. There are various requirements that a cell must satisfy before a SoLSA MS can perform normal camping on it:

- i) It should be a cell of the selected PLMN.
- ii) It should not be "barred".
- iii) It should not be in an LA which is in the list of "forbidden LA for roaming".
- iv) The radio path loss between SoLSA MS and BTS must be below a threshold set by the PLMN operator.
- v) It should not be an LSA exclusive access cell to which the SoLSA MS does not subscribe.

3GPP TS 03.22, subclause 3.2.1.

2. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

- The cell camped on (current serving cell) has become barred.
- There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
- The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

3. At least for every new sample or every second, whichever is the greatest, the SoLSA MS calculates the value of C1, C2 and C4 for the serving cell and the non-serving cells. The SoLSA MS shall make a cell reselection if:

- i) The path loss criterion parameter (C1) for the serving cell falls below zero for a period of 5 s.
- ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell for a period of 5 s. The best cell is:
 - the cell with the highest value of $C2 + LSA_OFFSET$ among those cells that have highest LSA priority among those that fulfil the criteria $C4 \geq 0$; or
 - the cell with the highest value of C2 among all cells, if no cell fulfil the criterion $C4 \geq 0$.

LSA_OFFSET and LSA ID(s) are broadcast on BCCH. LSA priority is defined by the list of LSAs for the subscriber stored on the SIM. Cells with no LSA priority, e.g. non-LSA cells, are given LSA priority lower than 0. If no LSA_OFFSET parameter is broadcast, LSA_OFFSET shall be set to 0.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C2 value for the neighbour cells:

- if the new cell is in the same location area: 0.
- if the new cell is in a different location area:
 - CELL_RESELECT_HYSTERESIS, which is broadcast on BCCH of the serving cell.
- in case of a cell reselection occurred within the previous 15 s: 5 dB.

3GPP TS 05.08, subclause 6.6.3.

4. Cell reselection for any other reason shall take place immediately, but the cell that the SoLSA MS was camped on shall not be returned to within 5 s if another suitable cell can be found. If valid receive level averages are not available, the SoLSA MS shall wait until these values are available and then perform the cell reselection if it is still required. The SoLSA MS may accelerate the measurement procedure within the requirements in 3GPP TS 05.08, subclause 6.6.1 to minimise the cell reselection delay. 3GPP TS 05.08, subclause 6.6.3.
5. If no suitable cell is found within 10 s, the cell selection algorithm of 3GPP TS 03.22 shall be performed. Since information concerning a number of channels is already known to the SoLSA MS, it may assign high priority to measurements on the strongest carriers from which it has not previously made attempts to obtain BCCH information, and omit repeated measurements on the known ones. 3GPP TS 05.08, subclause 6.6.3.
6. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
 - ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except;
 - a) in the case of the new cell being in a different location area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
 - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5 dB for a period of 5 s.

This indicates that it is a better cell.

3GPP TS 05.08, subclause 6.6.2.

7. The SoLSA MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.
8. The signal strength threshold criterion parameter C4 is used to determine whether prioritised LSA cell reselection shall apply and is defined by:

$$C4 = A - \text{PRIO_THR}$$

where

$$A = \text{RLA_C} - \text{RXLEV_ACCESS_MIN}$$

and PRIO_THR is the signal threshold for applying LSA reselection. PRIO_THR is broadcast on the BCCH. If the idle mode support is disabled for the LSA (3GPP TS 11.11, subclause 10.4.1.2) or if the cell does not belong to any LSA to which the MS is subscribed or if no PRIO_THR parameter is broadcast, PRIO_THR shall be set to ∞ .

3GPP TS 05.08, subclause 6.4.

9. The LSA identification is stored on the SIM card within the descriptor file for the LSA. 3GPP TS 11.11, subclause 10.4.1.3.

20.24.3.2 SoLSA Cell Reselection / idle mode support enabled / LSA Priority

20.24.3.2.1 Definition

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (see General Remark 1. in subclause 20.24).

20.24.3.2.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

- The cell camped on (current serving cell) has become barred.
- There is a better cell (in terms of the path loss criterion C2) in the same LA.
- The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. 3GPP TS 03.73, subclause 11.4.2.

20.24.3.2.3 Test purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest LSA priority the SoLSA MS is subscribed to.

20.24.3.2.4 Method of test

20.24.3.2.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63/ -50 | 53/ -60 | 33/ -80 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| LAC | | | | |
| C1 | 40 | 30 | 10 | |
| C2 | 40 | 30 | 10 | |
| C4 | 40 | 30 | 10 | |
| LSA IDs | 66.001 | 9.000.000 | 30.000 | |
| | 250 | 66.001 | 66.001 | |
| | 251 | 250 | 9.000.000 | |
| | 252 | 251 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|------------|------------------|-----------|
| Matching LSA on SIM | LSA1 | LSA1, LSA3 | LSA1, LSA3, LSA5 | |
| Escape PLMN | No | No | No | |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|------------|------------------|-----------|
| Matching LSA on SIM | LSA1 | LSA1, LSA3 | LSA1, LSA3, LSA5 | |
| Escape PLMN | Yes | Yes | Yes | |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

20.24.3.2.4.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) After approx. 60 s the SS is reconfigured and carrier 3 becomes barred ($CBA = 1$) in order to give the MS the time to perform cell reselection on carrier 3.
- d) The SS is reconfigured and the level of carrier 2 is decreased to $13 \text{ dB}_\mu\text{Vemf}() / -100 \text{ dBm}$. ($C2$ decreases to -10 dB).

20.24.3.2.4.3 void

20.24.3.2.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 (highest $C1$) within 50 s (Cell Selection).

NOTE 1: 33 s for the MS to read the BCCH of carrier 3 (30 s + 10 %), 10 s for communicating the data between SIM and ME, 5 s for search of a matching LSA on SIM. Total 48 s, allow 50 s.

- 2) The following response from the SoLSA MS shall be received on carrier 3 within 25 s after the first response on carrier 1 (Reselection, highest LSA Priority (15)).

NOTE 2: 5 s for the running average, 10 s to detect $C2$ differences, 2,4 s to read BCCH of carrier 1, 1 s to perform RA, 5 s for search of a matching LSA on SIM. Total 23,4 s, allow 25 s.

- 3) After step c), there shall be response from the SoLSA MS on carrier 2 within 55 s after carrier 3 has been barred (Highest LSA Priority on the SIM (8)).

NOTE 3: 30 s for the MS to read the BCCH of carrier 3, 20 s to reselect carrier 2, 5 s for search of a matching LSA on SIM: total 55 s.

- 4) After step d), there shall be response from the SoLSA MS on carrier 1 within 25 s after carrier 2 has been reconfigured.

NOTE 4: 5 s for the running average, 10 s to detect $C2$ differences, 2,4 s to read BCCH of carrier 1, 1 s to perform RA, 5 s for search of a matching LSA on SIM. Total 23,4 s, allow 25 s.

20.24.3.3 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / different location area

20.23.3.3.1 Definition

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (See General Remark 1. of subclause 20.24).

20.24.3.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - The cell camped on (current serving cell) has become barred.
 - There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
 - The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. 3GPP TS 03.73, subclause 11.4.2.

3. The LSA identification shall be stored on the SIM card in the LSA descriptor files (EF). LSAs can be described in four different ways (see 3GPP TS 11.11, subclause 10.4.1.3):

- as a list of LSA IDs (3 bytes);
- as a list of LAC + CIs (4 bytes);
- as a list of CIs (2 bytes);
- as a list of LACs (2 bytes); or
- as a combination of the lists above.

20.24.3.3.3 Test purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest C2 among those cells with the highest LSA priority the SoLSA MS is subscribed to even if the cell belongs to a different location area.

20.24.3.3.4 Method of test

20.24.3.3.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/ -70 | 33/ -80 | 33 / -80 | 13 / -100 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | 10 | |
| C1 | 20 | 10 | 10 | -10 |
| C2 | 20 | 10 | 10 | -10 |
| C4 | 20 | 10 | 10 | -10 |

| | | | | |
|--------|------|------|------|--------|
| LSA ID | 54 | 54 | 54 | 30.000 |
| LAC | 5 | 5 | 3 | 3 |
| CI | 5000 | 5001 | 5002 | 5003 |

c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1 | LSA1 | LSA1 | LSA5 |
| Escape PLMN | No | No | No | No |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1 | LSA1 | LSA1 | LSA5 |
| Escape PLMN | Yes | Yes | Yes | Yes |

e) Identification of the LSA by means of:

- LSA ID on Carrier 1;
- LAC + CI on Carrier 2;
- LAC on Carrier 3;
- CI on carrier 4.

(see subclause 20.24. General remark 2.)

f) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/ -70 | 33/ -80 | 33 / -80 | 13 / -100 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | 10 | |
| C1 | 20 | 10 | 10 | -10 |
| C2 | 20 | 10 | 10 | -10 |
| C4 | 20 | 10 | 10 | -10 |
| LSA ID | 100 | 250 | 250 | 250 |
| LAC | 3 | 3 | 10 | 5 |
| CI | 5000 | 500 | 5002 | 256 |

g) Further initial conditions (Carrier 1-4 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA7 | LSA7 | LSA7 | LSA5 |
| Escape PLMN | No | No | No | No |

h) Further initial conditions (Carrier 1-4 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA7 | LSA7 | LSA7 | LSA5 |
| Escape PLMN | Yes | Yes | Yes | Yes |

Run the following test procedure twice by using four different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d);

- using initial conditions e), f) and g);
- using initial conditions e), f) and h).

20.24.3.3.4.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.
- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and the level of carrier 3 is increased to 63 dB μ V emf() / -50 dBm (C2 increases to 40 dB).
- d) The SS is reconfigured and the level of carrier 2 is increased to 63 dB μ V emf() / -50 dBm (C2 increases to 40 dB).
- e) The SS is reconfigured and carrier 3 becomes barred (CBA = 1).
- f) The SS activates carrier 4 and monitors carriers 1, 2 and 4. Carrier 3 is switched off.
- g) The SS is reconfigured and the level of carrier 4 is increased to 33 dB μ V emf () / -80 dBm (C2 increases to 10 dB).

20.24.3.3.4.3 void

20.24.3.3.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. (Cell Selection, highest C1). There shall be no response from the SoLSA MS on any other carrier within 35 s after first response on carrier 1.

NOTE 1: Any potential access is likely to occur within 25 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 3 within 25 s after increasing the level of carrier 3 (now highest C2 (C2-CRH), for cells with C4 > 0).
- 3) After step d), there shall be no response from the SoLSA MS on carrier 2 within 35 s after increasing the level of carrier 2 (still highest C2/C2-CRH for carrier 3).

NOTE 2: Any potential access is likely to occur within 25 s.

- 4) After step e), there shall be response from the SoLSA MS on carrier 2 within 55 s after carrier 3 becomes barred.
- 5) After step f), there shall be no response from the SoLSA MS on carrier 4 within 60 s after carrier 4 is switched on (Highest LSA Priority (15), but C2 < 0).
- 6) After step g), there shall be response from the SoLSA MS on carrier 4 within 25 s after increasing level of carrier 4 (not highest C2, but C4 > 0 and highest LSA Priority (15) on the SIM).

20.24.3.4 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold

20.24.3.4.1 Definition

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (see General Remark 1 in subclause 20.24).

20.24.3.4.2 Conformance requirement

The SoLSA MS shall be able to calculate correctly the signal strength threshold criterion parameter C4 which is to determine whether prioritised LSA cell reselection shall apply.

The signal strength threshold criterion parameter C4 is used to determine whether prioritised LSA cell reselection shall apply and is defined by:

$$C4 = A - \text{PRIO_THR}$$

Where:

A is defined as above and PRIO_THR is the signal threshold for applying LSA reselection. PRIO_THR is broadcast on the BCCH. If the idle mode support is disabled for the LSA (see 3GPP TS 11.11) or if the cell does not belong to any LSA to which the MS is subscribed or if no PRIO_THR parameter is broadcast, PRIO_THR shall be set to ∞ .

3GPP TS 05.08, subclause 6.4.

20.24.3.4.3 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold any value

20.24.3.4.3.1 Test purpose

To verify that the SoLSA MS is able to reselect cells correctly according to parameter PRIO_THR. (parameter C4 criterion).

20.24.3.4.3.2 Method of test

20.24.3.4.3.2.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2.)
- b) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 47 / - 66 | 55 / -58 | 63 / -50 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 15 | 25 | 40 | |
| C2 | 15 | 25 | 40 | |
| PRIO_THR (level / dB) | 1 / 6 | 6 / 36 | 2 / 12 | |
| C4 | 9 | -11 | 28 | |
| LSA ID | 66.001 | 9.000.000 | 30.000 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |

NOTE: The level of PRIO_THR is evaluated according to 3GPP TS 05.08, clause 9 and table 1.

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1 | LSA3 | LSA5 | |
| Escape PLMN | No | No | No | |

- d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1 | LSA3 | LSA5 | |
| Escape PLMN | Yes | Yes | Yes | |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

20.24.3.4.3.2.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) Carrier 3 is barred (CBA = 1).
- d) The PRIO_THR value of carrier 2 is set to 0 dB (level 0).
- e) The PRIO_THR value of carrier 2 is set to 36 dB (level 6).

20.24.3.4.3.2.3 void

20.24.3.4.3.2.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 s after switch on.
- 2) After step c), the SoLSA MS shall respond on carrier 1 within 55 s after barring of carrier 3 (Highest Priority + C4 > 0).
- 3) After step d), the SoLSA MS shall respond on carrier 2 within 55 s after changing the PRIO_THR value of carrier 2 (C4 > 0 + Highest C2+LSA_OFFSET).
- 4) After step e), the SoLSA MS shall respond on carrier 1 within 55 s after changing the PRIO_THR value of carrier 2 (C4 > 0, Highest priority).

20.24.3.4.4 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold infinite

20.24.3.4.4.1 Test purpose

To verify that the SoLSA MS is able to reselect cells correctly according to parameter C2 among those cell not fulfilling C4 ≥ 0.

20.24.3.4.4.2 Method of test

20.24.3.4.4.2.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------|----------------|----------------|----------------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 53 / -60 | 58 / -55 | 31 / -82 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | | |
| PRIO_THR (level / dB) | 7 / 'infinite' | 7 / 'infinite' | 7 / 'infinite' | |
| C1 | 40 | 30 | 35 | 8 |
| C2 | 40 | 30 | 35 | 8 |
| C4 | <0 | <0 | <0 | 8 |
| LSA_OFFSET (level / dB) | | 5 / 32 | | |
| LSA ID | 66.001 | 66.001 | 9.000.000 | 30.000 |
| LAC | 5 | 5 | 3 | 3 |
| CI | 5000 | 5001 | 5002 | 5003 |

- c) Further initial conditions (Carrier 1-4 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1 | LSA1 | LSA3 | LSA5 |
| Escape PLMN | No | No | No | No |

d) Further initial conditions (Carrier 1-4 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1 | LSA1 | LSA3 | LSA5 |
| Escape PLMN | Yes | Yes | Yes | Yes |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

20.24.3.4.4.2.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.
- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and the level of carrier 1 is decreased to 33 dB μ V emf() / -80 dBm (C2 of carrier 1 becomes 10).
- d) The SS is reconfigured and the level of carrier 3 is increased to 63 dB μ V emf() / -50 dBm (C2 of carrier 3 becomes 40).
- e) Carrier 1 is switched off. Carrier 4 is switched on. The SS monitors carriers 2, 3 and 4.

20.24.3.4.4.2.3 void

20.24.3.4.4.2.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on any other carrier within 35 s after the first response on carrier 1.

NOTE 1: Any potential access is likely to occur within 25 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 s after carrier 1 has been reconfigured (Highest C2/C2-CRH).
- 3) After step d), there shall be response on carrier 3 within 25 s after carrier 2 has been reconfigured (Highest C2/C2-CRH).
- 4) After step e), there shall be response on carrier 4 within 60 s after the system has been reconfigured (idle mode support enabled for carrier 4).

NOTE: 5,5 s to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 s ($\pm 10\%$)), 33 s to read BCCH, 15 s for reselection, 5 s for search of a matching LSA on SIM. Allow 60 s.

20.24.3.5 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / LSA_OFFSET

20.24.3.5.1 Definition

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

20.24.3.5.2 Conformance requirement

While performing cell reselection, the SoLSA MS shall be able to calculate correctly the signal strength threshold criterion parameter consisting of $C2 + LSA_OFFSET$ to determine which LSA cell shall be selected among those having the same LSA priority; 3GPP TS 05.08, subclause 6.6.3.

20.24.3.5.3 Test Purpose

To verify that the SoLSA MS shall be able to reselect the cell with the highest value of $C2 + LSA_OFFSET$ among those cells that have highest LSA priority and fulfil the criteria $C4 \geq 0$.

20.24.3.5.4 Method of test

20.24.3.5.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 63 / -50 | 43 / -70 | 33 / -80 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 40 | 20 | 10 | |
| C2 | 40 | 20 | 10 | |
| C4 | 40 | 20 | 10 | |
| LSA_OFFSET (level / dB) | 0 / 0 | 1 / 4 | 4 / 24 | |
| LSA ID | 30.000 | 66.001 | 66.001 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |

NOTE: The level of LSA_OFFSET is evaluated according to 3GPP TS 05.08, clause 9 and table 1.

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA5 | LSA1 | LSA1 | |
| Escape PLMN | No | No | No | |

- d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA5 | LSA1 | LSA1 | |
| Escape PLMN | Yes | Yes | Yes | |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

20.24.3.5.4.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) Carrier 1 is barred (CBA = 1).
- d) Carrier 3 is barred (CBA = 1).

20.24.3.5.4.3 void

20.24.3.5.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 after 50 s. (highest value of C1). There shall be no response from the SoLSA MS on other carriers within 35s after the first response sent on carrier 1.

NOTE: Any potential access is likely to occur within 25 s.

- 2) After step c), the SoLSA MS shall respond on carrier 3 within 55 s after carrier 1 becomes barred. (same priority as for LSA on carrier 2 but highest value of C2+LSA_OFFSET).
- 3) After step d), the SoLSA MS shall respond on carrier 2 within 55 s after carrier 3 becomes barred.

20.24.3.6 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / cell combinations

20.24.3.6.1 Definition

-

20.24.3.6.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - The cell camped on (current serving cell) has become barred.
 - There is a better cell (in terms of the path loss criterion C2) in the same LA.
 - The MS will then reselect a new cell in order to fulfil the process goal.3GPP TS 03.22, subclause 4.5.
2. The SoLSA MS shall reselect the correct cell when subscription for normal LSA cells and LSA exclusive access cells varies; GSM 03.73, subclauses 4.3.1 and 4.3.3.
The setting of the LSA only bit on the SIM shall not influence the behaviour of the cell reselection: for subscribers with LSA only access call unrelated service requests are accepted even outside of the allowed LSAs. 3GPP TS 03.73, subclause 4.5.4.
3. When MS is out of the allowed LSA it shall be registered in PLMN but indicate subscriber/service specific "out of LSA area" notification. It shall be a network controlled function to prevent terminated or/and originated calls. Emergency calls are however always allowed. 3GPP TS 02.11, subclause 5.3.

20.24.3.6.3 Test purpose

To verify that the SoLSA MS shall reselect the correct cell when subscription for normal LSA cells and LSA exclusive access cells varies. The setting of LSA only bit on the SIM shall not influence the behaviour of the cell reselection.

20.24.3.6.4 Method of tests

20.24.3.6.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf) / dBm) | 53/ -60 | 43/ -70 | 63 / -50 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 30 | 20 | 40 | |
| C2 | 30 | 20 | 40 | |
| C4 | 30 | 20 | <0 | |

b) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID | 9.000.000 | 30.000 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | LSA3 | LSA5 | - | |
| Escape PLMN | Yes | No | No | |

c) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID | 250 | 9.000.000 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA3 | - | |
| Escape PLMN | No | Yes | No | |

d) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID | 250 | 30.000 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA5 | - | |
| Escape PLMN | No | No | Yes | |

e) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID | 250 | 250 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | - | - | |
| Escape PLMN | Yes | No | No | |

f) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).

Run the following test procedures twice using two different sets of initial conditions:

- with an LSA only SIM;
- with a normal LSA SIM.

20.24.3.6.4.2.1 Test Procedure

Using conditions from table a), b) and f).

- a) The SS activates the carriers 1, 2, 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and carrier 3 becomes barred (CBA = 1).

- d) The SS is reconfigured and carrier 2 becomes barred (CBA = 1) and carrier 3 becomes not barred (CBA = 0).

20.24.3.6.4.2.2 void

20.24.3.6.4.2.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 s. There shall be no response from the SoLSA MS on any other carrier within 35 s after the first response on carrier 3.

NOTE 1: Any potential access is likely to occur within 35 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 60 s after activating of carriers 2 and 3. (Highest LSA Priority on the SIM (15) for $C4 \geq 0$ in the present subscription).

NOTE 2: 5,5 s to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 s ($\pm 10\%$)), 33 s to read BCCH, 15 s for reselection, 5 s for search of a matching LSA on SIM. Allow 60 s.

- 3) After step d), there shall be response from SoLSA MS on carrier 1 within 55 s after carrier 2 has become barred (highest priority (8) with $C4 \geq 0$).

20.24.3.6.4.3.1 Test Procedure

Using conditions from table a), c) and f).

- a) The SS activates carrier 1 and monitors that carrier for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) The SS activates the carriers 2 and 3 (carrier 1 is still switched on) and monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- d) The SS is reconfigured and the carrier 2 becomes barred (CBA = 1).

20.24.3.6.4.3.2 void

20.24.3.6.4.3.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s.
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 after 60 s (highest LSA Priority on the SIM (8) with $C4 \geq 0$).
- 3) After step d), there shall be response from SoLSA MS on carrier 3 within 55 s after carrier 2 becomes barred (no subscription, Highest C2).

20.24.3.6.4.4.1 Test Procedure

Using conditions from table a), d) and f).

- a) The SS activates the carrier 1 and monitors that carrier for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) The SS activates the carriers 2 and 3 (carrier 1 is still switched on) and monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- d) The SS is reconfigured and carrier 2 becomes barred (CBA = 1).

20.24.3.6.4.4.2 void

20.24.3.6.4.4.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s.
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 after 60 s after carrier 2 and 3 were switched on (LSA with highest Priority (15)).
- 3) After step d), there shall be response from SoLSA MS on carrier 1 within 55 s after carrier 2 has become barred (Carrier 3 is an LSA exclusive access cell with no matching subscription).

20.24.3.6.4.5.1 Test Procedure

Using conditions from table a),e) and f).

- a) The SS activates carriers 1 and 3 and monitors these for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SS activates carrier 2 and carrier 3 becomes barred. (CBA = 1).
- d) The SS is reconfigured and carrier 2 becomes barred. (CBA = 1).

20.24.3.6.4.5.2 void

20.24.3.6.4.5.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 s (Carrier 1 is an LSA exclusive access cell with no matching subscription).
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 55 s.
- 3) After step d), there shall be no paging response from SoLSA MS on any carrier (Carrier 2 and 3 are barred, carrier 1 is an exclusive access cell, the SoLSA MS is in the limited state) within 65 s.

NOTE: Any potential access is likely to occur quicker.

20.24.3.7 SoLSA Cell Reselection / roaming

20.24.3.7.1 Definition

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (see General Remark 1. in subclause 20.24).

20.24.3.7.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - There is a better cell (in terms of the path loss criterion C2) in the same LA.
 - The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.
2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. 3GPP TS 03.73, subclause 11.4.2.

20.24.3.7.3 Test Purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest LSA priority the SoLSA MS is subscribed to even if subscriber is outside of his HPLMN.

20.24.3.7.4 Method of test

20.24.3.7.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24 General remark 2.).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 53/-60 | 33/-80 | 63/-50 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MCC, MNC | VPLMN | VPLMN | VPLMN | VPLMN |
| C1 | 20 | 30 | 10 | 40 |
| C2 | 20 | 30 | 10 | 40 |
| C4 | 20 | <0 | 10 | 40 |
| LSA ID | 9.000.000 | - | 9.000.001 | 54 |
| LAC | 5 | 5 | 5 | 5 |
| CI | 5000 | 5001 | 5002 | 5003 |

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | - | - | LSA8 | LSA9 |
| Escape PLMN | No | No | No | No |

- d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | - | - | LSA8 | LSA9 |
| Escape PLMN | Yes | Yes | Yes | Yes |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

20.24.3.7.4.2 Test Procedure

- a) The SS activates carrier 1 and carrier 2, pages the MS on these carriers and monitors these for RA requests from the SoLSA MS. Carriers 3 and 4 are switched off.
- b) The SoLSA MS is switched on.
- c) After approx. 60 s the SS is reconfigured and level of carrier 2 decreases to 33 dB μ V/-80dBm (C2 decreases to 10). The SS monitors carriers 1 and 2 for RA requests from the SoLSA MS.
- d) The SS activates carriers 3 and 4. The SS pages the MS on carriers 3 and 4, and monitors these carriers for RA requests from the SoLSA MS.
- e) The SS is reconfigured and carrier 3 becomes barred (CBA = 1). The SS pages the MS on carrier 4, and monitors this carrier for RA requests from the SoLSA MS.

20.24.3.7.4.3 void

20.24.3.7.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 2 within 50 s.
- 2) After step c), there shall be response from the SoLSA MS on carrier 1 within 25 s after decreasing the level of carrier 2 (highest C2).
- 3) After step d), there shall be response from the SoLSA MS on carrier 3 within 55 s (highest priority on the SIM card for matching LSA subscription).
- 4) After step e), there shall be response from the SoLSA MS on carrier 4 within 55 s.

20.24.4 SoLSA Cell Reselection / idle mode support / any value

General Remark

Definition of "idle mode support" is given in subclause 20.24 General Remark 1.

"Idle mode support" is only controlling if 'favouring' shall be done at cell reselection. It does not disable the LSA subscription.

20.24.4.1 Definition

While camped on a cell of the selected PLMN a SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

20.24.4.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - The cell camped on (current serving cell) has become barred.
 - There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
 - The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

20.24.4.3 Test purpose

To verify that the SoLSA MS shall not favour camping on the LSA for which support in idle mode is disabled.

20.24.4.4 Method of test

20.24.4.5 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 63/ -50 | 53/-60 | 58/-55 | 31 / -82 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | | |
| C1 | 40 | 30 | 35 | 8 |
| C2 | 40 | 30 | 35 | 8 |

| | | | | |
|--------|--------|--------|-----------|------|
| C4 | 40 | 30 | 35 | 8 |
| LSA ID | 66.000 | 66.000 | 9.000.001 | 5 |
| LAC | 5 | 5 | 3 | 3 |
| CI | 5000 | 5001 | 5002 | 5003 |

c) Further initial conditions (Carrier 1-4 are normal LSA cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------|-----------|-----------|-----------|-----------|
| Idle mode support enabled | No | No | No | Yes |
| Matching LSA on SIM | LSA2 | LSA2 | LSA4 | LSA6 |
| Escape PLMN | No | No | No | No |

d) Further initial conditions (Carrier 1-4 are LSA exclusive access cells).

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------|-----------|-----------|-----------|-----------|
| Idle mode support enabled | No | No | No | Yes |
| Matching LSA on SIM | LSA2 | LSA2 | LSA4 | LSA6 |
| Escape PLMN | Yes | Yes | Yes | Yes |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

20.24.4.6 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.
- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and the level of carrier 1 is decreased to 33 dB μ V emf() / -80 dBm (C2 of carrier 1 becomes 10).
- d) The SS is reconfigured and the level of carrier 3 is increased to 63 dB μ V emf() / -50 dBm (C2 of carrier 3 becomes 40).
- e) Carrier 1 is switched off. Carrier 4 is switched on. The SS monitors carriers 2, 3 and 4.

20.24.4.7 void

20.24.4.8 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on any other carrier within 35 s after the first response on carrier 1.

NOTE 1: Any potential access is likely to occur within 25 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 s after carrier 1 has been reconfigured (Highest C2/C2-CRH).
- 3) After step d), there shall be response on carrier 3 within 25 s after carrier 3 has been reconfigured (Highest C2/C2-CRH).
- 4) After step e), there shall be response on carrier 4 within 60 s after the system has been reconfigured (idle mode support enabled for carrier 4).

NOTE 2: 5,5 s to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 s ($\pm 10\%$)), 33 s to read BCCH, 15 s for reselection, 5 s for search of a matching LSA on SIM. Allow 60 s.

20.24.5 SoLSA Cell Reselection / LSA indication for idle mode

General Remark

Definition of "LSA indication for idle mode" is given in subclause 20.24 General Remark 1.

"LSA indication for idle mode" is only controlling if indication of the LSA name shall be done. It has no influence on the LSA subscription.

20.24.5.1 General Definition

The SoLSA MS in idle mode may inform the user whether or not the serving cell belongs to the subscribed LSA.

- The indication is dependent on the setting of the idle mode indication bit on the SIM card for that LSA.
- The indication is independent from the setting of the LSA idle mode support bit on the SIM card for that LSA (see subclause 20.24 General Remark 1).

20.24.5.2 General conformance requirement

1. The service subscriber can define a name (alphanumeric name, icon, etc) for each of her allowed LSAs. The MS will, in idle mode and if required by the user, indicate to the user the current LSA. The indication may be the name of the current LSA, as set by the user. The form of display and indication are left to manufacturer's choice. 3GPP TS 03.73, subclause 4.3.2.
2. In addition to indicate the registered PLMN, an MS with subscription for an LSA in the registered PLMN shall indicate this LSA when it is available. The indication towards the user is optional and may be done by displaying the stored LSA name that corresponds to the ID of the current LSA. An MS with LSA only access subscription may also give an indication towards the user, when the no subscribed LSAs are available to the user. The indication is optional and may be done by displaying the LSA only access text stored in the SIM. 3GPP TS 03.73, subclause 11.8.1.

20.24.5.3 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support enabled

20.24.5.3.1 Definition

See general Definition of this subclause.

20.24.5.3.2 Conformance requirement

1. When both idle mode support and idle mode indication are enabled on the SIM card, the SoLSA MS shall display the name (which was defined by the service subscriber) of the current LSA to the user.
2. When idle mode support is enabled and idle mode indication is disabled on the SIM card, it is expected that the SoLSA MS does not display the LSA name (which was defined by the service subscriber) of the current LSA to the user.

3GPP TS 03.73, subclause 4.3.2; 3GPP TS 03.73, subclause 11.8.1; 3GPP TS 11.11, subclause 10.4.1.2.

20.24.5.3.3 Test Purpose

1. To verify that if idle mode indication bit on the SIM card is enabled for the LSA, the SoLSA MS supports the LSA indication. The LSA name (text/icon) shall be displayed on the SoLSA MS.
2. To verify that if idle mode indication bit on the SIM card is disabled for the LSA the SoLSA MS does not support the LSA indication.

20.24.5.3.4 Method of test

20.24.5.3.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 53/-60 | 33/-80 | OFF |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | 30 | 10 | |
| C2 | 20 | 30 | 10 | |
| LSA ID | - | 66.001 | 9.000.000 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA1 | LSA3 | |
| Escape PLMN | No | No | No | |

20.24.5.3.4.2 Test Procedure

- a) The SS activates carrier 1, pages the MS on this carrier and monitors it for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) Carrier 2 and Carrier 3 are switched on. The SS pages the MS on carriers 1, 2 and 3, and monitors these carriers for RA requests from the SoLSA MS.
- d) The SS is reconfigured and carrier 3 becomes barred (CBA = 1). The SS pages the MS on carriers 1, 2 and 3, and monitors these carriers for RA requests from the SoLSA MS.
- e) The SS is reconfigured and sets CBA = 0 on carrier 3. The SS pages the MS on carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.

20.24.5.3.4.3a Specific PICS statements

-20.24.5.3.4.3b PIXIT statements

- Interface to the human user (p1=Y/N).
- Way to indicate the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Way to indicate the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

20.24.5.3.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no LSA indication on the SoLSA MS (No LSA).
- 2) After step c), there shall be response from the SoLSA MS on carrier 3 within 25 s (highest LSA Priority (8) on the SIM card). An LSA indication is expected on the SoLSA MS.
- 3) After step d), there shall be response from the SoLSA MS on carrier 2 within 55 s. There shall be no indication on the SoLSA MS (highest LSA Priority on the SIM card, no indication on the SIM card).
- 4) After step e), there shall be response from the SoLSA MS on carrier 3 within 55 s (LSA carrier on the SIM card). An LSA indication is expected on the SoLSA MS (idle mode indication for that LSA is enabled).

20.24.5.4 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support disabled

20.24.5.4.1 Definition

See general Definition of this subclause.

20.24.5.4.2 Conformance requirement

1. When idle mode support is disabled and idle mode indication is enabled on the SIM card, it is expected that the SoLSA MS displays the LSA name (which was defined by the service subscriber) of the current LSA to the user.
2. When idle mode support is disabled and idle mode indication is disabled on the SIM card, the SoLSA MS shall not display the LSA name (which was defined by the service subscriber) of the current LSA to the user.

3GPP TS 03.73, subclause 4.3.2; 3GPP TS 03.73, subclause 11.8.1; 3GPP TS 11.11, 1subclause 0.4.1.2.

20.24.5.4.3 Test Purpose

To verify that when idle mode support is disabled, the SoLSA MS shall display the LSA name in dependence from the idle mode indication bit.

20.24.5.4.4 Method of test

20.24.5.4.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 43/-70 | 53/-60 | 33/-80 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | 30 | 10 | |
| C2 | 20 | 30 | 10 | |
| LSA ID | 250 | 66.000 | 9.000.001 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA2 | LSA4 | |
| Escape PLMN | No | No | No | |

20.24.5.4.4.2 Test Procedure

- a) The SS activates carrier 1, pages this carrier and monitors it for RA requests from the SoLSA MS. Carriers 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) Carrier 2 and carrier 3 are switched on. The SS pages the MS on carriers 1, 2 and 3, and monitors these carriers for RA requests from the SoLSA MS.
- d) The SS is reconfigured and the level of carrier 3 increases to 63 dB μ Vemf / -50dBm (C2 increases to 40 dB).
- e) The SS is reconfigured and the level of carrier 3 decreases to 33 dB μ Vemf0,1,0 / - 80dBm (C2 decreases to 10 dB).

20.24.5.4.4.3a Specific PICS statements

-

20.24.5.4.4.3b PIXIT statements

- Interface to the human user (p1=Y/N).
- Way to indicate the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Way to indicate the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

20.24.5.4.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no LSA indication on the SoLSA MS.
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 s (highest C2). An LSA indication is expected on the SoLSA MS.
- 3) After step d), there shall be response from the SoLSA MS on carrier 3 within 25 s (highest C2). There shall be no LSA indication on the SoLSA MS.
- 4) After step e), there shall be response from the SoLSA MS on carrier 2 within 25 s (highest C2). An LSA indication is expected on the SoLSA MS.

20.25 Intersystem Cell Reselection

The default parameters for the GSM/GPRS cell, the accuracy of the MS signal measurements and tolerance of timers, are given in TS 51.010 section 20.22.

The default parameters and tolerances of the UTRAN cells are specified in TS 34.108.

20.25.2 Intersystem Cell Reselection/Idle Mode/FDD_Qmin

20.25.2.1 Conformance requirement

If the 3G Cell Reselection list includes UTRAN frequencies, the MS shall, at least every 5 s update the value RLA_C for the serving cell and each of the at least 6 strongest non-serving GSM cells.

The MS shall then reselect a suitable (see TS 25.304) UTRAN cell if its measured RSCP value exceeds the value of RLA_C for the serving cell and all of the suitable (see 3GPP TS 03.22) non-serving GSM cells by the value XXX_Qoffset for a period of 5 seconds and, for FDD, the UTRAN cells measured Ec/No value is equal or greater than the value FDD_Qmin. In case of a cell reselection occurring within the previous 15 seconds, XXX_Qoffset is increased by 5 dB.

Table 1: Radio sub-system link control parameters

| Parameter name | Description | Range | Bits | Channel |
|----------------|--|-------|------|----------|
| FDD_Qmin | A minimum threshold for Ec/No for UTRAN FDD cell re-selection, 0= -20dB, 1= -6dB, 2= -18dB, 3= -8dB, 4= -16dB, 5= -10dB, 6= -14dB, 7= -12dB. Default value= -12dB. | 0-7 | 3 | BCCH D/L |

References:

3GPP TS 05.08, subclause 6.6.5 and 9

20.25.2.2 Test purpose

To verify that the MS uses the FDD_Qmin parameter at cell re-selection from GSM to UTRAN while in GSM Idle Mode.

20.25.2.3 Method of test

Initial conditions

| Parameter | Cell 1 | Cell 2 |
|----------------------|----------|------------|
| | Carrier1 | Carrier2 |
| Channel Type carried | BCCH | BCH |
| Signal Level (dBm) | -50 | Off to -48 |
| Ec/No (dB) | - | -6>dB>-16 |
| | | |

NOTE 1: MS is IMSI updated on Cell 1.

NOTE 2: Carrier 1 is the BCCH carrier, GPRS not present.

NOTE 3: Carrier 2 is the UTRAN FDD cell configured according to TS 34.108, clause 6.1.4, Default settings for cell No.1

NOTE 4: Serving Cell Parameters are coded and transmitted on the specified Channel Type

NOTE 5: Carriers should have a relative accuracy of ± 2 dB.

NOTE 6: When executing the test in FDD band II or FDD band VIII carrier 2 shall use the high range UARFCN, defined in TS 3GPP 34.108 clause 5.1.1. This is to avoid the FDD band overlapping with the GSM band under test.

SYSTEM INFORMATION TYPE 3 REST OCTETS

SYSTEM INFORMATION TYPE 4 REST OCTETS

- GPRS **not** indicated

SYSTEM INFORMATION TYPE 2QUATER

| Information Element | Value/remark |
|------------------------------|----------------|
| < MP_CHANGE_MARK : bit (1) > | 0 |
| < FDD_Qmin : bit (3) > | '001'B (-6 dB) |

Test procedure

The MS is camping on the GSM cell and has received a 3G Neighbour Cell list in the 3G_NEIGHBOUR_CELL description in System Information Type 2quater. The FDD_Qmin in the 3G_MEASUREMENT_PARAMETERS description is set to -6 dB.

It is verified for 30 sec that no Cell Reselection to the UTRAN cell is performed.

System Information 2quater is updated with FDD_Qmin in the 3G_MEASUREMENT_PARAMETERS description set to -16 dB.

It is verified that a Cell Reselection to UTRAN is performed within 45 secs when UE receives and acts on revised SI2quater and the UTRAN cell Ec/No gets greater than FDD_Qmin. (45 secs = 30 secs period of SI reading + 5 secs for UE to receive and decode SI2quater +2*5sec, where 5 sec is the maximum time between 2 consecutive UTRAN measurements.)

Maximum duration of the test

2 minutes

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------|---|
| 1 | SS | | Carrier 2 is activated with -6>Ec/No>-16 (dB) |
| 2 | SS <->MS | | Verify that no cell reselection is performed to Carrier 2 for 30 sec. |
| 3 | SS | SYSTEM INFORMATION TYPE 2QUATER | See specific contents below. |
| 4 | MS -> SS | RRC CONNECTION REQUEST | Verify that the MS reselects to Carrier 2 within 45 secs from Step 3. Establishment cause shall be "interRAT-CellReselection" |

SYSTEM INFORMATION TYPE 2QUATER in Step 3

| Information Element | Value/remark |
|-----------------------------|-----------------|
| < MP_CHANGE_MARK : bit (1)> | 1 |
| < FDD_Qmin : bit (3) > | '100'B (-16 dB) |

20.25.3 Intersystem Cell Reselection/Idle Mode/FDD_Qoffset

20.25.3.1 Conformance requirement

If the 3G Cell Reselection list includes UTRAN frequencies, the MS shall, at least every 5 s update the value RLA_C for the serving cell and each of the at least 6 strongest non-serving GSM cells.

The MS shall then reselect a suitable (see TS 25.304) UTRAN cell if its measured RSCP value exceeds the value of RLA_C for the serving cell and all of the suitable (see 3GPP TS 03.22) non-serving GSM cells by the value XXX_Qoffset for a period of 5 seconds and, for FDD, the UTRAN cells measured Ec/No value is equal or greater than the value FDD_Qmin. In case of a cell reselection occurring within the previous 15 seconds, XXX_Qoffset is increased by 5 dB.

Table 1: Radio sub-system link control parameters

| Parameter name | Description | Range | Bits | Channel |
|----------------|--|-------|------|----------|
| FDD_Qoffset | Applies an offset to RLA_C for cell re-selection to access technology/mode FDD 0 = -∞ (always select a cell if acceptable), 1 = -28 dB, 2 = -24 dB, ... , 15 = 28 dB. Default value = 0 dB. | 0-15 | 4 | BCCH D/L |

Power Spectral Density: The units of Power Spectral Density (PSD) are extensively used in this document. PSD is a function of power versus frequency and when integrated across a given bandwidth, the function represents the mean power in such a bandwidth.

References:

3GPP TS 05.08, subclause 6.6.5 and 9; TS 25.101 subclause 3.1.

20.25.3.2 Test purpose

To verify that the MS uses the FDD_Qoffset parameter at cell re-selection from GSM/GPRS to UTRAN while in Idle Mode.

20.25.3.3 Method of test

Initial conditions

| Parameter | Unit | Cell 1 (GSM) |
|------------------|------|--------------|
| Test Channel | | 1 |
| RF Signal Level | dBm | -75 |
| RXLEV_ACCESS_MIN | dBm | -100 |
| FDD_Qoffset | dB | 20 |

| Parameter | Unit | Cell 2 (UTRAN) |
|----------------|----------------|-------------------|
| Test Channel | | 1 |
| CPICH_Ec (FDD) | dBm / 3.84 MHz | OFF to -62 to -48 |

NOTE 1: MS is IMSI updated on Cell 1.

NOTE 2: Carrier 1 is the BCCH carrier, GPRS not present.

NOTE 3: Carrier 2 is the UTRAN FDD cell configured according to TS 34.108, clause 6.1.4, Default settings for cell No.1

NOTE 4: Serving Cell Parameters are coded and transmitted on the specified Channel Type.

NOTE 5: Carriers should have a relative accuracy of ± 3 dB.

NOTE 6: When executing the test in FDD band II or FDD band VIII carrier 2 shall use the high range UARFCN, defined in TS 3GPP 34.108 clause 5.1.1. This is to avoid the FDD band overlapping with the GSM band under test.

SYSTEM INFORMATION TYPE 2QUATER

| Information Element | Value/remark |
|---------------------------------|-------------------|
| 0 1 < FDD_Qoffset : bit (4) > | 1 '1101'B (20 dB) |

Test procedure

The MS is camping on the GSM cell and has received a 3G Neighbour Cell list in the 3G_NEIGHBOUR_CELL description in System Information Type 2quater. The FDD_Qoffset in the 3G_MEASUREMENT_PARAMETERS description is set to 20 dB.

It is verified for 30 sec that no Cell Reselection to the UTRAN cell is performed.

The UTRAN cell CPICH Ec is increased to -50 dBm / 3.84 MHz and therefore, The mean power of the CPICH Ec integrated across 3.84 MHz bandwidth is -50dBm

It is verified that a Cell Reselection to UTRAN CPICH Ec is performed within 15.4 sec when the UTRAN cell mean power of the CPICH Ec integrated across 3.84 MHz gets greater than the GSM cell $RLA_C + FDD_Qoffset$. (15.4 sec = 2*5sec, where 5 sec is the maximum time between 2 consecutive UTRAN measurements, with 4 seconds to read the SIBs plus 10% tolerance overall)

Maximum duration of the test

2 minutes

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------|---|

20.25.4 Intersystem Cell Reselection/Idle Mode/Qsearch_I

20.25.4.1 Conformance requirement

If the 3G Cell Reselection list includes UTRAN frequencies, the MS shall, at least every 5 s update the value RLA_C for the serving cell and each of the at least 6 strongest non-serving GSM cells.

For FDD, the MS shall then reselect a suitable (see TS 25.304) UTRAN cell if its measured RSCP value exceeds the value of RLA_C for the serving cell and all of the suitable (see 3GPP TS 03.22) non-serving GSM cells by the value FDD_Qoffset for a period of 5 seconds and the UTRAN cells measured Ec/No value is equal or greater than the value FDD_Qmin. In case of a cell reselection occurring within the previous 15 seconds, FDD_Qoffset is increased by 5 dB.

For TDD, the MS shall then reselect a suitable (see TS 25.304) UTRAN cell if its measured RSCP value exceeds the value of TDD_Qoffset for a period of 5 seconds.

Table 1a: Radio sub-system link control parameters for FDD

| Parameter name | Description | Range | Bits | Channel |
|----------------|--|-------|------|----------|
| Qsearch_I | Search for 3G cells if signal level is below (0-7) or above (8-15) threshold 0 = - 98 dBm, 1 = - 94 dBm, ... , 6 = - 74 dBm, 7 = ∞ (always) 8 = - 78 dBm, 9 = - 74 dBm, ... , 14 = - 54 dBm, 15 = ∞ (never). Default value = ∞ (never). | 0-15 | 4 | BCCH D/L |

Table 1b: Radio sub-system link control parameters for TDD

| Parameter name | Description | Range | Bits | Channel |
|----------------|--|-------|------|----------|
| Qsearch_I | Search for 3G cells if signal level is below (0-7) or above (8-15) threshold 0 = - 98 dBm, 1 = - 94 dBm, ... , 6 = - 74 dBm, 7 = ∞ (always) 8 = - 90 dBm, 9 = - 86 dBm, ... , 14 = - 66 dBm, 15 = ∞ (never). Default value = ∞ (never). | 0-15 | 4 | BCCH D/L |

References:

3GPP TS 05.08, subclause 6.6.5 and 9

20.25.4.2 Test purpose

To verify that the MS uses the Qsearch_I parameter at cell re-selection from GSM to UTRAN while in Idle Mode.

20.25.4.3 Method of test

Initial conditions

For MS supporting FDD:

| Parameter | Unit | Cell 1 (GSM) |
|------------------|------|--------------|
| Test Channel | | 1 |
| RF Signal Level | dBm | -60 to -77 |
| RXLEV_ACCESS_MIN | dBm | -100 |
| MP_CHANGE_MARK | | 0 |
| Qsearch_I | | 15 to 6 |

| Parameter | Unit | Cell 2 (UTRAN) |
|----------------|----------------|----------------|
| Test Channel | | 1 |
| CPICH_Ec (FDD) | dBm / 3.84 MHz | OFF to -50 |

For MS supporting TDD:

| Parameter | Unit | Cell 1 (GSM) |
|------------------|------|---------------------------|
| Test Channel | | 1 |
| RF Signal Level | dBm | -77 to -71 |
| RXLEV_ACCESS_MIN | dBm | -100 |
| MP_CHANGE_MARK | | 0 |
| Qsearch_I | | 15 (never) to 12 (-74dBm) |

| Parameter | Unit | Cell 2 (UTRAN) |
|-------------------|----------------|----------------|
| Test Channel | | 1 |
| PCCPCH_RSCP (TDD) | dBm / 1.28 MHz | OFF to -50 |

NOTE 1: MS is IMSI attached on Cell 1.
If MS supports GPRS, then MS is GPRS attached on cell 1.

NOTE 2: Carrier 1 is the BCCH carrier, PBCCH not present, NC0.

NOTE 3: Carrier 2 is either the UTRAN FDD cell or the UTRAN TDD cell configured according to TS 34.108, clause 6.1.4, Default settings for cell No.1

NOTE 4: Serving Cell Parameters are coded and transmitted on the specified Channel Type

NOTE 5: Carriers should have a relative accuracy of ± 3 dB.

SYSTEM INFORMATION TYPE 2QUATER

| Information Element | Value/remark |
|-------------------------|------------------|
| < Qsearch_I : bit (4) > | '1111'B (Never) |
| < Qsearch_P : bit (4) > | '0111'B (Always) |

Specific PICS statements:

- Support of UTRAN FDD (TSPC_Type_UTRAN_FDD)
- Support of UTRAN TDD (TSPC_Type_UTRAN_TDD)

Test procedure

The MS is camping on the GSM cell and has received a 3G Neighbour Cell list in the 3G_NEIGHBOUR_CELL description in System Information Type 2quater. Qsearch_I in the 3G_MEASUREMENT_PARAMETERS description indicates that no 3G measurements shall be performed.

It is verified for 30 sec that no Cell Reselection to the UTRAN cell is performed.

For FDD, the SS broadcast a new System Information Type 2quater with an updated Qsearch_I indicating that 3G measurements shall be performed when the strongest GSM cell RLA_C is below -74 dBm.

For TDD, The SS broadcast a new System Information Type 2quater with an updated Qsearch_I indicating that 3G measurements shall be performed when the strongest GSM cell RLA_C is above -74 dBm.

It is verified for 65 sec that no Cell Reselection to the UTRAN cell is performed. (Maximum 30 sec for SI reading + 5 sec for System Information 2quater reading + 30 sec to find the UTRAN.)

For FDD, the GSM cell RLA_C is decreased to -77 dBm.

For TDD, the GSM cell RLA_C is increased to -71 dBm.

It is verified that a Cell Reselection to UTRAN is performed within 30 sec.

Maximum duration of the test

4 minutes

Expected sequence

This sequence is performed for each UTRAN mode the MS supports.

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|

20.25.5 Intersystem Cell Reselection / Idle Mode / High Priority

20.25.5.1 Conformance requirement

If the 3G Cell Reselection list or the E-UTRAN Neighbour Cell list include frequencies of other radio access technologies, the MS shall, at least every 5 s update the value RLA_C for the serving cell and each of the at least 6 strongest non serving GSM cells.

The MS shall then reselect a suitable (see 3GPP TS 25.304 for UTRAN and 3GPP TS 36.304 for E-UTRAN) cell of another radio access technology if the criteria below are satisfied. S_non-serving_XXX is the measurement quantity of a non-serving inter-RAT cell and XXX indicates the other radio access technology/mode and is defined as follows:

- for a UTRAN cell, is the measured RSCP value for the cell minus UTRAN_QRXLEVMIN for the cell's frequency;

...

Cell reselection to a cell of another inter-RAT frequency shall be performed if any of the conditions below (to be evaluated in the order shown) is satisfied:

- The S_non-serving_XXX of one or more cells of a higher priority inter-RAT frequency is greater than THRESH_XXX_high during a time interval T_reselection; in that case, the mobile station shall consider the

cells for reselection in decreasing order of priority and, for cells of the same priority, in decreasing order of $S_{\text{non-serving_XXX}}$, and reselect the first cell that satisfies the conditions above;

...

A UTRAN FDD cell shall only be reselected if, in addition to the criteria above, its measured E_c/N_o value is equal to or greater than $FDD_Q_{\text{min}} - FDD_Q_{\text{min_Offset}}$.

References:

3GPP TS 45.008, subclause 6.6.6

20.25.5.2 Test purpose

To verify that the MS uses the priority information and performs cell re-selection to High priority UTRAN cell while in Idle Mode.

20.25.5.3 Method of test

Initial conditions

| Parameter | Cell 1 | Cell 2 |
|----------------------|----------|------------|
| | Carrier1 | Carrier2 |
| Channel Type carried | BCCH | BCH |
| Signal Level (dBm) | -50 | Off to -60 |
| E_c/N_o (dB) | - | -6dB |

NOTE 1: MS is GPRS attached on Cell 1.

NOTE 2: Carrier 1 is the BCCH carrier, NC0.

NOTE 3: Carrier 2 is the UTRAN FDD cell configured according to TS 34.108, clause 6.1.4, Default settings for cell No.1

NOTE 4: Serving Cell Parameters are coded and transmitted on the specified Channel Type

NOTE 5: Carriers should have a relative accuracy of ± 3 dB.

NOTE 6: SYSTEM INFORMATION TYPE 2QUATER Instance1 and Instance2 as per 20.25.1.

Test procedure

The MS is GPRS attached and has received a 3G Neighbour Cell description in System Information Type 2quater message, along with priority information.

Update the Carrier 2, power level as per the initial conditions

It is verified that a Cell Reselection to UTRAN is performed within 30 sec.

Maximum duration of the test

5 minutes

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------|---|
| 1 | SS | | Carrier 2 is activated with $E_c/N_o = -6$ (dB) and power level -60(dBm) |
| 2 | MS -> SS | RRC CONNECTION REQUEST | Verify that the MS reselects to Carrier 2 within 30 secs from Step 1. Establishment cause shall be "interRAT-CellReselection" |

20.25.6 Intersystem Cell Reselection / Idle Mode / Low Priority

20.25.6.1 Conformance requirement

If the 3G Cell Reselection list or the E-UTRAN Neighbour Cell list include frequencies of other radio access technologies, the MS shall, at least every 5 s update the value RLA_C for the serving cell and each of the at least 6 strongest non serving GSM cells.

The MS shall then reselect a suitable (see 3GPP TS 25.304 for UTRAN and 3GPP TS 36.304 for E-UTRAN) cell of another radio access technology if the criteria below are satisfied. $S_non-serving_XXX$ is the measurement quantity of a non-serving inter-RAT cell and XXX indicates the other radio access technology/mode and is defined as follows:

- for a UTRAN cell, is the measured RSCP value for the cell minus $UTRAN_QRXLEVMIN$ for the cell's frequency;

...

For a GSM cell, S_GSM is defined as the C1 value for the cell (see subclause 6.4);

Cell reselection to a cell of another inter-RAT frequency shall be performed if any of the conditions below (to be evaluated in the order shown) is satisfied:

- The $S_non-serving_XXX$ of one or more cells of a higher priority inter-RAT frequency is greater than $THRESH_XXX_high$ during a time interval $T_reselection$; in that case, the mobile station shall consider the cells for reselection in decreasing order of priority and, for cells of the same priority, in decreasing order of $S_non-serving_XXX$, and reselect the first cell that satisfies the conditions above;
- The value of S_GSM is lower than $THRESH_GSM_low$ for the serving cell and all measured GSM cells during a time interval $T_reselection$; in this case, the mobile station shall consider for reselection the inter-RAT cells in the following order, and reselect the first one that satisfies the following criteria:
 - cells of a lower priority inter-RAT frequency whose $S_non-serving_XXX$ is greater than $THRESH_XXX_low$ during a time interval $T_reselection$; these cells shall be considered in decreasing order of priority and, for cells of the same priority, in decreasing order of $S_non-serving_XXX$;

...

A UTRAN FDD cell shall only be reselected if, in addition to the criteria above, its measured E_c/N_0 value is equal to or greater than $FDD_Qmin - FDD_Qmin_Offset$.

References:

3GPP TS 45.008, subclause 6.6.6

20.25.6.2 Test purpose

20.25.7 Intersystem Cell Reselection / Idle Mode / H_PRIO

20.25.7.1 Conformance requirement

If the 3G Cell Reselection list or the E-UTRAN Neighbour Cell list include frequencies of other radio access technologies, the MS shall, at least every 5 s update the value RLA_C for the serving cell and each of the at least 6 strongest non serving GSM cells.

The MS shall then reselect a suitable (see 3GPP TS 25.304 for UTRAN and 3GPP TS 36.304 for E-UTRAN) cell of another radio access technology if the criteria below are satisfied. S_non-serving_XXX is the measurement quantity of a non-serving inter-RAT cell and XXX indicates the other radio access technology/mode and is defined as follows:

- for a UTRAN cell, is the measured RSCP value for the cell minus UTRAN_QRXLEVMIN for the cell's frequency;

...

For a GSM cell, S_{GSM} is defined as the C1 value for the cell (see subclause 6.4);

Cell reselection to a cell of another inter-RAT frequency shall be performed if any of the conditions below (to be evaluated in the order shown) is satisfied:

- The $S_{non-serving_XXX}$ of one or more cells of a higher priority inter-RAT frequency is greater than $THRESH_XXX_high$ during a time interval $T_{reselection}$; in that case, the mobile station shall consider the cells for reselection in decreasing order of priority and, for cells of the same priority, in decreasing order of $S_{non-serving_XXX}$, and reselect the first cell that satisfies the conditions above;
- The value of S_{GSM} is lower than $THRESH_GSM_low$ for the serving cell and all measured GSM cells during a time interval $T_{reselection}$; in this case, the mobile station shall consider for reselection the inter-RAT cells in the following order, and reselect the first one that satisfies the following criteria:
 - cells of a lower priority inter-RAT frequency whose $S_{non-serving_XXX}$ is greater than $THRESH_XXX_low$ during a time interval $T_{reselection}$; these cells shall be considered in decreasing order of priority and, for cells of the same priority, in decreasing order of $S_{non-serving_XXX}$;
 - if no cells satisfy the criterion above, inter-RAT cells for which, during a time interval $T_{reselection}$, $S_{non-serving_XXX}$ is higher than S_{GSM} for the serving cell by at least a specific hysteresis H_{PRIO} ; these cells shall be considered in decreasing order of $S_{non-serving_XXX}$.

A UTRAN FDD cell shall only be reselected if, in addition to the criteria above, its measured E_c/N_0 value is equal to or greater than $FDD_Qmin - FDD_Qmin_Offset$.

References:

3GPP TS 45.008, subclause 6.6.6

20.25.7.2 Test purpose

To verify that the MS uses the priority information and performs cell re-selection from GSM to UTRAN, according to hysteresis criteria while in Idle Mode.

20.25.7.3 Method of test

Initial conditions

| Parameter | Cell 1 | Cell 2 |
|----------------------|------------|------------|
| | Carrier1 | Carrier2 |
| Channel Type carried | BCCH | BCH |
| Signal Level (dBm) | -50 to -90 | Off to -75 |
| E_c/N_0 (dB) | - | -6dB |

NOTE 1: MS is GPRS attached on Cell 1.

NOTE 2: Carrier 1 is the BCCH carrier, NC0.

NOTE 3: Carrier 2 is the UTRAN FDD cell configured according to TS 34.108, clause 6.1.4, Default settings for cell No.1

NOTE 4: Serving Cell Parameters are coded and transmitted on the specified Channel Type

NOTE 5: Carriers should have a relative accuracy of ± 3 dB.

NOTE 6: SYSTEM INFORMATION TYPE 2QUATER (REL-8) as per 20.25.1.

Test procedure

The MS is GPRS attached and has received a 3G Neighbour Cell description in System Information Type 2quater message, along with priority information.

Update the Carrier 1 and Carrier 2, power level as per the initial conditions.

It is verified that a Cell Reselection to UTRAN is performed within 30 sec.

Maximum duration of the test

5 minutes

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------|---|
| 1 | SS | SYSTEM INFORMATION TYPE 2QUATER | See specific contents below. |
| 2 | SS | | Carrier 2 is activated with Ec/No = -6 (dB) and power level -75(dBm) Set GSM power level to -90dBm to satisfy S_GSM criteria for low priority reselection evaluation |
| 3 | MS -> SS | RRC CONNECTION REQUEST | Verify that the MS reselects to Carrier 2 within 30 secs from Step 2. Establishment cause shall be "interRAT-CellReselection" |

Specific message contents

SYSTEM INFORMATION TYPE 2QUATER in Step 1

| Information Element | Value/remark |
|-------------------------------|-------------------|
| < MP_CHANGE_MARK : bit (1)> | 1 |
| < H_PRIO : bit(2) > | '01'B (5dB) |
| < UTRAN_PRIORITY : bit(3)> | '010'B |
| < THRESH_UTRAN_high : bit(5)> | '11111'B (62dB) |

20.26 Decoding of BCCH including information for UTRAN TDD cells

20.26.1 Conformance requirement

When a message is coded using CSN.1 notation, the definition of the CSN.1 syntax in CSN.1 Specification, Version 2.0, shall be used.

Where the description of information elements in this Technical Specification contains bits defined to be "spare bits", these bits shall set to the indicated value (0 or 1) by the sending side, and their value shall be ignored by the receiving side. With few exceptions, spare bits are indicated as being set to "0" in 3GPP TS 44.018.

The following rules apply for the coding of type 4 information elements:

- The octet number of an octet (which is defined in the figure of a sub-clause) consists of a positive integer, possibly of an additional letter, and possibly of an additional asterisk, see sub-clause f). The positive integer identifies one octet or a group of octets.
- Each octet group is a self contained entity. The internal structure of an octet group may be defined in alternative ways.
- An octet group is formed by using some extension mechanism. The preferred extension mechanism is to extend an octet (N) through the next octet(s) (Na, Nb, etc.) by using bit 8 in each octet as an extension bit.

The bit value "0" indicates that the octet group continues through to the next octet. The bit value "1" indicates that this octet is the last octet of the group. If one octet (Nb) is present, the preceding octets (N and Na) shall also be present.

In the format descriptions appearing in sub-clause 10.5.1 to 10.5.4, bit 8 is marked "0/1 ext" if another octet follows. Bit 8 is marked "1 ext" if this is the last octet in the extension domain.

Additional octets may be defined in later versions of the protocols ("1 ext" changed to "0/1 ext") and equipments shall be prepared to receive such additional octets; the contents of these octets shall be ignored. However the length indicated in clauses 9 and 10 only takes into account this version of the protocols.

- d) In addition to the extension mechanism defined above, an octet (N) may be extended through the next octet(s) (N+1, N+2 etc.) by indications in bits 7-1 (of octet N).
- e) The mechanisms in c) and d) may be combined.
- f) Optional octets are marked with asterisks (*).

- 3GPP TS 44.018 sections 10.1, 10.5.

20.26.2 Test purpose

To verify that the MS performs correctly when BCCH of suitable cell includes information for UTRAN-TDD cells.

20.26.3 Method of test

20.26.3.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 |
|---|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 48 / -65 | 38 / -75 |
| CBA | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -67 |
| MNC | | |
| MCC | | |
| C1 | 25 | -8 |
| C2 | 25 | -8 |
| ATT bit | 1 | 1 |
| MSCR | 1 | 1 |

For an E-GSM MS carrier 2 is chosen in the E-GSM band, carrier 1 ARFCN in the P-GSM band.

Specific system information messages settings are configured on carriers 1 and 2 as specified in section Specific Message Contents.

NOTE: UTRAN TDD cell needs not to be active.

20.26.3.2 Procedure

- a) The SS activates the carriers with specific system information settings
- b) The MS is switched on.
- c) The MS is paged on carrier 1.

20.26.4 Test requirements

- 1) After step b), the MS shall perform location update procedure on carrier 1 within 60 seconds..
- 2) After step c), MS shall respond to paging.

21 Received signal measurements

For evaluating the reception quality (the basis for handover and power control) the following two criteria are used:

- signal strength (RXLEV);
- signal quality (RXQUAL).

Unless otherwise specified all tests in clauses 21.1 to 21.4 are applicable for all MSs supporting the bands referred to in clause 1.

21.1 Signal strength

21.1.1 Definition

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

21.1.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21-1
 - 1.1 under normal conditions, 3GPP TS 05.08, subclause 8.1.2 and 3GPP TS 05.05, subclause 6.2.
 - 1.2 under extreme conditions, 3GPP TS 05.08, subclause 8.1.2, 3GPP TS 05.05, subclauses D.1 and D.2.

Table 21-1: Tolerance for relative accuracy of receive signal measurement

| Absolute level of lower level signal dBm | | | | | | Tolerance dB | | | |
|---|-----------------|-----------------------|---------------------|-----------------------|----------------------|-----------------|-------|-------------|-------|
| GSM Small MS | GSM Other MS | DCS 1800 Class 1&2 | DCS 1800 Class 3 | PCS 1900 Class 1&2 | PCS 1900 Other MS | Lower limit | | Upper limit | |
| | | | | | | Single | Multi | Single | Multi |
| ≥ -88 | ≥ -90 | ≥ -86 | ≥ -88 | ≥ -88 | ≥ -90 | 2 | 4 | 2 | 4 |
| ≥ -101 | ≥ -103 | ≥ -99 | ≥ -101 | ≥ -101 | ≥ -103 | 3 | 5 | 2 | 5 |
| < -101 | < -103 | < -99 | < -101 | < -101 | < -103 | 4 | 6 | 2 | 6 |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of ± 4 dB from -110 dBm to -70 dBm under normal conditions; 3GPP TS 05.08, subclause 8.1.2.
3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of ± 6 dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; 3GPP TS 05.08, subclause 8.1.2.
4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.
5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in 3GPP TS 05.08, subclause 8.1.4.

21.1.3 Test purpose

1. To verify that the RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N reported by the MS does not exceed conformance requirement 1.
 - 1.1 under normal conditions;
 - 1.2 under extreme conditions.
2. To verify that the RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N reported by the MS does not exceed conformance requirement 2 under normal conditions.
3. To verify that the RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N reported by the MS does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.
4. To verify that the RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N reported by the MS does not exceed conformance requirement 4.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

21.1.4 Method of test

21.1.4.1 Initial conditions

The SS is set to produce the BCCH of the serving cell at 63 dB μ Vemf() and the BCCHs of 6 surrounding cells at 28 dB μ Vemf(). The BCCH of the serving cell indicates these BCCHs, but not the BCCH of the serving cell. The ARFCN of the serving cell BCCH is chosen so as not to interfere with the other channels as shown in table 21-2. The fading profile for the BCCHs of the serving and surrounding cells will be set to static.

For circuit switch capable devices, after 30 s, a call is set up according to the generic call set up procedure to an ARFCN, within the supported band of operation. The SACCH indicates the same surrounding cell BCCHs as the BCCH of the serving cell.

For GPRS only devices, the Ready Timer (T3314) is indicated as disabled in the GMM ATTACH ACCEPT message. After 30s, a GPRS mode RLC unacknowledged mode downlink TBF is established on a single slot. Following TBF establishment, the SS transmits a PACKET MEASUREMENT ORDER message on downlink PACCH addressing the MS which sets the NETWORK_CONTROL_ORDER to '1' and indicates the value NC_REPORTING_PERIOD_T = 0.480ms. The PACKET MEASUREMENT ORDER does not modify the broadcast allocation list as indicated on the BCCH of the serving cell. Throughout the downlink TBF, the SS transmits two consecutive downlink RLC data blocks to the MS with the S/P bit set to '1' in the RLC/MAC header at least twice every 480ms. The PDTCH level is reported by the MS via the RXLEV_SERVING_CELL parameter and the neighbour cell BCCH levels are reported by the MS via the RXLEV_N parameters in the PACKET MEASUREMENT REPORT messages received on uplink PACCH.

NOTE: The 30 s is to allow the MS to scan and find all BCCHs.

Specific PICS statements:

- MS supporting packet switched services only (TSPC_operation_mode_C)

21.1.4.2 Procedure

- a) The levels of the TCH / PDTCH and BCCHs are set according to table 21-2 step 1. The SS waits 20 s before continuing.

Table 21-2: Signal levels at receiver input in dB μ Vemf()

| | ARFCN | TCH / PDTCH | BCCH1 | BCCH2 | BCCH3 | BCCH4 | BCCH5 | BCCH6 |
|--------------------|---------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|

| | GSM 750 | 438 | 475 | 511 | 440 | 455 | 485 | 500 |
| | 750/850 | 438 | 251 | 475 | 511 | 455 | 485 | 128 |
| 1 + m \times 21 | | 64,5 - m \times 10 | 64,5 - m \times 10 | 64,5 - m \times 10 | 64,5 - m \times 10 | 64,5 - m \times 10 | 64,5 - m \times 10 | 64,5 - m \times 10 |
| 2 + m \times 21 | | 54,5 - m \times 10 | 63,5 - m \times 10 | 54,5 - m \times 10 | 54,5 - m \times 10 | 54,5 - m \times 10 | 54,5 - m \times 10 | 54,5 - m \times 10 |
| 3 + m \times 21 | | 54,5 - m \times 10 | 62,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 |
| . | | . | . | . | . | . | 44,5 - m \times 10 | 44,5 - m \times 10 |
| 17 + m \times 21 | | 54,5 - m \times 10 | . | . | . | . | 44,5 - m \times 10 | 44,5 - m \times 10 |
| 18 + m \times 21 | | 44,5 - m \times 10 | . | . | . | . | 44,5 - m \times 10 | 44,5 - m \times 10 |
| . | | . | . | . | . | . | 44,5 - m \times 10 | 44,5 - m \times 10 |
| 21 + m \times 21 | | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 | 44,5 - m \times 10 |

m = 0, 1, 2, 3, 4.

- b) The measurement is done in 105 steps. The initial signal levels of the TCH / PDTCH of the serving cell and the BCCHs of the surrounding cells are adjusted according to table 21-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps 21 + m \times 21 where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell BCCHs in steps 1 + m \times 21 and 21 + m \times 21. The RXLEV values for BCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps 21 + m \times 21 is to allow an extra quarter reporting period for the MS to stabilize for steps 1 + m \times 21.

For circuit switched speech calls at steps 1 to 30 the SS simulates a base station with DTX off and at steps 31 to 105 the SS simulates a base station with DTX on. At step 64, within every 480 ms reporting period, out of the 4 SACCH and 8 SID timeslots the SS transmits the first six active timeslots of the TCH with signal level 39,5 dB μ Vemf() and the last six active timeslots of the TCH with signal level 29,5 dB μ Vemf(). At steps 1 to 30 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV_FULL and RXLEV_SUB. At steps 31 to 105 the SS shall check only the value of the parameter RXLEV_SUB.

For circuit switched data calls and signalling only connection the SS simulates a base station with DTX off for step 1 to 105. At steps 1 to 105 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV_FULL and RXLEV_SUB.

For GPRS only devices at steps 1 to 105 the SS checks the accuracy of the measured signal strength of the PDTCH by checking the value of the parameter RXLEV_SERVING_CELL received in the PACKET MEASUREMENT REPORT messages from the MS.

c) Step b) is repeated under extreme conditions (annex 1, TC2,2 and TC3).

21.1.5 Test requirements

21.1.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions tested the following applies:

- For each of the steps 1, 21, 22, 42, 43 and 64, of the 7 reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N values checked, the difference between the minimum reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N value and the maximum reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.
- For each of the steps 63 and 85, of the 7 reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N value shall be no more than 5 for small MS, DCS 1 800 and PCS 1 900 (Class 1 and 2) MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS, DCS 1 800 and PCS 1 900 (Class 1 and 2) MS or 8 for other MS and other PCS 1 900 MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.
- For step 84, of the 7 reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.
- For step 105, of the reported RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

NOTE: It is not mandatory for the MS to report any of the BCCHs in step 105.

21.1.5.2 Relative accuracy at a single frequency (BCCH1)

For normal and each of the 4 extreme conditions tested the following applies:

For: $n \leq 21$ and $RXLEV_1 / RXLEV_{N_1} = 63$

$RXLEV_n / RXLEV_{N_1} - (63 - n + r)$ shall be between:

-2 and +2

NOTE 1: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an $RXLEV / RXLEV_N$ of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports $RXLEV / RXLEV_N$ of 63.

Otherwise:

$RXLEV_{(m*21+1)} / RXLEV_{N_{(m*21+1)}} - RXLEV_{(m*21+n)} / RXLEV_{N_{(m*21+n)}} - n + 1$ shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 2 to 75 for other MS and other PCS 1 900 MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800 class 3, PCS 1 900 (Class 1 and 2) and Small GSM MS; or

76 to 100 for other MS and other PCS 1 900 MS.

-4 and +2

for steps 97 to 105 for DCS 1 800 class 1/2 MS; or steps 99 to 105 for DCS 1 800 class 3, PCS 1 900 (Class 1 and 2) and Small GSM MS; or 101 to 105 for other MS and other PCS 1 900 MS.

where: $1 < n \leq 21$ and $0 \leq m \leq 4$ as identified in table 21-2, and r is the number of the last step where $RXLEV / RXLEV_N$ of 63 was reported.

NOTE 2: It is not mandatory for the MS to report BCCH1 for steps greater than 99 for GSM 400, GSM 700, GSM 850, T_GSM 810 or GSM 900 Small MS or 101 for other GSM and other PCS 1 900 MS or 97 for a DCS 1 800 Class 1 or Class 2 MS and 99 for DCS 1 800 Class 3 and PCS 1 900 (Class 1 and 2) MS. If the MS reports a level and the upper limit for this step in the above formula implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

21.1.5.3 Absolute accuracy

For each BCCH reported, $|RXLEV_{MS} + m \times 10 - 62| / |RXLEV_{N_{MS}} + m \times 10 - 62|$ shall be no more than:

- 4 for steps 64 and 85 under normal conditions.
- 6 for steps 64 and 85 under extreme conditions.
- 6 for steps 1, 22 and 43 under normal and extreme conditions.

where: $0 \leq m \leq 4$ as identified in table 21-2.

21.2 Signal strength selectivity

21.2.1 Definition

The signal strength selectivity is a measure of the ability of the signal strength measuring part of the MS to discriminate against RF power from adjacent ARFCN. The RXLEV selectivity figure corresponds to the amount by which the adjacent channel power shall be attenuated.

21.2.2 Conformance requirement

The selectivity of the received signal measurement shall be as follows:

- for adjacent (200 kHz) channel; ≥ 16 dB;
- for adjacent (400 kHz) channel; ≥ 48 dB;
- for adjacent (600 kHz) channel; ≥ 56 dB.

3GPP TS 05.08, subclause 8.1.2.

21.2.3 Test purpose

To verify that the MS meets the conformance requirement at the 200 kHz adjacent channel above and below the wanted.

21.2.4 Method of test

21.2.4.1 Initial conditions

For GSM 450:

For circuit switch capable devices, a call is set up according to the generic call set up procedure on ARFCN 269 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 281.

For GPRS only devices, the Ready Timer (T3314) is indicated as disabled in the GMM ATTACH ACCEPT message. A GPRS mode RLC unacknowledged mode downlink TBF is established on a single slot on ARFCN 269. Following TBF establishment, the SS transmits a PACKET MEASUREMENT ORDER message on downlink PACCH addressing the MS which sets the NETWORK_CONTROL_ORDER to '1' and indicates the value NC_REPORTING_PERIOD_T = 0.480ms. The PACKET MEASUREMENT ORDER does not modify the broadcast allocation list as indicated on the BCCH of the serving cell in which BCCH3 is indicated at ARFCN 281. Throughout the downlink TBF, the SS transmits two consecutive downlink RLC data blocks to the MS with the S/P bit set to '1' in the RLC/MAC header at least twice every 480ms. The PDTCH level is reported by the MS via the RXLEV_SERVING_CELL parameter and the neighbour cell BCCH levels are reported by the MS via the RXLEV_N parameters in the PACKET MEASUREMENT REPORT messages received on uplink PACCH.

The RF level of the TCH / PDTCH and BCCH3 is set to 20 dB above reference sensitivity level.

BCCH1 and 2 at ARFCN 270 and 280 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 480:

For circuit switch capable devices, a call is set up according to the generic call set up procedure on ARFCN 316 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 328.

For GPRS only devices, the Ready Timer (T3314) is indicated as disabled in the GMM ATTACH ACCEPT message. A GPRS mode RLC unacknowledged mode downlink TBF is established on a single slot on ARFCN 316. Following TBF establishment, the SS transmits a PACKET MEASUREMENT ORDER message on downlink PACCH addressing the MS which sets the NETWORK_CONTROL_ORDER to '1' and indicates the value NC_REPORTING_PERIOD_T = 0.480ms. The PACKET MEASUREMENT ORDER does not modify the broadcast allocation list as indicated on the BCCH of the serving cell in which BCCH3 is indicated at ARFCN 328. Throughout the downlink TBF, the SS transmits two consecutive downlink RLC data blocks to the MS with the S/P bit set to '1' in the RLC/MAC header at least twice every 480ms. The PDTCH level is reported by the MS via the RXLEV_SERVING_CELL parameter and the neighbour cell BCCH levels are reported by the MS via the RXLEV_N parameters in the PACKET MEASUREMENT REPORT messages received on uplink PACCH.

The RF level of the TCH / PDTCH and BCCH3 is set to 20 dB above reference sensitivity level.

BCCH1 and 2 at ARFCN 317 and 327 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 710, GSM 750, T-GSM 810:

For circuit switch capable devices, a call is set up according to the generic call set up procedure on ARFCN 450 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 485.

For GPRS only devices, the Ready Timer (T3314) is indicated as disabled in the GMM ATTACH ACCEPT message. A GPRS mode RLC unacknowledged mode downlink TBF is established on a single slot on ARFCN 450. Following TBF establishment, the SS transmits a PACKET MEASUREMENT ORDER message on downlink PACCH addressing the MS which sets the NETWORK_CONTROL_ORDER to '1' and indicates the value NC_REPORTING_PERIOD_T = 0.480ms. The PACKET MEASUREMENT ORDER does not modify the broadcast allocation list as indicated on the BCCH of the serving cell in which BCCH3 is indicated at ARFCN 485. Throughout the downlink TBF, the SS transmits two consecutive downlink RLC data blocks to the MS with the S/P bit set to '1' in the RLC/MAC header at least twice every 480ms. The PDTCH level is reported by the MS via the RXLEV_SERVING_CELL parameter and the neighbour cell BCCH levels are reported by the MS via the RXLEV_N parameters in the PACKET MEASUREMENT REPORT messages received on uplink PACCH.

The RF level of the TCH / PDTCH and BCCH3 is set to 20 dB above reference sensitivity level.

BCCH1 and 2 at ARFCN 451 and 484 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 850:

For circuit switch capable devices, a call is set up according to the generic call set up procedure on ARFCN 170 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 210.

For GPRS only devices, the Ready Timer (T3314) is indicated as disabled in the GMM ATTACH ACCEPT message. A GPRS mode RLC unacknowledged mode downlink TBF is established on a single slot on ARFCN 170. Following TBF establishment, the SS transmits a PACKET MEASUREMENT ORDER message on downlink PACCH addressing the MS which sets the NETWORK_CONTROL_ORDER to '1' and indicates the value NC_REPORTING_PERIOD_T = 0.480ms. The PACKET MEASUREMENT ORDER does not modify the broadcast allocation list as indicated on the BCCH of the serving cell in which BCCH3 is indicated at ARFCN 210. Throughout the downlink TBF, the SS transmits two consecutive downlink RLC data blocks to the MS with the S/P bit set to '1' in the RLC/MAC header at least twice every 480ms. The PDTCH level is reported by the MS via the RXLEV_SERVING_CELL parameter and the neighbour cell BCCH levels are reported by the MS via the RXLEV_N parameters in the PACKET MEASUREMENT REPORT messages received on uplink PACCH.

The RF level of the TCH/ PDTCH and BCCH3 is set to 20 dB above reference sensitivity level.

BCCH1 and 2 at ARFCN 171 and 209 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 900:

For circuit switch capable devices, a call is set up according to the generic call set up procedure on ARFCN 40 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 80.

For GPRS only devices, the Ready Timer (T3314) is indicated as disabled in the GMM ATTACH ACCEPT message. A GPRS mode RLC unacknowledged mode downlink TBF is established on a single slot on ARFCN 40. Following TBF establishment, the SS transmits a PACKET MEASUREMENT ORDER message on downlink PACCH addressing the MS which sets the NETWORK_CONTROL_ORDER to '1' and indicates the value NC_REPORTING_PERIOD_T = 0.480ms. The PACKET MEASUREMENT ORDER does not modify the broadcast allocation list as indicated on the BCCH of the serving cell in which BCCH3 is indicated at ARFCN 80. Throughout the downlink TBF, the SS transmits two consecutive downlink RLC data blocks to the MS with the S/P bit set to '1' in the RLC/MAC header at least twice every 480ms. The PDTCH level is reported by the MS via the RXLEV_SERVING_CELL parameter and the neighbour cell BCCH levels are reported by the MS via the RXLEV_N parameters in the PACKET MEASUREMENT REPORT messages received on uplink PACCH.

The RF level of the TCH/ PDTCH and BCCH3 is set to 20 dB above reference sensitivity level.

BCCH1 and 2 at ARFCN 41 and 79 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For DCS 1 800 and PCS 1 900:

For circuit switch capable devices, a call is set up according to the generic call set up procedure on ARFCN 690 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 790.

For GPRS only devices, the Ready Timer (T3314) is indicated as disabled in the GMM ATTACH ACCEPT message. A GPRS mode RLC unacknowledged mode downlink TBF is established on a single slot on ARFCN 690. Following TBF establishment, the SS transmits a PACKET MEASUREMENT ORDER message on downlink PACCH addressing the MS which sets the NETWORK_CONTROL_ORDER to '1' and indicates the value NC_REPORTING_PERIOD_T = 0.480ms. The PACKET MEASUREMENT ORDER does not modify the broadcast allocation list as indicated on the BCCH of the serving cell in which BCCH3 is indicated at ARFCN 790. Throughout the downlink TBF, the SS transmits two consecutive downlink RLC data blocks to the MS with the S/P bit set to '1' in the RLC/MAC header at least twice every 480ms. The PDTCH level is reported by the MS via the RXLEV_SERVING_CELL parameter and the

neighbour cell BCCH levels are reported by the MS via the RXLEV_N parameters in the PACKET MEASUREMENT REPORT messages received on uplink PACCH.

The RF level of the TCH/ PDTCH and BCCH3 is set to 20 dB above reference sensitivity level.

BCCH1 and 2 at ARFCN 691 and 789 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

Specific PICS statements:

- MS supporting packet switched services only (TSPC_operation_mode_C)

21.2.4.2 Procedure

- a) The SS records the RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N values reported for the TCH / PDTCH and BCCH3
- b) BCCH1 and 2 are set to 9 dB above the signal level of the TCH / PDTCH and BCCH3

NOTE: The first adjacent channel interference requirement limits the level of BCCHs 1 and 2 to 9 dB. This ensures that the MS can maintain the call, and read BCCH3.

- c) These conditions are kept for 30 s.

- d) The SS records the RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N values reported for the TCH / PDTCH and BCCH3.

21.2.5 Test requirements

The values of RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N recorded in step d) shall be no more than 1 above the values recorded in step a).

NOTE: This one change in the reported value of RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N is calculated as follows: The level of the first adjacent interfering signal is such that C/I is -9 dB. With an RXLEV selectivity for the first adjacent channel of 16 dB, the power from the adjacent channel is equal to -7 dB with respect to the power level of the useful signal. The increase in power therefore is equal to $10\log(1 + 10^{-0.7}) = 0,71$ dB. Thus, the value of RXLEV (or RXLEV_SERVING_CELL) / RXLEV_N could increase by 1.

21.3 Signal quality under static conditions

In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate have been increased. The following figures have been used (static propagation conditions):

| Specified error rate | Multiplication factor | min. Max-events |
|----------------------|-----------------------|-----------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.3.1 Signal quality under static conditions - TCH/FS no DTX

21.3.1.1 Definition

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. The error assessment is based on 104 TDMA frames: RXQUAL_FULL.

21.3.1.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.3.1.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given in as per the table in 3GPP TS 05.08, subclause 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.3.1.4 Method of test

21.3.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Full rate

The SS commands the MS to establish the TCH burst-by-burst loop (C), see subclause 36.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dB μ V_{emf}(-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

21.3.1.4.2 Procedure

- a) The SS sets the level of the unwanted signal at a value for which the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4 is covered by one of the cases 1 to 13 of table 21.3.1.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.3.1.5). The SS shall take 10 samples.
- c) If the previous RXQUAL_n \geq 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period ^{*2}
- d) The SS shall increase the level of the unwanted signal in small steps^{*1}, after each level change repeating steps (b) and (c) until case 14 is reached.

- e) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 0 is reached.
- f) Steps b) through e) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 3300 (minimum total events(200)/minimum test limit(0.061)).
- g) The SS removes the unwanted signal and releases the call.

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

*³NOTE: When testing RXQUAL_SUB , on a full rate speech channel, the MS has approximately twice as many bits as the SS to assess BER. The MS has both SID and SACCH bits, whereas the SS only has the looped back SID bits. Therefore it is only tested that the MS uses the correct frames for RXQUAL_SUB reporting by checking both RXQUAL_SUB and RXQUAL_FULL reports. No quantitative assessment is done.

Maximum Duration of Test

40 minutes.

21.3.1.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\frac{\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)}{\sum_{i=0..14} (\text{sample counter } i)}$$

A result of <1 is a pass, >=1 is a fail

Table 21.3.1.5: Test criteria and limits for RXQUAL_FULL errors for TCH/FS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit DTX Off (%) |
|----------|--|---------------------------|------------------------|
| 0 | <0.1 | 0 | 12.2 |
| 1 | >=0.1, <0.26 | 0, 1 | 30.5 |
| 2 | >=0.26, <0.3 | 1 | 30.5 |
| 3 | >=0.3, <0.51 | 1, 2 | 30.5 |
| 4 | >=0.51, <0.64 | 2 | 18.3 |
| 5 | >=0.64, <1.0 | 2,3 | 18.3 |
| 6 | >=1.0, <1.3 | 3 | 12.2 |
| 7 | >=1.3, <1.9 | 3, 4 | 12.2 |
| 8 | >=1.9, <2.7 | 4 | 12.2 |
| 9 | >=2.7, <3.8 | 4, 5 | 12.2 |
| 10 | >=3.8, <5.4 | 5 | 6.1 |
| 11 | >=5.4, <7.6 | 5, 6 | 6.1 |
| 12 | >=7.6, <11.0 | 6 | 6.1 |
| 13 | >=11.0, <15.0 | 6, 7 | 6.1 |
| 14 | >=15.0 | 7 | 6.1 |

21.3.2 Signal quality under static conditions - TCH/HS

21.3.2.1 Definition

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the half rate channel without downlink DTX, the error assessment is based on 52 TDMA frames: RXQUAL_FULL. In case downlink DTX is used, the assessment is based on 12 TDMA frames: RXQUAL_SUB.

21.3.2.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.3.2.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given as per the table in 3GPP TS 05.08, subclause 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.3.2.4 Method of test

21.3.2.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a half rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Half rate

The SS commands the MS to establish the TCH burst-by-burst loop (loop C), see subclause 36.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dB μ Vemf (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

The SS sets downlink DTX off.

21.3.2.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.3.2.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.3.2.5). The SS shall take 10 samples.
- c) If the previous RXQUAL_n >= 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period *²
- d) The SS shall increase the level of the unwanted signal in small steps*¹, after each level change repeating step (b) until case 14 is reached.
- e) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) until case 0 is reached.
- f) Steps d) and e) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 3300.
- g) The SS releases the call

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

Maximum Duration of Test

40 minutes.

21.3.2.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)$$

$$\sum_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, >=1 is a fail.

Table 21.3.2.5: Test criteria and limits for RXQUAL_FULL for TCH/AHS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit DTX Off (%) |
|----------|--|---------------------------|------------------------|
| 0 | <0.1 | 0 | 12.2 |
| 1 | >=0.1, <0.26 | 0, 1 | 46 |
| 2 | >=0.26, <0.3 | 1 | 46 |
| 3 | >=0.3, <0.51 | 1, 2 | 46 |
| 4 | >=0.51, <0.64 | 2 | 34.5 |
| 5 | >=0.64, <1.0 | 2,3 | 34.5 |
| 6 | >=1.0, <1.3 | 3 | 18.3 |
| 7 | >=1.3, <1.9 | 3, 4 | 18.3 |
| 8 | >=1.9, <2.7 | 4 | 18.3 |
| 9 | >=2.7, <3.8 | 4, 5 | 18.3 |
| 10 | >=3.8, <5.4 | 5 | 6.1 |
| 11 | >=5.4, <7.6 | 5, 6 | 6.1 |
| 12 | >=7.6, <11.0 | 6 | 6.1 |
| 13 | >=11.0, <15.0 | 6, 7 | 6.1 |
| 14 | >=15.0 | 7 | 6.1 |

21.3.3 Signal quality under static conditions - TCH/AFS – DTX off

21.3.3.1 Definition

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL.

21.3.3.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.3.3.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given by the table in 3GPP TS 05.08, subclause 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.3.3.4 Method of test

21.3.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the Mid ARFCN range, power control level set to maximum power. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Full rate

The multirate configuration indicates the use of the following set of codecs modes:

| Codec Mode | TCH/AFS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_4 | 12,2 |
| CODEC_MODE_3 | 7,95 |
| CODEC_MODE_2 | 5,9 |
| CODEC_MODE_1 | 4,75 |

The Initial Codec Mode shall be set to the lowest codec mode (CODEC_MODE_1).

The SS sends a CMC and CMI corresponding to the lowest codec mode (CODEC_MODE_1).

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The SS transmits the wanted signal (Standard Test Signal C1) on the traffic channel at the nominal frequency of the receiver and its level is nominally 28 dB μ Vemf (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.

21.3.3.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.3.3.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.3.3.5). The SS shall take 10 samples.
- c) When $\sum_{i=0..14}(\text{sample counter}(i)) = 800$ the CMI shall be changed to indicate CODEC_MODE_2, at 1600 CMI = CODEC_MODE_3, and at 2400 CMI = CODEC_MODE_4.
- d) If the previous RXQUAL_n ≥ 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period *²
- e) The SS shall increase the level of the unwanted signal in small steps*¹, after each level change repeating steps (b) and (c) until case 14 is reached.
- f) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 0 is reached.
- g) Steps d) and e) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 3300.
- h) The SS releases the call

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

Maximum Duration of Test

40 minutes.

21.3.3.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)$$

$$\sum_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, >=1 is a fail.

Table 21.3.3.5: Test criteria and limits for RXQUAL_FULL for TCH/AFS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit DTX Off (%) |
|----------|--|---------------------------|------------------------|
| 0 | <0.1 | 0 | 12.2 |
| 1 | >=0.1, <0.26 | 0, 1 | 30.5 |

| 14 | >=15.0 | 7 | 6.1 |

21.3.4 Signal quality under static conditions - TCH/AHS - DTX Off

21.3.4.1 Definition

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the half rate channel without downlink DTX, the error assessment is based on 52 TDMA frames: RXQUAL_FULL.

21.3.4.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.3.4.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The

probability that the correct RXQUAL band is reported shall meet the values given by the table in 3GPP TS 05.08, subclause 8.2.4.

2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.3.4.4 Method of test

21.3.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the Mid ARFCN range, power control level set to maximum power. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Half rate

The multirate configuration indicates the use of the following set of codecs modes:

| Codec Mode | TCH/AHS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_3 | 7.95 |
| CODEC_MODE_2 | 6.7 |
| CODEC_MODE_1 | 4,75 |

The Initial Codec mode (ICM) shall be set to the lowest codec mode (CODEC_MODE_1).

The SS continuously sends a CMC corresponding to the lowest codec mode (CODEC_MODE_1).

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The SS transmits the wanted signal (Standard Test Signal C1 on the traffic channel using the Initial Codec Mode (ICM) at the nominal frequency of the receiver and its level is 28 dB μ Vemf (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.

The SS sets downlink DTX off.

21.3.4.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.3.4.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.3.4.5). The SS shall take 10 samples.
- c) When $\sum_{i=0..14}(\text{sample counter}(i)) = 1100$ the CMI shall be changed to indicate CODEC_MODE_2, at 2200 CMI = CODEC_MODE_3.
- d) If the previous $\text{RXQUAL}_n \geq 6$ the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period *²
- e) The SS shall increase the level of the unwanted signal in small steps*¹, after each level change repeating steps (b) and (c) until case 14 is reached.

- f) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 0 is reached.
- g) Steps d) and e) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 3300.
- h) The SS releases the call

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

Maximum Duration of Test

40 minutes.

21.3.4.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\frac{\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)}{\sum_{i=0..14} (\text{sample counter } i)}$$

A result of <1 is a pass, >=1 is a fail.

Table 21.3.4.5: Test criteria and limits for RXQUAL_FULL for TCH/AHS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit DTX Off (%) |
|----------|--|---------------------------|------------------------|
| 0 | <0.1 | 0 | 12.2 |
| 1 | >=0.1, <0.26 | 0, 1 | 46 |
| 2 | >=0.26, <0.3 | 1 | 46 |
| 3 | >=0.3, <0.51 | 1, 2 | 46 |

| 5 | >=0.64, <1.0 | 2,3 | 34.5 |
| 6 | >=1.0, <1.3 | 3 | 18.3 |
| 7 | >=1.3, <1.9 | 3, 4 | 18.3 |
| 8 | >=1.9, <2.7 | 4 | 18.3 |
| 9 | >=2.7, <3.8 | 4, 5 | 18.3 |
| 10 | >=3.8, <5.4 | 5 | 6.1 |
| 11 | >=5.4, <7.6 | 5, 6 | 6.1 |
| 12 | >=7.6, <11.0 | 6 | 6.1 |
| 13 | >=11.0, <15.0 | 6, 7 | 6.1 |
| 14 | >=15.0 | 7 | 6.1 |

21.3.5 Signal quality under static conditions - TCH/AFS – DTX on

21.3.5.1 Definition

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. In case downlink DTX is used, the assessment is based on a subset of TDMA frames containing SID_UPDATE frames and SACCH frames: RXQUAL_SUB. On TCH/AFS and TCH/AHS, there is no fixed subset of TDMA frames that will always be transmitted during DTX, however a SID_UPDATE will be

transmitted every 8 speech frames. A detection algorithm is required in the receiver which informs about whether a SID_UPDATE (see 3GPP TS 05.03 and 3GPP TS 06.93) frame was transmitted (and thus can be used for quality and signal level estimation) or not.

21.3.5.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.3.5.3 Test purpose

1. To verify that, for downlink DTX, the reported parameter RXQUAL_SUB is the received signal quality, averaged over the correct frames (SID_UPDATE and SACCH), mapped by the MS to the eight levels RXQUAL scale in a manner that can be related to an equivalent average BER before channel decoding assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given by the table in 3GPP TS 05.08, subclause 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.3.5.4 Method of test

21.3.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the Mid ARFCN range, power control level set to maximum power. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Full rate

The multirate configuration indicates the use of the following set of codecs modes:

| Codec Mode | TCH/AFS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_4 | 12,2 |
| CODEC_MODE_3 | 7,95 |
| CODEC_MODE_2 | 5,9 |
| CODEC_MODE_1 | 4,75 |

The Initial Codec Mode shall be arbitrarily set to one of the codec modes of the codec set. *³

The SS sends a CMC and CMI corresponding to the initial codec mode selection.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The SS transmits the wanted signal (Standard Test Signal C1) on the traffic channel at the nominal frequency of the receiver and its level is nominally 28 dB μ V_{emf} (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.

The SS sets downlink DTX on.

21.3.5.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.3.5.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.3.5.5). The SS shall take 10 samples.
- c) If the previous RXQUAL_n \geq 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period ^{*2}
- d) The SS shall increase the level of the unwanted signal in small steps^{*1}, after each level change repeating step (b) and (c) until case 14 is reached.
- e) The SS shall decrease the level of the unwanted signal in small steps^{*1}, after each level change repeating step (b) and (c) until case 0 is reached.
- f) Steps c) and d) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 1100.
- g) The SS releases the call

^{*1} NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

^{*2} NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

^{*3} NOTE: Using varying codec modes does not improve the test depth because the channel coding of the SID_UPDATE frames are identical for all codec modes. (TS 3GPP 45.003).

Maximum Duration of Test

15 minutes.

21.3.5.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)$$

$$\sum_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, \geq 1 is a fail.

Table 21.3.5.5: Test criteria and limits for RXQUAL_SUB for TCH/AFS

| Case (i) | BER measured by SS (12 of 16 bursts) (%) | Assumed BER estimated by MS (16 of 16 bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit (%) |
|----------|--|---|---------------------------|----------------|
| 0 | <0.05 | <0.11 | 0, | 40.25 |

21.3.6 Signal quality under static conditions - TCH/AHS – DTX On

21.3.6.1 Definition

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. In case downlink DTX is used, the assessment is based on a subset of TDMA frames containing SID_UPDATE frames and SACCH frames: RXQUAL_SUB. On TCH/AHS, there is no fixed subset of TDMA frames that will always be transmitted during DTX, however a SID_UPDATE will be transmitted every 8 speech frames. A detection algorithm is required in the receiver that informs about whether a SID_UPDATE (see 3GPP TS 05.03 and 3GPP TS 06.93) frame was transmitted (and thus can be used for quality and signal level estimation) or not.

21.3.6.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.3.6.3 Test purpose

1. To verify that, for downlink DTX, the reported parameter RXQUAL_SUB is the received signal quality, averaged over the correct frames (SID_UPDATE and SACCH), mapped by the MS to the eight levels RXQUAL scale in a manner that can be related to an equivalent average BER before channel decoding assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given by the table in 3GPP TS 05.08, subclause 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality averaged over the reporting period of length one SACCH multiframe.

21.3.6.4 Method of test

21.3.6.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the Mid ARFCN range, power control level set to maximum power. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Half rate

The multirate configuration indicates the use of the following set of codecs modes:

| Codec Mode | TCH/AHS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_3 | 7.95 |
| CODEC_MODE_2 | 6.7 |
| CODEC_MODE_1 | 4,75 |

The Initial Codec Mode shall be arbitrarily set to one of the codec modes of the codec set. *³

The SS sends a CMC and CMI corresponding to the initial codec mode selection.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The SS transmits the wanted signal (Standard Test Signal C1) on the traffic channel at the nominal frequency of the receiver and its level is nominally 28 dB μ V_{emf} (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.

The SS sets downlink DTX on.

21.3.6.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.3.6.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.3.6.5). The SS shall take 10 samples.
- c) If the previous RXQUAL_n \geq 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period *²
- d) The SS shall increase the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 14 is reached.
- e) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 0 is reached.
- f) Steps c) and d) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 1200.
- g) The SS releases the call

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

*³ NOTE: Using varying codec modes does not improve the test depth because the channel coding of the SID_UPDATE frames are identical for all codec modes. (TS 3GPP 45.003).

Maximum Duration of Test

17 minutes.

21.3.6.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)$$

$$\sum_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, >=1 is a fail.

Table 21.3.6.5: Test criteria and limits for RXQUAL_SUB for TCH/AHS

| Case (i) | BER measured by SS (12 of 16 bursts) (%) | Assumed BER estimated by MS (16 of 16 bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit (%) |
|----------|--|---|---------------------------|----------------|
| 0 | <0.05 | <0.11 | 0, | 40.25 |
| 1 | >=0.05, <0.2 | >=0.055, <0.256 | 0, 1 | 71.5 |
| 2 | >=0.2, <0.4 | >=0.164, <0.475 | 0, 1, 2 | 71.5 |
| 3 | >=0.4, <0.5 | >=0.329, <0.548 | 1, 2 | 71.5 |
| 4 | >=0.5, <0.8 | >=0.384, <0.914 | 1, 2, 3 | 71.5 |
| 5 | >=0.8, <0.9 | >=0.603, <1.096 | 2, 3 | 60.5 |
| 6 | >=0.9, <1.5 | >=0.713, <1.827 | 2, 3, 4 | 60.5 |

| 12 | >=7.3, <12.1 | >=5.482, <15.077 | 5, 6, 7 | 34.5 |
| 13 | >=12.1, <24.15 | >=9.101, <30.154 | 6, 7 | 24.4 |
| 14 | >=24.15 | >=18.147 | 7 | 18.3 |

21.4 Signal quality under TUhigh propagation conditions

In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate have been increased. The following figures have been used (TUHigh propagation conditions):

| Specified error rate | Multiplication factor | min. Max-events |
|----------------------|-----------------------|-----------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.4.1 Signal quality under TUhigh propagation conditions - TCH/FS

21.4.1.1 Definition

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL.

21.4.1.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of 1 SACCH multiframe. The assessed equivalent BER before channel decoding shall be mapped to the eight levels of RXQUAL using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08 subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe.

3GPP TS 05.08, subclause 8.2.3.

21.4.1.3 Test purpose

1. To verify, under TUhigh conditions, that the received signal quality is measured and reported to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of length one SACCH multiframe for the TCH/FS. The probability that the correct RXQUAL band is reported shall meet the values given as per the table in 3GPP TS 05.08 subclause 8.2.
2. To verify that the reported parameters (RXQUAL) is the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.4.1.4 Method of test

21.4.1.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Full rate

The SS commands the MS to establish the TCH burst-by-burst loop (C), see subclause 36.

The SS produces the standard test signal C1, with TUhigh propagation profile. It shall be at the nominal frequency of the receiver at a level of 28 dB μ Vemf (-85 dBm).

The SS also generates an independent, uncorrelated interfering (unwanted) signal with TUhigh propagation profile. The unwanted signal is the standard test signal I1, on the same timeslot and same ARFCN of the wanted signal.

21.4.1.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.4.1.5.

- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.4.1.5). The SS shall take 10 samples.
- c) If the previous RXQUAL_n >= 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period *²
- d) The SS shall increase the level of the unwanted signal in small steps*¹, after each level change repeating steps (b) and (c) until case 14 is reached.
- e) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 0 is reached.
- f) Steps b) through e) should be repeated until the total number of samples, sum_{i=0..14}(sample counter(i)) is a minimum of 1650 (minimum total events(200)/minimum test limit(0.122)).
- g) The SS removes the unwanted signal and releases the call.

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

Maximum Duration of Test

14 minutes.

21.4.1.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)$$

$$\sum_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, >=1 is a fail.

Table 21.4.1.5: Test criteria and limits for RXQUAL FULL errors for TCH/FS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit |
|----------|--|---------------------------|------------|
| 0 | <0.1 | 0, 1 | 18.3 |
| 1 | >=0.1, <0.26 | 0, 1, 2 | 18.3 |
| 2 | >=0.26, <0.3 | 0, 1, 2 | 18.3 |
| 3 | >=0.3, <0.51 | 0, 1, 2, 3 | 18.3 |
| 4 | >=0.51, <0.64 | 1, 2, 3 | 18.3 |
| 5 | >=0.64, <1.0 | 1, 2, 3, 4 | 30.5 |
| 6 | >=1.0, <1.3 | 2, 3, 4 | 30.5 |
| 7 | >=1.3, <1.9 | 2, 3, 4, 5 | 30.5 |
| 8 | >=1.9, <2.7 | 3, 4, 5 | 30.5 |
| 9 | >=2.7, <3.8 | 3, 4, 5, 6 | 30.5 |
| 10 | >=3.8, <5.4 | 4, 5, 6 | 12.2 |
| 11 | >=5.4, <7.6 | 4, 5, 6, 7 | 12.2 |
| 12 | >=7.6, <11.0 | 5, 6, 7 | 12.2 |
| 13 | >=11.0, <15.0 | 5, 6, 7 | 12.2 |
| 14 | >=15.0 | 6, 7 | 12.2 |

21.4.2 Signal quality under TUhigh propagation conditions - TCH/AFS

21.4.2.1 Definition

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL.

21.4.2.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of 1 SACCH multiframe. The assessed equivalent BER before channel decoding shall be mapped to the eight levels of RXQUAL using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08 subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.4.2.3 Test purpose

1. To verify, under TUhigh conditions, that the received signal quality is measured and reported to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of length one SACCH multiframe for the TCH/AFS. The probability that the correct RXQUAL band is reported shall meet the values given by the table in 3GPP TS 05.08 subclause 8.2.
2. To verify that the reported parameters (RXQUAL) is the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.4.2.4 Method of test

21.4.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the Mid ARFCN range, power control level set to maximum power. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Full rate

The multirate configuration indicates the use of the following set of codecs modes:

| Codec Mode | TCH/AFS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_4 | 12,2 |
| CODEC_MODE_3 | 7,95 |
| CODEC_MODE_2 | 5,9 |
| CODEC_MODE_1 | 4,75 |

The Initial Codec Mode shall be set to the lowest codec mode (CODEC_MODE_1).

The SS sends a CMC and CMI corresponding to the lowest codec mode (CODEC_MODE_1).

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with TUhigh propagation characteristics. The SS transmits the wanted signal (Standard Test Signal C1) on the traffic channel, with

TUhigh propagation profile, at the nominal frequency of the receiver at a level of 28 dB μ V_{emf} (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot and on same ARFCN of the wanted signal.

The SS commands the MS to establish the TCH burst-by-burst loop (C), see subclause 36.

21.4.2.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.4.2.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.4.2.5). The SS shall take 10 samples.
- c) When $\sum_{i=0..14}(\text{sample counter}(i)) = 400$ the CMI shall be changed to indicate CODEC_MODE_2, at 800 CMI = CODEC_MODE_3, and at 1200 CMI = CODEC_MODE_4.
- d) If the previous RXQUAL_n ≥ 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period ^{*2}
- e) The SS shall increase the level of the unwanted signal in small steps^{*1}, after each level change repeating steps (b) and (c) until case 14 is reached.
- f) The SS shall decrease the level of the unwanted signal in small steps^{*1}, after each level change repeating step (b) and (c) until case 0 is reached.
- g) Steps d) and e) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 1650.
- h) The SS releases the call.

^{*1} NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

^{*2} NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

Maximum Duration of Test

14 minutes.

21.4.2.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)$$

$$\sum_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, ≥ 1 is a fail.

Table 21.4.2.5: Test criteria and limits for RXQUAL FULL errors for TCH/AFS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit |
|----------|--|---------------------------|------------|
| 0 | <0.1 | 0, 1 | 18.3 |
| 1 | >=0.1, <0.26 | 0, 1, 2 | 18.3 |
| 2 | >=0.26, <0.3 | 0, 1, 2 | 18.3 |
| 3 | >=0.3, <0.51 | 0, 1, 2, 3 | 18.3 |
| 4 | >=0.51, <0.64 | 1, 2, 3 | 18.3 |
| 5 | >=0.64, <1.0 | 1, 2, 3, 4 | 30.5 |
| 6 | >=1.0, <1.3 | 2, 3, 4 | 30.5 |
| 7 | >=1.3, <1.9 | 2, 3, 4, 5 | 30.5 |
| 8 | >=1.9, <2.7 | 3, 4, 5 | 30.5 |
| 9 | >=2.7, <3.8 | 3, 4, 5, 6 | 30.5 |
| 10 | >=3.8, <5.4 | 4, 5, 6 | 12.2 |
| 11 | >=5.4, <7.6 | 4, 5, 6, 7 | 12.2 |
| 12 | >=7.6, <11.0 | 5, 6, 7 | 12.2 |
| 13 | >=11.0, <15.0 | 5, 6, 7 | 12.2 |
| 14 | >=15.0 | 6, 7 | 12.2 |

21.4.3 Signal quality under TUhigh propagation conditions - TCH/AHS

21.4.3.1 Definition

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the half rate channel without downlink DTX, the error assessment is based on 52 TDMA frames: RXQUAL_FULL.

21.4.3.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of 1 SACCH multiframe. The assessed equivalent BER before channel decoding shall be mapped to the eight levels of RXQUAL using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08 subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

21.4.3.3 Test purpose

1. To verify, under TUhigh conditions, that the received signal quality is measured and reported to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of length one SACCH multiframe for the TCH/AHS. The probability that the correct RXQUAL band is reported shall meet the values given by the table in 3GPP TS 05.08 subclause 8.2.
2. To verify that the reported parameters (RXQUAL) is the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.4.3.4 Method of test

21.4.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with in the Mid ARFCN range, power control level set to maximum power. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Half rate

The multirate configuration indicates the use of the following set of codecs modes:

| Codec Mode | TCH/AHS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_3 | 7.95 |
| CODEC_MODE_2 | 6.7 |
| CODEC_MODE_1 | 4,75 |

The Initial Codec mode (ICM) shall be set to the lowest codec mode (CODEC_MODE_1).

The SS sends a CMC and CMI corresponding to the lowest codec mode (CODEC_MODE_1).

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with TUhigh propagation characteristics. The SS transmits the wanted signal (Standard Test Signal C1) on the traffic channel, with TUhigh propagation profile, at the nominal frequency of the receiver at a level of 28 dBμVemf (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot and on same ARFCN of the wanted signal.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.

21.4.3.4.2 Procedure

- a) The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.4.3.5.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where (i) corresponds to the case determined by the BER of the looped back bursts (table 21.4.3.5). The SS shall take 10 samples.

When $\sum_{i=0..14}(\text{sample counter}(i)) = 550$ the CMI shall be changed to indicate CODEC_MODE_2, and at 1100 CMI = CODEC_MODE_3.

- c) If the previous $\text{RXQUAL}_n \geq 6$ the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period *²
- d) The SS shall increase the level of the unwanted signal in small steps*¹, after each level change repeating steps (b) and (c) until case 14 is reached.
- e) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 0 is reached.
- f) Steps d) and e) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 1650.
- g) The SS releases the call.

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

Maximum Duration of Test

14 minutes.

21.4.3.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\frac{\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)}{\sum_{i=0..14} (\text{sample counter } i)}$$

$$\text{sum}_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, >=1 is a fail.

Table 21.4.3.5: Test criteria and limits for RXQUAL_FULL for TCH/AFS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL_) | Test limit DTX Off (%) |
|----------|--|---------------------------|------------------------|
| 0 | <0.1 | 0, 1 | 18.3 |
| 1 | >=0.1, <0.26 | 0, 1, 2 | 18.3 |
| 2 | >=0.26, <0.3 | 0, 1, 2 | 18.3 |
| 3 | >=0.3, <0.51 | 0, 1, 2, 3 | 18.3 |
| 4 | >=0.51, <0.64 | 1, 2, 3 | 18.3 |
| 5 | >=0.64, <1.0 | 1, 2, 3, 4 | 30.5 |
| 6 | >=1.0, <1.3 | 2, 3, 4 | 30.5 |
| 7 | >=1.3, <1.9 | 2, 3, 4, 5 | 30.5 |
| 8 | >=1.9, <2.7 | 3, 4, 5 | 30.5 |
| 9 | >=2.7, <3.8 | 3, 4, 5, 6 | 30.5 |
| 10 | >=3.8, <5.4 | 4, 5, 6 | 12.2 |
| 11 | >=5.4, <7.6 | 4, 5, 6, 7 | 12.2 |
| 12 | >=7.6, <11.0 | 5, 6, 7 | 12.2 |
| 13 | >=11.0, <15.0 | 5, 6, 7 | 12.2 |
| 14 | >=15.0 | 6, 7 | 12.2 |

21.4.4 Signal quality under TU High propagation conditions - O-TCH/WFS

21.4.4.1 Definition

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL.

21.4.4.2 Conformance requirement

1. The received signal quality shall be measured by the MS and BSS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of 1 SACCH block; 3GPP TS 05.08 subclauses 8.2.2.

When the quality is assessed over the full-set and sub-set of frames defined in subclause 8.4, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as follows:

| | | | |
|----------|-------|---------------|------------------------|
| RXQUAL_0 | | BER < 0,2 % | Assumed value = 0,14 % |
| RXQUAL_1 | 0,2 % | < BER < 0,4 % | Assumed value = 0,28 % |
| RXQUAL_2 | 0,4 % | < BER < 0,8 % | Assumed value = 0,57 % |
| RXQUAL_3 | 0,8 % | < BER < 1,6 % | Assumed value = 1,13 % |
| RXQUAL_4 | 1,6 % | < BER < 3,2 % | Assumed value = 2,26 % |
| RXQUAL_5 | 3,2 % | < BER < 6,4 % | Assumed value = 4,53 % |

| | | | | |
|----------|--------|-------|----------|-------------------------|
| RXQUAL_6 | 6,4 % | < BER | < 12,8 % | Assumed value = 9,05 % |
| RXQUAL_7 | 12,8 % | < BER | | Assumed value = 18,10 % |

3GPP 05.08, subclause 8.2.4

- For each channel, the measured parameters (RXQUAL) shall be the received signal quality, averaged on that channel over the reporting period of length one SACCH multiframe defined in subclause 8.4. In averaging, measurements made during previous reporting periods shall always be discarded; 3GPP TS 05.08, subclause 8.2.3.

21.4.4.3 Test purpose

- To verify, under TUhigh conditions, that the received signal quality is measured and reported to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of length one SACCH multiframe for the O-TCH/WFS. The probability that the correct RXQUAL band is reported shall meet the values given by the table in 3GPP TS 05.08 subclause 8.2.
- To verify that the reported parameters (RXQUAL) is the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.4.4.4 Method of test

21.4.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a O-TCH/WFS with an ARFCN in the Mid ARFCN range, power control level set to maximum power. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

Specific PICS Statements:

-

PIXIT Statements:

- Loop C delay Full rate

The multirate configuration indicates the use of the following set of codecs modes:

| Codec Mode | O-TCH/WFS in kbit/s |
|--------------|---------------------|
| CODEC_MODE_4 | 23,85 |
| CODEC_MODE_3 | 12,65 |
| CODEC_MODE_2 | 8,85 |
| CODEC_MODE_1 | 6,60 |

The Initial Codec Mode shall be set to the lowest codec mode (CODEC_MODE_1).

The SS sends a CMC and CMI corresponding to the lowest codec mode (CODEC_MODE_1).

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with TUhigh propagation characteristics. The SS transmits the wanted signal (Standard Test Signal C1) on the traffic channel, with TUhigh propagation profile, at the nominal frequency of the receiver at a level of 28 dB \square Vemf (-85 dBm). The unwanted signal is the standard test signal I1, on the same timeslot and on same ARFCN of the wanted signal.

The SS commands the MS to establish the TCH burst-by-burst loop (C), see subclause 36.

21.4.4.4.2 Procedure

- The SS sets the level of the unwanted signal such that the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is covered by one of the cases 1 to 13 of table 21.4.4.5.

- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases a sample counter(i), and then an event counter(i) for each incorrect MS reported RXQUAL level, where i corresponds to the case determined by the BER of the looped back bursts (table 21.4.4.5). The SS shall take 10 samples.
- c) When $\sum_{i=0..14}(\text{sample counter}(i)) = 400$ the CMI shall be changed to indicate CODEC_MODE_2, at 800 CMI = CODEC_MODE_3, and at 1200 CMI = CODEC_MODE_4.
- d) If the previous RXQUAL_n ≥ 6 the SS shall set the unwanted signal to a level that ensures SACCH bursts will be successfully received by the MS. The SS shall wait 7 SACCH multiframe periods. The SS shall reapply the unwanted signal, then wait 1 SACCH multiframe period *²
- e) The SS shall increase the level of the unwanted signal in small steps*¹, after each level change repeating steps (b) and (c) until case 14 is reached.
- f) The SS shall decrease the level of the unwanted signal in small steps*¹, after each level change repeating step (b) and (c) until case 0 is reached.
- g) Steps d) and e) should be repeated until the total number of samples, $\sum_{i=0..14}(\text{sample counter}(i))$ is a minimum of 1650.
- h) The SS releases the call.

*¹ NOTE: It is intended that the small steps are ~0.2dB, however the accuracy and linearity of these steps is inconsequential to the outcome of the test. It is intended that the test will be performed over a range of C/I which are representative of the normal operational range of the MS.

*² NOTE: This special case for poor RF conditions is intended to ensure that the RADIO_LINK_TIMEOUT does not expire. The values have been selected to guarantee a net SACCH/T FER less than 62% (effective limit before failure ~67%).

Maximum Duration of Test

14 minutes.

21.4.4.5 Test requirements

The sets of test results for sample counter (i) and event counter (i) should be combined as follows.

$$\sum_{i=0..14} ((\text{event counter } i * 100) / \text{test limit } i)$$

$$\sum_{i=0..14} (\text{sample counter } i)$$

A result of <1 is a pass, ≥ 1 is a fail.

Table 21.4.4.5: Test criteria and limits for RXQUAL FULL errors for O-TCH/WFS

| Case (i) | BER estimated by MS/SS (all applicable bursts) (%) | Expected RXQUAL (RXQUAL _l) | Test limit |
|----------|--|--|------------|
| 0 | <0.1 | 0, 1 | 18.3 |
| 1 | >=0.1, <0.26 | 0, 1, 2 | 18.3 |
| 2 | >=0.26, <0.3 | 0, 1, 2 | 18.3 |
| 3 | >=0.3, <0.51 | 0, 1, 2, 3 | 18.3 |
| 4 | >=0.51, <0.64 | 1, 2, 3 | 18.3 |
| 5 | >=0.64, <1.0 | 1, 2, 3, 4 | 30.5 |
| 6 | >=1.0, <1.3 | 2, 3, 4 | 30.5 |
| 7 | >=1.3, <1.9 | 2, 3, 4, 5 | 30.5 |
| 8 | >=1.9, <2.7 | 3, 4, 5 | 30.5 |
| 9 | >=2.7, <3.8 | 3, 4, 5, 6 | 30.5 |
| 10 | >=3.8, <5.4 | 4, 5, 6 | 12.2 |
| 11 | >=5.4, <7.6 | 4, 5, 6, 7 | 12.2 |
| 12 | >=7.6, <11.0 | 5, 6, 7 | 12.2 |
| 13 | >=11.0, <15.0 | 5, 6, 7 | 12.2 |
| 14 | >=15.0 | 6, 7 | 12.2 |

21.8 GMSK_MEAN_BEP Measurement for PDTCH

In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate have been increased. The following figures have been used (static propagation conditions):

| Specified error rate | Multiplication factor | Min. error events |
|----------------------|-----------------------|-------------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.8.1 Definition

The MS must be capable of measuring the MEAN_BEP parameters under static channel conditions, which is specified in terms of bit error probability (BEP) before channel decoding averaged over the four bursts in a radio block and then filtered for the measurement report. The MS has to map this filtered BEP into MEAN_BEP values in the table “MEAN_BEP mapping and accuracy for GMSK” in subclause 8.2.5 of 3GPP TS 45.008. The accuracy requirements in this table apply for static channel conditions for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS.

21.8.2 Conformance requirement

The mapping of the MEAN_BEP to the equivalent BEP and the accuracies to which an MS shall be capable of estimating the quality parameters under static channel conditions are given for EGPRS GMSK in table 21.8-1. The accuracy requirements below apply for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS, assuming no changes in transmitted downlink power. For EGPRS, filtering according to 3GPP TS 45.008 subclause 10.2.3.2.1 with forgetting factor of 0.03 is assumed.

Table 21.8-1: MEAN_BEP mapping and accuracy for EGPRS GMSK

| MEAN_BEP | Range of log ₁₀ (actual BEP) | Expected MEAN_BEP interval | Probability that the expected MEAN_BEP is reported shall not be lower than: |
|-------------|---|-----------------------------------|---|
| MEAN_BEP_0 | > -0.60 | MEAN_BEP_0/1 | 80 % |
| MEAN_BEP_1 | -0.70 -- -0.60 | MEAN_BEP_1/0/2 | 80 % |
| MEAN_BEP_2 | -0.80 -- -0.70 | MEAN_BEP_2/1/3 | 75 % |
| MEAN_BEP_3 | -0.90 -- -0.80 | MEAN_BEP_3/2/4 | 75 % |
| MEAN_BEP_4 | -1.00 -- -0.90 | MEAN_BEP_4/3/5 | 75 % |
| MEAN_BEP_5 | -1.10 -- -1.00 | MEAN_BEP_5/4/6 | 75 % |
| MEAN_BEP_6 | -1.20 -- -1.10 | MEAN_BEP_6/5/7 | 75 % |
| MEAN_BEP_7 | -1.30 -- -1.20 | MEAN_BEP_7/6/8 | 75 % |
| MEAN_BEP_8 | -1.40 -- -1.30 | MEAN_BEP_8/7/9 | 75 % |
| MEAN_BEP_9 | -1.50 -- -1.40 | MEAN_BEP_9/8/10 | 75 % |
| MEAN_BEP_10 | -1.60 -- -1.50 | MEAN_BEP_10/9/11 | 70 % |
| MEAN_BEP_11 | -1.70 -- -1.60 | MEAN_BEP_11/10/12 | 70 % |
| MEAN_BEP_12 | -1.80 -- -1.70 | MEAN_BEP_12/11/13 | 70 % |
| MEAN_BEP_13 | -1.90 -- -1.80 | MEAN_BEP_13/12/14 | 70 % |
| MEAN_BEP_14 | -2.00 -- -1.90 | MEAN_BEP_14/13/15 | 70 % |
| MEAN_BEP_15 | -2.10 -- -2.00 | MEAN_BEP_15/13/14/16/17 | 80 % |
| MEAN_BEP_16 | -2.20 -- -2.10 | MEAN_BEP_16/14/15/17/18 | 80 % |
| MEAN_BEP_17 | -2.30 -- -2.20 | MEAN_BEP_17/15/16/18/19 | 80 % |
| MEAN_BEP_18 | -2.40 -- -2.30 | MEAN_BEP_18/16/17/19/20 | 80 % |
| MEAN_BEP_19 | -2.50 -- -2.40 | MEAN_BEP_19/17/18/20/21 | 80 % |
| MEAN_BEP_20 | -2.60 -- -2.50 | MEAN_BEP_20/18/19/21/22 | 80 % |
| MEAN_BEP_21 | -2.70 -- -2.60 | MEAN_BEP_21/19/20/22/23 | 80 % |
| MEAN_BEP_22 | -2.80 -- -2.70 | MEAN_BEP_22/20/21/23/24 | 80 % |
| MEAN_BEP_23 | -2.90 -- -2.80 | MEAN_BEP_23/21/22/24/25 | 80 % |
| MEAN_BEP_24 | -3.00 -- -2.90 | MEAN_BEP_24/22/23/25/26 | 80 % |
| MEAN_BEP_25 | -3.10 -- -3.00 | MEAN_BEP_25/22/23/24/26/27/ 28 | 75 % |
| MEAN_BEP_26 | -3.20 -- -3.10 | MEAN_BEP_26/23/24/25/27/28/ 29 | 75 % |
| MEAN_BEP_27 | -3.30 -- -3.20 | MEAN_BEP_27/24/25/26/28/29/ 30 | 75 % |
| MEAN_BEP_28 | -3.40 -- -3.30 | MEAN_BEP_28/25/26/27/29/30/ 31 | 75 % |
| MEAN_BEP_29 | -3.50 -- -3.40 | MEAN_BEP_29/26/27/28/30/31 | 90 % |
| MEAN_BEP_30 | -3.60 -- -3.50 | MEAN_BEP_30/27/28/29/31 | 90 % |
| MEAN_BEP_31 | < -3.60 | MEAN_BEP_31/28/29/30 | 90 % |

Reference: 3GPP TS 45.008 subclause 8.2.5.

21.8.3 Test purpose

To verify for EGPRS, under static channel conditions, that the BEP is measured and mapped to the MEAN_BEP values defined in subclause 8.2.5 of 3GPP TS 45.008 by the MS in a manner that can be related to an equivalent average BEP before channel decoding. The probability that the correct MEAN_BEP value is reported shall meet the values in the table “MEAN_BEP mapping and accuracy for GMSK” in subclause 8.2.5 of 3GPP TS 45.008.

21.8.4 Method of test

The SS compares the long-term BER average calculated by counting bit errors determined in EGPRS loop-back mode to a set of related MEAN_BEP values.

The MEAN_BEP values correspond to the same MS-received bits that are looped-back for calculation of the long-term BER average (one-phase approach). For acquiring these MEAN_BEP values, the SS periodically opens the test loop for a short period of time to poll the MS for a measurement report.

The testing of BEP accuracy is performed at 3 sample points inside the ranges given in table 21.8-2.

Table 21.8-2: MEAN_BEP GMSK test intervals

| Interval | Range of log ₁₀ (actual BEP) | Range of actual BEP [%] | Range of expected MEAN_BEP |
|----------|---|-------------------------|----------------------------|
| High | < -3.6 | < 0.025 | 31 |
| Mid | -2.7 ... -2.1 | 0.2 ... 0.79 | 16 ... 21 |
| Low | -2.0 ... -1.5 | 1.0 ... 3.16 | 10 ... 14 |

NOTE 1: At the beginning of the test procedure, the forgetting factor “e” is set to 0.03. It is not changed any more since the SS does not know if signalling messages are correctly received unless the MS misses the commands to open or close the loop which the SS can easily detect and which requires a retransmission.

NOTE 2: The MS is polled only after 150 radio blocks since only then the BEP contribution of the command to close the loop (which is not looped back) has decayed.

NOTE 3: For acquisition of measurement reports, the test loop has to be opened for a short period of time. During that period, no data shall be received by the MS that is used for calculating MEAN_BEP estimates.

NOTE 4: The above range of expected MEAN_BEP for intervals Mid and Low have been defined in a way that the accuracy requirements are the same for a given range.

21.8.4.1 Initial conditions

The SS produces a wanted signal and a white noise signal as an interferer (random signal) known as unwanted signal, both with static propagation characteristics. The SS transmits the wanted signal (standard test signal C1) on the PDTCH channel using the MCS-4 at the nominal frequency of the receiver and with a level of –82 dBm. The unwanted signal is the standard test signal I3, on the same nominal frequency.

The MS is EGPRS capable and in the state "idle, GMM-registered" with a P-TMSI allocated.

21.8.4.2 Procedure

- a) The unwanted signal is switched off and the forgetting factor “e” is set to 0.03. The SS orders the MS into the EGPRS Switched Radio Block Loopback Mode as specified in 3GPP TS 44.014 Section 5.5.1. The SS commands the MS into Radio Block Loopback Sub-mode: OFF.
- b) The SS commands the MS into Radio Block Loopback Sub-mode: ON. The SS sends 150 radio blocks to the MS. After these 150 radio blocks the SS commands the MS into Radio Block Loopback Sub-mode: OFF and polls the MS to send a measurement report. The SS starts sending data blocks with TFI not assigned to the DUT until it has received the measurement report. The SS stores the MEAN_BEP value reported by the MS and calculates (updates) the average BER of all looped back bits received so far.
- c) The SS repeats the procedure described in step b) for a total of 1640 times.
- d) The SS counts the number of MEAN_BEP values outside the expected MEAN_BEP interval corresponding to MEAN_BEP_31 and stores the result in error counter N_high. The BER calculation is reset.
- e) The SS commands the MS into Radio Block Loopback Sub-mode: ON, switches the noise signal on and raises the level of the unwanted signal until the BER of the looped back data is between 0.25% and 0.63% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_21 and MEAN_BEP_16, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- f) The SS repeats the procedure described in step b) for a total of 820 times.
- g) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.8-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_mid. The BER calculation is reset.
- h) The SS commands the MS into Radio Block Loopback Sub-mode: ON and raises the level of the unwanted signal until the BER of the looped back data is between 1.26% and 2.51% (calculated based on at least 100 bit

errors), corresponding to the inner limits of MEAN_BEP_14 and MEAN_BEP_10, respectively. During the measurements the level of the unwanted signal shall be kept constant.

- i) The SS repeats the procedure described in step b) for a total of 870 times.
- j) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.8-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_low.

Expected maximum test time for statistical error limit tests: 3h 30 min.

21.8.5 Test requirements

Testing of the conformance requirement can be done either with fixed minimum number of samples or based on the statistical test method that could lead to an early pass/fail decision with test time significantly reduced for a MS not on the limit.

21.8.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit error rate given in table 21.8-3.

The number of error events determined in steps d), g) and j) stored in error counters N_high, N_mid and N_low shall not exceed the error event limit defined in table 21.8-3 for each of the error counters.

Table 21.8-3: Test criteria and error limits for MEAN_BEP_GMSK

| Range | Specified error limit | Tested error limit | Number of test samples | Error event limit |
|-------|-----------------------|--------------------|------------------------|-------------------|
| High | 10 % | 12.2 % | 1640 | 200 |
| Mid | 20 % | 24.4 % | 820 | 200 |
| Low | 30 % | 34.5 % | 870 | 300 |

21.8.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of performance are defined in Annex 7.

The calculation of the error rate for this test shall be done according to the values specified in tables 21.8-4.

Table 21.8-4: Statistical error limits for MEAN_BEP_GMSK

| Range | Block per s | Org. error rate requirement | Derived test limit | Target number of samples | Target test time /s Note1 | Target test time /hh:mm:ss |
|-------|-------------|-----------------------------|--------------------|--------------------------|---------------------------|----------------------------|
| High | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| Mid | 50 | 0,244 | 0,301096 | 1146 | 3437 | 00:57:17 |
| Low | 50 | 0,345 | 0,42573 | 810 | 2431 | 00:40:31 |

Note1: Test time is based on the calculation that only every 150th radio block is used for error calculation.

21.9 8PSK_MEAN_BEP Measurement for PDTCH

In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate have been increased. The following figures have been used (static propagation conditions):

| Specified error rate | Multiplication factor | Min. error events |
|----------------------|-----------------------|-------------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.9.1 Definition

The MS must be capable of measuring the MEAN_BEP parameters under static channel conditions, which is specified in terms of bit error probability (BEP) before channel decoding averaged over the four bursts in a radio block and then filtered for the measurement report. The MS has to map this filtered BEP into MEAN_BEP values in the table “MEAN_BEP mapping and accuracy for 8PSK” in subclause 8.2.5 of 3GPP TS 45.008. The accuracy requirements in this table apply for static channel conditions for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS.

21.9.2 Conformance requirement

The mapping of the MEAN_BEP to the equivalent BEP and the accuracies to which an MS shall be capable of estimating the quality parameters under static channel conditions are given for EGPRS 8PSK in table 21.9-1. The accuracy requirements below apply for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS, assuming no changes in transmitted downlink power. For EGPRS, filtering according to 3GPP TS 45.008 subclause 10.2.3.2.1 with forgetting factor of 0.03 is assumed.

Table 21.9-1: MEAN_BEP mapping and accuracy for EGPRS 8PSK

| MEAN_BEP | Range of log ₁₀ (actual BEP) | Expected MEAN_BEP interval | Probability that the expected MEAN_BEP is reported shall not be lower than: |
|-------------|---|----------------------------|---|
| MEAN_BEP_0 | > -0.60 | MEAN_BEP_0/1/2 | 85 % |
| MEAN_BEP_1 | -0.64 -- -0.60 | MEAN_BEP_1/0/2/3 | 85 % |
| MEAN_BEP_2 | -0.68 -- -0.64 | MEAN_BEP_2/0/1/3/4 | 85 % |
| MEAN_BEP_3 | -0.72 -- -0.68 | MEAN_BEP_3/1/2/4/5 | 85 % |
| MEAN_BEP_4 | -0.76 -- -0.72 | MEAN_BEP_4/2/3/5/6 | 85 % |
| MEAN_BEP_5 | -0.80 -- -0.76 | MEAN_BEP_5/3/4/6/7 | 85 % |
| MEAN_BEP_6 | -0.84 -- -0.80 | MEAN_BEP_6/4/5/7/8 | 85 % |
| MEAN_BEP_7 | -0.88 -- -0.84 | MEAN_BEP_7/5/6/8/9 | 85 % |
| MEAN_BEP_8 | -0.92 -- -0.88 | MEAN_BEP_8/6/7/9/10 | 80 % |
| MEAN_BEP_9 | -0.96 -- -0.92 | MEAN_BEP_9/7/8/10/11 | 80 % |
| MEAN_BEP_10 | -1.00 -- -0.96 | MEAN_BEP_10/8/9/11/12 | 80 % |
| MEAN_BEP_11 | -1.04 -- -1.00 | MEAN_BEP_11/9/10/12/13 | 80 % |
| MEAN_BEP_12 | -1.08 -- -1.04 | MEAN_BEP_12/10/11/13/14 | 80 % |
| MEAN_BEP_13 | -1.12 -- -1.08 | MEAN_BEP_13/11/12/14/15 | 80 % |
| MEAN_BEP_14 | -1.16 -- -1.12 | MEAN_BEP_14/12/13/15/16 | 85 % |
| MEAN_BEP_15 | -1.20 -- -1.16 | MEAN_BEP_15/13/14/16 | 85 % |
| MEAN_BEP_16 | -1.36 -- -1.20 | MEAN_BEP_16/14/15/17 | 85 % |
| MEAN_BEP_17 | -1.52 -- -1.36 | MEAN_BEP_17/16/18 | 95 % |
| MEAN_BEP_18 | -1.68 -- -1.52 | MEAN_BEP_18/17/19 | 95 % |
| MEAN_BEP_19 | -1.84 -- -1.68 | MEAN_BEP_19/18/20 | 95 % |
| MEAN_BEP_20 | -2.00 -- -1.84 | MEAN_BEP_20/19/21 | 95 % |
| MEAN_BEP_21 | -2.16 -- -2.00 | MEAN_BEP_21/20/22 | 85 % |
| MEAN_BEP_22 | -2.32 -- -2.16 | MEAN_BEP_22/21/23 | 85 % |
| MEAN_BEP_23 | -2.48 -- -2.32 | MEAN_BEP_23/22/24 | 85 % |
| MEAN_BEP_24 | -2.64 -- -2.48 | MEAN_BEP_24/23/25 | 85 % |
| MEAN_BEP_25 | -2.80 -- -2.64 | MEAN_BEP_25/23/24/26/27 | 85 % |

| MEAN_BEP_28 | -3.28 -- -3.12 | MEAN_BEP_28/26/27/29/30 | 80 % |
| MEAN_BEP_29 | -3.44 -- -3.28 | MEAN_BEP_29/27/28/30/31 | 80 % |
| MEAN_BEP_30 | -3.60 -- -3.44 | MEAN_BEP_30/28/29/31 | 90 % |
| MEAN_BEP_31 | < -3.60 | MEAN_BEP_31/29/30 | 90 % |

Reference: 3GPP TS 45.008 subclause 8.2.5.

21.9.3 Test purpose

To verify for EGPRS, under static channel conditions, that the BEP is measured and mapped to the MEAN_BEP values defined in subclause 8.2.5 of 3GPP TS 45.008 by the MS in a manner that can be related to an equivalent average BEP before channel decoding. The probability that the correct MEAN_BEP value is reported shall meet the values in the table "MEAN_BEP mapping and accuracy for 8PSK" in subclause 8.2.5 of 3GPP TS 45.008.

21.9.4 Method of test

The SS compares the long-term BER average calculated by counting bit errors determined in EGPRS loop-back mode to a set of related MEAN_BEP values.

The MEAN_BEP values correspond to the same MS-received bits that are looped-back for calculation of the long-term BER average (one-phase approach). For acquiring these MEAN_BEP values, the SS periodically opens the test loop for a short period of time to poll the MS for a measurement report.

The testing of BEP accuracy is performed at 3 sample points inside the ranges given in table 21.9-2.

Table 21.9-2: MEAN_BEP 8PSK test intervals

| Interval | Range of log ₁₀ (actual BEP) | Range of actual BEP [%] | Range of expected MEAN_BEP |
|----------|---|-------------------------|----------------------------|
| High | < -3.6 | < 0.025 | 31 |
| Mid | -2.0 ... -1.36 | 1.0 ... 4.37 | 17 ... 20 |
| Low | -1.12 ... -0.88 | 7.59 ... 13.2 | 8 ... 13 |

NOTE 1: At the beginning of the test procedure, the forgetting factor "e" is set to 0.03. It is not changed any more since the SS does not know if signalling messages are correctly received unless the MS misses the commands to open or close the loop which the SS can easily detect and which requires a retransmission.

NOTE 2: The MS is polled only after 150 radio blocks since only then the BEP contribution of the command to close the loop (which is not looped back) has decayed.

NOTE 3: For acquisition of measurement reports, the test loop has to be opened for a short period of time. During that period, no data shall be received by the MS that is used for calculating MEAN_BEP estimates.

NOTE 4: The above range of expected MEAN_BEP for intervals Mid and Low have been defined in a way that the accuracy requirements are the same for a given range.

21.9.4.1 Initial conditions

The SS produces a wanted signal and a white noise signal as an interferer (random signal) known as unwanted signal, both with static propagation characteristics. The SS transmits the wanted signal (standard test signal C1) on the PDTCH channel using the MCS-9 at the nominal frequency of the receiver and with a level of -82 dBm. The unwanted signal is the standard test signal I3, on the same nominal frequency.

The MS is EGPRS capable and in the state "idle, GMM-registered" with a P-TMSI allocated.

21.9.4.2 Procedure

- a) The unwanted signal is switched off and the forgetting factor "e" is set to 0.03. The SS orders the MS into the EGPRS Switched Radio Block Loopback Mode as specified in 3GPP TS 44.014 Section 5.5.1. The SS commands the MS into Radio Block Loopback Sub-mode: OFF.
- b) The SS commands the MS into Radio Block Loopback Sub-mode: ON. The SS sends 150 radio blocks to the MS. After these 150 radio blocks the SS commands the MS into Radio Block Loopback Sub-mode: OFF and polls the MS to send a measurement report. The SS starts sending data blocks with TFI not assigned to the DUT

until it has received the measurement report. The SS stores the MEAN_BEP value reported by the MS and calculates (updates) the average BER of all looped back bits received so far.

- c) The SS repeats the procedure described in step b) for a total of 1640 times.
- d) The SS counts the number of MEAN_BEP values outside the expected MEAN_BEP interval corresponding to MEAN_BEP_31 and stores the result in error counter N_high. The BER calculation is reset.
- e) The SS commands the MS into Radio Block Loopback Sub-mode: ON, switches the noise signal on and raises the level of the unwanted signal until the BER of the looped back data is between 1.4% and 3% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_20 and MEAN_BEP_17, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- f) The SS repeats the procedure described in step b) for a total of 3279 times.
- g) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.9-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_mid. The BER calculation is reset.
- h) The SS commands the MS into Radio Block Loopback Sub-mode: ON and raises the level of the unwanted signal until the BER of the looped back data is between 8.3% and 12% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_13 and MEAN_BEP_8, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- i) The SS repeats the procedure described in step b) for a total of 820 times.
- j) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.9-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_low.

Expected maximum test time for statistical error limit tests: 6h 40 min.

21.9.5 Test requirements

Testing of the conformance requirement can be done either with fixed minimum number of samples or based on the statistical test method that could lead to an early pass/fail decision with test time significantly reduced for a MS not on the limit.

21.9.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit error rate given in table 21.9-3.

The number of error events determined in steps d), g) and j) stored in error counters N_high, N_mid and N_low shall not exceed 200 for each of the error counters.

Table 21.9-3: Test criteria and error limits for MEAN_BEP_8PSK

| Range | Specified error limit | Tested error limit | Number of test samples | Error event limit |
|-------|-----------------------|--------------------|------------------------|-------------------|
| High | 10 % | 12.2 % | 1640 | 200 |
| Mid | 5 % | 6.1 % | 3279 | 200 |
| Low | 20 % | 24.4 % | 820 | 200 |

21.9.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of performance are defined in Annex 7.

The calculation of the error rate for this test shall be done according to the values specified in tables 21.8-4.

Table 21.9-4: Statistical error limits for MEAN_BEP_8PSK

| Range | Block per s | Org. error rate requirement | Derived test limit | Target number of samples | Target test time /s Note1 | Target test time /hh:mm:ss |
|-------|-------------|-----------------------------|--------------------|--------------------------|---------------------------|----------------------------|
| High | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| Mid | 50 | 0,061 | 0,075274 | 4583 | 13750 | 03:49:10 |
| Low | 50 | 0,244 | 0,301096 | 1146 | 3437 | 00:57:17 |

NOTE 1: Test time is based on the calculation that only every 150th radio block is used for error calculation.

21.10 Measurement accuracy for inter-RAT system (TDD)

21.10.1 1,28Mcps TDD Option

21.10.1.1 1.28Mcps TDD / P-CCPCH RSCP Measurement absolute accuracy in AWGN propagation condition

21.10.1.1.1 Definition

The P-CCPCH_RSCP measurement absolute accuracy in GSM(GPRS) cell is defined as the P-CCPCH_RSCP measured from UE in GSM(GPRS) cell compared to the actual neighbor TD-SCDMA cell P-CCPCH_RSCP.

21.10.1.1.2 Minimum Requirements

The accuracy requirements in Table 21.10.1.1.2-1 are valid under the following conditions:

P-CCPCH RSCP \geq -102 dBm

P-CCPCH $E_c/I_o \geq$ -8 dB

DwPCH $E_c/I_o \geq$ -5 dB

Table 21.10.1.1.2-1: P-CCPCH_RSCP absolute accuracy

| Parameter | Unit | Accuracy [dB] | | Conditions |
|--------------|------|------------------|-------------------|-----------------------|
| | | Normal condition | Extreme condition | I_o [dBm/ 1.28 MHz] |
| P-CCPCH_RSCP | dBm | ± 6 | ± 9 | -94...-70 |
| | dBm | ± 8 | ± 11 | -70...-50 |

The rate of correct measurements observed during repeated tests shall be at least 90%.

The normative reference for this requirement is TS 45.008 clauses 8.1.5.2.

21.10.1.1.3 Test Purpose

The purpose of this test is to verify that the relative P-CCPCH RSCP measurement accuracy is within the specified limits.

21.10.1.1.4 Method of test

21.10.1.1.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see TS 34.122 clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see TS 34.122 clause G.2.4.

Cell 1 is a GSM cell and cell 2 is a UTRA TDD cell. In the measurement information message it is indicated to the UE that periodic reporting of the UTRA TDD *PCCPCH RSCP* measurement is used.

Table 21.10.1.1.4.1-1 Cell 1 GSM cell test parameters

| Parameter | Unit | Test 1 | Test 2 | Test 3 |
|-----------------|------------|--------|--------|--------|
| UTRA RF Channel | | | 2 | |
| Cell Level | dBm/200KHz | | -70 | |

| Note 1: PCCPCH RSCP and Io levels have been calculated from other parameters for information purposes. They are not settable parameters themselves. | | | |

21.10.1.1.4.2 Procedure

- 1) Initial cell configured according to table 21.10.1.1.4.1-1 and table 21.10.1.1.4.1-2 a call is set up on cell1.
- 2) SS shall transmit MEASUREMENT INFORMATION message to indicate cell 2 neighbor cell description information based on table 21.10.1.1.4.1-2.

- 3) UE shall transmit periodically MEASUREMENT REPORT messages.
- 4) SS shall check PCCPCH_RSCP value of Cell 2 in MEASUREMENT REPORT messages.
- 5) The result of step 3) is compared to actual power level of PCCPCH RSCP of Cell 2.
- 6) SS shall count number of MEASUREMENT REPORT messages transmitted by UE. After 1000 MEASUREMENT REPORT messages have been received from UE, the RF parameters are set up according to table 21.10.1.1.4.1-1 and table 21.10.1.1.4.1-2 for Test 2. While RF parameters are being set up, MEASUREMENT REPORT messages from UE are ignored. SS shall wait for additional 1s and ignore the MEASUREMENT REPORT messages during this period. Then, steps 4) and 5) above are repeated.
- 7) SS shall count number of MEASUREMENT REPORT messages transmitted by UE. After 1000 MEASUREMENT REPORT messages have been received from UE, the RF parameters are set up according to table 21.10.1.1.4.1-1 and table 21.10.1.1.4.1-2 for Test 3. While RF parameters are being set up, MEASUREMENT REPORT messages from UE are ignored. SS shall wait for additional 1s and ignore the MEASUREMENT REPORT messages during this period. Then, steps 4) and 5) above are repeated.
- 8) After further 1000 MEASUREMENT REPORT messages have been received from UE, the SS shall transmit CHANNEL RELEASE message.

21.10.1.1.5 Test requirements

The P-CCPCH RSCP measurement accuracy shall meet the minimum requirements in clause 21.10.1.1.2 for at least 900 of the 1000 measurement reports in step 4.

NOTE: If the above Test Requirements differ from the Minimum Requirement, then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in 34.122 clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in 34.122 clause F.4.

21.11a MEAN_BEP 16-QAM in EGPRS2-A Configuration

In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate have been increased. The following figures have been used (static propagation conditions):

| Specified error rate | Multiplication factor | Min. error events |
|----------------------|-----------------------|-------------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.11a.1 Definition

The MS must be capable of measuring the MEAN_BEP parameters under static channel conditions, which is specified in terms of bit error probability (BEP) before channel decoding averaged over the four bursts in a radio block and then filtered for the measurement report. The MS has to map this filtered BEP into MEAN_BEP values in the table "MEAN_BEP mapping and accuracy for 16-QAM (EGPRS2-A and EGPRS2-B)" in subclause 10.2.3.3 of 3GPP TS 45.008. The accuracy requirements in this table apply for static channel conditions for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS.

21.11a.2 Conformance requirement

The mapping of the MEAN_BEP to the equivalent BEP and the accuracies to which an MS shall be capable of estimating the quality parameters under static channel conditions are given for EGPRS2-A 16-QAM in table 21.11a-1. The accuracy requirements below apply for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS, assuming no changes in transmitted downlink power. The requirements apply for PDTCH/F in *A/Gb mode*, and the estimated values are averaged applying filtering according to subclause 10.2.3.2.1 with forgetting factor of 0.03.

Table 21.11a-1: MEAN_BEP mapping and accuracy for EGPRS2-A 16-QAM

| MEAN_BEP | Range of log ₁₀ (actual BEP) | Expected MEAN_BEP interval | Probability that the expected MEAN_BEP for EGPRS2-A is reported shall not be lower than see: |
|-------------|---|----------------------------|--|
| MEAN_BEP_0 | [> -0.60] | MEAN_BEP_0/1/2 | 90 % |
| MEAN_BEP_1 | [-0.64 -- -0.60] | MEAN_BEP_1/0/2/3 | 90 % |
| MEAN_BEP_2 | [-0.68 -- -0.64] | MEAN_BEP_2/0/1/3/4 | 90 % |
| MEAN_BEP_3 | [-0.72 -- -0.68] | MEAN_BEP_3/1/2/4/5 | 90 % |
| MEAN_BEP_4 | [-0.76 -- -0.72] | MEAN_BEP_4/2/3/5/6 | 90 % |
| MEAN_BEP_5 | [-0.80 -- -0.76] | MEAN_BEP_5/3/4/6/7 | 90 % |
| MEAN_BEP_6 | [-0.84 -- -0.80] | MEAN_BEP_6/4/5/7/8 | 90 % |
| MEAN_BEP_7 | [-0.88 -- -0.84] | MEAN_BEP_7/5/6/8/9 | 90 % |
| MEAN_BEP_8 | [-0.92 -- -0.88] | MEAN_BEP_8/6/7/9/10 | 90 % |
| MEAN_BEP_9 | [-0.96 -- -0.92] | MEAN_BEP_9/7/8/10/11 | 90 % |
| MEAN_BEP_10 | [-1.00 -- -0.96] | MEAN_BEP_10/8/9/11/12 | 90 % |
| MEAN_BEP_11 | [-1.04 -- -1.00] | MEAN_BEP_11/9/10/12/13 | 90 % |
| MEAN_BEP_12 | [-1.08 -- -1.04] | MEAN_BEP_12/10/11/13/14 | 90 % |
| MEAN_BEP_13 | [-1.12 -- -1.08] | MEAN_BEP_13/11/12/14/15 | 90 % |
| MEAN_BEP_14 | [-1.16 -- -1.12] | MEAN_BEP_14/12/13/15/16 | 90 % |
| MEAN_BEP_15 | [-1.20 -- -1.16] | MEAN_BEP_15/13/14/16 | 90 % |
| MEAN_BEP_16 | [-1.36 -- -1.20] | MEAN_BEP_16/14/15/17 | 90 % |
| MEAN_BEP_17 | [-1.52 -- -1.36] | MEAN_BEP_17/16/18 | 90 % |
| MEAN_BEP_18 | [-1.68 -- -1.52] | MEAN_BEP_18/17/19 | 90 % |
| MEAN_BEP_19 | [-1.84 -- -1.68] | MEAN_BEP_19/18/20 | 90 % |
| MEAN_BEP_20 | [-2.00 -- -1.84] | MEAN_BEP_20/19/21 | 90 % |
| MEAN_BEP_21 | [-2.16 -- -2.00] | MEAN_BEP_21/20/22 | 90 % |
| MEAN_BEP_22 | [-2.32 -- -2.16] | MEAN_BEP_22/21/23 | 90 % |
| MEAN_BEP_23 | [-2.48 -- -2.32] | MEAN_BEP_23/22/24 | 90 % |
| MEAN_BEP_24 | [-2.64 -- -2.48] | MEAN_BEP_24/23/25 | 90 % |
| MEAN_BEP_25 | [-2.80 -- -2.64] | MEAN_BEP_25/23/24/26/27 | 90 % |
| MEAN_BEP_26 | [-2.96 -- -2.80] | MEAN_BEP_26/24/25/27/28 | 90 % |
| MEAN_BEP_27 | [-3.12 -- -2.96] | MEAN_BEP_27/25/26/28/29 | 90 % |
| MEAN_BEP_28 | [-3.28 -- -3.12] | MEAN_BEP_28/26/27/29/30 | 90 % |
| MEAN_BEP_29 | [-3.44 -- -3.28] | MEAN_BEP_29/27/28/30/31 | 90 % |
| MEAN_BEP_30 | [-3.60 -- -3.44] | MEAN_BEP_30/28/29/31 | 90 % |
| MEAN_BEP_31 | [< -3.60] | MEAN_BEP_31/29/30 | 90 % |

Reference: 3GPP TS 45.008 subclause 10.2.3.3.

21.11a.3 Test purpose

To verify for EGPRS2-A, under static channel conditions, that the BEP is measured and mapped to the MEAN_BEP values defined in subclause 10.2.3.3 of 3GPP TS 45.008 by the MS in a manner that can be related to an equivalent average BEP before channel decoding. The probability that the correct MEAN_BEP value is reported shall meet the values in the table "MEAN_BEP mapping and accuracy for 16-QAM" in subclause 10.2.3.3 of 3GPP TS 45.008.

21.11a.4 Method of test

The SS compares the long-term BER average calculated by counting bit errors determined in EGPRS loop-back mode to a set of related MEAN_BEP values.

The MEAN_BEP values correspond to the same MS-received bits that are looped-back for calculation of the long-term BER average (one-phase approach). For acquiring these MEAN_BEP values, the SS periodically opens the test loop for a short period of time to poll the MS for a measurement report.

The testing of BEP accuracy is performed at 3 sample points inside the ranges given in table 21.11a-2.

Table 21.11a-2: MEAN_BEP 16-QAM test intervals

| Interval | Range of log ₁₀ (actual BEP) | Range of actual BEP [%] | Range of expected MEAN_BEP |
|----------|---|-------------------------|----------------------------|
| High | < -3.6 | < 0.025 | 31 |
| Mid | -2.0 ... -1.36 | 1.0 ... 4.37 | 17 ... 20 |
| Low | -1.12 ... -0.88 | 7.59 ... 13.2 | 8 ... 13 |

NOTE 1: At the beginning of the test procedure, the forgetting factor “e” is set to 0.03. It is not changed any more since the SS does not know if signalling messages are correctly received unless the MS misses the commands to open or close the loop which the SS can easily detect and which requires a retransmission.

NOTE 2: The MS is polled only after 150 radio blocks since only then the BEP contribution of the command to close the loop (which is not looped back) has decayed.

NOTE 3: For acquisition of measurement reports, the test loop has to be opened for a short period of time. During that period, no data shall be received by the MS that is used for calculating MEAN_BEP estimates.

NOTE 4: The above range of expected MEAN_BEP for intervals Mid and Low have been defined in a way that the accuracy requirements are the same for a given range.

21.11a.4.1 Initial conditions

The SS produces a wanted signal and a white noise signal as an interferer (random signal) known as unwanted signal, both with static propagation characteristics. The SS transmits the wanted signal (standard test signal C1) on the PDTCH channel using the DAS-5-DAS-12 at the nominal frequency of the receiver and with a level of –82 dBm. The unwanted signal is the standard test signal I3, on the same nominal frequency.

The MS is EGPRS2-A capable and in the state "idle, GMM-registered" with a P-TMSI allocated.

21.11a.4.2 Procedure

- a) The unwanted signal is switched off and the forgetting factor “e” is set to 0.03. The SS orders the MS into the EGPRS2-A Switched Radio Block Loopback Mode as specified in 3GPP TS 44.014 Section 5.5.6. The SS commands the MS into Radio Block Loopback Sub-mode: OFF.
- b) The SS commands the MS into Radio Block Loopback Sub-mode: ON. The SS sends 150 radio blocks to the MS. After these 150 radio blocks the SS commands the MS into Radio Block Loopback Sub-mode: OFF and polls the MS to send a measurement report. The SS starts sending data blocks with TFI not assigned to the DUT until it has received the measurement report. The SS stores the MEAN_BEP value reported by the MS and calculates (updates) the average BER of all looped back bits received so far.
- c) The SS repeats the procedure described in step b) for a total of 1640 times.
- d) The SS counts the number of MEAN_BEP values outside the expected MEAN_BEP interval corresponding to MEAN_BEP_31 and stores the result in error counter N_high. The BER calculation is reset.
- e) The SS commands the MS into Radio Block Loopback Sub-mode: ON, switches the noise signal on and raises the level of the unwanted signal until the BER of the looped back data is between 1.4% and 3% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_20 and MEAN_BEP_17, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- f) The SS repeats the procedure described in step b) for a total of 1640 times.
- g) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.11a-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_mid. The BER calculation is reset.
- h) The SS commands the MS into Radio Block Loopback Sub-mode: ON and raises the level of the unwanted signal until the BER of the looped back data is between 8.3% and 12% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_13 and MEAN_BEP_8, respectively. During the measurements the level of the unwanted signal shall be kept constant.

- i) The SS repeats the procedure described in step b) for a total of 1640 times.
- j) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.11a-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_{low}.

Expected maximum test time for statistical error limit tests: 5h 45 min.

21.11a.5 Test requirements

Testing of the conformance requirement can be done either with fixed minimum number of samples or based on the statistical test method that could lead to an early pass/fail decision with test time significantly reduced for a MS not on the limit.

21.11a.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit error rate given in table 21.11a-3.

The number of error events determined in steps d), g) and j) stored in error counters N_{high}, N_{mid} and N_{low} shall not exceed the error event limit as defined in Table 21.11a-3 for each of the error counters.

Table 21.11a-3: Test criteria and error limits for MEAN_BEP_16-QAM

| Range | Specified error limit | Tested error limit | Number of test samples | Error event limit |
|-------|-----------------------|--------------------|------------------------|-------------------|
| High | 10 % | 12.2 % | 1640 | 200 |
| Mid | 10 % | 12.2 % | 1640 | 200 |
| Low | 10 % | 12.2 % | 1640 | 200 |

21.11a.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of performance are defined in Annex 7.

The calculation of the error rate for this test shall be done according to the values specified in tables 21.11a-4.

Table 21.11a-4: Statistical error limits for MEAN_BEP_16-QAM

| Range | Block per s | Org. error rate requirement | Derived test limit | Target number of samples | Target test time /s (Note) | Target test time /hh:mm:ss |
|--|-------------|-----------------------------|--------------------|--------------------------|----------------------------|----------------------------|
| High | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| Mid | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| Low | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| NOTE: Test time is based on the calculation that only every 150th radio block is used for error calculation. | | | | | | |

21.12a MEAN_BEP 32-QAM in EGPRS2-A Configuration

In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate have been increased. The following figures have been used (static propagation conditions):

| Specified error rate | Multiplication factor | Min. error events |
|----------------------|-----------------------|-------------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.12a.1 Definition

The MS must be capable of measuring the MEAN_BEP parameters under static channel conditions, which is specified in terms of bit error probability (BEP) before channel decoding averaged over the four bursts in a radio block and then filtered for the measurement report. The MS has to map this filtered BEP into MEAN_BEP values in the table “MEAN_BEP mapping and accuracy for 32-QAM (EGPRS2-A and EGPRS2-B)” in subclause 10.2.3.3 of 3GPP TS 45.008. The accuracy requirements in this table apply for static channel conditions for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS.

21.12a.2 Conformance requirement

The mapping of the MEAN_BEP to the equivalent BEP and the accuracies to which an MS shall be capable of estimating the quality parameters under static channel conditions are given for EGPRS2-A 32-QAM in table 21.12a-1. The accuracy requirements below apply for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS, assuming no changes in transmitted downlink power. The requirements apply for PDTCH/F in *A/Gb mode*, and the estimated values are averaged applying filtering according to subclause 10.2.3.2.1 with forgetting factor of 0.03.

Table 21.12a-1: MEAN_BEP mapping and accuracy for EGPRS2-A 32-QAM

| MEAN_BEP | Range of log ₁₀ (actual BEP) | Expected MEAN_BEP interval | Probability that the expected MEAN_BEP for EGPRS2-A is reported shall not be lower than: |
|-------------|---|----------------------------|--|
| MEAN_BEP_0 | [> -0.60] | MEAN_BEP_0/1/2 | 90 % |
| MEAN_BEP_1 | [-0.64 -- -0.60] | MEAN_BEP_1/0/2/3 | 90 % |
| MEAN_BEP_2 | [-0.68 -- -0.64] | MEAN_BEP_2/0/1/3/4 | 90 % |
| MEAN_BEP_3 | [-0.72 -- -0.68] | MEAN_BEP_3/1/2/4/5 | 90 % |

Reference: 3GPP TS 45.008 subclause 10.2.3.3.

21.12a.3 Test purpose

To verify for EGPRS2-A, under static channel conditions, that the BEP is measured and mapped to the MEAN_BEP values defined in subclause 10.2.3.3 of 3GPP TS 45.008 by the MS in a manner that can be related to an equivalent average BEP before channel decoding. The probability that the correct MEAN_BEP value is reported shall meet the values in the table "MEAN_BEP mapping and accuracy for 32-QAM" in subclause 10.2.3.3 of 3GPP TS 45.008.

21.12a.4 Method of test

The SS compares the long-term BER average calculated by counting bit errors determined in EGPRS2-A loop-back mode to a set of related MEAN_BEP values.

The MEAN_BEP values correspond to the same MS-received bits that are looped-back for calculation of the long-term BER average (one-phase approach). For acquiring these MEAN_BEP values, the SS periodically opens the test loop for a short period of time to poll the MS for a measurement report.

The testing of BEP accuracy is performed at 3 sample points inside the ranges given in table 21.12a-2.

Table 21.12a-2: MEAN_BEP 32-QAM test intervals

| Interval | Range of $\log_{10}(\text{actual BEP})$ | Range of actual BEP [%] | Range of expected MEAN_BEP |
|----------|---|-------------------------|----------------------------|
| High | < -3.6 | < 0.025 | 31 |
| Mid | -2.0 ... -1.36 | 1.0 ... 4.37 | 17 ... 20 |
| Low | -1.12 ... -0.88 | 7.59 ... 13.2 | 8 ... 13 |

NOTE 1: At the beginning of the test procedure, the forgetting factor "e" is set to 0.03. It is not changed any more since the SS does not know if signalling messages are correctly received unless the MS misses the commands to open or close the loop which the SS can easily detect and which requires a retransmission.

NOTE 2: The MS is polled only after 150 radio blocks since only then the BEP contribution of the command to close the loop (which is not looped back) has decayed.

NOTE 3: For acquisition of measurement reports, the test loop has to be opened for a short period of time. During that period, no data shall be received by the MS that is used for calculating MEAN_BEP estimates.

NOTE 4: The above range of expected MEAN_BEP for intervals Mid and Low have been defined in a way that the accuracy requirements are the same for a given range.

21.12a.4.1 Initial conditions

The SS produces a wanted signal and a white noise signal as an interferer (random signal) known as unwanted signal, both with static propagation characteristics. The SS transmits the wanted signal (standard test signal C1) on the PDTCH channel using the DAS-5-DAS-12 at the nominal frequency of the receiver and with a level of -82 dBm. The unwanted signal is the standard test signal I3, on the same nominal frequency.

The MS is EGPRS2-A capable and in the state "idle, GMM-registered" with a P-TMSI allocated.

21.12a.4.2 Procedure

- a) The unwanted signal is switched off and the forgetting factor "e" is set to 0.03. The SS orders the MS into the EGPRS2-A Switched Radio Block Loopback Mode as specified in 3GPP TS 44.014 Section 5.5.6. The SS commands the MS into Radio Block Loopback Sub-mode: OFF.
- b) The SS commands the MS into Radio Block Loopback Sub-mode: ON. The SS sends 150 radio blocks to the MS. After these 150 radio blocks the SS commands the MS into Radio Block Loopback Sub-mode: OFF and polls the MS to send a measurement report. The SS starts sending data blocks with TFI not assigned to the DUT until it has received the measurement report. The SS stores the MEAN_BEP value reported by the MS and calculates (updates) the average BER of all looped back bits received so far.
- c) The SS repeats the procedure described in step b) for a total of 1640 times.

- d) The SS counts the number of MEAN_BEP values outside the expected MEAN_BEP interval corresponding to MEAN_BEP_31 and stores the result in error counter N_high. The BER calculation is reset.
- e) The SS commands the MS into Radio Block Loopback Sub-mode: ON, switches the noise signal on and raises the level of the unwanted signal until the BER of the looped back data is between 1.4% and 3% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_20 and MEAN_BEP_17, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- f) The SS repeats the procedure described in step b) for a total of 1640 times.
- g) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.11a-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_mid. The BER calculation is reset.
- h) The SS commands the MS into Radio Block Loopback Sub-mode: ON and raises the level of the unwanted signal until the BER of the looped back data is between 8.3% and 12% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_13 and MEAN_BEP_8, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- i) The SS repeats the procedure described in step b) for a total of 1640 times.
- j) The SS determines the expected MEAN_BEP interval corresponding to the average BER of all looped back bits using table 21.12a-1. The SS determines the number of MEAN_BEP values outside this interval and stores the result in error counter N_low.

Expected maximum test time for statistical error limit tests: 5h 45 min.

21.12a.5 Test requirements

Testing of the conformance requirement can be done either with fixed minimum number of samples or based on the statistical test method that could lead to an early pass/fail decision with test time significantly reduced for a MS not on the limit.

21.12a.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit error rate given in table 21.12a-3.

The number of error events determined in steps d), g) and j) stored in error counters N_high, N_mid and N_low shall not exceed the error event limit as defined in Table 21.12a-3 for each of the error counters.

Table 21.12a-3: Test criteria and error limits for MEAN_BEP_32-QAM

| Range | Specified error limit | Tested error limit | Number of test samples | Error event limit |
|-------|-----------------------|--------------------|------------------------|-------------------|
| High | 10 % | 12.2 % | 1640 | 200 |
| Mid | 10 % | 12.2 % | 1640 | 200 |
| Low | 10 % | 12.2 % | 1640 | 200 |

21.12a.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of performance are defined in Annex 7.

The calculation of the error rate for this test shall be done according to the values specified in tables 21.12a-4.

Table 21.12a-4: Statistical error limits for MEAN_BEP_32-QAM

| Range | Block per s | Org. error rate requirement | Derived test limit | Target number of samples | Target test time /s (Note) | Target test time /hh:mm:ss |
|-------|-------------|-----------------------------|--------------------|--------------------------|----------------------------|----------------------------|
| | | | | | | |

| | | | | | | |
|-------|--|-------|----------|------|------|----------|
| High | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| Mid | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| Low | 50 | 0,122 | 0,150548 | 2292 | 6875 | 01:54:35 |
| Note: | Test time is based on the calculation that only every 150th radio block is used for error calculation. | | | | | |

21.13 AQPSK_MEAN_BEP measurement for VAMOS I/II/III

In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate have been increased. The following figures have been used (static propagation conditions):

| Specified error rate | Multiplication factor | Min. error events |
|----------------------|-----------------------|-------------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.13.1 Definition

The MS must be capable of measuring the MEAN_BEP parameters under static channel conditions, which is specified in terms of bit error probability (BEP) before channel decoding averaged over the four bursts of a Speech frame and then filtered for the measurement report. The MS has to map this filtered BEP into MEAN_BEP values in the table “MEAN_BEP mapping and accuracy for AQPSK (for VAMOS I, VAMOS II and VAMOS III MS)” in sub clause 8.2.5 of 3GPP TS 45.008. The accuracy requirements in this table apply for static channel conditions for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS.

21.13.2 Conformance requirement 3GPP TS 45.008 subclause 8.2.5

The mapping of the MEAN_BEP to the equivalent BEP and the accuracies to which an MS shall be capable of estimating the quality parameters under static channel conditions are given in the following tables for GMSK, 8-PSK and AQPSK respectively. The accuracy requirements below apply for sensitivity limited operation for signal levels above the reference sensitivity level for the type of MS, assuming no changes in transmitted downlink power. In *A/Gb mode*, the requirements apply for full rate TCH, E-TCH and O-TCH (no DTX). Similarly in *Iu mode*, the requirements apply to DBPSCH/F (no DTX). The estimated values are averaged (cf. subclause 8.2.3.2) over the reporting period of length 104 TDMA frames (480 ms). Furthermore, in both *A/Gb mode* and *Iu mode*, different requirements are given for EGPRS, in which case filtering according to subclause 10.2.3.2.1 with forgetting factor of 0.03 is assumed. The requirements for VAMOS mode shall apply for values of SCPIR from -4 dB to +4 dB for VAMOS I and for values of SCPIR from -10 dB to +10 dB for VAMOS II and VAMOS III.

MEAN_BEP mapping and accuracy for AQPSK (for VAMOS I, VAMOS II and VAMOS III MS)

| MEAN_BEP | Range of log10(actual BEP) | Expected MEAN_BEP interval | Probability that the expected MEAN_BEP is reported shall not be lower than: |
|-------------|----------------------------|---------------------------------------|---|
| | | | see NOTE *) |
| MEAN_BEP_0 | > -0.60 | [MEAN_BEP_0/1/2] | [80 %] |
| MEAN_BEP_1 | -0.70 -- -0.60 | [MEAN_BEP_1/0/2/3/4] | [80 %] |
| MEAN_BEP_2 | -0.80 -- -0.70 | [MEAN_BEP_2/1/3/4/5] | [70 %] |
| MEAN_BEP_3 | -0.90 -- -0.80 | [MEAN_BEP_3/2/4/5] | [70 %] |
| MEAN_BEP_4 | -1.00 -- -0.90 | [MEAN_BEP_4/3/5/6] | [70 %] |
| MEAN_BEP_5 | -1.10 -- -1.00 | [MEAN_BEP_5/3/4/6/7] | [70 %] |
| MEAN_BEP_6 | -1.20 -- -1.10 | [MEAN_BEP_6/4/5/7/8] | [70 %] |
| MEAN_BEP_7 | -1.30 -- -1.20 | [MEAN_BEP_7/5/6/8/9] | [70 %] |
| MEAN_BEP_8 | -1.40 -- -1.30 | [MEAN_BEP_8/5/6/7/9/10] | [70 %] |
| MEAN_BEP_9 | -1.50 -- -1.40 | [MEAN_BEP_9/6/7/8/10/11] | [70 %] |
| MEAN_BEP_10 | -1.60 -- -1.50 | [MEAN_BEP_10/7/8/9/11/12] | [65 %] |
| MEAN_BEP_11 | -1.70 -- -1.60 | [MEAN_BEP_11/8/9/10/12/13] | [65 %] |
| MEAN_BEP_12 | -1.80 -- -1.70 | [MEAN_BEP_12/9/10/11/13/14] | [65 %] |
| MEAN_BEP_13 | -1.90 -- -1.80 | [MEAN_BEP_13/10/11/12/14/15] | [65 %] |
| MEAN_BEP_14 | -2.00 -- -1.90 | [MEAN_BEP_14/11/12/13/15/16] | [65 %] |
| MEAN_BEP_15 | -2.10 -- -2.00 | [MEAN_BEP_15/11/12/13/14/16/17] | [70 %] |
| MEAN_BEP_16 | -2.20 -- -2.10 | [MEAN_BEP_16/13/14/15/17/18] | [70 %] |
| MEAN_BEP_17 | -2.30 -- -2.20 | [MEAN_BEP_17/14/15/16/18/19] | [70 %] |
| MEAN_BEP_18 | -2.40 -- -2.30 | [MEAN_BEP_18/14/15/16/17/19/20] | [70 %] |
| MEAN_BEP_19 | -2.50 -- -2.40 | [MEAN_BEP_19/15/16/17/18/20/21] | [70 %] |
| MEAN_BEP_20 | -2.60 -- -2.50 | [MEAN_BEP_20/16/17/18/19/21/22] | [70 %] |
| MEAN_BEP_21 | -2.70 -- -2.60 | [MEAN_BEP_21/17/18/19/20/22/23] | [70 %] |
| MEAN_BEP_22 | -2.80 -- -2.70 | [MEAN_BEP_22/18/19/20/21/23/24] | [70 %] |
| MEAN_BEP_23 | -2.90 -- -2.80 | [MEAN_BEP_23/19/20/21/22/24/25] | [70 %] |
| MEAN_BEP_24 | -3.00 -- -2.90 | [MEAN_BEP_24/20/21/22/23/25/26] | [70 %] |
| MEAN_BEP_25 | -3.10 -- -3.00 | [MEAN_BEP_25/21/22/23/24/26/27/28] | [65 %] |
| MEAN_BEP_26 | -3.20 -- -3.10 | [MEAN_BEP_26/22/23/24/25/27/28/29] | [65 %] |
| MEAN_BEP_27 | -3.30 -- -3.20 | [MEAN_BEP_27/23/24/25/26/28/29/30] | [65 %] |
| MEAN_BEP_28 | -3.40 -- -3.30 | [MEAN_BEP_28/23/24/25/26/27/29/30/31] | [65 %] |
| MEAN_BEP_29 | -3.50 -- -3.40 | [MEAN_BEP_29/23/24/25/26/27/28/30/31] | [80 %] |
| MEAN_BEP_30 | -3.60 -- -3.50 | [MEAN_BEP_30/24/25/26/27/28/29/31] | [80 %] |
| MEAN_BEP_31 | < -3.60 | [MEAN_BEP_31/27/28/29/30] | [80 %] |

NOTE *) The values in this column apply in *A/Gb mode* for full rate TCH (no DTX) in VAMOS mode.

21.13.3 Test purpose

To verify for VAMOS I/II/III, under static channel conditions, that the BEP is measured and mapped to the MEAN_BEP values defined in subclause 8.2.5 of 3GPP TS 45.008 by the MS in a manner that can be related to an equivalent average BEP before channel decoding. The probability that the correct MEAN_BEP value is reported shall meet the values in the table “MEAN_BEP mapping and accuracy for AQPSK (for VAMOS I, VAMOS II and VAMOS III MS)” in sub clause 8.2.5 of 3GPP TS 45.008.

21.13.4 Method of test

The SS compares the long term BER average calculated by counting bit errors determined in loop-back type C mode over a SACCH multi frame period to a set of related MEAN_BEP values.

The MEAN_BEP values correspond to the same MS received bits that are looped-back for calculation of the long-term BER average (one-phase approach). For acquiring these MEAN_BEP values, MS will report MEAN BEP in Enhanced Measurement Report for every SACCH multi-frame period.

The testing of BEP accuracy is performed at 4 sample points inside the ranges given in table 21.13.4-1.

Table 21.13.4-1: MEAN_BEP AQPSK test intervals

| Interval | Range of log ₁₀ (actual BEP) | Range of actual BEP [%] | Range of expected MEAN_BEP |
|----------|---|-------------------------|----------------------------|
| High | < -3.6 | < 0.025 | 31 |
| Mid_High | -3.2...-2.8 | 0.0631...0.158 | 23-26 |
| Mid_low | -2.7 ... -2.1 | 0.2 ... 0.79 | 16 ... 21 |
| Low | -2.0 ... -1.5 | 1.0 ... 3.16 | 10 ... 14 |

NOTE 1: The above range of expected MEAN_BEP for intervals Mid and Low have been defined in a way that the accuracy requirements are the same for a given range.

21.13.4.1 Initial conditions

The SS transmits a Standard Test Signal C1 (AQPSK) (wanted signal) on the active VAMOS subchannel (subchannel 2) using trainings sequence 5 from TSC set 2 on the TCH channel using the VAMOS TCH/AFS 12.2 at the nominal frequency of the receiver and with a level of -82 dBm and the other VAMOS subchannel (subchannel 1) uses trainings sequences 5 from TSC set 1. The SCPIR_DL is set to +4 dB.

The SS transmits a white noise signal as an interferer (random signal) known as unwanted signal. The unwanted signal is the standard test signal I3 as specified in TS 51.010 annex 5.2, on the same nominal frequency. Both wanted and unwanted signal contains static propagation characteristics.

RADIO_LINK_TIMEOUT is set to maximum.

Specific PICS Statements:

- VAMOS I supported (TSPC_VAMOS_Type1)
- VAMOS II supported (TSPC_VAMOS_Type2)
- VAMOS III supported (TSPC_VAMOS_Type3)

For MS indicating VAMOS III support, connect the SS to the MS antenna connectors according to Annex A1.1.6.2.

21.13.4.2 Procedure

- a) The unwanted signal is switched off and the SS commands the MS to create traffic channel loop back signalling Type C: ON

The SS sends 6000 speech frames to the MS. During this period for 250 times, the MS will report MEAN BEP in Enhanced Measurement Report for every SACCH multi-frame period. For each reported Mean_BEP value the SS calculates (updates) the average BER of all looped back bits received until the previous SACCH multi frame containing the MEAN_BEP value. The SS commands the MS traffic channel loop back signalling Type C: OFF.

- b) The SS counts the number of MEAN_BEP values outside the expected MEAN_BEP interval corresponding to MEAN_BEP_31 and stores the result in error counter N_high. The BER calculation is reset.
- c) The SS commands the MS traffic channel loop back signalling Type C: ON, switches the noise signal on and raises the level of the unwanted signal until the BER of the looped back data is between 0.0631% and 0.158% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_23 and MEAN_BEP_26, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- d) The SS repeats the procedure described in step a.
- e) The SS determines the expected MEAN_BEP interval corresponding to the each BER using table "MEAN_BEP mapping and accuracy for AQPSK (for VAMOS I, VAMOS II and VAMOS III MS)" in subclause 8.2.5 of 3GPP TS 45.008. The SS determines the number of MEAN_BEP values outside of these intervals and stores the result in error counter N_mid_high. The BER calculation is reset.
- f) The SS commands the MS traffic channel loop back signalling Type C: ON, switches the noise signal on and raises the level of the unwanted signal until the BER of the looped back data is between 0.2% and 0.79%

(calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_21 and MEAN_BEP_16, respectively. During the measurements the level of the unwanted signal shall be kept constant.

- g) The SS repeats the procedure described in step a).
- h) The SS determines the expected MEAN_BEP interval corresponding to the each BER using table “MEAN_BEP mapping and accuracy for AQPSK (for VAMOS I, VAMOS II and VAMOS III MS)” in subclause 8.2.5 of 3GPP TS 45.008. The SS determines the number of MEAN_BEP values outside of these intervals and stores the result in error counter N_mid_low. The BER calculation is reset.
- i) The SS commands the MS traffic channel loop back signalling Type C: ON, switches the noise signal on and raises the level of the unwanted signal until the BER of the looped back data is between 1.0% and 3.16% (calculated based on at least 100 bit errors), corresponding to the inner limits of MEAN_BEP_14 and MEAN_BEP_10, respectively. During the measurements the level of the unwanted signal shall be kept constant.
- j) The SS repeats the procedure described in step a).
- k) The SS determines the expected MEAN_BEP interval corresponding to each BER of all looped back bits using table “MEAN_BEP mapping and accuracy for AQPSK (for VAMOS I, VAMOS II and VAMOS III MS)” in subclause 8.2.5 of 3GPP TS 45.008. The SS determines the number of MEAN_BEP values outside of these intervals and stores the result in error counter N_low.
- l) The SS repeats step a) to k) with SCPIR_DL values 0 dB and -4 dB.
- m) If the MS signals VAMOS II or VAMOS III support step a) to k) shall be repeated with SCPIR_DL values -8 dB and -10 dB.

Expected maximum test time for statistical error limit tests: 300 min.

21.13.5 Test requirements

Testing of the conformance requirement can be done either with fixed minimum number of samples or based on the statistical test method that could lead to an early pass/fail decision with test time significantly reduced for a MS not on the limit.

21.13.5.1 Fixed limit test with minimum number of samples

The fixed testing of the conformance requirement is done using the minimum number of samples and the limit error rate given in table 21.13.5-1.

The number of error events determined in steps b), e) and h) stored in error counters N_high, N_mid_high, N_mid_low and N_low shall not exceed the error event limit as defined in Table 21.13.5-1 for each of the error counters.

Table 21.13.5-1: Test criteria and error limits for MEAN_BEP_AQPSK

| Range | Specified error limit | Tested error limit | Number of test samples | Error event limit |
|----------|-----------------------|--------------------|------------------------|-------------------|
| High | 10 % | 12.2 % | 6000 | [200] |
| Mid_high | 10 % | 12.2 % | 6000 | [200] |
| Mid_low | 10 % | 12.2 % | 6000 | [200] |
| Low | 10 % | 12.2 % | 6000 | [200] |

21.13.5.2 Statistical test with early pass / fail decision

Specific details on statistical testing of performance are defined in Annex 7.

The calculation of the error rate for this test shall be done according to the values specified in table 21.13.5-2.

Table 21.13.5-2: Statistical error limits for MEAN_BEP_AQPSK

| Range | Block per s | Org. error rate requirement | Derived test limit | Target number of samples | Target test time /s (Note) | Target test time /hh:mm:ss |
|----------|-------------|-----------------------------|--------------------|--------------------------|----------------------------|----------------------------|
| High | 50 | 0,122 | 0,150548 | 6000 | 6875 | 01:54:35 |
| Mid_high | 50 | 0,122 | 0,150548 | 6000 | 6875 | 01:54:35 |
| Mid_low | 50 | 0,122 | 0,150548 | 6000 | 6875 | 01:54:35 |
| Low | 50 | 0,122 | 0,150548 | 6000 | 6875 | 01:54:35 |

22 Transmit power control timing and confirmation

Unless otherwise specified all tests in clauses 22.1 to 22.10 are applicable for all MSs supporting the bands referred to in clause 1.

22.1 Transmit power control timing and confirmation, single slot

22.1.1 Definition

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS_TXPWR_CONF field in the uplink SACCH L1 header.

22.1.2 Conformance requirement

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; 3GPP TS 05.08, subclause 4.2.
2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; 3GPP TS 05.08, subclause 4.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; 3GPP TS 05.08, subclause 4.7.
4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 4.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; 3GPP TS 05.08, subclause 4.7.

22.1.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.

5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

22.1.4 Method of test

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3.

22.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range (see table 3.3), power control level set to maximum power.

22.1.4.2 Procedure

- a) The SS signals minimum power control level to the MS in the SACCH.
- b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.
- d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 8.
- f) After 3 s the SS sets the SACCH TXPWR to 9.
- g) The SS measures the MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 8.
- i) The SS measures the MS transmitter output power on TDMA frame 6.
- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.
- k) When the MS has changed channel its output power is measured on the first burst on the new channel.

22.1.5 Test requirements

NOTE: Refer to tables 13-2, 13-3 and 13-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the MS_TXPWR_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

22.2 Void

22.3 GPRS Uplink Power Control - Use of α and Γ_{CH} parameters

22.3.1 Definition

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuous two-way connection.

The RF output power, P_{CH} , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha \times (C + 48), P_{MAX}),$$

Where:

- Γ_{CH} is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see 3GPP TS 04.60).
- Γ_0 = 36 dBm for DCS 1 800 and PCS 1900
= 39 dBm for all other bands.
- α is a system parameter, broadcast on PBCCH or optionally sent to MS in an RLC control message (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60).
- C is the normalised received signal level at the MS as defined in 3GPP TS 05.08, subclause 10.2.3.1.
- P_{MAX} is the maximum allowed output power in the cell =
GPRS_MS_TXPWR_MAX_CCH if PBCCH exists
MS_TXPWR_MAX_CCH otherwise

All power values are expressed in dBm. (Note that the constants Γ_0 and 48 are included only for optimising the coding of Γ_{CH} and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting $\alpha = 1$ and keeping Γ_{CH} constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting $\alpha = 0$. With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

22.3.2 Conformance requirement

The MS shall use the same output power on all four bursts within one radio block. 3GPP TS 05.08, subclause 10.2.1.

If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. 3GPP TS 05.08, subclause 10.2.1.

When the MS receives new Γ_{CH} or α values, the MS shall use the new value to update P_{CH} 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. 3GPP TS 05.08, subclause 10.2.1.

The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of $2 \pm 1,5$ dB in the transmitted value. The MS may round the calculated output power to the nearest nominal output power value. 3GPP TS 05.08, subclause 10.2.1.

22.3.3 Test purpose

To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.

To verify that the highest power supported by the MS is used if the calculated power is greater.

To verify that the MS applies new Γ_{CH} or α values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.

To verify that any change of 2 dB in the calculated power corresponds to a change of $2 \pm 1,5$ dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in subclause 13.16.

22.3.4 Method of test

22.3.4.1 Initial conditions

The SS establishes a BCCH, and optionally a PBCCH on the same carrier, in the mid ARFCN range. GPRS_MS_TXPWR_MAX_CCH is set to the maximum level (39 dBm for GSM and 36 dBm for DCS and PCS). The Γ_{CH} value is set such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the Power Class of the MS under test. The α value is set to 0.

The SS establishes a downlink TBF on the same ARFCN as the BCCH and PBCCH, and send data blocks to poll the MS for channel quality reports. The downlink power level is adjusted until a stable RXLEV-value of 58 is reported by the MS in the channel quality report (see 3GPP TS 05.08, subclause 8.1.4 and 10.2.3) – corresponding to a used C value in the range of -52dBm to -53dBm.

MS shall transmit on the uplink. This is achieved using the GPRS test mode by transmitting a GPRS_TEST_MODE_CMD (see 3GPP TS 04.14, subclause 5.4).

22.3.4.2 Procedure

- a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.

The method of power measurement is described in subclause 13.16.

- b) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands). If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- c) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- d) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the value 5dB below the maximum power control level supported by the power class of the MS under test. The α value is set to 1.
- e) The SS shall decrement the α value with a step size of 0.1 until α equals 0. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- f) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

NOTE: If the power values measured for the four bursts of the radio block with α equal to 1.0 are:

$$- P_{m0}, P_{m1}, P_{m2}, P_{m3}.$$

And, the power values measured for the four bursts of the radio block with α equal to 0.5 are:

$$- P_{n0}, P_{n1}, P_{n2}, P_{n3}.$$

Then:

$$- P_{m(\max)} = \text{MAX}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$$

$$- P_{m(\min)} = \text{MIN}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$$

$$- P_{n(\max)} = \text{MAX}(P_{n0}, P_{n1}, P_{n2}, P_{n3});$$

$$- P_{n(\min)} = \text{MIN}(P_{n0}, P_{n1}, P_{n2}, P_{n3}).$$

The maximum and minimum step sizes are:

$$- \text{STEP}(\text{MAX}) = P_{m(\max)} - P_{n(\min)};$$

$$- \text{STEP}(\text{MIN}) = P_{m(\min)} - P_{n(\max)}.$$

- g) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{\text{CH}})$ equals the midrange power control level supported by the MS under test. The α value is set to 0.
- h) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- i) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .
- j) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{\text{CH}})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands). The α value is set to 0.
- k) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- l) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

22.3.5 Test requirements

1. The power of all four bursts within the radio block measured in step a) and c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table.

| Power class | Bands other than DCS 1 800 and PCS 1 900 Nominal Maximum output power | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum output power | Tolerance (dB) for normal conditions |
|-------------|--|---|--|---|
| 1 | ----- | 1 W (30 dBm) | 1 W (30dBm) | ± 2 |
| 2 | 8 W (39 dBm) | 0,25 W (24 dBm) | 0,25 W (24 dBm) | ± 2 |
| 3 | 5 W (37 dBm) | 4 W (36 dBm) | 2 W (33 dBm) | ± 2 |
| 4 | 2 W (33 dBm) | | | ± 2 |
| 5 | 0,8 W (29 dBm) | | | ± 2 |

2. The power of all four bursts within the radio block measured in step b) shall be 0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands with an accuracy of ± 5 dB in both cases.
3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of α values shall be $\leq 4,5$ dB for either set1 or set2.
4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of α values shall be $\geq -0,5$ dB for either set1 or set2.

Note: 1 dB tolerance is to be included in test requirements 3. and 4.
The same alpha value set (either set1 or set2) shall be used in all the steps f), i) and l) and for both test requirements 3. and 4.

22.4 GPRS Uplink Power Control - Independence of TS Power Control

22.4.1 Definition

-

22.4.2 Conformance requirement

For a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. 3GPP TS 05.08, subclause 10.2.1.

On a multislot uplink configuration the MS may restrict the interslot output power control range to a 10 dB window, on a TDMA frame basis. On those timeslots where the ordered power level is more than 10 dB lower than the applied power level of the highest power timeslot, the MS shall transmit at a lowest possible power level within 10 dB range from the highest applied power level, if not transmitting at the actual ordered power level. 3GPP TS 45.005, subclause 4.1.1.

22.4.3 Test purpose

To verify that for a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH.

22.4.4 Method of test

22.4.4.1 Initial conditions

The MS shall transmit on the uplink with the maximum number of TS for the multislot class of the MS.. This is achieved using the GPRS test mode by first establishing a downlink TBF and transmitting a GPRS_TEST_MODE_CMD (see 3GPP TS 04.14, subclause 5.4). Each TS is transmitting on its maximum power. The α -value is set to 0.

Specific PICS Statements:

- MS using reduced interslot dynamic range in multislot configurations (TSPC_AddInfo_Red_IntSlotRange_Mult_Conf)

PIXIT Statements:

-

22.4.4.2 Procedure

- a) The SS shall modify the Γ_{CH} value of one TS such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands).
- b) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block of the TS under test.
- c) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block of the other active TS.
- d) The SS shall modify the Γ_{CH} value for the TS under test such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the MS under test.
- e) Steps a) to d) shall be repeated for each TS of the multislot configuration.

22.4.5 Test requirements

1. The power of all four bursts within the radio block measured in step b) shall be 0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands with an accuracy of ± 5 dB in both cases. For an MS using reduced interslot dynamic range, the power measured in step b) shall be within $10\text{dB} \pm 3\text{dB}$ of the average power of the timeslots measured in step c).
2. For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in table 22.4-1 (see also 3GPP TS 45.005).

Table 22.4-1: The MS maximum output power

| Power class | Bands other than DCS 1 800 and PCS 1 900 Nominal Maximum output power | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum output power | Tolerance (dB) for normal conditions |
|-------------|--|---|--|---|
| 1 | ----- | 1 W (30 dBm) | 1 W (30dBm) | ± 2 |
| 2 | 8 W (39 dBm) | 0,25 W (24 dBm) | 0,25 W (24 dBm) | ± 2 |
| 3 | 5 W (37 dBm) | 4 W (36 dBm) | 2 W (33 dBm) | ± 2 |
| 4 | 2 W (33 dBm) | | | ± 2 |
| 5 | 0,8 W (29 dBm) | | | ± 2 |

From R99 onwards, in order to manage mobile terminal heat dissipation resulting from transmission on multiple uplink timeslots, the mobile station shall reduce its maximum output power on a per-assignment basis by the values given in table 22.4-2 or 22.4-3:

Table 22.4-2: R99 and Rel-4 MS: Allowed maximum output power reduction in a multislot configuration

| Number of timeslots in uplink assignment | Permissible nominal reduction of maximum output power, (dB) |
|--|---|
| 1 | 0 |
| 2 | 0 to 3,0 |
| 3 | 1,8 to 4,8 |
| 4 | 3,0 to 6,0 |

Table 22.4-3: From Rel-5 onwards: Allowed maximum output power reduction in a multislot configuration

| Number of timeslots in uplink assignment | Permissible nominal reduction of maximum output power, (dB) |
|--|---|
| 1 | 0 |
| 2 | 3,0 |
| 3 | 4,8 |
| 4 | 6,0 |
| 5 | 7,0 |
| 6 | 7,8 |
| 7 | 8,5 |
| 8 | 9,0 |

From Rel-5 onwards, the actual supported maximum output power shall be in the range indicated by the parameters GMSK_MULTISLOT_POWER_PROFILE (See 3GPP TS 24.008) for n allocated uplink timeslots:

$$a \leq \text{MS maximum output power} \leq \min(\text{MAX_PWR}, a + b)$$

Where:

$$a = \min(\text{MAX_PWR}, \text{MAX_PWR} + \text{GMSK_MULTISLOT_POWER_PROFILE} - 10\log(n));$$

MAX_PWR equals to the MS maximum output power according to the relevant power class and

GMSK_MULTISLOT_POWER_PROFILE 0 = 0 dB;
 GMSK_MULTISLOT_POWER_PROFILE 1 = 2 dB;
 GMSK_MULTISLOT_POWER_PROFILE 2 = 4 dB;
 GMSK_MULTISLOT_POWER_PROFILE 3 = 6 dB.

For DCS 1800 and PCS 1900 frequency bands $b = 3$ dB, for all other bands $b = 2$ dB.

22.5 Void

22.6 Normal transmit power control timing and confirmation in ECSD

22.6.1 Definition

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS_TXPWR_CONF field in the uplink SACCH L1 header.

22.6.2 Test conformance

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; 3GPP TS 05.08, subclause 4.2.
2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; 3GPP TS 05.08, subclause 4.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; 3GPP TS 05.08, subclause 4.7.
4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 4.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; 3GPP TS 05.08, subclause 4.7.

22.6.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.
5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

22.6.4 Test method

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

22.6.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (see table 3.3), power control level set to maximum power.

The SS commands the MS to operate in multislot configuration where it has highest possible number of Tx slots.

22.6.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

- a) The SS signals minimum power control level to the MS in the SACCH for one of the subchannels.
- b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.
- d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 8.

- f) After 3 s the SS sets the SACCH TXPWR to 9.
- g) The SS measures the MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 8.
- i) The SS measures the MS transmitter output power on TDMA frame 6.
- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.
- k) When the MS has changed channel its output power is measured on the first burst on the new channel.
- l) Steps a) to k) are repeated on the next subchannel until each is tested.

22.6.5 Test requirement

NOTE: Refer to tables 13.17.3-1, 13.17.3-2, 13.17.3-3 and 13.17.3-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the MS_TXPWR_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

22.7 ECSD Fast Power Control (FPC) timing and interworking with normal power control

22.7.1 Definition

Using the SACCH L1 header, normal uplink power control modifies the MS transmit power at a maximum rate of one power control level change per SACCH period (480ms). Under Fast Power Control the output power of an MS, in E-TCH mode, is updated each fast power reporting period. There are 24 fast power reporting periods in a 104 frame SACCH period.

22.7.2 Test conformance

1. In the E-TCH mode, the MS shall, if so indicated by the BSS in the SACCH L1 header or Assignment command, use FPC (fast power control); 3GPP TS 05.08, subclause 4.2
2. Switching between the normal power control mechanism and FPC shall be done if FPC is enabled or disabled via signalling in the SACCH L1 header. The respective power control mechanism to be used shall then be active as from the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 4.7
3. The initial power control level to be used by the MS immediately after switching between normal and fast power control mechanisms shall, in both cases, be the level last commanded by the normal power control mechanism; 3GPP TS 05.08, subclause 4.7
4. The fast power control mechanism shall use the differential power control mechanism defined in the table of 3GPP TS 05.08, subclause 4.3
5. The MS shall employ the most recently commanded fast power control level on each uplink E-TCH channel; 3GPP TS 05.08, subclause 4.2

6. If a power control command is received but the requested output power is not supported by the MS, the MS shall use the supported output power which is closest to the requested output power; 3GPP TS 05.08, subclause 4.3
7. If FPC is in use, the MS shall report, in the SACCH L1 header, the power control level used at the end of the normal power control reporting period; 3GPP TS 05.08, subclause 4.2
8. In case of a multislot configuration, each bi-directional channel shall be power controlled individually by the corresponding SACCH or fast inband signalling link, whichever is applicable; 3GPP TS 05.08, subclause 4.2

22.7.3 Test purpose

1. To verify that the MS switches between normal power control and fast power control mechanisms in accordance with conformance requirements 1 and 2.
2. To verify that the initial power control level used by the MS after switching between normal and fast power control mechanisms is in accordance with conformance requirement 3.
3. To verify that power level changes using the fast power control are implemented by the MS in accordance with conformance requirements 4 and 5.
4. To verify that power control commands requesting levels not supported by the MS are treated in accordance with conformance requirement 6.
5. To verify that the power reported by the MS at the end of the normal power control reporting period is in accordance with conformance requirement 7.
6. To verify that in a multislot configuration the MS implements fast power control independently on each bi-directional E-TCH in accordance with conformance requirement 8.

22.7.4 Test method

22.7.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (see table 3.3).

The SS commands the MS to operate in multislot configuration where it has the highest possible number of bi-directional E-TCHs. Using normal power control, the level of each TX slot is set to maximum power.

22.7.4.2 Procedure

For the purpose of this test the SS shall randomly select one bi-directional E-TCH to exercise. All other E-TCHs shall maintain the state defined under the initial conditions. In this procedure these other E-TCHs are referred to as the active but unselected channels.

- a) Using the normal power control mechanism, the SS shall command the MS to transmit at power level 8 in the case of DCS 1 800 and PCS 1 900 or power level 15 in the case of all other bands on the selected E-TCH. After 1s, a power measurement shall be made on each TX slot of the multislot configuration.

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- b) The SS shall command the MS to switch between the normal power control and the fast power control mechanism by means of the SACCH L1 header (see 3GPP TS 04.04). Each power control mechanism shall be maintained for a single SACCH period. This cycle shall be repeated until all power measurements specified in steps c) to h) have been completed.

During the SACCH periods when normal power control is active, the SS shall command the MS to maintain the power levels set in step a). During the SACCH period when Fast Power Control is active, the SS shall command the MS to follow the schedule of fast power control detailed in the table below.

| FPC Reporting Period Number | Fast Power Control Command | Nominal Output Power during FPC Reporting period Bands other than DCS 1 800 and PCS 1 900 | Nominal Output Power during FPC Reporting Period DCS 1 800 & PCS 1 900 | Pn |
|-----------------------------|----------------------------|---|--|-----|
| 0 | 1 Step Decrease | 13 dBm | 14 dBm | P0 |
| 1 | 1 Step Decrease | 11 dBm | 12 dBm | |
| 2 | 1 Step Decrease | 9 dBm | 10 dBm | |
| 3 | 1 Step Decrease | 7 dBm | 8 dBm | |
| 4 | 1 Step Decrease | 5 dBm | 6 dBm | |
| 5 | 1 Step Decrease | 5 dBm | 4 dBm | |
| 6 | 1 Step Decrease | 5 dBm | 2 dBm | |
| 7 | 1 Step Decrease | 5 dBm | 0 dBm | |
| 8 | 2 Step Increase | 5 dBm | 0 dBm | P34 |
| 9 | 2 Step Increase | 9 dBm | 4 dBm | |
| 10 | 2 Step Increase | 13 dBm | 8 dBm | |
| 11 | 2 Step Increase | 17 dBm | 12 dBm | |
| 12 | 2 Step Increase | 21 dBm | 16 dBm | |
| 13 | 2 Step Increase | Min (25 dBm, Pmax) | 20 dBm | |
| 14 | 2 Step Increase | Min (29 dBm, Pmax) | Min (24 dBm, Pmax) | |
| 15 | 2 Step Increase | Min (33 dBm, Pmax) | Min (28 dBm, Pmax) | |
| 16 | 2 Step Decrease | Pmax | Pmax | P69 |
| 17 | 1 Step Increase | Pmax – 4 dB | Pmax – 4 dB | P73 |
| 18 | 2 Step Decrease | Pmax – 2 dB | Pmax – 2 dB | P78 |
| 19 | 3 Step Increase | Pmax – 6 dB | Pmax – 6 dB | P82 |
| 20 | 2 Step Decrease | Pmax | Pmax | P86 |
| 21 | 2 Step Decrease | Pmax – 4 dB | Pmax – 4 dB | P91 |
| 22 | 4 Step Increase | Pmax – 8 dB | Pmax – 8 dB | P95 |
| 23 | No Change | Pmax | Pmax | P99 |

Pmax is the maximum power for the mobile class.

Pn values refer to the power measured in the nth frame of the SACCH period.

- a) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frames 0 and 103 of the SACCH period when normal power control is active.
- b) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frames 0, 34, 69, 73, 78, 82, 86, 91, 95 and 99 of the SACCH period when fast power control is active.
- c) The SS shall make power measurements of the selected timeslots during frames 0 and 103 of the SACCH period when normal power control is active.
- d) The SS shall make power measurements on the selected timeslot during frames 0, 34, 69, 73, 78, 82, 86, 91, 95 and 99 of the SACCH period when fast power control is active. These power measurements shall be referred to as P0, P34, P69, P73, P78, P82, P86, P91, P95 and P99 respectively.
- e) The SS shall note the MS TX power reported by the MS for the selected timeslot in the SACCH reporting period following the change from fast power control to normal power control.
- f) The SS shall note the MS TX power reported by the MS for the selected timeslot in the SACCH reporting period following the change from normal power control to fast power control.

22.7.5 Test requirement

- a) The powers measured for the unselected timeslots in steps a), c) and d) shall conform with the Pmax specification for the MS power class given in the following table.

| Power class | Bands other than DCS 1 800 and PCS 1 900 Nominal Maximum output power (MS TX Level) | Bands other than DCS 1 800 and PCS 1 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output Power (MS TX Level) | DCS 1 800 & PCS 1 900 Tolerance (dB) for normal conditions |
|-------------|--|--|---|--|---|
| E1 | 33 dBm (5) | ±2 | 30 dBm | 30 dBm (0) | ±2 |
| E2 | 27 dBm (8) | ±3 | 26 dBm | 26 dBm (2) | -4/+3 |
| E3 | 23 dBm (10) | ±3 | 22 dBm | 22 dBm (4) | ±3 |

- b) The power measured for the selected timeslot in steps a) and e) shall be 14dBm in the case of DCS 1 800 and PCS 1 900 and 13dBm in the case of all other bands. In all cases the tolerance shall be ±3 dB.
- c) The powers measured in step f) shall conform with the power specifications in the following table.

| Pn | Bands other than DCS 1 800 and PCS 1 900 | DCS 1 800/PCS 1 900 | Tolerance |
|-----|--|---------------------|-----------|
| P0 | 13 dBm | 14 dBm | ±3 dB |
| P34 | 5 dBm | 0 dBm | ±5 dB |
| P69 | Pmax | Pmax | ±2 dB |
| P73 | Pmax – 4 dB | Pmax – 4 dB | ±3 dB |
| P78 | Pmax – 2 dB | Pmax – 2 dB | ±3 dB |
| P82 | Pmax – 6 dB | Pmax – 6 dB | ±3 dB |
| P86 | Pmax | Pmax | ±2 dB |
| P91 | Pmax – 4 dB | Pmax – 4 dB | ±3 dB |
| P95 | Pmax – 8 dB | Pmax – 8 dB | ±3 dB |
| P99 | Pmax | Pmax | ±2 dB |

See table in test requirement a) for Pmax value for MS power class.

- a) The power level reported by the MS in step g) shall be MS TX level corresponding to Pmax for the MS power class. See the table in test requirement a).
- b) The power level reported by the MS in step h) shall be MS TX Level 8 in the case of DCS1800 and PCS 1 900 and MS TX Level 15 in the case of all other bands.

22.8 EGPRS Uplink Power Control - Use of α and Γ_{CH} parameters

22.8.1 Definition

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuous two-way connection.

The RF output power, P_{CH} , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha \times (C + 48), P_{MAX}),$$

Where:

- Γ_{CH} is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see 3GPP TS 04.60).
- Γ_0 = 36 dBm for DCS 1 800 and PCS 1 900
= 39 dBm for all other bands.
- α is a system parameter, broadcast on PBCCH or optionally sent to MS in an RLC control message (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60).
- C is the normalised received signal level at the MS as defined in 3GPP TS 05.08, subclause 10.2.3.1.

P_{MAX} is the maximum allowed output power in the cell =
 $GPRS_MS_TXPWR_MAX_CCH$ if PBCCH exists
 $MS_TXPWR_MAX_CCH$ otherwise.

All power values are expressed in dBm. (Note that the constants Γ_0 and 48 are included only for optimising the coding of Γ_{CH} and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting $\alpha = 1$ and keeping Γ_{CH} constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting $\alpha = 0$. With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

22.8.2 Conformance requirement

1. The MS shall use the same output power on all four bursts within one radio block. 3GPP TS 3GPP TS 05.08, subclause 10.2.1.
2. If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. 3GPP TS 05.08, subclause 10.2.1.
3. When the MS receives new Γ_{CH} or α values, the MS shall use the new value to update P_{CH} 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. 3GPP TS 05.08, subclause 10.2.1.
4. The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of $2 \pm 1,5$ dB in the transmitted value. The MS may round the calculated output power to the nearest nominal output power value. 3GPP TS 05.08, subclause 10.2.1.

22.8.3 Test purpose

1. To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.
2. To verify that the highest power supported by the MS is used if the calculated power is greater.
3. To verify that the MS applies new Γ_{CH} or α values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.
4. To verify that any change of 2 dB in the calculated power corresponds to a change of $2 \pm 1,5$ dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in subclause 13.16.

22.8.4 Test method

22.8.4.1 Initial conditions

The SS establishes a BCCH and optionally a PBCCH on the same carrier in the mid ARFCN range. $GPRS_MS_TXPWR_MAX_CCH$ is set to the maximum level (36dBm for DCS 1 800 and PCS 1 900 and 39dBm for all other bands). The Γ_{CH} value is set such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the Power Class of the MS under test. The α value is set to 0.

The SS establishes a downlink TBF on the same ARFCN as the BCCH and PBCCH, and send data blocks to poll the MS for channel quality reports. The downlink power level is adjusted until a stable RXLEV-value of 58 is reported by the MS in the channel quality report (see 3GPP TS 05.08, subclause 8.1.4 and 10.2.3) – corresponding to a used C value in the range of -52dBm to -53dBm.

The SS orders the MS to transmit on the uplink. This is achieved using the GPRS test mode by transmitting a GPRS_TEST_MODE_CMD (see 3GPP TS 04.14, clause 5.4).

22.8.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

- a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.
- b) The method of power measurement is described in subclause 13.17.3.

NOTE 1: For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- c) Void.
- d) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands). If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- e) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- f) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the value 5dB below the maximum power control level supported by the power class of the MS under test. The α value is set to 1.
- g) The SS shall decrement the α value with a step size of 0.1 until α equals 0. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- h) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

NOTE 2: If the power values measured for the four bursts of the radio block with α equal to 1.0 are:

$$- P_{m0}, P_{m1}, P_{m2}, P_{m3}.$$

And, the power values measured for the four bursts of the radio block with α equal to 0.5 are:

$$- P_{n0}, P_{n1}, P_{n2}, P_{n3}.$$

Then:

$$- P_{m(\max)} = \text{MAX}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$$

$$- P_{m(\min)} = \text{MIN}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$$

$$- P_{n(\max)} = \text{MAX}(P_{n0}, P_{n1}, P_{n2}, P_{n3});$$

$$- P_{n(\min)} = \text{MIN}(P_{n0}, P_{n1}, P_{n2}, P_{n3}).$$

The maximum and minimum step sizes are:

$$- \text{STEP}(\text{MAX}) = P_{m(\max)} - P_{n(\min)};$$

$$- \text{STEP}(\text{MIN}) = P_{m(\min)} - P_{n(\max)}.$$

- g) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the midrange power control level supported by the MS under test. The α value is set to 0.
- h) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- i) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .
- j) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands). The α value is set to 0.
- k) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- l) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

22.8.5 Test requirement

1. The power of all four bursts within the radio block measured in step a) and c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table.

| Power class | Bands except DCS 1 800 and PCS 1 900 Nominal Maximum output power | Bands except DCS 1 800 and PCS 1 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS 1 800 & PCS 1 900 Tolerance (dB) for normal conditions |
|-------------|--|--|---|--|---|
| 1 | ----- | | 30 dBm | 30 dBm | ± 2 |
| 2 | 39 dBm | | 24 dBm | 24 dBm | ± 2 |
| 3 | 37 dBm | | 36 dBm | 33 dBm | ± 2 |
| 4 | 33 dBm | | | | ± 2 |
| 5 | 29 dBm | | | | ± 2 |
| E1 | 33 dBm | ± 2 | 30 dBm | 30 dBm | ± 2 |
| E2 | 27 dBm | ± 3 | 26 dBm | 26 dBm | -4/+3 |
| E3 | 23 dBm | ± 3 | 22 dBm | 22 dBm | ± 3 |

2. The power of all four bursts within the radio block measured in step b) shall be 0dBm for a DCS 1 800 or PCS 1 900 MS and 5dBm for all other MS with an accuracy of ± 5 dB in all cases.
3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of α values shall be $\leq 4,5$ dB for either set1 or set2.
4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of α values shall be $\geq -0,5$ dB for either set1 or set2.

Note: 1 dB tolerance is included in test requirements 3. and 4.
The same alpha value set (either set1 or set2) shall be used in all the steps f), i) and l) and for both test requirements 3. and 4.

22.8a EGPRS2A Uplink Power Control - Use of α and Γ_{CH} parameters

22.8a.1 Definition

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuous two-way connection.

Since the conformance requirements, test procedures and test requirements for EGPRS uplink power control – use of α and Γ_{CH} are defined in subclause 22.8 only 16QAM specific requirements and procedures are handled with this subclause. The RF output power, P_{CH} , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha \times (C + 48), P_{MAX}),$$

Where:

- Γ_{CH} is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see 3GPP TS 44.060).
- Γ_0 = 36 dBm for DCS 1800 and DCS 1900
= 39 dBm for all other bands.
- α is a system parameter sent to MS in an RLC control message (see 3GPP TS 44.008 / 3GPP TS 24.008 and 3GPP TS 44.060).
- C is the normalised received signal level at the MS as defined in 3GPP TS 45.008, subclause 10.2.3.1.
- P_{MAX} is the maximum allowed output power in the cell = GPRS_MS_TXPWR_MAX_CCH

All power values are expressed in dBm. (Note that the constants Γ_0 and 48 are included only for optimising the coding of Γ_{CH} and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting $\alpha = 1$ and keeping Γ_{CH} constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting $\alpha = 0$. With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

22.8a.2 Conformance requirement

1. The MS shall use the same output power on all four bursts within one radio block. 3GPP TS 3GPP TS 45.008, subclause 10.2.1.
2. If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. 3GPP TS 45.008, subclause 10.2.1.
3. When the MS receives new Γ_{CH} or α values, the MS shall use the new value to update P_{CH} 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. 3GPP TS 45.008, subclause 10.2.1.
4. The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of $2 \pm 1,5$ dB in the transmitted value. The MS may round the calculated output power to the nearest nominal output power value. 3GPP TS 45.008, subclause 10.2.1.

22.8a.3 Test purpose

1. To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.
2. To verify that the highest power supported by the MS is used if the calculated power is greater.
3. To verify that the MS applies new Γ_{CH} or α values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.
4. To verify that any change of 2 dB in the calculated power corresponds to a change of $2 \pm 1,5$ dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in subclause 13.16.

22.8a.4 Test method

22.8a.4.1 Initial conditions

The SS establishes a BCCH in the mid ARFCN range. GPRS_MS_TXPWR_MAX_CCH is set to the maximum level (36dBm for DCS 1800 and DCS 1900 and 39dBm for all other bands). The Γ_{CH} value is set such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the Power Class of the MS under test. The α value is set to 0.

The SS establishes a downlink TBF on the same ARFCN as the BCCH and send data blocks to poll the MS for channel quality reports. The downlink power level is adjusted until a stable RXLEV-value of 58 is reported by the MS in the channel quality report (see 3GPP TS 45.008, subclause 8.1.4 and 10.2.3) – corresponding to a used C value in the range of -52dBm to -53dBm.

The SS orders the MS to transmit on the uplink. This is achieved using the GPRS test mode by transmitting a GPRS_TEST_MODE_CMD (see 3GPP TS 44.014, clause 5.4).

22.8a.4.2 Procedure

- a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.
- b) The method of power measurement is described in subclause 13.17.3a.

NOTE 1: For 16QAM modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3a.

- c) Void.
- d) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1800 and DCS 1900 and 5dBm for all other bands). If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- e) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- f) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the value 5dB below the maximum power control level supported by the power class of the MS under test. The α value is set to 1.
- g) The SS shall decrement the α value with a step size of 0.1 until α equals 0. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- h) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2;

0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

NOTE 2: If the power values measured for the four bursts of the radio block with α equal to 1.0 are:

- $P_{m0}, P_{m1}, P_{m2}, P_{m3}$.

And, the power values measured for the four bursts of the radio block with α equal to 0.5 are:

- $P_{n0}, P_{n1}, P_{n2}, P_{n3}$.

Then:

- $P_{m(max)} = \text{MAX}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$

- $P_{m(min)} = \text{MIN}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$

- $P_{n(max)} = \text{MAX}(P_{n0}, P_{n1}, P_{n2}, P_{n3});$

- $P_{n(min)} = \text{MIN}(P_{n0}, P_{n1}, P_{n2}, P_{n3}).$

The maximum and minimum step sizes are:

- $\text{STEP(MAX)} = P_{m(max)} - P_{n(min)};$

- $\text{STEP(MIN)} = P_{m(min)} - P_{n(max)}.$

- g) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the midrange power control level supported by the MS under test. The α value is set to 0.
- h) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- i) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .
- j) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1800 and DCS 1900 and 5dBm for all other bands). The α value is set to 0.
- k) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- l) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following two sets of pairs of α values, set1: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0, set2: 1.0 and 0.6; 0.9 and 0.5; 0.8 and 0.4; 0.7 and 0.3; 0.6 and 0.2; 0.5 and 0.1; 0.4 and 0.0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

22.8a.5 Test requirement

1. The power of all four bursts within the radio block measured in step a) to e) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table.

| Power class | Bands except DCS 1800 and DCS 1900 Nominal Maximum output power | Bands except DCS 1800 and DCS 1900 Tolerance (dB) for normal conditions | DCS 1800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS 1800 & DCS 1900 Tolerance (dB) for normal conditions |
|-------------|---|---|---------------------------------------|---------------------------------------|--|
| E1 | 31 dBm | ±2 | 28 dBm | 28 dBm | ±2 |
| E2 | 25 dBm | ±3 | 24 dBm | 24 dBm | -4/+3 |
| E3 | 21 dBm | ±3 | 20 dBm | 20 dBm | ±3 |

2. The power of all four bursts within the radio block measured in step b) shall be 0dBm for a DCS 1800 or DCS 1900 MS and 5dBm for all other MS with an accuracy of ±5 dB in all cases.
3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of α values shall be $\leq 4,5$ dB for either set1 or set2.
4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of α values shall be $\geq -0,5$ dB for either set1 or set2.

NOTE: 1 dB tolerance is included in test requirements 3. and 4.
The same alpha value set (either set1 or set2) shall be used in all the steps h), i) and l) and for both test requirements 3. and 4.

22.9 EGPRS Uplink Power Control - Independence of TS Power Control

22.9.1 Definition

-

22.9.2 Test conformance

For an EGPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. 3GPP TS 05.08, subclause 10.2.1.

On a multislot uplink configuration the MS may restrict the interslot output power control range to a 10 dB window, on a TDMA frame basis. On those timeslots where the ordered power level is more than 10 dB lower than the applied power level of the highest power timeslot, the MS shall transmit at a lowest possible power level within 10 dB range from the highest applied power level, if not transmitting at the actual ordered power level. 3GPP TS 45.005, subclause 4.1.1.

22.9.3 Test purpose

To verify that EGPRS power control is applied to each PDCH in a multislot configuration independently.

22.9.4 Test method

22.9.4.1 Initial conditions

The SS establishes a downlink TBF. The SS orders the MS to transmit on the maximum number of timeslots for the multislot class of the MS on the uplink. This is achieved using the GPRS test mode by transmitting a GPRS_TEST_MODE_CMD (see 3GPP TS 04.14, subclause 5.4).

Each timeslot is transmitting on its maximum power. The α -value is set to 0.

Specific PICS Statements:

- MS using reduced interslot dynamic range in multislot configurations

PIXIT Statements:

-

22.9.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

- a) The SS shall modify the Γ_{CH} value of one timeslot such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands).
- b) The SS shall make a transmitter output power measurement on each of the four bursts of any radio block of the timeslot under test.

NOTE: For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- c) The SS shall make a transmitter output power measurement on each of the four bursts of any radio block of the other active timeslots.
- d) The SS shall modify the Γ_{CH} value for the timeslot under test such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the MS under test.
- e) Steps a) to d) shall be repeated for each timeslot of the multislot configuration.

22.9.5 Test requirement

1. The power of all four bursts within the radio block measured in step b) shall be 0dBm for a DCS 1 800 or PCS 1 900 MS and 5dBm for all other MS with an accuracy of ± 5 dB in all cases. For an MS using reduced interslot dynamic range, the power measured in step b) shall be within $10\text{dB} \pm 3\text{dB}$ of the average power of the timeslots measured in step c).
2. For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in table 22.9-1 (see also 3GPP TS 05.05 / 3GPP TS 45.005).

Table 22.9-1: The MS maximum output power

| Power class | Bands except DCS 1 800 and PCS 1 900 Nominal Maximum output power | Bands except DCS 1 800 and PCS 1 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS 1 800 & PCS 1 900 Tolerance (dB) for normal conditions |
|-------------|--|--|---|--|---|
| 1 | ----- | | 30 dBm | 30 dBm | ± 2 |
| 2 | 39 dBm | | 24 dBm | 24 dBm | ± 2 |
| 3 | 37 dBm | | 36 dBm | 33 dBm | ± 2 |
| 4 | 33 dBm | | | | ± 2 |
| 5 | 29 dBm | | | | ± 2 |
| E1 | 33 dBm | ± 2 | 30 dBm | 30 dBm | ± 2 |
| E2 | 27dBm | ± 3 | 26 dBm | 26 dBm | -4/+3 |
| E3 | 23dBm | ± 3 | 22 dBm | 22 dBm | ± 3 |

From R99 onwards, in order to manage mobile terminal heat dissipation resulting from transmission on multiple uplink timeslots, the mobile station shall reduce its maximum output power on a per-assignment basis by the values given in table 22.9-2 or 22.9-3:

Table 22.9-2: R99 and Rel-4: Allowed maximum output power reduction in a multislots configuration

| Number of timeslots in uplink assignment | Permissible nominal reduction of maximum output power (dB) |
|--|--|
| 1 | 0 |
| 2 | 0 to 3,0 |
| 3 | 1,8 to 4,8 |
| 4 | 3,0 to 6,0 |

Table 22.9-3: From Rel-5 onwards: Allowed maximum output power reduction in a multislots configuration

| Number of timeslots in uplink assignment | Permissible nominal reduction of maximum output power (dB) |
|--|--|
| 1 | 0 |
| 2 | 3,0 |
| 3 | 4,8 |
| 4 | 6,0 |
| 5 | 7,0 |
| 6 | 7,8 |
| 7 | 8,5 |
| 8 | 9,0 |

From Rel-5 onwards, the actual supported maximum output power shall be in the range indicated by the parameters XXX_MULTISLOT_POWER_PROFILE (See 3GPP TS 24.008) for n allocated uplink timeslots:

$$a \leq \text{MS maximum output power} \leq \min(\text{MAX_PWR}, a + b)$$

Where:

$$a = \min(\text{MAX_PWR}, \text{MAX_PWR} + \text{XXX_MULTISLOT_POWER_PROFILE} - 10\log(n));$$

MAX_PWR equals to the MS maximum output power according to the relevant power class;

XXX_MULTISLOT_POWER_PROFILE refers either to GMSK_MULTISLOT_POWER_PROFILE or 8-PSK_MULTISLOT_POWER_PROFILE depending on the modulation type concerned, and

XXX_MULTISLOT_POWER_PROFILE 0 = 0 dB;
 XXX_MULTISLOT_POWER_PROFILE 1 = 2 dB;
 XXX_MULTISLOT_POWER_PROFILE 2 = 4 dB;
 XXX_MULTISLOT_POWER_PROFILE 3 = 6 dB.

For DCS 1800 and PCS 1900 frequency bands $b = 3$ dB, for all other bands $b = 2$ dB.

22.9a EGPRS2A Uplink Power Control - Independence of TS Power Control

22.9a.1 Definition

Since the conformance requirements, test procedures and test requirements for EGPRS uplink power control – Independence of TS Power control are defined in subclause 22.9, only 16QAM specific requirements and procedures are handled with this subclause.

22.9a.2 Test conformance

For an EGPRS2A multislots MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. 3GPP TS 05.08, subclause 10.2.1.

On a multislot uplink configuration the MS may restrict the interslot output power control range to a 10 dB window, on a TDMA frame basis. On those timeslots where the ordered power level is more than 10 dB lower than the applied power level of the highest power timeslot, the MS shall transmit at a lowest possible power level within 10 dB range from the highest applied power level, if not transmitting at the actual ordered power level. 3GPP TS 45.005, subclause 4.1.1.

22.9a.3 Test purpose

To verify that EGPRS power control is applied to each PDCH in a multislot configuration independently.

22.9a.4 Test method

22.9a.4.1 Initial conditions

The SS establishes a downlink TBF. The SS orders the MS to transmit on the maximum number of timeslots for the multislot class of the MS on the uplink. This is achieved using the GPRS test mode by transmitting a GPRS_TEST_MODE_CMD (see 3GPP TS 04.14, subclause 5.4).

Each timeslot is transmitting on its maximum power. The α -value is set to 0.

Specific PICS Statements:

- MS using reduced interslot dynamic range in multislot configurations

PIXIT Statements:

-

22.9a.4.2 Procedure

- The SS shall modify the Γ_{CH} value of one timeslot such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (0dBm for DCS 1 800 and PCS 1 900 and 5dBm for all other bands).
- The SS shall make a transmitter output power measurement on each of the four bursts of any radio block of the timeslot under test.

NOTE: For 16QAM modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3a.

- The SS shall make a transmitter output power measurement on each of the four bursts of any radio block of the other active timeslots.
- The SS shall modify the Γ_{CH} value for the timeslot under test such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the MS under test.
- Steps a) to d) shall be repeated for each timeslot of the multislot configuration.

22.9a.5 Test requirement

- The power of all four bursts within the radio block measured in step b) shall be 0dBm for a DCS 1 800 or PCS 1 900 MS and 5dBm for all other MS with an accuracy of ± 5 dB in all cases. For an MS using reduced interslot dynamic range, the power measured in step b) shall be within $10\text{dB} \pm 3\text{dB}$ of the average power of the timeslots measured in step c).
- For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in table 22.9-1 (see also 3GPP TS 05.05 / 3GPP TS 45.005).

Table 22.9-1: The MS maximum output power

| Power class | Bands except DCS 1 800 and PCS 1 900 Nominal Maximum output power | Bands except DCS 1 800 and PCS 1 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS 1 800 & PCS 1 900 Tolerance (dB) for normal conditions |
|-------------|--|--|---|--|---|
| E1 | 31 dBm | ±2 | 28 dBm | 28 dBm | ±2 |
| E2 | 25 dBm | ±3 | 24 dBm | 24 dBm | -4/+3 |
| E3 | 21 dBm | ±3 | 20 dBm | 20 dBm | ±3 |

In order to manage mobile terminal heat dissipation resulting from transmission on multiple uplink timeslots, the mobile station shall reduce its maximum output power on a per-assignment basis by the values given in 22.9-3:

Table 22.9-3: From Rel-5 onwards: Allowed maximum output power reduction in a multislot configuration

| Number of timeslots in uplink assignment | Permissible nominal reduction of maximum output power (dB) |
|--|--|
| 1 | 0 |
| 2 | 3,0 |
| 3 | 4,8 |
| 4 | 6,0 |
| 5 | 7,0 |
| 6 | 7,8 |
| 7 | 8,5 |
| 8 | 9,0 |

From Rel-5 onwards, the actual supported maximum output power shall be in the range indicated by the parameters XXX_MULTISLOT_POWER_PROFILE (See 3GPP TS 24.008) for n allocated uplink timeslots:

$$a \leq \text{MS maximum output power} \leq \min(\text{MAX_PWR}, a + b)$$

Where:

$$a = \min(\text{MAX_PWR}, \text{MAX_PWR} + \text{XXX_MULTISLOT_POWER_PROFILE} - 10\log(n));$$

MAX_PWR equals to the MS maximum output power according to the relevant power class;

XXX_MULTISLOT_POWER_PROFILE refers to 8-PSK_MULTISLOT_POWER_PROFILE

XXX_MULTISLOT_POWER_PROFILE 0 = 0 dB;
 XXX_MULTISLOT_POWER_PROFILE 1 = 2 dB;
 XXX_MULTISLOT_POWER_PROFILE 2 = 4 dB;
 XXX_MULTISLOT_POWER_PROFILE 3 = 6 dB.

For DCS 1800 and PCS 1900 frequency bands b = 3 dB, for all other bands b = 2 dB.

22.10 Void

22.11 Power control in exclusive allocation mode

22.11.1 Conformance requirements

Sub-clauses 10.2.1 and 10.2.2 do not apply for the PDCH/H in Exclusive MAC mode while in DTM. In this case:

- The MS shall apply the output power ordered by the network on the SACCH to all channels (both for the TCH/H and the PDCH/H).

- The network shall use the same output power on the dedicated connection and on all the blocks on the PDCH/H addressed to the MS. Blocks not addressed to the MS may be transmitted at a lower power level. As an exception, the bursts transmitted on the BCCH carrier shall be transmitted at the BCCH level.

NOTE: Power control is not applicable to point-to-multipoint services.

References

3GPP TS 05.08/45.008, sub-clause 10.2

22.11.2 Test purpose

To verify that MS applies the output power ordered by the network on the SACCH to all channels.

22.11.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

Test Procedure

The MS is triggered to initiate packet uplink transfer data and sends a DTM REQUEST message to the SS. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resources in a timeslot adjoining the CS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. Once the SS has verified that the MS is correctly sending RLC data blocks to the SS, the SS sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS. The SS measures the MS transmitter output power, on the timeslot(s), which changes by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level. The SS then sets the TXPWR to a lower random value and then verifies that the MS lowers the output power of the transmitter for both the PDTCH and the TCH to this level. After the SS has received approximately 9k octets of data from the MS, the SS commands the change of transit power by passing the PACKET POWER / TIMING ADVANCE message to the MS on the PACCH. Whilst the MS continues with the transmission of the 10k octets, the SS verifies that the MS has not followed the order to change power as indicated in the PACKET POWER / TIMING ADVANCE message.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | MS | | MS in the active state (U10) of a call on Timeslot N with set to Channel Type=TCH/H. |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 10k octets. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | PACKET ASSIGNMENT | See specific message contents. |
| 5 | MS<->SS | { Uplink data transfer } | Macro –transmission of ~9k octets. |
| 6 | SS->MS | PACKET POWER CONTROL / TIMING ADVANCE | Sent after approximately 9k octets have been correctly passed to the MS. The message only changes the output power of the MS by setting the Γ_{CH} parameter to maximum for each of the timeslots the MS is utilising. Setting the parameter to maximum indicates the MS should turn down the output power in the timeslots indicated. |
| 7 | MS<->SS | { Uplink data transfer } | Macro – Completion on transmission of 10k octets. |
| 8 | SS | | Verify that no the MS does not change the transmission power after receiving the PACKET POWER CONTROL / TIMING ADVANCE message. |

Specific message contents

PACKET ASSIGNMENT (Step 4):

| | |
|--|-------------------|
| As default message contents except: RR Packet Uplink Assignment IE - TIMESLOT_ALLOCATION RR Packet Downlink Assignment IE | N Not included |
|--|-------------------|

22.12 Downlink power control, PR mode A, GPRS TBF

22.12.1 Conformance requirements

The MS is required to meet the 05.05 specification when the downlink power control is used in PR mode A.

References

3GPP TS 05.08/45.008, sub-clause 10.2.2

22.12.2 Test purpose

To verify that MS still correctly decodes RLC data blocks while the BSS applies power control mode A and PR mode A and makes downlink power variations on an EGPRS TBF which shares the same PDCH.

22.12.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS and EGPRS supported.

The test is performed in TU50 radio environment, at the reference point of $c/i = 16\text{dB}$.

Mobile Station:

The MS is in GPRS idle mode with a P-TMSI allocated and the PDP context 2 activated; it is allocated a GPRS TBF.

Test Procedure

The GPRS MS is allocated a downlink TBF (TBF1) and a downlink EGPRS transfer is simulated as if an EGPRS downlink TBF (TBF2) were allocated on the same PDCHs. Downlink RLC data blocks are sent to MS using the same power level while on TBF2 different power levels are used: on the EGPRS TBF, downlink RLC data blocks are sent at the BCCH ($P_0 = 0$ dB) power level, then RLC data blocks with different attenuations and valid PR fields are sent.

During the transfer, the RLC data blocks shall be correctly received by the GPRS MS (TBF1) under the 05.05 requirements.

Maximum Duration of Test

1 minute

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|---|
| 1. | SS | | The SS initiates with MS1 an GPRS Downlink packet transfer containing 20k octets, in BTS_PWR_CTRL_MODE mode A and PR Mode A. |
| 2. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks in 8PSK (MCS9) to MS2 at the BCCH power-2dB level (PR=00), alternately with MS1 so that one block out of 2 is sent to MS2. |
| 3. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks (CS3) are sent to the MS at the BCCH power level (PR=00), alternately with MS2 so that one block out of 2 is sent to MS1, and trigger a Packet downlink Ack/Nack on the 12 th RLC data block. |
| 4. | MS -> SS | Packet downlink Ack/Nack | The Packet downlink Ack/Nack acknowledges at least 90% of the RLC data blocks |
| 5. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks with a 4dB attenuation and a valid PR=01 field in 8PSK (MCS9), alternately with MS1 so that one block out of 2 is sent to MS2. |
| 6. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks (CS3) are sent to the MS at the BCCH power level (PR=00), alternately with MS2 so that one block out of 2 is sent to MS1, and trigger a Packet downlink Ack/Nack on the 12 th RLC data block. |
| 7. | MS -> SS | Packet downlink Ack/Nack | The Packet downlink Ack/Nack acknowledges at least 90% of the RLC data blocks |
| 8. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks with a 6dB attenuation and a valid PR=01 field in 8PSK (MCS9), alternately with MS1 so that one block out of 2 is sent to MS2. |
| 9. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks (CS3) are sent to the MS at the BCCH power level (PR=00), alternately with MS2 so that one block out of 2 is sent to MS1, and trigger a Packet downlink Ack/Nack on the 12 th RLC data block. |
| 10. | MS -> SS | Packet downlink Ack/Nack | The Packet downlink Ack/Nack acknowledges at least 90% of the RLC data blocks |
| 11. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks to the MS at the BCCH power-2 dB level (PR=00) in GMSK (MCS4) alternately with MS1 so that one block out of 2 is sent to MS2. |
| 12. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks (CS3) are sent to the MS at the BCCH power level (PR=00), alternately with MS2 so that one block out of 2 is sent to MS1, and trigger a Packet downlink Ack/Nack on the 12 th RLC data block. |
| 13. | MS -> SS | Packet downlink Ack/Nack | The Packet downlink Ack/Nack acknowledges at least 90% of the RLC data blocks |
| 14. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks with a 10dB attenuation and a valid PR (PR=10) field in GMSK (MCS4) alternately with MS1 so that one block out of 2 is sent to MS2. |
| 15. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks (CS3) are sent to the MS at the BCCH power level (PR=00), alternately with MS2 so that one block out of 2 is sent to MS1, and trigger a Packet downlink Ack/Nack on the 12 th RLC data block. |
| 16. | MS -> SS | Packet downlink Ack/Nack | The Packet downlink Ack/Nack acknowledges at least 90% of the RLC data blocks |
| 17. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks with a 8dB attenuation and a valid PR (PR=10) field in GMSK (MCS4) alternately with MS1 so that one block out of 2 is sent to MS2. |

| | | | |
|-----|----------|----------------------------|---|
| 18. | SS -> MS | RLC DATA BLOCK | Send 12 Downlink RLC data blocks (CS3) are sent to the MS at the BCCH power level (PR=00), alternately with MS2 so that one block out of 2 is sent to MS1, and trigger a Packet downlink Ack/Nack on the 12 th RLC data block. |
| 19. | MS -> SS | Packet downlink Ack/Nack | The Packet downlink Ack/Nack acknowledges at least 90% of the RLC data blocks |
| 20. | SS<->MS | { Downlink data transfer } | Macro – Completion on transmission of 20k octets. |

22.13 Enhanced Power Control (EPC) timing and measurement reporting in single slot operation.

22.13.1 Definition

The EPC is Rel-5 feature which is part of GERAN Feature Package 2, see 3GPP TS 24.008. The EPC signalling is mapped onto every SACCH burst, allowing a control interval of 120 ms. It can be used with any speech traffic channel (both GMSK and 8PSK modulated) and does not impact the speech channel coding. The EPC is based on differential control to adjust the employed RF power level, see 3GPP TS 45.008.

22.13.2 Test conformance

1. The MS shall employ the most recently commanded EPC power control level, as indicated by the EPC Uplink Power Control Command sent on the corresponding EPCCH in the downlink. The EPC Uplink Power Control Command is sent once every EPC reporting period, see 3GPP TS 45.008 subclause 8.4.1b. The MS shall ignore the Ordered MS Power Level sent in the SACCH L1 header in the downlink, 3GPP TS 45.008, subclause 4.2.
2. When on a channel in EPC mode, the MS shall use the EPCCH in the uplink for EPC measurement reporting, 3GPP TS 45.008 subclause 4.2.
3. When on a channel in EPC mode, the MS shall confirm, in the SACCH L1 header on the uplink, the RF power control level at the last burst of the previous SACCH period, as specified for normal power control, 3GPP TS 45.008, subclause 4.2.
4. If a power control command is received but the requested output power is not supported by the MS, the MS shall use the supported output power which is closest to the requested output power, 3GPP TS 45.008, subclause 4.3.
5. The enhanced power control mechanism shall use the differential power control mechanism defined in 3GPP TS 45.008, subclause 4.3.
6. When the MS is ordered to obey the Ordered MS Power Level, the timing according to 3GPP TS 45.008 subclause 4.7.1 applies, see 3GPP TS 45.008, subclause 4.7.3.
7. When the MS is ordered to obey the EPC Uplink Power Control Command, it shall, upon receipt of an EPC Uplink Power Control Command on an EPCCH in the downlink, change to the new power level on the corresponding uplink channel at the first TDMA frame belonging to the next EPC reporting period (as specified in 3GPP TS 45.008 subclause 8.4.1b), see 3GPP TS 45.008, subclause 4.7.3.

22.13.3 Test purpose

1. To verify that power level changes using EPC are implemented by the MS in accordance with conformance requirements 1, 5 and 7.
2. To verify that power control commands requesting levels not supported by the MS are treated in accordance with conformance requirement 4.
3. To verify that the RF power control level confirmed by the MS is in accordance with conformance requirement 3.
4. To verify that the EPC measurement reporting in accordance with conformance requirement 2.
5. To verify that the timing cycle in EPC mode is in accordance with conformance requirements 6 and 7.

22.13.4 Test method

22.13.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for single slot configuration on a channel with ARFCN in the Mid ARFCN range (see table 3.3). The power control level is set to maximum power using normal power control.

Specific PICS statements:

-

PIXIT statements:

-

22.13.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

- a) Using the normal power control mechanism, the SS shall command the MS to transmit at power level 8 (14dBm) in the case of DCS 1 800 and PCS 1 900 or power level 15 (13 dBm) in the case of all other bands on the TCH/O-TCH, see 3GPP TS 45.005, clause 4. After 1s, see 3GPP TS45.008, clause 4.71 a power measurement shall be made.

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- b) The SS shall command the MS to switch from normal power control to EPC by means of the SACCH L1 header (see 3GPP TS 44.004). The SS shall note the MS TX power reported by the MS in the EPC reporting period following the change from normal power control to EPC.
- c) The SS shall command the MS to follow the schedule of enhanced power control detailed in table 22.13-1 below. The SS shall make power measurements during frame n of each SACCH period when enhanced power control is active. These power measurements shall be referred to as P_{n,m} respectively.

Table 22.13-1: EPC Timing and Reporting

| EPC Reporting Period Number | EPC Uplink Power Control Command | Nominal Output Power during EPC Reporting Period Bands other than DCS 1 800 and PCS 1 900 | Nominal Output Power during EPC Reporting Period DCS 1 800 & PCS 1 900 | P _{m,n} |
|-----------------------------|----------------------------------|---|--|------------------|
| 0 | 1 Step Decrease | 13 dBm | 14 dBm | P1,0 |
| 1 | 1 Step Decrease | 11 dBm | 12 dBm | P1,12 |
| 2 | 1 Step Decrease | 9 dBm | 10 dBm | P1,38 |
| 3 | 1 Step Decrease | 7 dBm | 8 dBm | P1,64 |
| 4 | 1 Step Decrease | 5 dBm | 6 dBm | P1,90 |
| 5 | 1 Step Decrease | 5 dBm | 4 dBm | P2,12 |
| 6 | 1 Step Decrease | 5 dBm | 2 dBm | P2,38 |
| 7 | 1 Step Decrease | 5 dBm | 0 dBm | P2,64 |
| 8 | 2 Step Increase | 5 dBm | 0 dBm | P2,90 |
| 9 | 2 Step Increase | 9 dBm | 4 dBm | P3,12 |
| 10 | 2 Step Increase | 13 dBm | 8 dBm | P3,38 |
| 11 | 2 Step Increase | 17 dBm | 12 dBm | P3,64 |
| 12 | 2 Step Increase | 21 dBm | 16 dBm | P3,90 |
| 13 | 2 Step Increase | Min (25 dBm, P _{max}) for 8PSK 25 dBm for GMSK | 20 dBm | P4,12 |
| 14 | 2 Step Increase | Min (29 dBm, P _{max}) for 8PSK 29 dBm for GMSK | Min (24 dBm, P _{max}) for 8PSK 24 dBm for GMSK | P4,38 |
| 15 | 4 Step Increase | Min (33 dBm, P _{max}) | Min (28 dBm, P _{max}) | P4,64 |
| 16 | 2 Step Decrease | P _{max} | P _{max} | P4,90 |
| 17 | 1 Step Increase | P _{max} – 4 dB | P _{max} – 4 dB | P5,12 |
| 18 | 2 Step Decrease | P _{max} – 2 dB | P _{max} – 2 dB | P5,38 |
| 19 | 3 Step Increase | P _{max} – 6 dB | P _{max} – 6 dB | P5,64 |
| 20 | 2 Step Decrease | P _{max} | P _{max} | P5,90 |
| 21 | 2 Step Decrease | P _{max} – 4 dB | P _{max} – 4 dB | P6,12 |
| 22 | 4 Step Increase | P _{max} – 8 dB | P _{max} – 8 dB | P6,38 |
| 23 | No Change | P _{max} | P _{max} | P6,64 |

P_{max} is the maximum power for the mobile class, see table 22.13-3.

P_{m,n} values refer to the power measured in the n-th frame of the m-th SACCH multiframe.

- d) The SS shall command the MS to switch to normal power control. The SS shall note the MS TX power reported by the MS in the SACCH reporting period following the change from EPC to normal power control.

22.13.5 Test requirement

- a) The power measured in steps a) and b) shall be 14dBm in the case of DCS 1 800 and PCS 1 900 and 13dBm in the case of all other bands. In all cases the tolerance shall be ± 3 dB.
- b) The powers measured in step c) shall conform with the power specifications in the following table 22.13-2.

Table 22.13-2: EPC Power Measurements

| P _{m,n} | Bands other than DCS 1 800 and PCS 1 900 | DCS 1 800/PCS 1 900 | Tolerance |
|------------------|--|-------------------------|------------|
| P1,0 | 13 dBm | 14 dBm | ± 3 dB |
| P2,90 | 5 dBm | 0 dBm | ± 5 dB |
| P4,90 | P _{max} | P _{max} | ± 2 dB |
| P5,12 | P _{max} – 4 dB | P _{max} – 4 dB | ± 3 dB |
| P5,38 | P _{max} – 2 dB | P _{max} – 2 dB | ± 3 dB |
| P5,64 | P _{max} – 6 dB | P _{max} – 6 dB | ± 3 dB |
| P5,90 | P _{max} | P _{max} | ± 2 dB |
| P6,12 | P _{max} – 4 dB | P _{max} – 4 dB | ± 3 dB |
| P6,38 | P _{max} – 8 dB | P _{max} – 8 dB | ± 3 dB |
| P6,64 | P _{max} | P _{max} | ± 2 dB |

- c) The power level reported by the MS in step d) shall be MS TX level corresponding to Pmax for the MS power class, see bellow table 22.13-3.

Table 22.13-3: The MS maximum output power for GMSK and 8PSK modulation

| Power class | Bands except DCS 1 800 and PCS 1 900Nominal Maximum output power | Bands except DCS 1 800 and PCS 1 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS 1 800 & PCS 1 900 Tolerance (dB) for normal conditions |
|-------------|--|---|--|---------------------------------------|--|
| 1 | ----- | | 30 dBm | 30 dBm | ±2 |
| 2 | 39 dBm | | 24 dBm | 24 dBm | ±2 |
| 3 | 37 dBm | | 36 dBm | 33 dBm | ±2 |
| 4 | 33 dBm | | | | ±2 |
| 5 | 29 dBm | | | | ±2 |

| E3 | 23dBm | ±3 | 22 dBm | 22 dBm | ±3 |

22.14 Enhanced Power Control (EPC) timing and measurement reporting in multislots operation.

22.14.1 Definition

The EPC is Rel-5 feature which is part of GERAN Feature Package 2, see 3GPP TS 24.008. The EPC is based on differential control to adjust the employed RF power level, see 3GPP TS 45.008.

High Speed Circuit Switched Data (HSCSD) is one possibility for EPC operation in multislots configuration, see 3GPP TS 45.002, clause 6.4.2.1

22.14.2 Test conformance

8. The MS shall employ the most recently commanded EPC power control level, as indicated by the EPC Uplink Power Control Command sent on the corresponding EPCCH in the downlink. The EPC Uplink Power Control Command is sent once every EPC reporting period, see 3GPP TS 45.008 subclause 8.4.1b. The MS shall ignore the Ordered MS Power Level sent in the SACCH L1 header in the downlink, 3GPP TS 45.008, subclause 4.2.
9. In case of a multislots configuration, each bi-directional channel shall be power controlled individually by the corresponding SACCH, E-IACCH or EPCCH, whichever is applicable, 3GPP TS 45.008, subclause 4.2
10. When on a channel in EPC mode, the MS shall use the EPCCH in the uplink for EPC measurement reporting, 3GPP TS 45.008 subclause 4.2.
11. When on a channel in EPC mode, the MS shall confirm, in the SACCH L1 header on the uplink, the RF power control level at the last burst of the previous SACCH period, as specified for normal power control, 3GPP TS 45.008, subclause 4.2
12. If a power control command is received but the requested output power is not supported by the MS, the MS shall use the supported output power which is closest to the requested output power, 3GPP TS 45.008, subclause 4.3
13. The enhanced power control mechanism shall use the differential power control mechanism defined in 3GPP TS 45.008, subclause 4.3
14. When the MS is ordered to obey the Ordered MS Power Level, the timing according to 3GPP TS 45.008 subclause 4.7.1 applies, see 3GPP TS 45.008, subclause 4.7.3

15. When the MS is ordered to obey the EPC Uplink Power Control Command, it shall, upon receipt of an EPC Uplink Power Control Command on an EPCCH in the downlink, change to the new power level on the corresponding uplink channel at the first TDMA frame belonging to the next EPC reporting period (as specified in 3GPP TS 45.008 subclause 8.4.1b), see 3GPP TS 45.008, subclause 4.7.3

22.14.3 Test purpose

1. To verify that power level changes using EPC are implemented by the MS in accordance with conformance requirements 1, 6 and 8.
2. To verify that power control commands requesting levels not supported by the MS are treated in accordance with conformance requirement 5.
3. To verify that the RF power control level confirmed by the MS is in accordance with conformance requirement 4.
4. To verify that in a multislot configuration the MS implements enhanced power control independently on each bi-directional SACCH or EPCCH in accordance with conformance requirement 2.
5. To verify that the EPC measurement reporting in accordance with conformance requirement 3.
6. To verify that the timing cycle in EPC mode is in accordance with conformance requirement 7 and 8.

22.14.4 Test method

22.14.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (see table 3.3).

The SS commands the MS to operate in multislot configuration where it has the highest possible number of bi-directional TCHs or O-TCHs. Using normal power control, the level of each TX slot is set to maximum power.

Specific PICS statements:

-

PIXIT statements:

-

22.14.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

For the purpose of this test the SS shall randomly select one bi-directional TCH (in case of GMSK modulation) or O-TCH (in case of 8PSK) to exercise. All other channels shall maintain the state defined under the initial conditions. In this procedure these other TCHs/O-TCHs are referred to as the active but unselected channels.

- a) Using the normal power control mechanism, the SS shall command the MS to transmit at power level 8 (14dBm) in the case of DCS 1 800 and PCS 1 900 or power level 15 (13 dBm) in the case of all other bands on the selected TCH/O-TCH, see 3GPP TS 45.005, clause 4. After 1s, a power measurement shall be made on each TX slot of the multislot configuration.

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- b) The SS shall command the MS to switch between the normal power control and the enhanced power control mechanism on the selected TCH/O-TCH by means of the SACCH L1 header (see 3GPP TS 44.004). Each power control mechanism shall be maintained for 6 SACCH multiframes. This cycle shall be repeated until all power measurements specified in steps iii) to vi) below have been completed.

During the SACCH periods when normal power control is active, the SS shall command the MS to maintain the power levels set in step a). During the SACCH periods when Enhanced Power Control is active, the SS shall command the MS to follow the schedule of enhanced power control detailed in table 22.14-1 below.

Table 22.14-1: EPC Timing and Reporting

| EPC Reporting Period Number | EPC Uplink Power Control Command | Nominal Output Power during EPC Reporting Period Bands other than DCS 1 800 and PCS 1 900 | Nominal Output Power during EPC Reporting Period DCS 1 800 & PCS 1 900 | P _{m,n} |
|-----------------------------|----------------------------------|---|--|------------------|
| 0 | 1 Step Decrease | 13 dBm | 14 dBm | P1,0 |
| 1 | 1 Step Decrease | 11 dBm | 12 dBm | P1,12 |
| 2 | 1 Step Decrease | 9 dBm | 10 dBm | P1,38 |
| 3 | 1 Step Decrease | 7 dBm | 8 dBm | P1,64 |
| 4 | 1 Step Decrease | 5 dBm | 6 dBm | P1,90 |
| 5 | 1 Step Decrease | 5 dBm | 4 dBm | P2,12 |
| 6 | 1 Step Decrease | 5 dBm | 2 dBm | P2,38 |
| 7 | 1 Step Decrease | 5 dBm | 0 dBm | P2,64 |
| 8 | 2 Step Increase | 5 dBm | 0 dBm | P2,90 |
| 9 | 2 Step Increase | 9 dBm | 4 dBm | P3,12 |
| 10 | 2 Step Increase | 13 dBm | 8 dBm | P3,38 |
| 11 | 2 Step Increase | 17 dBm | 12 dBm | P3,64 |
| 12 | 2 Step Increase | 21 dBm | 16 dBm | P3,90 |
| 13 | 2 Step Increase | Min (25 dBm, P _{max}) for 8PSK 25 dBm for GMSK | 20 dBm | P4,12 |
| 14 | 2 Step Increase | Min (29 dBm, P _{max}) for 8PSK 29 dBm for GMSK | Min (24 dBm, P _{max}) for 8PSK 24 dBm for GMSK | P4,38 |
| 15 | 4 Step Increase | Min (33 dBm, P _{max}) | Min (28 dBm, P _{max}) | P4,64 |
| 16 | 2 Step Decrease | P _{max} | P _{max} | P4,90 |
| 17 | 1 Step Increase | P _{max} – 4 dB | P _{max} – 4 dB | P5,12 |
| 18 | 2 Step Decrease | P _{max} – 2 dB | P _{max} – 2 dB | P5,38 |
| 19 | 3 Step Increase | P _{max} – 6 dB | P _{max} – 6 dB | P5,64 |
| 20 | 2 Step Decrease | P _{max} | P _{max} | P5,90 |
| 21 | 2 Step Decrease | P _{max} – 4 dB | P _{max} – 4 dB | P6,12 |
| 22 | 4 Step Increase | P _{max} – 8 dB | P _{max} – 8 dB | P6,38 |
| 23 | No Change | P _{max} | P _{max} | P6,64 |

P_{max} is the maximum power for the mobile class, see table 22.14-2.

P_{m,n} values refer to the power measured in the n-th frame of the m-th SACCH multiframe.

- i) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frames 0 and 103 of each SACCH period when normal power control is active.
- ii) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frame n of each SACCH period when enhanced power control is active.
- iii) The SS shall make power measurements of the active and selected timeslot during frames 0 and 103 of each SACCH period when normal power control is active.
- iv) The SS shall make power measurements on the active and selected timeslot during frame n of each SACCH period when enhanced power control is active. These power measurements shall be referred to as P_{n,m} respectively.
- v) The SS shall note the MS TX power reported by the MS for the active and selected timeslot in the SACCH reporting period following the change from enhanced power control to normal power control.
- vi) The SS shall note the MS TX power reported by the MS for the active and selected timeslot in the EPC reporting period following the change from normal power control to enhanced power control.

22.14.5 Test requirement

- a) The powers measured for the active but unselected timeslots in steps i), ii) shall conform with the Pmax specification for the MS power class given in the table 22.14-2 (see 3GPP TS 45.005, clause 4.1.1).

Table 22.14-2: The MS maximum output power for GMSK and 8PSK modulation

| Power class | Bands except DCS 1 800 and PCS 1 900 Nominal Maximum output power | Bands except DCS 1 800 and PCS 1 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS 1 800 & PCS 1 900 Tolerance (dB) for normal conditions |
|-------------|---|---|--|---------------------------------------|--|
| 1 | ----- | | 30 dBm | 30 dBm | ±2 |
| 2 | 39 dBm | | 24 dBm | 24 dBm | ±2 |
| 3 | 37 dBm | | 36 dBm | 33 dBm | ±2 |
| 4 | 33 dBm | | | | ±2 |
| 5 | 29 dBm | | | | ±2 |
| E1 | 33 dBm | ±2 | 30 dBm | 30 dBm | ±2 |
| E2 | 27dBm | ±3 | 26 dBm | 26 dBm | -4/+3 |
| E3 | 23dBm | ±3 | 22 dBm | 22 dBm | ±3 |

In order to manage mobile terminal heat dissipation resulting from transmission on multiple uplink timeslots, the mobile station shall reduce its maximum output power on a per-assignment basis, see 3GPP TS 45.005, clause 4.1.1. For Rel-5 onwards these power reductions are shown in the table 22.14-3.

Table 22.14-3: From Rel-5 onwards: Allowed maximum output power reduction in a multislots configuration

| Number of timeslots in uplink assignment | Permissible nominal reduction of maximum output power (dB) |
|--|--|
| 1 | 0 |
| 2 | 3,0 |
| 3 | 4,8 |
| 4 | 6,0 |
| 5 | 7,0 |
| 6 | 7,8 |
| 7 | 8,5 |
| 8 | 9,0 |

From Rel-5 onwards, the actual supported maximum output power shall be in the range indicated by the parameters XXX_MULTISLOT_POWER_PROFILE (See 3GPP TS 24.008) for n allocated uplink timeslots:

$$a \leq \text{MS maximum output power} \leq \min(\text{MAX_PWR}, a + b)$$

Where:

$$a = \min(\text{MAX_PWR}, \text{MAX_PWR} + \text{XXX_MULTISLOT_POWER_PROFILE} - 10\log(n));$$

MAX_PWR equals to the MS maximum output power according to the relevant power class;

XXX_MULTISLOT_POWER_PROFILE refers either to GMSK_MULTISLOT_POWER PROFILE or 8-PSK_MULTISLOT_POWER_PROFILE depending on the modulation type concerned, and

XXX_MULTISLOT_POWER_PROFILE 0 = 0 dB;
 XXX_MULTISLOT_POWER_PROFILE 1 = 2 dB;
 XXX_MULTISLOT_POWER_PROFILE 2 = 4 dB;
 XXX_MULTISLOT_POWER_PROFILE 3 = 6 dB.

For DCS 1 800 and PCS 1 900 frequency bands b = 3 dB, for all other bands b = 2 dB.

- b) The power measured for the selected timeslot in step iii) shall be 14 dBm in the case of DCS 1 800 and PCS 1 900 and 13 dBm in the case of all other bands. In all cases the tolerance shall be ± 3 dB.
- c) The powers measured in step iv) shall conform to the power specifications in the following table 22.14-4.

Table 22.14-4: EPC Power Measurements

| P _{m,n} | Bands other than DCS 1 800 and PCS 1 900 | DCS 1 800/PCS 1 900 | Tolerance |
|------------------|--|-------------------------|------------|
| P1,0 | 13 dBm | 14 dBm | ± 3 dB |
| P2,90 | 5 dBm | 0 dBm | ± 5 dB |
| P4,90 | P _{max} | P _{max} | ± 2 dB |
| P5,12 | P _{max} – 4 dB | P _{max} – 4 dB | ± 3 dB |
| P5,38 | P _{max} – 2 dB | P _{max} – 2 dB | ± 3 dB |
| P5,64 | P _{max} – 6 dB | P _{max} – 6 dB | ± 3 dB |
| P5,90 | P _{max} | P _{max} | ± 2 dB |
| P6,12 | P _{max} – 4 dB | P _{max} – 4 dB | ± 3 dB |
| P6,38 | P _{max} – 8 dB | P _{max} – 8 dB | ± 3 dB |
| P6,64 | P _{max} | P _{max} | ± 2 dB |

- d) The power level reported by the MS in step v) shall be MS TX level corresponding to P_{max} for the MS power class. See the table 22.14-2 in test requirement a).
- e) The power level reported by the MS in step vi) shall be MS TX Level 8 in the case of DCS 1 800 and PCS 1 900 and MS TX Level 15 in the case of all other bands.

23 Single frequency reference

23.1 Definition

The MS is required to use one single frequency reference for both RF generation/reception and baseband signals. A test method to verify this is not available.

23.2 Conformance requirement

The MS shall use the same frequency source for both RF frequency generation and clocking the time base; 3GPP TS 05.10, subclause 6.1.

23.3 Test purpose

There is no test specified.

24 Tests of the layer 1 signalling functions

Testing of Layer 1 signalling functions is included in the tests in clauses 15, 16, 17, 18, 19, 20, 21, 22, 23. Other Layer 1 functions are tested in clauses 12, 13 and 14. Some testing of Layer 1 functions is integrated with Layer 3 signalling testing (26).

25 Tests of the layer 2 signalling functions

References:

- 1 3GPP TS 04.06 and 3GPP TS 04.08/ 3GPP TS 24.008 / 3GPP TS 44.018, 3GPP TS 04.05.

- 2 ITU-T Recommendation X.290: OSI Conformance Testing Methodology and Framework for CCITT applications, Part 2: Abstract Test Suite Specification.

25.1 Introduction, objective and scope

25.1.1 General

The objective of clause 25 is to provide detail of how Layer 2 of the MS is tested to verify conformance to the testable parameters given in 3GPP TS 04.06. The tests cover SAPI = 0, and they will be carried out on SDCCH and FACCH/F and on FACCH/H if the MS supports half-rate. Testing of unnumbered information transfer on SACCHs is covered implicitly by the test in subclause 26.6.3.

The testing is performed using the test configuration described in subclause 25.1.1.2. This configuration does not provide for testing of conformance of any maintenance functions.

The MS under test shall conform to the test configuration, and the Remote Single layer (RS) test method (ITU-T Recommendation X.290, subclause 8.1.4) will be used.

25.1.2 Test configurations

The Layer 2 test configuration defines the Layer 2 functional blocks of a MS being tested and the access arrangement between MS and tester.

NOTE: These functional blocks provide the Layer 2 basic capabilities which have to be implemented in accordance with the specification given in 3GPP TS 04.06. However, the definition of Layer 2 in the form of a number of functional blocks places no requirements on the Layer 2 implementation in a MS.

An example of a functional composition of the MS Layer 2 is given in 3GPP TS 04.05. These function blocks provide basic capabilities which have to be implemented in accordance with 3GPP TS 04.05 and 3GPP TS 04.06.

Also there are alternatives or options included in 3GPP TS 04.05 and 3GPP TS 04.06, these are provided as complementary capabilities.

25.1.3 Pre-conditions

Before carrying out any Layer 2 tests the tests specified in clauses 12, 13, 14 and 15 to 23 (Layer 1 tests) shall be performed.

Apart from powering up the MS to be tested and being able to establish a call the only access to the MS needed and used for Layer 2 testing is the radio interface. It therefore is necessary that the MS is able to synchronize to the System Simulator and to decode its BCCH and CCCH. Furthermore, the MS must be able to perform the following elementary Layer 3 procedures:

- Paging;
- Immediate Assignment;
- Dedicated Channel Assignment;
- Handover;
- Channel Release.

It is necessary that the tests are performed in the order specified, except where the starting point is set (subclause 25.1.5).

The data link is maintained by the MS and the SS sending fill frames (see 3GPP TS 04.06, subclause 5.4.2.3) on the SDCCH when no other frames are to be transmitted. Fill frames are also sent on the FACCH while the channel mode is set to signalling. The default mode is signalling. The tests will normally be performed with the MS sending fill frames on the main DCCH (i.e. FACCH or SDCCH). Consequently throughout the tests fill frames will be sent and received even while waiting for other Layer 2 frames. The scheduling of the fill frame sending cannot be specified as this sending is closely linked to the processing times in the MS. Therefore, the instants of transmission of fill frames cannot

be tested nor the number of these transmissions however, in certain circumstances, the fact that a fill frame is sent can be used as proof that the MS requirement has been fulfilled.

25.1.4 Layer 2 test frames

The Layer 2 conformance test is accomplished by sequences of those frames which are contained in 3GPP TS 04.06 (Layer 2 frame repertoire etc.).

These frame sequences are under control of the System Simulator and are related to the state that the System Simulator perceives the MS to be in as a result of frames transferred across the MS-BS interface.

These frame sequences shall comply with the following rules:

- 1) The test sequences exchanged between the System Simulator and MS are assumed to be free from transmission errors.
- 2) The tester may introduce errors in the direction tester to MS by inserting wrong parameters in the address, control and length indication field.
- 3) The tester may simulate errors in the direction MS to tester by ignoring the receipt of frames from the MS.
- 4) The tester may violate the protocol rules related to the control of state variables to provoke sequence gaps.
- 5) There is no contention on the Dm channel at Layer 1 (Layer 1 point-to-point).
- 6) With respect to contention on the Dm channel at Layer 2, two distinct situations are defined:
 - i) Test of the protocol procedure supported by a single entity. In this case there is no contention on the Dm channel (one peer-to-peer information transfer invoked at a time). This test applies to all MSs and is performed for SAPI = 0.
 - ii) Test of Layer 2 multiplexing and MS processing capacity in terms of the number of SAPs and links which a MS is able to support simultaneously. In this case there is contention on the Dm channel at Layer 2 and this contention is resolved within Layer 2 based on the SAPI. This test applies to MSs which are designed for supporting SAPI in addition to SAPI = 0.

Examples of special GSM Layer 2 functions to be tested:

- Correct L2 functions on specific GSM control channels;
- Length indication;
- Segmentation, more data bit;
- SABM/UA containing information for contention resolution;
- Abnormal release.

25.1.5 Establishment of the dedicated physical resource

The System Simulator shall simulate a BS with BCCH/CCCH on one carrier. The MS shall be listening to this CCCH and able to respond to paging messages. The system simulator sends Paging Request to the MS on the paging channel. The MS shall respond with Channel Request on the random access channel. The system simulator sends Immediate Assign to the MS, thereby ordering the MS either to a SDCCH or to a TCH, that is FACCH. Each test is performed once on SDCCH, once on FACCH/F and once on FACCH/H if the MS supports half-rate. However tests that explicitly check SDCCH and FACCH are performed once if the MS does not support half-rate and twice (once with FACCH/F and once with FACCH/H) if the MS supports half-rate.

25.1.6 Release of the dedicated physical resource

After a test has been performed the System Simulator shall initiate the release of the SDCCH or FACCH, as laid out in 3GPP TS 04.08 / 3GPP TS 23.108, subclause 7.1.6. This shall return the MS to the idle mode, i.e. the MS shall again be listening to the CCCH of the System Simulator.

25.2 Test sequences

Timing requirement:

The MS shall respond to a command within T200 as defined in 3GPP TS 04.06.

The MS shall repeat a command after time-out of T200 if the command has not been acknowledged as defined in 3GPP TS 04.06.

Constant bit values:

In each frame from the MS:

- bits 6 through 8 of the address field shall be set to zero as defined in 3GPP TS 04.06.
- except for test 25.2.7, the address extension bit (EA bit) shall be set to 1 as defined in 3GPP TS 04.06.
- except for test 25.2.7, the length indicator field extension bit (EL bit) shall be set to 1 as defined in 3GPP TS 04.06.

This shall be checked each time a frame from the MS is received.

Fill bits:

The fill bits transmitted with each frame from the MS whose length indicator L is less than N201 as defined in 3GPP TS 04.06 shall be set as defined in 3GPP TS 04.06.

Frame format description

The frames are described by the following parameter sets:

SABM (C, P, M = 0, L = 0) (* SABM without an information field*)

SABM (C, P, M = 0, L > 0) (* SABM with an information field*)

DISC (C, P, M = 0, L = 0)

UA, (F, M = 0, L = 0) (* UA without an information field*)

UA, (F, M = 0, L > 0) (* UA with an information field*)

DM (R, F, M = 0, L = 0)

RR (C, P, M = 0, L = 0, N(R))

RR (R, F, M = 0, L = 0, N(R))

REJ (C, P, M = 0, L = 0, N(R))

REJ (R, F, M = 0, L = 0, N(R))

I (C, P, M = 0, L < N201, N(S), N(R))

I (C, P, M = 1, L = N201, N(S), N(R))

UI (C, P = 0, M = 0, L = 0)

UI (C, P = 0, M = 0, L < N201)

where:

C = command

R = response

P = poll

F = final

M = M bit

L = length indicator

N(S) = send sequence number

N(R) = receive sequence number

25.2.1 Initialization

25.2.1.1 Initialization when contention resolution required

25.2.1.1.1 Normal initialization

25.2.1.1.1.1 Test purpose

To test the normal establishment of multiple frame operation between the SS and the MS when contention resolution is required.

25.2.1.1.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

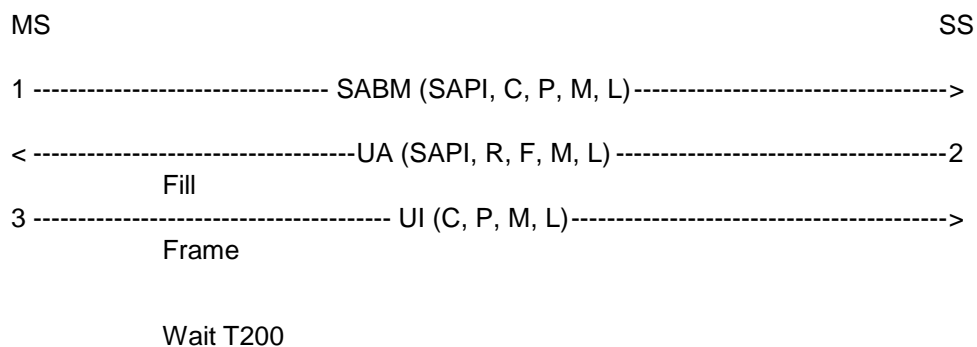

The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 after the UA to ensure the SABM frame is not repeated. This confirms that the UA has been received.

The MS is returned to the idle state as described in subclause 25.1.1.6.

Expected sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM.

information field = information field of SABM.

25.2.1.1.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$.

information field = Page Response.

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

25.2.1.1.2 Initialization failure

25.2.1.1.2.1 Loss of UA frame

25.2.1.1.2.1.1 Test purpose

To test the MS response to the loss of a Layer 2 UA frame during initialization.

25.2.1.1.2.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending an SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

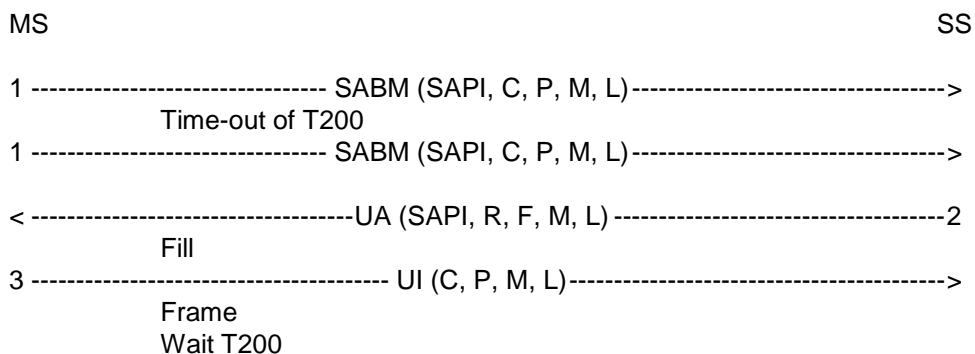

The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 to ensure the SABM frame is not repeated

The MS is returned to the initial condition by clearing of the call (not part of this test).

Expected sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM.

information field = information field of SABM.

25.2.1.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$.

information field = Page Response.

The second SABM frame shall follow the first SABM frame after.

time-out of timer T200.

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

25.2.1.1.2.2 UA frame with different information field

25.2.1.1.2.2.1 Test purpose

To test that the MS will leave the channel and return to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that the MS will thereafter repeat the immediate assignment procedure returning to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that MS will not attempt to perform the immediate assignment procedure after the first repetition.

25.2.1.1.2.2.2 Method of test

The MS is paged as described in the general section for Layer 2 testing in subclause 25.1.5. The MS is now in a condition to test the Layer 2 aspects of multiple frame establishment with contention resolution and a UA frame with an information field different from the one in its SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

The SS shall wait for $3 \times T200$ to check that the MS does not send any L2 frames other than L2 fill frames on the assigned channel.

After a time equal to $3 \times T200$ the SS checks that there are no more Layer 2 frames on the assigned channel, for a period of 1 s.

NOTE 1: Possible fill frames are allowed in order to take into account processing time inside the MS.

NOTE 2: There are no further attempts of immediate assignment procedure after the repetition.

15 s after sending the UA frame in response to the repetition of the immediate assignment procedure the SS pages the MS according to subclause 25.2.1.1.1, to make sure that the MS has returned to the idle state.

```

MS                                                    SS
<-----PAGING REQUEST-----1
2 ----- CHANNEL REQUEST----->
< ----- IMMEDIATE ASSIGNMENT-----3
4 ----- SABM (SAPI, C, P, M, L)----->
< -----UA (SAPI, R, F, M, L)-----5
6 ----- CHANNEL REQUEST----->
< ----- IMMEDIATE ASSIGNMENT-----7
8 ----- SABM (SAPI, C, P, M, L)----->
< -----UA (SAPI, R, F, M, L)-----9
Wait for at least 3*T200, fill frames may occur.
There are no Layer 2 frames on the assigned channel for 1 s.
The MS is paged 15 s after step 9.
MS is in idle state.
<-----PAGING REQUEST-----10
11      CHANNEL REQUEST                                     >

```

The frames from the SS will be:

5, 9: Two UA frames containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

25.2.1.1.2.2.3 Test requirements

The frames from the MS shall be:

4, 8: Two SABM frames containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 < L \leq N201$.

information field = Page Response.

25.2.1.1.2.3 Information frame and supervisory frames in response to an SABM frame

25.2.1.1.2.3.1 Test purpose

To test that the MS will ignore receipt of frames other than a UA when received in response to the SABM frame.

25.2.1.1.2.3.2 Method of test

As in subclause 25.2.1.1.2.2, but instead of returning a UA frame the SS will respond with an I frame, RR frame, REJ frame. (So this test will actually be performed 3 times.) The MS shall ignore receipt of the frames sent by the SS and therefore resend its SABM frame after time-out of T200.

Expected Sequence

```

MS                                                    SS
1 ----- SABM (SAPI, C, P, M, L)----->
< -----I, RR, REJ (SAPI, C, P, M, L, N(R), N(S)) -----2
      Time-out of T200
1 ----- SABM (SAPI, C, P, M, L)----->

```

The frames from the SS will be:

2: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, $0 \leq L \leq N201$ (arbitrary), N(R), N(S) arbitrary.

information field arbitrary.

or One RR frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary.

or One REJ frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary.

25.2.1.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$.

information field = Page Response.

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

25.2.1.1.3 Initialization denial

25.2.1.1.3.1 Test purpose

To test that the MS takes appropriate action if the network side indicates that it can not enter the multiple frame established state.

25.2.1.1.3.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200 for the MS to transmit.

The MS shall not repeat the SABM frame.

Expected Sequence

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

25.2.1.1.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$.

information field = Page Response.

25.2.1.1.4 Total initialization failure

25.2.1.1.4.1 Test purpose

To test the MS response to the lack of the system to respond to requests to initialize the data link.

25.2.1.1.4.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times. The MS shall not send the SABM any more than six times.

The SS continues to send paging messages on the BCCH/CCCH and the test continues as in test 25.2.1.1.1.

Expected Sequence

| MS | SS |
|---------------------------------------|----|
| 1 ----- SABM (SAPI, C, P, M, L)-----> | |
| Time-out of T200 | |
| 1 ----- SABM (SAPI, C, P, M, L)-----> | |
| Time-out of T200 | |
| 1 ----- SABM (SAPI, C, P, M, L)-----> | |
| Time-out of T200 | |
| 1 ----- SABM (SAPI, C, P, M, L)-----> | |
| Time-out of T200 | |
| 1 ----- SABM (SAPI, C, P, M, L)-----> | |
| Time-out of T200 | |
| 1 ----- SABM (SAPI, C, P, M, L)-----> | |

25.2.1.1.4.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0, $\leq L \leq N201$.

information field = Page Response.

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

25.2.1.2 Initialization, contention resolution not required

This procedure is used after a data link has been established with contention resolution and a new data link is established on a new channel e.g. handover, dedicated channel assignment.

25.2.1.2.1 Normal initialization without contention resolution

25.2.1.2.1.1 Test purpose

To test the normal initialization of multiple-frame operation when contention resolution is not required.

25.2.1.2.1.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame without contention resolution.

The SS responds with a UA frame.

The MS shall then send an I frame containing the assignment complete message.

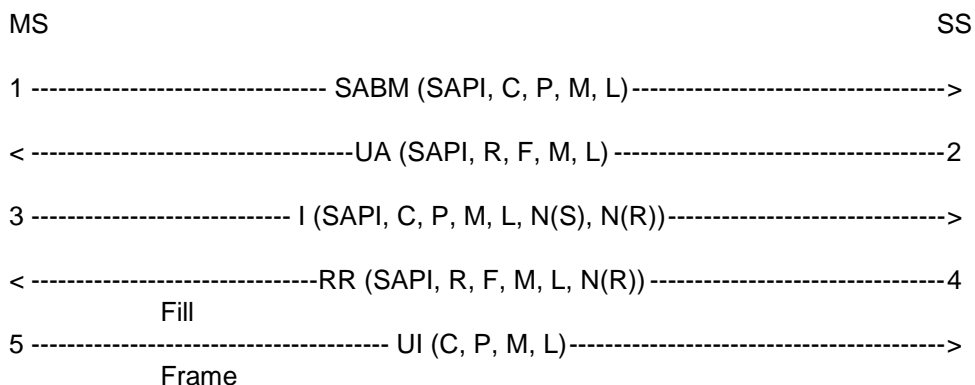

The SS shall acknowledge the I frame with an RR frame.

The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign an FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

Expected Sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1.

25.2.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0.

Information field = Assignment Complete.

5: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

25.2.1.2.2 Initialization failure

25.2.1.2.2.1 Test purpose

To test the MS response to the loss of a Layer 2 UA frame during initialization.

25.2.1.2.2.2 Method of test

The SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

The SS responds with a UA frame.

The MS shall then send an I frame containing the assignment complete message.

The SS shall acknowledge the I frame with an RR frame.

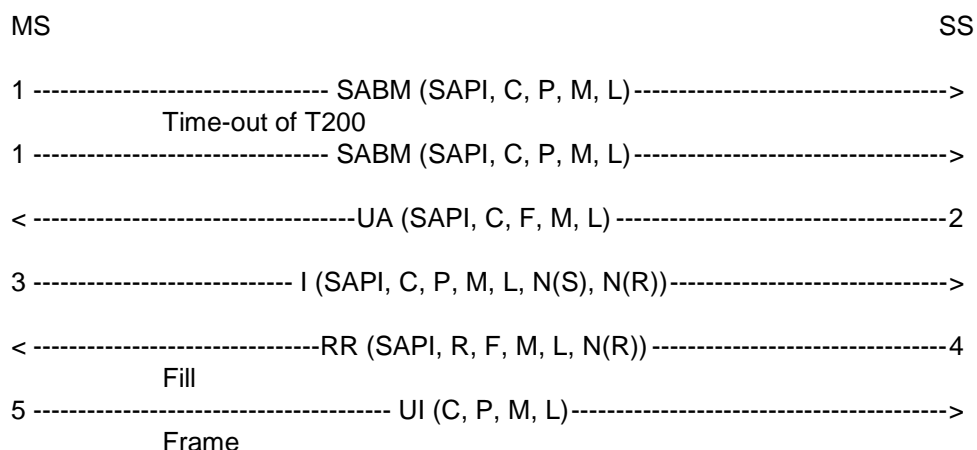

The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign a FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

The MS is returned to the idle state as described in subclause 25.1.1.6.

Expected Sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1.

25.2.1.2.2.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0

Information field = Assignment Complete

5: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

25.2.1.2.3 Initialization denial

25.2.1.2.3.1 Test purpose

To test that the MS takes appropriate action if the data link can not be initialized if the network side indicates the Layer 3 process is busy.

25.2.1.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200.

The MS shall not repeat the SABM frame. However the MS will attempt to re-establish the link on the previous channel.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

Expected Sequence

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

25.2.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

25.2.1.2.4 Total initialization failure

25.2.1.2.4.1 Test purpose

To test the MS response to the lack of the system to respond to requests to initialize the data link.

25.2.1.2.4.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times.

The MS shall not send the SABM any more than six times.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

Expected Sequence

25.2.1.2.4.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

25.2.2 Normal information transfer

25.2.2.1 Sequence counting and I frame acknowledgements

25.2.2.1.1 Test purpose

To test the operation of Layer 2 sequence numbering. Since there are 8 sequence numbers the test cycles through 9 information frame transfers.

25.2.2.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall acknowledge this I frame with an Identity Response I frame or a RR frame.

This is repeated a further 8 times as rapidly as possible assuming a window size 1.

The MS Layer 3 response time should be less than $4 \cdot T_{200}$ and therefore the MS responses to at least the 5th, 6th, 7th, 8th and 9th I frames must be an I frame on the SDCCH. On the FACCH it is possible that all MS responses at Layer 2 will be RR frames.

The frames from the SS will be:

1, 3, 5, 7, 9, 11, 13, 15, 17: One I frame (occurs nine times) containing:

$SAPI = 0, C = 1, P = 0, M = 0, 0 \leq L \leq N_{201}$.

$N(S) = 0, 1, 2, 3 \dots 7, 0$.

$N(R) = (\text{number of I frames received in the test sequence hitherto}) \bmod 8$.

information field = Identity Request (IMEI).

19, 21, and so on, until the SS has received 9 I frames from the MS: One RR frame containing:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0$.

$N(R) = (\text{number of I frames received in the test sequence hitherto}) \bmod 8$.

25.2.2.1.3 Test requirements

There shall be an integer $k \geq 0$ such that for $i = 1, 2, \dots, k + 9$ the following conditions (a) and (b) both hold:

(a) The MS sends 9 I frames and k RR frames during the test.

(b) The frames sent by the MS in step $2 \times i$ are:

(b1) If the frame is an RR frame (occurs k times): one RR frame containing:

$SAPI = 0, R = 1, F = 0, M = 0, L = 0$.

$N(R) = ((\text{Value of } N(S) \text{ in the last received I frame from the SS}) + 1) \bmod 8$.

(b2) If the frame is an I frame (occurs 9 times): one I frame containing:

$SAPI = 0, C = 0, P = 0, M = 0, 0 \leq L \leq N_{201}$.

$N(R) = ((\text{Value of } N(S) \text{ in the last received I frame from the SS}) + 1) \bmod 8$.

$N(S) = (\text{number of I frame sent hitherto by the MS to SS excluding the actual I frame}) \bmod 8$.

information field = Identity Response (IMEI).

Example of expected sequence (assuming $3 \times T200 < L3 \text{ reaction time} < 4 \times T200$):

The frames from the SS will be:

1, 3, 5, 7, 9, 11, 13, 15, 17: One I frame (occurs nine times) containing:

$SAPI = 0, C = 1, P = 0, M = 0, 0 \leq L \leq N201.$

$N(S) = 0, 1, 2, 3, \dots, 7, 0.$

$N(R) = 0, 0, 0, 0, 0, 1, 2, 3, 4.$

information field = Identity Request (IMEI).

19, 21, 23, 25, 27: One RR frame (occurs five times) containing:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0.$

$N(R) = 5, 6, 7, 0, 1.$

The frames from the MS shall be:

2, 4, 6, 8: One RR frame (occurs four times) containing:

$SAPI = 0, R = 1, F = 0, M = 0, L = 0.$

$N(R) = 1, 2, 3, 4.$

10, 12, 14, 16, 18, 20, 22, 24, 26: One I frame (occurs nine times) containing:

$SAPI = 0, C = 0, P = 0, M = 0, 0 \leq L \leq N201.$

$N(R) = 5, 6, 7, 0, 1, 1, 1, 1, 1.$

$N(S) = 0, 1, 2, 3, 4, 5, 6, 7, 0.$

information field = Identity Response (IMEI).

25.2.2.2 Receipt of an I frame in the timer recovery state

25.2.2.2.1 Test purpose

To test that the MS is able to respond to I frames whilst in the timer recovery state.

25.2.2.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

The SS then sends a valid Identity Request I frame asking for IMEI which does not acknowledge receipt of the I frame from the MS.

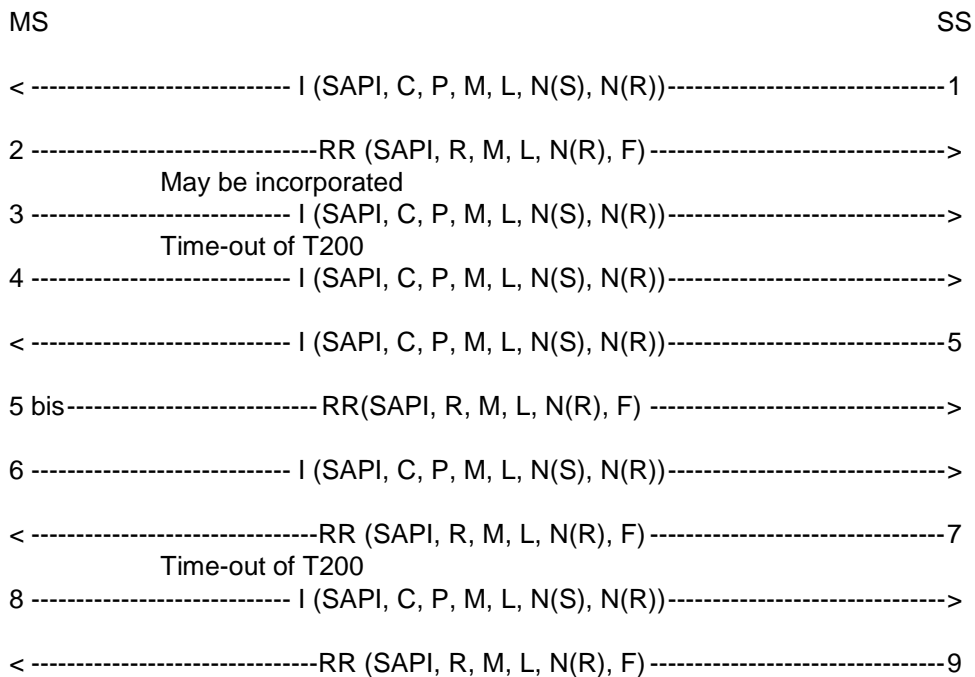

On the FACCH the MS may send an RR frame acknowledging the I frame.

The MS shall repeat the I frame, this frame will acknowledge receipt of the second I frame from the SS.

The SS then acknowledges receipt of the MS I frame by sending a RR frame.

The MS shall send the next I frame. The SS acknowledges this I frame.

Expected Sequence

The frames from the SS will be:

1, 5: One I frame (occurs twice) containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, 1, N(R) = 0.

information field = Identity Request.

7, 9: One RR frame (occurs twice) containing:

SAPI = 0, R = 0, F = 1, 0, M = 0, L = 0, N(R) = 1, 2.

25.2.2.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

3, 8: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(R) = 1, 2, N(S) = 0, 1

information field = Identity Response

4, 6: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$, N(R) = 1, 2, N(S) = 0.

information field = Identity Response.

5 bis: (possible only on the FACCH) One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 2.

25.2.2.3 Segmentation and concatenation

25.2.2.3.1 Test purpose

To test the proper use of segmentation and concatenation, suspend and resume.

25.2.2.3.2 Method of test

Specific PICS statements:

- MS supporting USSD (TSPC_Serv_SS_unstruct)
- MS supporting CC protocol for at least one Bearer Capability (TSPC_AddInfo_CCprotocol_oneBC)

If the MS supports the UnStructuredSSData operation, then the MS is made to activate an unknown supplementary service as defined in 3GPP TS 02.30 with the following sequence *NN*si#: NN is chosen to be undefined in 3GPP TS 02.30 annex 2 and is an IA5. Total length of *NN*si# shall be 20 characters.

If the MS does not support the UnStructuredSSData operation, then the MS is made to initiate a call.

The SS responds with the Immediate Assign procedure firstly allocating a SDCCH and on the second repeat of the test a TCH.

The MS is brought into the multiple frame established state by continuing as described in test 25.2.1.1.1. The layer three message element in the SABM will be CM Serv Request.

The SS sends the UA and waits for 10 s. The SS then sends an I frame with CM Serv Accept.

The MS sends either:

- a REGISTER message which is segmented between two I frames; or
- a SETUP message.

The SS shall acknowledge only the I frame with more bit set to 1 (if any) but it shall not acknowledge the I frame with more bit set to 0.

The SS then performs a handover (in the case of SDCCH this shall be finely synchronized) while still on the assigned channel and without acknowledging the last I frame of the MS layer 3 message, making sure to fill the handover command to more than 21 octets (for example by using the cell channel description element).

On the SDCCH the MS will go into timer recovery and resend the last I frame of the layer 3 message with the P bit set to 1 when it acknowledges the two I frames of the handover command. On the FACCH the MS may simply acknowledge both I frames.

The MS does not attempt to resend the last I frame of the REGISTER or SETUP message on the old channel but instead goes to the new channel where it performs a random access using the Handover Access message and then multiple frame establishment without contention resolution as described in test 25.2.1.2.1.

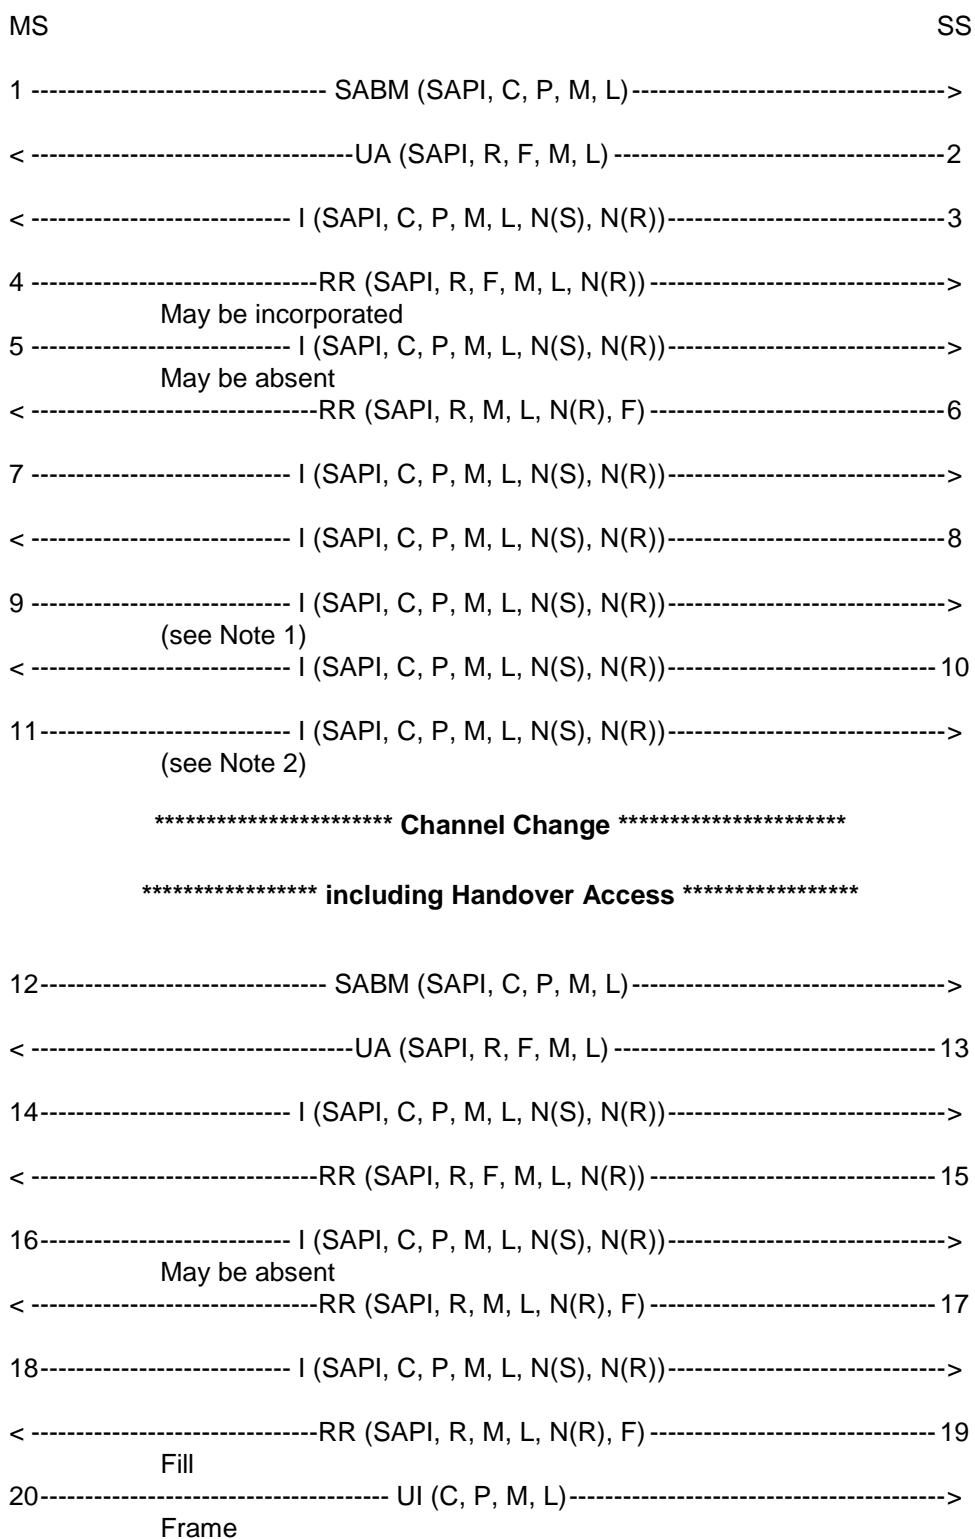

The MS shall then send an I frame with the Handover complete message. Assuming this is a finely synchronized handover.

The SS acknowledges this I frame.

The MS shall then resend the previous REGISTER or SETUP message, that is all frames which are acknowledged in the usual way.

The test has to be repeated on the FACCH.

Expected Sequence

NOTE 1: The MS may send RR frames on the FACCH in addition to the I frames in 9 and 11.

NOTE 2: The I frame in 11 is optional.

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM.

information field = information field of SABM.

3: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 < L < N201$, N(S) = 0, N(R) = 0.

information field = CM Service Accept.

6: One RR frame containing: (This frame is sent only if frame 5 was received)

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1.

8, 10: Two I frames containing:

SAPI = 0, C = 1, P = 0, M = 1, 0, L = N201, $\leq N201$, N(S) = 1, 2, N(R) = 1 or 0.

information field = Handover.

13: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

15, 17, 19: Two or three RR frames containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, 2 or 1, 2, 3.

25.2.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$.

information field = CM Service Request.

4: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

5, 7: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, L = N201, $\leq N201$, N(S) = 0, 1 or 0, N(R) = 1.

information field = Register or Setup.

9, 11: Two I frames containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 < L \leq N201$, N(S) = 1 or 0, N(R) = 2, 3.

information field = Register or Setup.

NOTE: The I frame in 11 is optional.

12: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

14: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 < L < N201$, N(S) = 0, N(R) = 0.

information field = Handover Complete.

16, 18: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, L = N201, $0 < L \leq N201$, N(S) = 1, 2 or 1, N(R) = 0.

information field = Register or Setup.

20: UI frame containing:

C = 0, P = 0, M = 0, L = 0.

25.2.3 Normal layer 2 disconnection

25.2.3.1 Test purpose

To test the normal data link disconnection sequences.

25.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

The SS sends a Layer 2 Disconnect message to the MS.

The MS shall respond with a UA frame and return to the idle state; no more Layer 2 (I, S or U) frames, except possibly one or more "Fill" frames, shall be sent. The SS may receive "Fill" frames after the sending of the DISC frame. If this occurs this may only happen for up to T200 after the sending of the DISC frame. The checking for Layer 2 frames, and the recording of any "Fill" frames, is done for a time defined as $4 \times T200$.

The SS confirms that the MS has returned to the idle state by performing test 25.2.1.1.1.

Expected Sequence

| MS | | SS |
|----|-------------------------------------|----|
| < | ----- DISC (SAPI, C, P, M, L) ----- | 1 |
| 2 | -----UA (SAPI, R, M, L, F)----- | > |

The frames from the SS will be:

1: One DISC frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0.

25.2.3.3 Test requirements

The frames from the MS shall be:

2: One UA frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0.

No other Layer 2 (I, S or U) frames shall occur. If "Fill" frames are sent this may only be done for up to T200 after the sending of the DISC frame.

25.2.4 Test of link failure

25.2.4.1 I frame loss (MS to SS)

25.2.4.1.1 Test purpose

To test that the MS repeats an I frame N200 times with T200 between two I frames and that the MS releases the layer 2 link after N200 repetitions of the I frame in the case when no answer to the I frame is received.

25.2.4.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

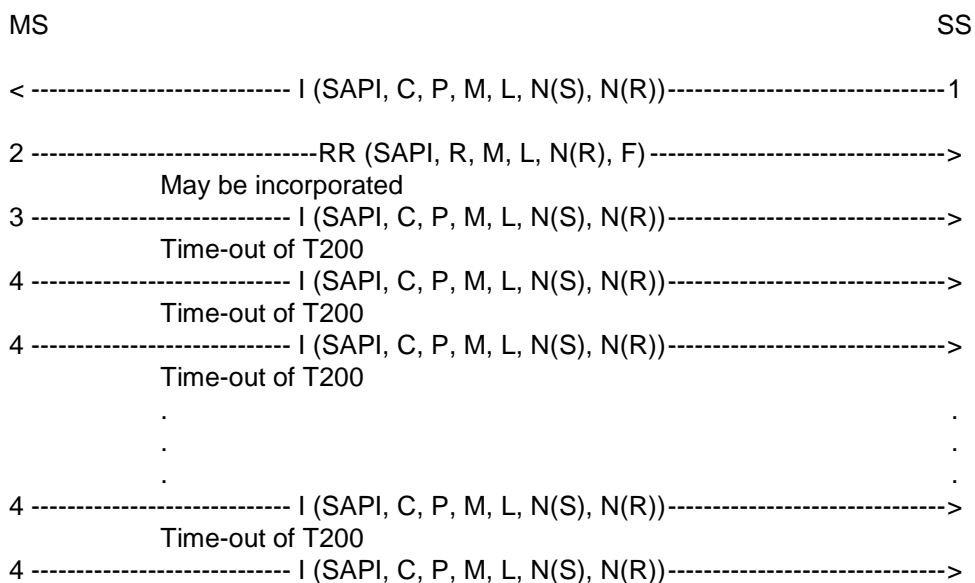

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

This is repeated until the MS has sent the I frame N200+1 times. The MS shall not send any layer 2 frame. This is checked for a time of $4 \times T200$. The MS shall return to the idle state. This is checked by performing test 25.2.1.1.1.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0.

information field = Identity Request.

25.2.4.1.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(R) = 1, N(S) = 0.

information field = Identity Response.

4: One I frame (occurs N200 times) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$, N(R) = 1, N(S) = 0.

information field = Identity Response.

25.2.4.2 RR response frame loss (SS to MS)

Covered in test 25.2.2.2.

25.2.4.3 RR response frame loss (MS to SS)

25.2.4.3.1 Test purpose

To test the Layer 2 recovery mechanism in the event of RR frame loss.

25.2.4.3.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends a I frame containing a Layer 3 message using PD = 1111 (e.g. OFH) to the MS. The L3 message is TEST INTERFACE with tested device equal to 0.

The MS shall respond with a RR frame.

The SS ignores the RR frame from the MS but after T200 from the I frame sent by the SS the SS repeats the I frame but with the P bit set to 1. This simulates loss of the RR from the MS.

The MS shall respond with either an RR or REJ frame.

NOTE: This requirement is less restrictive than 3GPP TS 04.06.

Expected Sequence

| MS | | SS |
|---------|---------------------------------------|----|
| < ----- | I (SAPI, C, P, M, L, N(S), N(R))----- | 1 |
| 2 ----- | RR (SAPI, R, M, L, N(R), F)----- | > |
| | Time-out of T200 | |
| < ----- | I (SAPI, C, P, M, L, N(S), N(R))----- | 3 |
| 4 ----- | RR (SAPI, R, M, L, N(R), F)----- | > |
| OR | | |
| 4 ----- | REJ (SAPI, R, M, L, N(R), F)----- | > |

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0.

3: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 3, N(S) = 0, N(R) = 0.

25.2.4.3.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

4: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1.

OR

4: One REJ frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1.

25.2.5 Test of frame transmission with incorrect C/R values

Purpose of tests

To test that the MS will react correctly upon the reception of a frame with incorrect C/R value.

Initial Conditions

Perform the establishment of the dedicated physical resource according to 25.1.5 and initialize the link as in subclause 25.2.1.1.1. Then proceed as stated below.

25.2.5.1 I frame with C bit set to zero

25.2.5.1.1 Test purpose

To test that the MS will take no action when it receives an I frame with the C bit set to zero (R).

25.2.5.1.2 Method of test

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

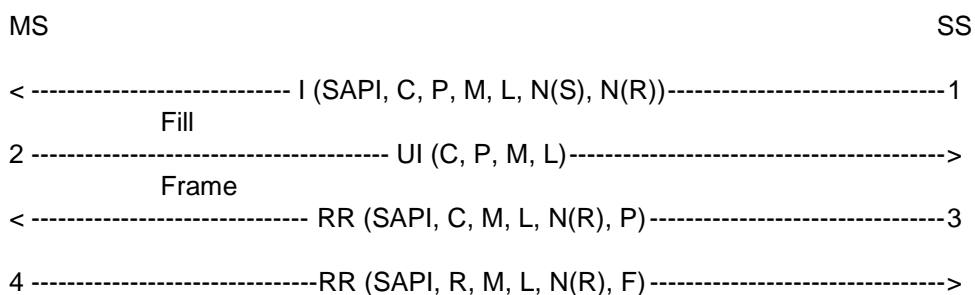

The SS shall send an I frame with the C bit set to zero to the MS.

The SS shall then wait for at least 4 times T200 to make sure that the MS does not respond to that I frame but that the MS keeps sending fill frames.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$, N(R) = 0, N(S) = 0.

Information field = Identity Request.

3: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0.

25.2.5.1.3 Test requirements

The frames from the MS shall be:

2: UI frames containing:

C = 0, P = 0, M = 0, L = 0.

4: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0.

25.2.5.2 SABM frame with C bit set to zero

25.2.5.2.1 Test purpose

To test that the MS will take no action when it receives an SABM frame with the C bit set to zero (R).

25.2.5.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an I frame containing a Layer 3 message using PD=1111 (e.g. 0FH) in order to raise V(R) in the MS to 1. The L3 message is TEST INTERFACE with tested device equal to 0.

The MS shall acknowledge this by the appropriate RR frame.

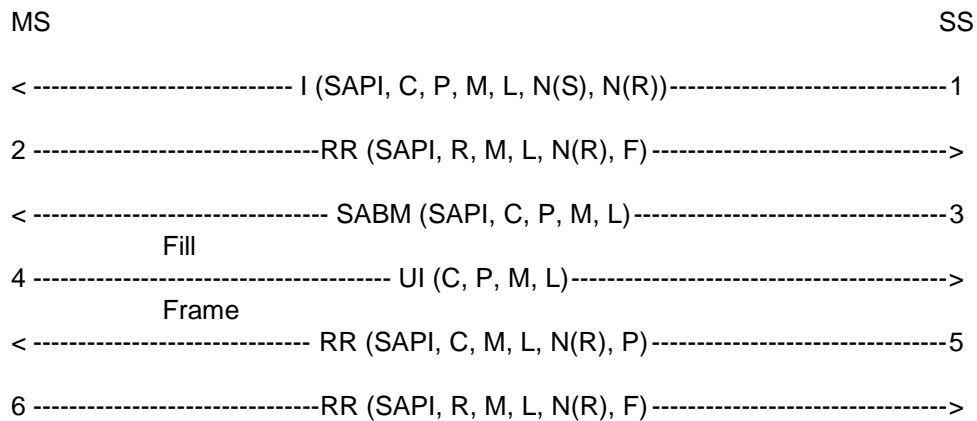

The SS sends SABM with the C bit set to zero.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

The MS is returned to the idle state as described in subclause 25.2.1.1.6.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0.

3: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

5: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0.

25.2.5.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

4: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

6: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1.

25.2.6 Test of errors in the control field

Purpose of tests

To test that the MS will react in the proper way to errors in the Control Field.

25.2.6.1 N(S) sequence error

25.2.6.1.1 Test purpose

To test that the MS will ignore the contents of the I field of an out-of-sequence I frame from the SS.

25.2.6.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS shall send a correct I frame containing Identity Request.

The MS shall acknowledge this in a RR frame or piggy back the acknowledgement onto the I frame carrying Identity Response.

The SS shall then send an I frame containing Identity Request with incorrect N(S) but correctly acknowledging the MS's I frame; P bit set to zero.

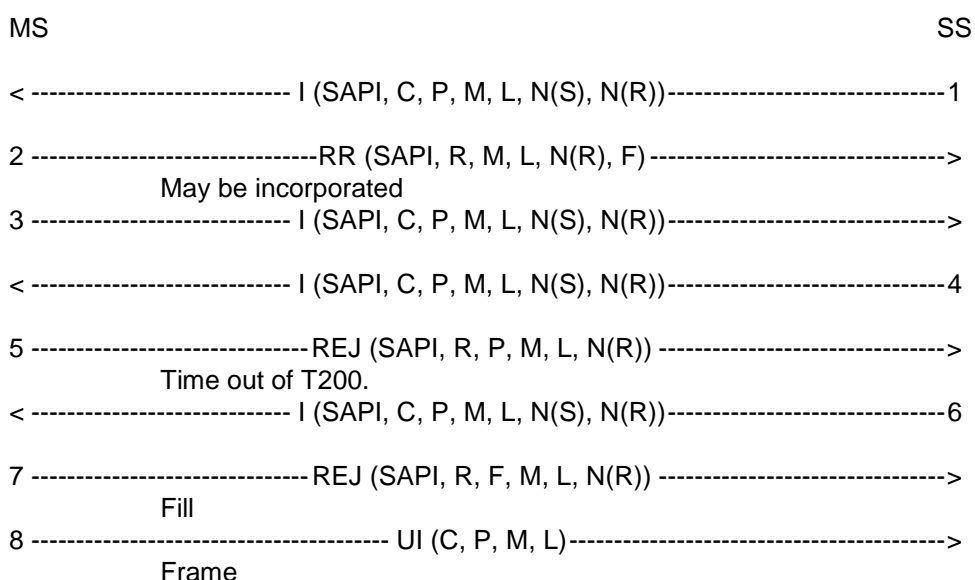

The MS shall send a REJ frame.

The SS shall, after T200, send another I frame with incorrect N(S), P bit set to 1 this time.

The MS shall respond with a REJ, F bit set to 1.

The MS shall resume the transmission of fill frames.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0.

information field = Identity Request.

4: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 1

information field = Identity Request

6: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 1

information field = Identity Request

25.2.6.1.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(R) = 1, N(S) = 0.

information field = Identity Response.

5: One REJ frame containing:

SAPI = 0, R = 1, P = 0, M = 0, L = 0, N(R) = 1.

7: One REJ frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1.

8: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

25.2.6.2 N(R) sequence error

25.2.6.2.1 Test purpose

To test that the MS will detect a N(R) sequence error and react in the proper way to it.

25.2.6.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS shall send an I frame containing an information field of length N201 and an incorrect receive sequence number.

The MS may:

- a) send a DISC frame within $N200 \times T200$; or
- b) perform a "local end release".

In case a) the SS shall respond with a UA frame. In case b) it detects a lower layer failure.

NOTE: The delay $N200 \times T200$ is specified for test purpose only. It is assumed that the L3 reaction time within the MS to command a release is less than this delay, which is less than the delay before the SS would detect a L2 failure.

Expected Sequence

| | |
|--|----|
| MS | SS |
| < ----- I (SAPI, C, P, M, L, N(R), N(S)) ----- | 1 |
| optional | |
| 2 ----- DISC (C, P, M, L) -----> | |
| < ----- UA (R, F, M, L) ----- | 3 |

The frames from the SS are:

1: One I frame:

SAPI = 0, C = 1, P = 0, M = 1, L = N201, N(R) = 1, N(S) = 0.

In case a):

3: One UA frame:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

25.2.6.2.3 Test requirements

The frame from the MS in case a) shall be:

2: One DISC frame:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

25.2.6.3 Improper F bit

25.2.6.3.1 Test purpose

To test that the MS, being in the timer recovery state, will return to the multiple frame established state only after having received an RR response with the F bit set to 1. This test is covered in test 25.2.2.2.

25.2.7 Test on receipt of invalid frames

25.2.7.1 Test purpose

To test that the MS will ignore all invalid frames.

25.2.7.2 Method of test

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

The SS shall then transmit an:

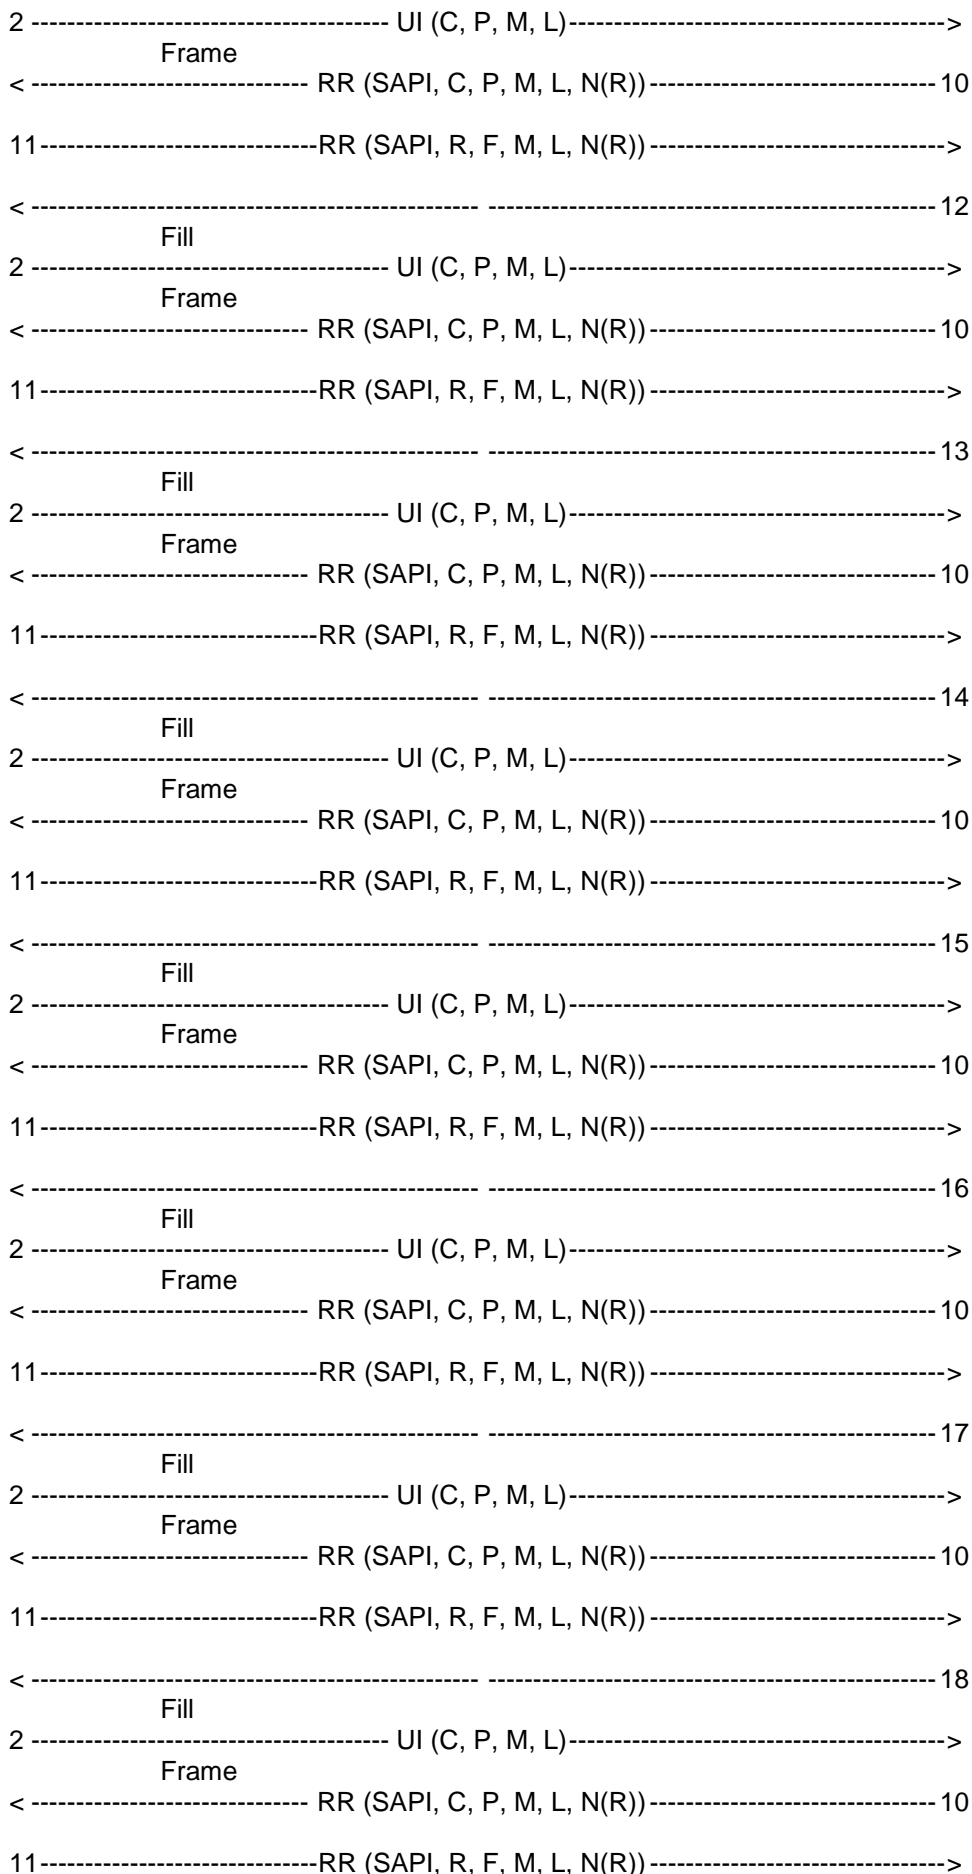

- RR frame with the Length indicator greater than zero and a faulty N(R);
- REJ frame with the EA bit set to zero and a faulty N(R);
- SABM frame with the EL bit set to zero;
- DM frame with the Length indicator greater than zero;
- DISC frame with the M bit set to 1;
- UA frame with the EA bit set to zero;
- I frame with the Length indicator greater than N201;
- I frame with the M bit set to 1 and the Length indicator less than N201;
- command frames with correct Address and Length indicator field and a non-implemented control field.

After T200 the SS shall in every case transmit an RR command, P bit set to 1.

The MS shall respond with an RR response, F bit set to 1.

Expected Sequence

The frames from the SS are:

1: One RR frame:

SAPI = 0, R = 0, F = 0, M = 0, L > 0, N(R) = 1.

3: One REJ frame:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, EA = 0.

4: One SABM frame:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, EL = 0.

5: One DM frame:

SAPI = 0, R = 0, F = 1, M = 0, L > 0.

6: One DISC frame:

SAPI = 0, C = 1, P = 1, M = 1, L = 0.

7: One UA frame:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, EA = 0.

8: One I frame:

SAPI = 0, C = 1, P = 0, M = 0, L > N201, N(R) = 0, N(S) = 6.

9: One I frame:

SAPI = 0, C = 1, P = 0, M = 1, L < N201, N(R) = 0, N(S) = 7.

10: One RR frame:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0.

12: One command frame with

Control Field = xxx1 1101.

13: One command frame with

Control field = xxx1 1011.

14: One command frame with

Control field = xxx1 0111.

15: One command frame with

Control field = 01x1 1111.

16: One command frame with

Control field = 1xx1 1111.

17: One command frame with

Control field = 0011 0011.

18: One command frame with

Control field = 1xx1 0011.

NOTE: An "x" stands for an arbitrary bit value.

25.2.7.3 Test requirements

The frames from the MS shall be:

2: One UI frame (occurs fifteen times):

$C = 0, P = 0, M = 0, L = 0.$

11: One RR frame (occurs fifteen times):

$SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0.$

26 Testing of layer 3 functions

Ref.: 3GPP TS 04.08 / 3GPP TS 24.008 / 3GPP TS 44.018

NOTE: The tests on functioning of the elementary procedures in the MS are grouped as the description of those procedures in 3GPP TS 04.08 / 3GPP TS 24.008 / 3GPP TS 44.018. However, the test procedures are carried out in an order which is more logic for the purpose of testing.

26.1 Default conditions and structured sequence of tests

26.1.1 Default test conditions during layer 3 tests

During tests in clause 26 the following default test conditions shall apply if not otherwise stated within the test description. In the table below, decimal values are normally used. Sometimes a hexadecimal value, indicated with a "H", or a binary value, indicated with a "B" is given.

| | GSM 900 | DCS 1 800 |

These informations are provided by system information 1, 2, 3 and 4 messages.

The system information elements which are broadcast on the SACCH during the dedicated mode should be consistent with those sent on the BCCH when the MS was in idle mode prior to the channel request.

In addition, all fill paging messages sent on the paging sub-channels will have by default, their page mode set to NORMAL PAGING.

26.1.2 Structured sequence of the tests

The tests shall be performed in the order as indicated in the following table.

The validity of the tests depends upon the results of the tests performed before.

| | | |
|---|----|--------------------------|
| Channel request (basic test) | RR | 26.2.1 |
| Immediate assignment | RR | 26.6.1 |
| IMSI attach/detach (basic) | RR | 26.2.2 |
| Paging | RR | 26.6.2 |
| Test of the mobile station functions in idle mode | RR | 26.3 |
| Frequency redefinition | RR | 26.6.6 |
| Measurement report (incl. system info not idle) | RR | 26.6.3 |
| Authentication | MM | 26.7.2 |
| Cipher mode setting | RR | 26.6.8 |
| Identification | MM | 26.7.3 |
| Sequenced MM/CM message transfer | .. | 26.2.3 |
| Channel release | RR | 26.6.12 |
| Location updating | MM | 26.7.4 |
| TMSI reallocation | MM | 26.7.1 |
| Classmark change | RR | 26.6.11 |
| Call control (verification on CC state diagram) | CC | 26.8.1.1 and 26.8.1.2 |
| Call rearrangement | CC | 26.8.1.4.4 |
| DTMF information transfer | CC | 26.8.1.4.1 |
| Handover | RR | 26.6.5 |
| Additional assignment | RR | 26.6.9 |
| Partial release | RR | 26.6.10 |
| Re-establishment | CC | 26.8.2 |
| Dedicated channel assignment (during calls) | RR | 26.6.4 |
| Transmission mode change | RR | 26.6.7 |
| Mobility management connection establishment | MM | 26.7.5 |
| Test of Layer 3 error handling | | 26.5 |
| User to user signalling | CC | 26.8.3 |
| Testing of structured procedures | | 26.9 |
| E-GSM or R-GSM or ER-GSM signalling | | 26.10 |
| Multiband signalling | | 26.11 |

26.1.3 General rules for message parameters

The following rules concerning message parameters apply to clause 26:

- 1) Those values of parameters which are a consequence of the context of a test and which are not specific to that test need not be defined.
- 2) If the value of a parameter of an uplink message (MS to Network) is specified in a test, the implicit meaning is that it has to be checked; if the value is not specified, it is not to be checked unless stated otherwise.
- 3) An optional field or optional Information Element of a downlink message (Network to MS), the presence of which is not a consequence of a test description, shall be absent in that test.
- 4) If an optional field or Information Element is not indicated for the uplink (MS to Network) - unless specified otherwise -, it may be included or not.
- 5) The Protocol Discriminator, Transaction Identifier and Message Type of all uplink messages have to be checked.

26.1.4 General rules for layer 3 testing

Unless otherwise specified, before the SS pages the MS, the MS must be given the necessary time to be able to receive paging (see clause 20). In addition and unless otherwise specified, the SS must wait at least 1s after the last time slot of the message block containing a CHANNEL RELEASE, before sending a PAGING to the mobile (see 3GPP TS 04.13).

In the signalling tests, where the following statement is used:

- 'the RF level of cell x is set sufficiently low to ensure that cell x is not suitable as defined in 3GPP TS 05.08 subclause 6.6.2';

this means that for the cell to be "not suitable" by virtue of its RF level, the RF level is to be lowered until C1 is below 0.

26.1.5 Format of layer 3 test descriptions

In subclauses 26.2, 26.5, 26.6, 26.7, 26.9, 26.10 and 26.11 a rigorous description technique is used which is defined here.

For every test, a subclause titled "method of test" and a subclause titled "expected sequence" define the exact test steps and the verifications to be performed in the test. These subclauses are normative and give requirements for the MS behaviour. The information of both subclauses applies.

For the message contents further normative requirements for the MS behaviour are defined in the following parts which apply in the following order (starting with the highest) on basis of the general rules of 26.1.3:

- specifications in the "method of test" and "expected sequence" subclauses;
- specifications in the subclause titled "specific message contents";
- specifications in the subclause "default message contents" at the end of the relevant subclauses 26.5, 26.6, 26.7, 26.9, 26.10 or 26.11;
- specifications of default conditions in subclause 26.1.

The relevant section may contain the definition of abbreviations of L3 message names that are used in that section.

In many cases, a test description contains an introductory subclause explaining the background of the relevant procedures and explaining why the tests of that description are essential.

For every test, test purposes are given. In general conformance testing methodology, the correspondence between test purposes and test cases can be n to m: To one test purpose more than one test case may correspond (e.g. different test cases checking data variations); also a test case may serve more than one test purpose. In some contexts a structure of conformance test descriptions is advisable which specifies in one part (non-duplicated) test purposes with references to corresponding test suites serving the test purposes, in another part test suites realizing the test purposes; this structuring is especially useful for gaining completeness and avoiding duplications. In the present document, however, it is preferred to group descriptions by test cases. The reasons are:

- The structure is more sought to assist the test execution and evaluation than test development. It must be easy to determine why a wrong behaviour leads to a verdict.
- The structure is to be close to GSM 11.10 phase 1.

For every test purpose of a test, a conformance requirement is given.

For each conformance requirement in a test description, references to core specifications are given.

For every test, the related PICS/PIXIT statements that are necessary for performing the test are given.

For every test, initial conditions for both the System Simulator and the Mobile Station are given. Unless otherwise specified, these initial conditions apply together with the default conditions of 26.1, the initial conditions of the test prevailing over the default conditions of 26.1.

For every test, the foreseen final state of the MS after the test and the maximum duration of the test are specified. These parts are non-normative and do not contain a description of verifications to be performed. The contained information might be used for sequencing different tests and for the decision when a test is to be interrupted.

The expected sequence specifies the actions in numbered steps in a tabular form. In the column "direction", "SS -> MS" denotes a message sent from the SS to the MS, "MS -> SS" denotes a message sent from the MS to the SS, "SS" denotes an action at the SS, "MS" denotes an action at the MS (e.g. interaction with the user or higher layers). The column "message" defines the L3 messages to be sent or expected by the SS. In the "comments" column, further normative information is to be found, e.g. message parameters. In some cases, different alternative behaviours are possible in a test. Then test steps in alternative sequences are numbered as:

"A n", "A n + 1", ..., "A n + k";

"B n", "B n + 1", ..., "B n + l";

"C n", "C n + 1", ..., "C n + m";

etc. (n, m, l, k integers > 0).

and step numbering of a re-unified sequence resumes with the lowest of $n + k + 1$, $n + l + 1$, $n + m + 1$.

In some cases the test steps of a test are to be repeated. Then an execution counter is introduced for the test.

26.2 Initial tests

26.2.1 Channel request

The random access procedure is used by the MS to ask for resources to the network. If it is not performed correctly, the MS could prevent other MSs from obtaining resources, or the network could be overloaded if the MS does not respect the duration between 2 CHANNEL REQUEST messages.

26.2.1.1 Channel request / initial time

26.2.1.1.1 Conformance requirement

- 1) The MS shall start the initial access procedure at the latest 0,7 s after reception of the paging message.
- 2) The MS shall spread the initial CHANNEL REQUEST with equal probability on the correct number of time slots.

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.3.1.1.2 and 3.3.2.2.

26.2.1.1.2 Test purpose

- 1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0,7 s after reception of the PAGING message.
- 2) To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision.

26.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Tx-Integer = 5. The CCCH is either combined or not with SDCCH. This is arbitrarily chosen.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

Specific test parameters:

K = 200.

The MS is paged. The SS measures and stores the number of CCCH RACH slots between the sending of the PAGING REQUEST message and the reception of the CHANNEL REQUEST from the MS, excluding the slots containing the messages themselves. The SS sends an IMMEDIATE ASSIGNMENT REJECT. The sequence is performed K times.

Maximum Duration of Test

30 min.

Between two consecutive executions (for k and k+1), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter k = 1, ... , K.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile Identity" IE contains the TMSI allocated to the MS. |
| 2 | SS | | The SS measures the number f of CCCH RACH slots between the sending of PAGING REQUEST message and the reception of a CHANNEL REQUEST message from the MS. |
| 3 | SS | | The SS stores f. f(k) shall be lower than 700/4,615+8 if the CCCH is not combined or lower than 81+8 if the CCCH is combined with SDCCH. |
| 4 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | the first "request reference" corresponds to the CHANNEL REQUEST sent by the MS. |

NOTE: The test limit has been computed to give a confidence of [99,74 %] that a unit which follows the requirements will pass. The number of samples (200) has been chosen to get a good compromise between the test time and the risk of passing a bad unit.

26.2.1.1.4 Test requirements

$S(n) = \text{CARD} \{k \mid f(k) = n\}$

The following requirements shall be met:

$S(n) \leq 41$ for all n.

NOTE: $CARD \{k \mid f(k) = n\}$ is mathematical notation for the number of times that $f(k)$ equals n .

26.2.1.2 Channel request / repetition time

26.2.1.2.1 Conformance requirement

- 1) The MS shall spread retransmissions of a CHANNEL REQUEST message, with equal probability on Tx-Integer timeslots and with the correct delay after the reception of the PAGING REQUEST.
- 2) The MS shall not retransmit another CHANNEL REQUEST message when Max-retrans is reached.

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2.

26.2.1.2.2 Test purpose

- 1) To verify that the MS spreads retransmission of a CHANNEL REQUEST message with equal probability on Tx-Integer time slots and correctly applies the fixed delay when the following conditions apply:
 - the CCCH is combined or not combined with SDCCHs;
 - the maximum number of retransmissions is equal to one of the following values: 1, 2, 4, 7;
 - Tx-Integer is put to any of the allowed values among those which are greater or equal to 6.
- 2) To verify that the MS retransmits exactly Max_Retrans times a CHANNEL REQUEST message if the network never responds to the CHANNEL REQUEST message.

26.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell.

Tx-Integer is arbitrarily chosen in the set {6, 7, 8, 9, 10, 11, 12, 14, 16, 20, 25, 32, 50}.

Max_Retrans is arbitrarily chosen in the set {1, 2, 4, 7}.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

Specific test parameters

K equals the upper rounded value of $230/\text{Max_Retrans}$.

m equals the upper rounded value of $0,5 \times \text{Tx-Integer}$.

Counter $M = 0$.

Parameter S : according to table 3.1/3GPP TS 04.08 / 3GPP TS 44.018 (this parameter depend on the value chosen for Tx-Integer).

$N0 = \max(8, \text{Tx-Integer})$.

The MS is paged. The MS sends a CHANNEL REQUEST message. The MS retransmits CHANNEL REQUEST messages Max_Retrans times. The SS measures the number of CCCH RACH slots $f(i,k)$ between the moment where a CHANNEL REQUEST message has been received, and the reception of the following CHANNEL REQUEST message, excluding the slots containing the messages themselves. The SS updates the counter M . The SS does not answer to the CHANNEL REQUEST messages Max_Retrans times. After the last CHANNEL REQUEST message in every sequence where k is lower than K , the SS sends an IMMEDIATE ASSIGNMENT REJECT . In the last sequence ($k = K$), the SS does not respond to the MS. The MS shall not send any other CHANNEL REQUEST message.

Maximum Duration of Test

The execution of one sequence (for one value k): 10 s.

Between two consecutive executions (for k and $k+1$), the SS must wait for 35 s, which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter $k = 1, \dots, K$ for each of the 2 test cases.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile Identity" = TMSI of the MS. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 3 | MS -> SS | CHANNEL REQUEST | Steps 3, 4, 5 are executed for execution counter $i = 1, \dots, \text{Max_Retrans}$. |
| 4 | | | "Establishment Cause" = Answer to paging. The SS measures the number $f(i,k)$ of CCCH RACH slots between: - the moment where the last CHANNEL REQUEST message has been received, and - the reception of the new CHANNEL REQUEST message from the MS, excluding the slots containing the messages themselves. $f(i,k)$ shall be in the set $\{S, S+1, \dots, S+T-1\}$ |
| 5 | SS | | If $f(i,k) - S \geq m$, $M = M+1$ |
| A6 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Depending on the value of k , step A6 or B6 is performed: $k < K$ The third "Request Reference" IE corresponds to the last CHANNEL REQUEST message received. The third "Wait Indication" IE specifies 0 s. Other fields do not address the MS under test. |
| B6 | SS | | $k = K$ The SS checks that the MS sends no more CHANNEL REQUEST messages. This is verified during 3 s. |
| 7 | SS | | $M / (K * \text{Max_Retrans})$ shall be inside the following interval: $[0,8 - m/\text{Tx-Integer} ; 1,2 - m/\text{Tx-Integer}]$ |

NOTE: The confidence interval in step 7, and the number of samples are chosen in such a way that the possibility of not accepting a correct MS is less than [0,26 %].

26.2.1.3 Channel request / random reference

26.2.1.3.1 Conformance requirement

A CHANNEL REQUEST message sent by the MS shall include a random reference randomly drawn from a uniform probability distribution for every new transmission.

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.23.3.1.2.

26.2.1.3.2 Test purpose

To verify that an MS produces different random references for a CHANNEL REQUEST. If a MS always produces the same random reference, it makes possible that different MSs of the same product series produce the same random reference.

26.2.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH not combined with SDCCH.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a valid TMSI. It is in the MM-state "idle, updated" and in the RR idle-mode.

Test Procedure

Specific test parameters:

K = 7.

D = 4.

The SS sends a PAGING REQUEST message. The SS stores the "Random Reference" r(k) contained as a parameter in the CHANNEL REQUEST message sent by the MS. This sequence is performed K times, and it is verified that the MS produces different values r(k).

Maximum Duration of Test

6 min

Between two consecutive executions (for k and k+1), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter k = 1, ..., K.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 3 | SS | | The SS stores the "Random Reference" contained in the CHANNEL REQUEST message. |

26.2.1.3.4 Test requirements

At least D values of $r(1)$, ..., $r(k)$ shall be different.

NOTE: D has been computed such that the probability of refusing a correct MS is less than [0,027 %].

26.2.2 IMSI detach and IMSI attach

The IMSI detach/attach procedures are used to indicate to the network that the MS is deactivated/activated. These procedures are allowed or not by the network (ATT flag set to "MSs in the cell shall apply IMSI attach and detach procedure" or "MSs in the cell are not allowed to apply IMSI attach and detach procedure").

If the IMSI attach procedure does not work correctly then the network would in certain situations not try to establish Mobile Terminating call even if the MS is "idle updated".

If an MS performs an unwanted IMSI detach procedure or does not perform IMSI detach when required, network resources are wasted.

26.2.2.1 Conformance requirement

- 1) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI detach procedure upon deactivation.
- 2) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI attach procedure upon activation.
- 3) The MS shall not perform the IMSI detach procedure if the Subscriber Identity Module is removed when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".
- 4) The MS shall not perform the IMSI attach procedure if the Subscriber Identity Module is inserted, when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".
- 5) The MS shall correctly perform the IMSI detach procedure, upon switch off, when it is required by the network to do so.
- 6) The MS shall correctly perform the IMSI attach procedure upon switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure, which is part of this IMSI attach procedure, this means that the MS shall send a TMSI REALLOCATION COMPLETE message.
- 7) The MS shall correctly perform the IMSI detach procedure upon SIM removal when it is required by the network to do so.
- 8) The MS shall correctly perform the IMSI attach procedure, following SIM insertion and switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure which is part of this IMSI attach procedure. This means that the MS shall send a TMSI REALLOCATION COMPLETE message.

Reference(s):

3GPP TS 02.07, normative annex B, subclause B1.17.

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.4.3 and 4.4.4.

26.2.2.2 Test purpose

- 1) To verify that the MS correctly performs IMSI detach/attach procedures when it is required by the network and upon deactivation/activation or SIM removal/insertion and does not perform these procedures when not required.
- 2) To verify that the mobile station acknowledges a re-allocated TMSI during IMSI attach.

26.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters.

For procedures 1 and 2 ATT flag is set to "MSs in the cell are not allowed to apply IMSI attach and detach procedure".

For procedures 3 and 4 ATT flag is set to "MSs in the cell should apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Specific PICS statements:

- a: SIM removal possible without removing power source (TSPC_AddInfo_SIMRmv)
- b: On/off switch (TSPC_Feat_OnOff)
- c: IMSI detach after SIM removal (TSPC_AddInfo_DetachOnSIMRmv)
- d: IMSI detach after removing power source (TSPC_AddInfo_DetachOnPwrDn)

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a valid TMSI which may be different from the initial one. It is "idle updated".

Test Procedure

The SS indicates that IMSI detach/attach is not allowed. If possible the MS is switched off, then switched on, otherwise it has its power source removed and then restored (see b in PICS). The SS checks that the MS does not perform IMSI detach/attach procedures. If possible (if a = Yes, see PICS), the SIM is removed, then the SIM is inserted. The SS checks that the MS does not perform IMSI detach/attach procedures.

The SS indicates that IMSI detach/attach is allowed. After a delay of 35s the MS should have detected that the SS indicates now, that IMSI detach/attach is allowed. If possible (if b = Yes, see PICS) the MS is switched off, otherwise it has its power source removed (if d = Yes, see PICS). The MS initiates an IMSI detach procedure. Then depending on what has been performed before, the MS is switched on or has its power source restored. It initiates an IMSI attach procedure. The location updating procedure contains an implicit TMSI reallocation. The SIM is removed or power source is removed. If (a = yes and c = yes) or (a = no and d = yes) the MS initiates an IMSI detach procedure. Then the SIM is inserted or power source is restored, it initiates an IMSI attach procedure, the location updating procedure contains an implicit TMSI reallocation.

Maximum Duration of Test

4 min

Expected Sequence

Procedure 1

| Step | Direction | Message | Comments |
|------|-----------|---------|--|
| 1 | MS | | If possible the MS is switched off (see b in PICS), otherwise the MS has its power source removed. The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 s. Depending on what has been performed in step 1, the MS is brought back to operation. The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 s. |
| 2 | MS | | |
| 3 | MS | | |
| 4 | MS | | |

Procedure 2

| | | | |
|---|----|--|--|
| 1 | MS | | If possible (a = Yes, see PICS), the SIM is removed from the MS. The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 s. The SIM is inserted in the MS. The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 s. |
| 2 | MS | | |
| 3 | MS | | |
| 4 | MS | | |

Procedure 3

| | | | |
|----|----------|----------------------------|---|
| 1 | MS | | The MS is switched off, or has its power source removed, depending on value b in the PICS file. If b = Yes or d = Yes the MS initiates an IMSI detach procedure (steps A2, A3, A4, A5), otherwise the SS goes straight to step 6. |
| A2 | MS -> SS | CHANNEL REQUEST | After the sending of this message, the SS waits the disconnection of the main signalling link. |
| A3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| A4 | MS -> SS | IMSI DETACH INDICATION | |
| A5 | SS -> MS | CHANNEL RELEASE | |
| 6 | MS | | |
| 7 | MS -> SS | CHANNEL REQUEST | "Location Updating Type" = IMSI attach. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 9 | MS -> SS | LOCATION UPDATING REQUEST | The SS allocates a new TMSI |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 11 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

Specific message contents:

SYSTEM INFORMATION TYPE 3 message:

| Information Element | value/remark |
|--|---|
| Control Channel Description - Attach/Detach allowed | MS shall apply IMSI attach and detach procedures. |

Procedure 4

| | | | |
|----------------------|--|--|---|
| 1 | MS | | The SIM is removed from the MS, or has its power source removed. If (a = Yes and c= Yes) or (a = no and d = yes) in PICS, the MS initiates an IMSI detach procedure (steps A2, A3, A4, A5), otherwise the SS goes straight to step 6. |
| A2 A3 A4 A5 | MS -> SS SS -> MS MS -> SS SS -> MS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT IMSI DETACH INDICATION CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |
| 6 | MS | | Depending on what has been performed in step 1, the MS is brought back to operation. |
| 7 | MS -> SS | CHANNEL REQUEST | The MS initiates a IMSI attach procedure. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 9 | MS -> SS | LOCATION UPDATING REQUEST | "Location Updating Type" = IMSI attach. |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT | The SS allocates a new TMSI |
| 11 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

Specific message contents:

SYSTEM INFORMATION TYPE 3 message:

| Information Element | value/remark |
|--|---|
| Control Channel Description - Attach/Detach allowed | MS shall apply IMSI attach and detach procedures. |

26.2.3 Sequenced MM / CM message transfer

The RR sublayer of the MS shall have an associated send state variable V(SD) for sending MM and CM messages. This send state variable has been introduced to avoid the duplication of MM and CM messages. It is useful for the network after a handover or a change of channel to identify duplicated messages.

If the MS started V(SD) with 1 instead of 0 the network would incorrectly diagnose loss of message.

If the MS later on does not handle correctly incrementation of V(SD) the network would not be able to continue the dialogue.

26.2.3.1 Conformance requirement

The MS shall implement correctly the "send state variable V(SD)" ("Send duplicated"), included in transmitted MM and CM messages.

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.1.4.3.

26.2.3.2 Test purpose

To verify that V(SD) is correctly set to 0 at the beginning of the establishment of the first RR connection and to verify that the MS handles correctly this variable in the special case of IDENTITY REQUEST messages, which are MM messages.

26.2.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

The MS is paged. After reception of the PAGING RESPONSE message from the MS, the SS sends an IDENTITY REQUEST message. The MS sends an IDENTITY RESPONSE message where N(SD) = 0. The SS repeats its IDENTITY REQUEST message 10 times. The MS transmits IDENTITY RESPONSE message with the value 1 and 0 in the N(SD) field alternately.

Maximum Duration of Test

1 min

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | IDENTITY REQUEST | |
| 6 | MS -> SS | IDENTITY RESPONSE | N(SD) = 0 |
| 7 | SS -> MS | IDENTITY REQUEST | Steps 7, 8, 9 and 10 are repeated 5 times. |
| 8 | MS -> SS | IDENTITY RESPONSE | N(SD) = 1. |
| 9 | SS -> MS | IDENTITY REQUEST | |
| 10 | MS -> SS | IDENTITY RESPONSE | N(SD) = 0. |
| 11 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

26.2.4 Establishment cause

The establishment cause set by the MS in the CHANNEL REQUEST message shall be consistent with the requested service or function, with the capabilities of the MS and with the indications given by the network.

If the MS uses a wrong establishment cause, the network might assign an inappropriate or incompatible resource.

In the case of Emergency call a wrong priority might be used.

If a reserved value is used, the network may discard the channel request.

26.2.4.1 Conformance requirements

In the CHANNEL REQUEST message, the MS shall include an establishment cause which correspond to the establishment cause given by the MM sublayer and the broadcasted NECI value, or which correspond to one of the establishment causes "answer to paging" given by the RR entity in response to a PAGING REQUEST message including the Channel Needed information.

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2.

26.2.4.2 Test purpose

To verify that the establishment cause sent by the MS in the Max-Retrans+1 CHANNEL REQUEST messages is consistent with the requested service, with the capabilities of the MS and with the indications of the network in the following cases:

- 1) If the MS supports a service on a traffic channel:
 - 1.1 when the NECI bit is set to 0 and call re-establishment is attempted and the call was established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise.
- 2) If the MS supports a service on half rate channel:
 - 2.1 when the NECI bit is set to 1 and call re-establishment is attempted and the call was established on TCH/H.
- 3) If the MS supports speech:
 - 3.1 when the NECI bit is set to 0 and a speech call is attempted.
 - 3.2 when the NECI bit is set to 1 and a speech call is attempted.
- 4) If the MS supports a data service:
 - 4.1 when the NECI bit is set to 0 and a data call is attempted.
 - 4.2 when the NECI bit is set to 1 and a data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used).
- 5)
 - 5.1 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "any channel".
 - 5.2 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "SDCCH".
 - 5.3 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/F".
 - 5.4 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/H or TCH/F".
- 6)
 - 6.1 when the NECI bit is set to 0 and IMSI attach is attempted.
 - 6.2 when the NECI bit is set to 0 and normal location updating is attempted.
 - 6.3 when the NECI bit is set to 0 and periodic location updating is attempted.
 - 6.4 when the NECI bit is set to 0 and IMSI detach is attempted.
 - 6.5 when the NECI bit is set to 1 and IMSI attach is attempted.
 - 6.6 when the NECI bit is set to 1 and normal location updating is attempted.
 - 6.7 when the NECI bit is set to 1 and periodic location updating is attempted.
 - 6.8 when the NECI bit is set to 1 and IMSI detach is attempted.

7) If the MS supports a non call related supplementary service operation:

7.1 when the NECI bit is set to 0 and a supplementary service operation is attempted at the MS.

7.2 when the NECI bit is set to 1 and a supplementary service operation is attempted at the MS.

8) If the MS supports SMS/PP MO:

8.1 when the NECI bit is set to 0 and a mobile originated short message service transaction is attempted.

8.2 when the NECI bit is set to 1 and a mobile originated short message service transaction is attempted.

NOTE: To verify that when the MS supports speech and an emergency call is attempted and the NECI bit is set to 0, then the MS sends a CHANNEL REQUEST message with an establishment cause consistent with the requested service, with the capabilities of the MS and with the indications of the network is done in test 26.9.6.1.1 test purpose 1.

26.2.4.3 Method of test

Initial Conditions

System Simulator:

for all procedures: 1 cell, Max-Retrans = 7 slots. The NECI bit is set to 0.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Specific PICS statements:

- a: MS supports speech on TCH/F (TSPC_AddInfo_Full_rate_version_1)

- b: MS supports speech on TCH/H (TSPC_AddInfo_Half_rate_version_1)

- c: MS supports data on TCH/F (TSPC_AddInfo_FullRateData)

- d: MS supports data on TCH/H (TSPC_AddInfo_HalfRateData)

- e: MS only supports SDCCH (TSPC_AddInfo_SDCCHOnly)

- f: MS supports a supplementary service operation (TSPC_AddInfo_SS)

- g: MS supports SMS/PP MO (TSPC_Serv_TS22)

- h: On/Off switch (TSPC_Feat_OnOff)

- i: MS supports AMR (TSPC_AddInfo_Full_rate_version_3)

- j: MS supports Speech for Half Rate Version 3 (TSPC_AddInfo_Half_rate_version_3)

NOTE: In the above PICS, data and speech refer to the Radio Resource Channel Mode.

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedures

NOTE: If the procedures are chained, the SS shall ensure that at the beginning of each procedure, the initial conditions are reached and that the MS had enough time to decode the broadcasted parameters.

Procedure 1

If the MS supports a service on a traffic channel:

A call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "110".

Procedure 2

If the MS supports a service on half rate channel:

The NECI bit is set to 1. A call is established on TCH/H for a supported service. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "011010".

Procedure 3

If the MS supports speech:

A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111" if the MS does not support speech on half rate channel (version 1, GSM, nor version 3, AMR) or "0100" if the MS supports speech on half rate channel (version 1, GSM, or/and version 3, AMR).

Procedure 4

If the MS supports a data service:

A data call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used). The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111" if the MS does not support a data service on half rate channel or "0101" if the MS supports a data service on half rate channel.

Procedure 5

The MS is paged with the paging indication set to "any channel". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "SDCCH". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0010" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only. The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "TCH/H or TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST

messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0011" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only.

Procedure 6

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

The MS is switched off or powered off. Then system information messages are altered so that IMSI attach/detach is allowed in the cell. The MS is switched on or powered on. The MS performs IMSI attach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or "000" when NECI = 0. The IMSI attach procedure is followed. The location area code of the cell is changed, T3212 is set to 1 deci-hour. The MS performs a location updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or "000" when NECI = 0. The location updating procedure is followed. The SS waits for at least 7 minutes. The MS performs a periodic updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000". The location updating procedure is followed. The MS is switched off or powered off. If the MS has an On/off switch (see PICS), it attempts IMSI detach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or "111" when NECI = 0.

Procedure 7

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

If the MS supports a non call related supplementary service operation:

A supplementary service operation is attempted at the MS. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001".

Procedure 8

If the MS supports SMS/PP MO:

A mobile originated short message service transaction is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or "111" when NECI = 0.

Maximum Duration of Test

For procedures 1, 2, 3, 4 and 5: 5 minutes, including 1 minute for any necessary operator actions.

For procedure 6: 20 minutes, including 2 minutes for any necessary operator actions.

For procedures 7, 8: 10 minutes, including 2 minutes for any necessary operator actions.

Expected Sequence

Procedure 1

This procedure is performed if the MS supports a service on a traffic channel.

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | | | a call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The generic call setup procedure is used. |
| 2 | SS | | the SS stops transmission on the SACCH. |
| 3 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "110" |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 2

This procedure is performed if the MS supports a service on half rate channel.

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS | | The NECI bit is set to 1, a call is established on TCH/H for a supported service. The generic call setup procedure is used. |
| 2 | | | the SS stops transmission on the SACCH. |
| 3 | SS | | all messages have establishment cause set to "011010" |
| 4 | MS -> SS | 8 CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 3

This procedure is performed if the MS supports speech.

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | MS | | a speech call is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "111" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The NECI bit is set to 1 |
| 5 | SS | | The SS waits for 30 s |
| 6 | MS | | a speech call is attempted |
| 7 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "0100" if the MS supports speech (GSM and/or AMR) on half rate or set to "111" otherwise |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 4

This procedure is performed if the MS supports a data service.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | MS | | a data call is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "111" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | |
| 5 | SS | | The NECI bit is set to 1 |
| 6 | MS | | The SS waits for 30 s |
| 7 | MS -> SS | 8 CHANNEL REQUEST | a data call is attempted for a service supported by the MS on half rate (for any data service if the MS does not support any data service on half rate) |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | all messages have establishment cause set to "0101" if the MS supports a data service on half rate or set to "111" otherwise |

Procedure 5

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|------------------------------------|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = any channel |
| 2 | MS -> SS | 8 CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The SS waits for 5 s |
| 5 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = SDCCH |
| 6 | MS -> SS | 8 CHANNEL REQUEST | |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 8 | SS | | The SS waits for 5 s |
| 9 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = TCH/F |
| 10 | MS -> SS | 8 CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 12 | SS | | The SS waits for 5 s |
| 13 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = TCH/H or TCH/F |
| 14 | MS -> SS | 8 CHANNEL REQUEST | |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 6

The sequence is executed for execution counter $k = 1, 2$.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 0 | SS | | When $k = 1$, NECI set to 0 When $k = 2$, NECI set to 1 |
| 1 | MS | | The MS is switched off or has its power source removed |
| 2 | SS | | IMSI attach/detach is set to "MSs in the cell shall apply IMSI attach and detach procedure" |
| 3 | MS | | The MS is switched on or powered on |
| 4 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "000" when $k = 1$ "0000" when $k = 2$ |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = IMSI attach |
| 7 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 8 | SS -> MS | CHANNEL RELEASE | |
| 9 | SS | | the LAC of the cell is changed and T3212 is set to 6 minutes |
| 10 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "000" when $k = 1$ "0000" when $k = 2$. The MS must send its first Channel Request within 33s after the LAC has been changed. |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 12 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = Normal location updating |
| 13 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 14 | SS -> MS | CHANNEL RELEASE | |
| 15 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "000" when $k = 1$ "0000" when $k = 2$. The MS must send its first Channel Request within 7 minutes after the preceding Channel Release |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 17 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = Periodic updating |
| 18 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 19 | SS -> MS | CHANNEL RELEASE | |
| 20 | MS | | If possible (see PICS), the MS is switched off, otherwise it has its power source removed |
| 21 | MS | | If the MS was switched off it attempts IMSI detach |
| 22 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "111" when $k = 1$ "0001" when $k = 2$ |
| 23 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 7

The sequence is executed for execution counter $k = 1, 2$.

This procedure is performed if the MS supports a non call related supplementary service operation.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 0 | SS | | When $k = 1$, NECI set to 0 When $k = 2$, NECI set to 1 |
| 1 | MS | | a non call related supplementary service operation is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "111" when $k = 1$ "0001" when $k = 2$ |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 8

This procedure is performed if the MS supports SMS/PP MO.

The sequence is executed for execution counter k = 1, 2.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 0 | SS | | When k = 1, NECI set to 0 When k = 2, NECI set to 1 a mobile originated short message service transaction is attempted all messages have establishment cause set to: "111" when k = 1 "0001" when k = 2 |
| 1 | MS | | |
| 2 | MS -> SS | 8 CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

26.3 Test of MS functions in idle mode

26.3.1 Initial conditions

The SIM shall contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

Related PICS/PIXIT statements

During the tests in subclauses 26.3.2 and 26.3.3, the following parameters apply according to the above PICS/PIXIT statement:

| 8 | +53 | 251 |

For testing an E-GSM Mobile station (see PICS/PIXIT), the BCCH ARFCN of cell 7 at GSM 900 column shall be 985 (instead of 97). For testing an R-GSM or an ER-GSM Mobile station (see PICS/PIXIT), the BCCH ARFCN of cell 7 at GSM 900 column shall be 965 (instead of 97).

NOTE 4: The SIM should contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

26.3.2 MS indication of available PLMNs

26.3.2.1 Test purpose

To verify that a MS can present the available PLMNs to the user when asked to do so in manual mode according to the requirements of 3GPP TS 05.08 and 3GPP TS 02.11.

26.3.2.2 Method of test

- a) The MS is switched on, equipped with a SIM containing default values except for those values listed under subclause 26.3.1 (initial conditions).
- b) The MS is put into manual network selection mode (see PIXIT).

26.3.2.3 Test requirements

- 1) On entering manual network selection mode, the MS shall present a list of available PLMNs in all its bands of operation (MCC and MNC values, or any other valid indications, see PIXIT), within 2 minutes. Any PLMN shall only be presented once. The list shall include the MCC and MNC of:

GSM 400, GSM 710, GSM 750, T-GSM 810, GSM 850 and GSM 900: cells 1 to 7, but not of cell 8.

DCS 1 800: cells 1 to 6, but not of cell 7.

PCS 1 900: cells 1 to 6, but not of cell 7.

Multiband: cells 2, 3, 4, 6, 7 and 1 or 5 (cell 1 and 5 have the same MCC and MNC), but not of cell 8.

26.3.3 MS will send only if BSS is "on air"

26.3.3.1 Test purpose

To verify that the MS will not produce any RF transmission if no BSS is received.

26.3.3.2 Method of test

- a) The RF-signal for the BCCHs of:

GSM 400, GSM 710, GSM 750, T-GSM 810, GSM 850 and GSM 900: cell 1 to 8 is switched off.

DCS 1 800: cell 1 to 7 is switched off.

PCS 1 900: cell 1 to 7 is switched off.

Any Multiband: cell 1 to 8 is switched off.

- b) The SS shall wait 20 s to allow the MS to detect the loss of cells.
- c) By MMI, an attempt to originate a call is made.
- d) By MMI, an attempt to originate an emergency call is made.

26.3.3.3 Test requirements

26.3.3.3.1 General test requirements

- 1) The MS must not give "service indication".
- 2) In steps c) and d) the MS shall not produce any RF output.

26.3.3.3.2 Test Procedures

26.3.3.3.2.1 Test Procedure 1

For MS not supporting speech (see PICS) perform steps a, b, and c.

26.3.3.3.2.2 Test Procedure 2

For MS supporting speech (see PICS) perform steps a, b, c and d.

26.3.4 Manual mode of PLMN selection

26.3.4.1 Conformance requirements

In manual mode, the MS can try to obtain normal service on any available VPLMN and it shall try to obtain normal service on a VPLMN if and only if the user makes a manual selection of this VPLMN.

Reference

3GPP TS 03.22 subclause 3.1.

26.3.4.2 Test purpose

To check that in manual mode the MS is able to obtain normal service on a PLMN which is neither the better nor a preferred PLMN and that it tries to obtain service on VPLMN if and only if the user selects it manually.

26.3.4.3 Method of test

Initial conditions

System Simulator:

2 cells, defaults parameter unless otherwise specified.

The SS transmits 2 BCCH carriers in the supported band(s) of the mobile station (for a multiband MS carrier A and B shall be in different bands) with the initial following parameters:

| | | level (dB μ Vemf) |
|-----------|--------|-----------------------|
| carrier A | PLMN 1 | 38 |
| carrier B | PLMN 2 | 33 |

Mobile Station:

The MS is "idle updated" on PLMN1 (HPLMN) and is in manual mode.

The preferred PLMN list does not contain PLMN2, it contains PLMN 3.

Specific PICS statements:

- Support of multiband functionality (TSPC_Type_MB_Simul)

PIXIT Statements:

- Description of the manual PLMN selector.

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

For the different networks and during the whole test, "IMSI attach" flag is set in the BCCH data.

Carrier A is turned off. The MS does not attempt a location updating during 2 minutes.

Carrier A is turned back on with a different MCC-MNC (indicating PLMN 3) and with a higher level (48 dBmVemf) than PLMN 2. The MS does not attempt a location updating during 2 minutes.

PLMN 2 is selected manually. The MS performs a location updating on PLMN 2. Carrier B is turned off. The MS does not attempt a location updating during 2 minutes.

Maximum duration of test

10 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|-----------------------------|--|--|--|
| 1 2 | SS | | carrier A is turned off wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |
| 3 4 | SS | | carrier A is turned on with a different MNC-NCC (PLMN3) and with a high level (48dBmVemf) wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |
| 5 6 7 8 9 10 | MS MS -> SS SS -> MS MS -> SS SS -> MS SS -> MS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT LOCATION UPDATING REQUEST LOCATION UPDATING ACCEPT CHANNEL RELEASE | PLMN 2 selected manually on carrier B |
| 11 12 | SS | | carrier B is turned off wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |

Specific message contents

None.

26.4 Lower layer failures in layer 3 testing

26.4.1 Introduction

The text in this subclause is intended to develop a standardized way of creating lower layer failures whilst testing the performance of Layer 3 signalling.

There are two groups of lower layer failures:

- 1) Detected by analysis of reception at Layer 1 (3GPP TS 05.08, 3GPP TS 04.08 / 3GPP TS 44.018),
- 2) Data link layer failures.

References

3GPP TS 04.08 / 3GPP TS 44.018, 3GPP TS 04.06, 3GPP TS 05.08

26.4.2 Layer 1 reception failures

The absence of reception of correct frames on the SACCH until the S counter reaches value 0 will be interpreted as a Layer 1 failure.

26.4.3 Data link layer failures

Many kinds of error cases can be caused in Layer 2. For example too many "T200 - time-out/retrying" - pairs.

NOTE 1: All types of data link failures are indicated similarly to the RR layer (Release Indication).

NOTE 2: All types of L1 failures are indicated similarly to each layer (Abort Indication, Error Indication).

26.4.4 Lower layer failures, used for the tests in clause 25

For L3 testing different lower layer failures are performed:

- 1) T100 time-out in Layer 1.
- 2) Too many T200 time-outs consecutively in Layer 2.

26.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions

26.5.1 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown protocol discriminator

An MS ignores messages with unknown protocol discriminator. This allows for the introduction of new messages which will be ignored by MS of earlier phases.

26.5.1.1 Conformance requirements

If the mobile station receives a standard L3 message with a protocol discriminator different from those specified in table 9.2/3GPP TS 04.07, the mobile station shall ignore the message.

References

3GPP TS 04.07, subclause 11.2.1.

26.5.1.2 Test purpose

To verify that a MS supporting TCH and the call control protocol ignores a message containing an undefined protocol discriminator in the special case of a message coded otherwise like a CC STATUS ENQUIRY message received by the MS having a mobile terminating call in CC-state U10, "active".

26.5.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged and an RR connection has been established.

If the MS supports the call control protocol, the test may alternatively be performed with the MS having a mobile terminating call in the CC-state U10, "active".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

Same as in the initial conditions.

Test Procedure

The SS sends a message to the MS which is coded like a CC STATUS ENQUIRY message relating to the active call except for the fact that the protocol discriminator of the message is undefined.

Maximum duration of test

11 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | SS -> MS | UNKNOWN MESSAGE | The SS waits between 5 s and 10 s verifying during this period that the MS does not send a L3 message on the main signalling link. |
| 2 | SS | | |

Specific message contents

UNKNOWN MESSAGE

| Information element | Value/remark |
|------------------------|---|
| Protocol discriminator | 0000 |
| TI flag | transaction originated by SS |
| TI value | TI value of the active call if the test is performed in state U10 otherwise the value is arbitrary. |
| Message Type | H'34 |

26.5.2 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / TI and skip indicator

26.5.2.1 TI and skip indicator / RR

The MS ignores RR messages with skip indicator different to 0. This allows for the introduction of new RR messages which will be ignored by MS of earlier phases, especially on the downlink CCCH and BCCH.

26.5.2.1.1 TI and skip indicator / RR / Idle Mode

26.5.2.1.1.1 Conformance requirements

A radio resource message received with skip indicator different from 0000 shall be ignored.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.3.1.

26.5.2.1.1.2 Test purpose

To verify that the MS ignores an RR message with skip indicator different from H'0 in the special case of a PAGING REQUEST TYPE 1 message received in the MM-state "idle, updated" and in RR-idle mode.

26.5.2.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Test Procedure

For every binary value x in the range 0001 - 0110 (binary) and for binary value x = 1 000, the following procedure is performed: The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to x. It is verified that the MS does not answer to the paging request message.

Maximum duration of test

5 s for each execution.

Expected sequence

The sequence is executed for execution counter k = 1, 2, 3, 4, 5, 6, 8.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The value of the skip indicator IE is the binary encoding of k. |
| 2 | SS | | During 3 s the SS verifies that the MS does not send any message on the RACH. |

Specific message contents

None.

26.5.2.1.2 TI and skip indicator / RR / RR-Connection established

26.5.2.1.2.1 Conformance requirements

A radio resource message received with skip indicator different from H'0 shall be ignored.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.3.1.

26.5.2.1.2.2 Test purpose

To verify that the MS ignores RR messages with skip indicator different from H'0 in the case of a message being received during the RR-connection establishment in the MM-state "idle, updated" / "wait for network command" and in RR-connected mode.

26.5.2.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters, max retrans = 2.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to H'0. The first CHANNEL REQUEST message will be answered with an IMMEDIATE ASSIGNMENT addressing the MS but with skip indicator set to H'1. Transmission of the second CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT message.

The second CHANNEL REQUEST message is answered by an IMMEDIATE ASSIGNMENT REJECT message addressing the MS but with skip indicator set to H'2 and a reject time set to 255 s. Transmission of the third CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT REJECT message.

The third CHANNEL REQUEST message from the MS will be answered with a correct IMMEDIATE ASSIGNMENT addressing the MS and having skip indicator set to H'0.

In the RR-Connected mode messages such as CIPHERING MODE COMMAND, HANDOVER COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE are sent with the skip indicator <> H'0 and it is checked that the MS does not take any action on these commands.

Maximum duration of test

40 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The value of the skip indicator IE is H'0 |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | skip indicator set to H'1 |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | skip indicator = H'2, reject time = 255 s |
| 6 | MS -> SS | CHANNEL REQUEST | Cause, answer to paging |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | skip indicator = H'0 |
| 8 | MS -> SS | PAGING RESPONSE | RR connection established |
| 9 | SS -> MS | AUTHENTICATION REQUEST | |
| 10 | MS -> SS | AUTHENTICATION RESPONSE | |
| 11 | SS -> MS | CIPHERING MODE COMMAND | skip indicator = H'3 |
| 12 | SS | | the SS neither starts ciphering nor deciphering with IMSI requested |
| 13 | SS -> MS | IDENTITY REQUEST | to check the MS still uses unciphered mode |
| 14 | MS -> SS | IDENTITY RESPONSE | |
| 15 | SS -> MS | ASSIGNMENT COMMAND | skip indicator = H'4 |
| 16 | SS | | SS checks no SABM is sent by the MS on the new channel |
| 17 | SS -> MS | HANDOVER COMMAND | skip indicator = H'5 |
| 18 | SS | | During 3 s the SS verifies that the MS does not send a handover failure or RR STATUS message on the old channel |
| 19 | SS -> MS | CHANNEL RELEASE | skip indicator = H'6 |
| 20 | SS -> MS | IDENTITY REQUEST | with IMSI requested |
| 21 | MS -> SS | IDENTITY RESPONSE | to check the RR connection is still established |
| 22 | SS -> MS | CHANNEL RELEASE | skip indicator = H'0 |
| 23 | SS | | The SS checks that the layer 2 connection is released |

Specific message contents

None.

26.5.2.2 TI and skip indicator / MM

The MS ignores MM messages with skip indicator different to 0. This allows for the introduction of new MM messages which will be ignored by MS of earlier phases.

26.5.2.2.1 Conformance requirements

A mobility management message received with skip indicator different from 0000 shall be ignored.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.3.1.

26.5.2.2.2 Test purpose

To verify that the MS ignores an MM message with skip indicator different from H'0 in the special case of an IDENTITY REQUEST message received.

26.5.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active", or alternatively, the MS has been paged and an RR connection has been established.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

Same as in the initial conditions.

Test Procedure

For every binary value x in the range 0001 - 0110 and for the binary value x = 1 000, the following procedure is performed: The SS sends an IDENTITY REQUEST message to the MS with skip indicator set to x. It is verified during 5 s that the MS does not answer to the IDENTITY REQUEST message.

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'1. |
| 2 | SS | | The SS starts verifying that the MS does not send any L3 message on the main signalling link. This verification continues until step 16 of this test sequence. |
| 3 | SS | | The SS waits 1 second. |
| 4 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'2. |
| 5 | SS | | The SS waits 1 second. |
| 6 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'3. |
| 7 | SS | | The SS waits 1 second. |
| 8 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'4. |
| 9 | SS | | The SS waits 1 second. |
| 10 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'5. |
| 11 | SS | | The SS waits 1 second. |
| 12 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'6. |
| 13 | SS | | The SS waits 1 second. |
| 14 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'8. |
| 15 | SS | | The SS waits 5 s. |
| 16 | SS | | The SS stops verifying that the MS does not send any L3 message on the main signalling link. |

Specific message contents

None.

26.5.2.3 TI and skip indicator / CC

26.5.2.3.1 Conformance requirements

- a) Whenever any call control message except SETUP or RELEASE COMPLETE is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the receiving entity shall send a RELEASE COMPLETE message with cause value #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the Null state.
- b1) When a RELEASE COMPLETE message is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the MM-connection associated with that transaction identifier shall be released.
- b2) When a SETUP message is received with a transaction identifier flag set to "1", this message shall be ignored.
- b3) When a SETUP message is received specifying a transaction identifier which is recognized as relating to an active call or to a call in progress, this SETUP message shall be ignored.
- c) When a CC message with a TI value = 111 is received, this message shall be ignored.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.3.

26.5.2.3.2 Test purpose

- a) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a DISCONNECT message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, sends a RELEASE COMPLETE message with cause value #81 and referring to the latter TI without changing the state of the active call (this is verified by use of the status enquiry procedure).
- b) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a:
 - b1) RELEASE COMPLETE message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, or a
 - b2) SETUP message with TI flag referring to a transaction originated by the MS (in the special case where the TI value is equal to the TI value relating to the active call), or a
 - b3) SETUP message with TI referring to the active call, ignores that message without changing the state of the active call (this is verified by use of the status enquiry procedure).
- c) To verify that the MS ignores a CC message with a TI value of 111.

26.5.2.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

Test Procedure

The SS sends a DISCONNECT message to the MS with a TI not relating to the active call. The MS shall respond with a RELEASE COMPLETE message including cause value #81 and specifying the same transaction. By means of the status enquiry procedure the SS checks that the CC-state of the active call did not change.

Then the SS sends the following call control messages to the MS:

- a RELEASE COMPLETE message, where the TI does not refer to the active call;
- a SETUP message with TI flag set to 1;
- a SETUP message with TI referring to the active call;
- a DISCONNECT message with a TI value of 111.

Each time the SS verifies that the MS does not respond to the message and each time the SS verifies by means of the status enquiry procedure that the CC-state of the active call has not been changed.

Maximum duration of test

40 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS -> MS | DISCONNECT | TI flag = 0; TI does not refer to the active call. |
| 2 | MS -> SS | RELEASE COMPLETE | TI flag = 1; TI value is equal to TI value received in step 1; Cause IE indicates cause value #81. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 5 | SS -> MS | RELEASE COMPLETE | TI flag = 0; TI does not refer to the active call. |
| 6 | SS | | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link. |
| 7 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 8 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 9 | SS -> MS | SETUP | TI flag = 1; TI value is equal to TI value of the active call. |
| 10 | SS | | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link. |
| 11 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 12 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 13 | SS -> MS | SETUP | TI flag = 0; TI refers to the active call. |
| 14 | SS | | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link. |
| 15 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 16 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 17 | SS -> MS | DISCONNECT | TI flag = 0; TI value is 111. |
| 18 | SS | | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link. |
| 19 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 20 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

26.5.3 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / undefined or unexpected message type

26.5.3.1 Undefined or unexpected message type / undefined message type / CC

26.5.3.1.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.4; 3GPP TS 04.07, subclause 11.2.4.

26.5.3.1.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with CC protocol discriminator and an arbitrary undefined message type, returns a STATUS message with cause value #97 to the peer CC entity without changing the state of the active call (this is verified by use of the status enquiry procedure).

26.5.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

Test Procedure

The SS sends a message to the MS the PD of which refers to call control, the TI of which refers to the active call, and the message type of which is undefined in the call control protocol (however bit 7 of the message type is "0"). The SS then checks that the MS responds with a STATUS message specifying cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause value #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | see comments | PD = "call control; call related SS messages" TI is that of the active call Message type is undefined for call control, bit 7 of the message type is "0" Cause IE indicates cause value #97. |
| 2 | MS -> SS | STATUS | |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 4 | MS -> SS | STATUS | |

Specific message contents

None.

26.5.3.2 Undefined or unexpected message type / undefined message type / MM

26.5.3.2.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.4.

26.5.3.2.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with MM protocol discriminator and message type undefined for the mobility management protocol, returns an MM STATUS message with reject cause value #97 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the CC TI has value 0 (so that it has the same encoding as the skip indicator when sent from the SS) and where the message type has the same encoding as DISCONNECT in CC.

26.5.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active". The TI of that mobile terminating call has value 0.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

Test Procedure

The SS sends a message to the MS the PD of which refers to mobility management, the skip indicator of which is "0000", and the message type of which is "0000 0000". The SS then checks that the MS responds with an MM STATUS message specifying reject cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS -> MS | see comments | PD = "mobility management messages" Skip indicator = "0000" Message type = "0000 0000" rest of the message is H'02 H'E0 H'90 |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #97. |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

26.5.3.3 Undefined or unexpected message type / undefined message type / RR

26.5.3.3.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 8.4.

26.5.3.3.2 Test purpose

To verify that an MS in RR connected mode on receipt of a message with RR protocol discriminator and message type undefined for the RR protocol, returns an RR STATUS message with reject cause value #97 without changing its state (this is checked by observing that the MS does not send L3 messages).

26.5.3.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged and an RR connection has been established.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in "idle updated" state.

Test Procedure

The SS sends a message to the MS the PD of which refers to radio resources management, the skip indicator of which is "0000", and the message type of which is "0010 1010". The SS then checks that the MS responds with an RR STATUS message specifying reject cause value #97. The SS then verifies during 5 s that the MS does not send a L3 message on the main signalling link but continues sending L2 fill frames on the main signalling link. Then the SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MMS responds with a RELEASE COMPLETE message otherwise. Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS->MS | see comments | PD = "radio resources management messages" Skip indicator = "0000" Message type = "0010 0101" rest of the message is H'02 H'E0 H'90 |
| 2 | MS->SS | RR STATUS | RR cause IE indicates RR cause value #97. |
| 3 | SS | | During 5 s the SS verifies that the MS does not send a L3 message on the main signalling link but still continues to send L2 fill frames on the main signalling link. |
| 4 | SS->MS | SETUP | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A5 | MS->SS | CALL CONFIRMED | This message shall be sent by the MS if p = Y. |
| B5 | MS->SS | RELEASE COMPLETE | This message shall be sent by the MS if p = N. |
| 6 | SS->MS | CHANNEL RELEASE | The SS waits for disconnection of the main signalling link. |

Specific message contents

None.

26.5.3.4 Undefined or unexpected message type / unexpected message type / CC

26.5.3.4.1 Conformance requirements

If the Mobile Station receives a message not consistent with the protocol state, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #98 "Message type not compatible with protocol state".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.4.

26.5.3.4.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a call in CC-state U10, "active", on receipt of an inopportune CC message, returns a STATUS message with reject cause value #98 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the inopportune CC message is a CALL PROCEEDING message relating to the active call.

26.5.3.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call in CC-state U10, "active".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a call in CC-state U10, "active".

Test Procedure

The SS sends a CALL PROCEEDING message to the MS. The SS then checks that the MS responds with a STATUS message specifying reject cause value #98. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | SS -> MS | CALL PROCEEDING | |
| 2 | MS -> SS | STATUS | Cause IE indicates cause value #98. |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

26.5.4 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unforeseen information elements in the non-imperative message part

26.5.4.1 Unforeseen information elements in the non-imperative message part / duplicated information elements

26.5.4.1.1 Conformance requirements

If an information element with format T, TV, or TLV is repeated in a message in which repetition of the information element is not specified, only the contents of the information element appearing first shall be handled and all subsequent repetitions of the information element shall be ignored.

References

3GPP TS 04.08 / 3GPP TS 24.008 / 3GPP TS 44.018, subclause 8.6.3.

26.5.4.1.2 Test purpose

To verify that the MS ignores an unforeseen second occurrence of an information element with format T, TV, or TLV in the special case of the mobile identity IE which has format TLV in the LOCATION UPDATING ACCEPT message.

26.5.4.1.3 Method of test

Initial conditions

System Simulator:

2 cells A and B belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell B. It does not have a valid TMSI.

Test Procedure

The RF level of cell A is lowered until the MS selects cell B (according to the cell-reselection procedures of 3GPP TS 05.08). The MS shall establish an RR connection and initiate the normal location updating procedure (using TMSI). The SS responds to the location update request with the LOCATION UPDATING ACCEPT message containing the mobile identity IE specifying the IMSI of the MS followed by an additional mobile identity IE specifying the TMSI that was assigned to the MS in the initial conditions (i.e. duplication of information element).

The SS then pages the MS using the PAGING REQUEST TYPE 1 message including the TMSI which was previously used in the LOCATION UPDATE ACCEPT message. The SS then verifies during 5 s that the MS does not answer to paging. The SS then pages the MS with its IMSI. The SS verifies that the MS responds on cell B by initiating the immediate assignment procedure using the CHANNEL REQUEST message.

Maximum duration of test

20 s.

Expected sequence

During 3 s the SS verifies that the MS does not send any message on the RACH.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | Mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | (see below) |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | SS | | The SS waits at least 5 s to give the MS time to become pageable |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity 1 IE specifies the TMSI of the MS. Mobile identity 2 is omitted. |
| 9 | SS | | The SS waits at least 5 s During that period the SS verifies that the MS does not send any message on the RACH. |
| 10 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity 1 IE specifies the IMSI of the MS. Mobile identity 2 is omitted. |
| 11 | MS -> SS | CHANNEL REQUEST | Establishment cause = answer to paging. |
| 12 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents

LOCATION UPDATING ACCEPT

| Information element | value/remark |
|-------------------------------|---|
| location area identification | LAI of cell B |
| Mobile identity | coded TLV, specifies the IMSI of the MS |
| Type of identity | IMSI |
| Odd/even indication | corresponding to IMSI |
| Identity digit 1 etc. | corresponding to IMSI |
| Mobile identity (duplication) | coded TLV |
| Type of identity | TMSI of the MS |
| Odd/even indication | corresponding to TMSI |
| Identity digit 1 etc. | corresponding to TMSI |

26.5.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / non-semantic mandatory IE errors

26.5.5.1 Non-semantic mandatory IE errors / RR

26.5.5.1.1 Non-semantic mandatory IE errors / RR / missing mandatory IE error

26.5.5.1.1.1 Non-semantic mandatory IE errors / RR / missing mandatory IE error / special case

The MS shall accept a CHANNEL RELEASE message whether it contains an RR cause or not. This allows for the shortening of the message in the future.

26.5.5.1.1.1.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is a CHANNEL RELEASE message, the actions taken shall be the same as specified for a normal RR-connection release.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.1.1.1.2 Test purpose

To verify that the MS in RR connected mode releases the connection upon receipt of a CHANNEL RELEASE message with missing RR cause (which is "mandatory" in that message).

26.5.5.1.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Test Procedure

A mobile terminating RR connection is established. Then the SS sends a CHANNEL RELEASE message in which the RR cause IE is missing. It is verified that the MS releases the main signalling link by sending a L2 DISC frame. The main signalling link release is then completed.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | The mandatory RR cause IE is missing (the message consists only of protocol discriminator, skip indicator, and message type). |
| 6 | MS -> SS | | The main signalling link is released (this is observed by a L2 DISC frame sent from the MS to the SS). |

Specific message contents

None.

26.5.5.1.1.2 Non-semantical mandatory IE errors / RR / missing mandatory IE error / general case

In the general case, the MS has to report an RR message with missing mandatory IE by the use of an RR STATUS message, but otherwise to ignore it. This is a recovery mechanism for unforeseen states.

26.5.5.1.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is not one of the messages listed in subclauses 8.5.1, 8.5.2, and 8.5.3 of 3GPP TS 04.08 / 3GPP TS 24.008, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #96 "invalid mandatory information".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.1.1.2.2 Test purpose

To verify that the MS in RR connected mode ignores a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are missing except for the fact that it returns a RR STATUS message.

26.5.5.1.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in RR-connected mode.

Test Procedure

A mobile terminating RR connection is established. Then the SS sends a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are missing. The SS verifies that the MS does not start ciphering and returns a RR STATUS message.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | The mandatory ciphering mode setting IE and cipher response IE are missing. |
| 6 | MS -> SS | RR STATUS | RR cause IE specifies RR cause value #96. |

Specific message contents

None.

26.5.5.1.2 Non-semantic mandatory IE errors / RR / comprehension required

26.5.5.1.2.1 Conformance requirements

When an RR message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 of 3GPP TS 04.08 / 3GPP TS 24.008) is received, the MS shall proceed as follows: When the message is not one of the messages listed in 3GPP TS 04.08 subclauses 8.5.1, 8.5.2 and 8.5.3, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a RR STATUS message with cause value #96 "invalid mandatory information".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.1.2.2 Test purpose

To verify that the MS having an RR-connection established ignores a HANDOVER COMMAND message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a RR STATUS message with cause # 96 "invalid mandatory information".

26.5.5.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in state U10, "active"; or alternatively, the MS has been paged and an RR-connection has been established.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

As in the initial conditions.

Test Procedure

The SS sends a HANDOVER command message containing in the non-imperative part an IE encoded as comprehension required. The SS verifies that the MS returns a RR STATUS message with cause value #96 without changing the dedicated channel.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | HANDOVER COMMAND | See below. |
| 2 | MS -> SS | RR STATUS | Sent on the old channel. RR cause IE specifies RR cause value #96. |

Specific message contents

HANDOVER COMMAND

| Information element | value/remark |
|----------------------------|--------------|
| cell description | as required |
| channel description | as required |
| handover reference | as required |
| power command | as required |
| comprehension required IEI | 0000 0000 |
| length | 0000 0001 |
| unrecognized IE contents | xxxx xxxx |

26.5.5.2 Non-semantic mandatory IE errors / MM

The MS shall ignore MM messages with syntactically incorrect mandatory IE. This allows to use reserved values in later phases.

26.5.5.2.1 Non-semantic mandatory IE errors / MM / syntactically incorrect mandatory IE

26.5.5.2.1.1 Conformance requirements

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a MM STATUS message with cause value #96 "invalid mandatory information".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.2.1.2 Test purpose

To verify that an MS supporting at least one BC, having a CC entity in state U10, "active", ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity; that the MS otherwise ignores the message is checked by means of the status enquiry procedure.

26.5.5.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in the CC-state U10, "active".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a mobile terminating call in the CC-state U10, "active".

Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state (this is verified by use of the status enquiry procedure).

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS -> MS | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111"). |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #96. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10. |

Specific message contents

None.

26.5.5.2.2 Non-semantic mandatory IE errors / MM / syntactically incorrect mandatory IE

26.5.5.2.2.1 Conformance requirement(s)

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.2.2.2 Test purpose

To verify that an MS having been paged and having an RR connection established ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) *identity type* IE specifies a reserved value for the type of identity; the fact that the MS otherwise ignores the message is checked by testing that it answers as usual to an incoming SETUP message.

26.5.5.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged; an RR connection has been established.

The MS has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen final state of the MS

The MS is in the MM-state "idle updated" listening to the BCCH/CCCH of the cell. It has a valid TMSI.

Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state; this is verified as follows:

The SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MS responds with a RELEASE COMPLETE message otherwise.

Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS -> MS | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111"). |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #96. |
| 3 | SS -> MS | SETUP | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A4 | MS -> SS | CALL CONFIRMED | This message shall be sent by the MS if p = Y. |
| B4 | MS -> SS | RELEASE COMPLETE | This message shall be sent by the MS if p = N. |
| 5 | SS -> MS | CHANNEL RELEASE | The SS waits for disconnection of the main signalling link. |

Specific message contents

None.

26.5.5.2.3 Non-semantical mandatory IE errors / MM / comprehension required

The "comprehension required" mechanism allows for the introduction of essential new information elements into messages, such that a message is ignored and a report is sent if the new information element is not understood.

26.5.5.2.3.1 Conformance requirements

When an MM message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 of 3GPP TS 04.08 / 3GPP TS 24.008) is received, the MS shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.2.3.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but encoded as "comprehension required" ignores the message except for the fact that it returns an MM STATUS message with cause value #96 "invalid mandatory information"; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.5.2.3.3 Method of test

Initial conditions

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Test Procedure

The Rf level of cell A is lowered until the MS selects cell B. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns the MM STATUS message with cause #96 in response to the LOCATION UPDATING ACCEPT. The SS then waits for the MS to abort the RR-connection. The SS verifies that the MS establishes a new RR connection and starts a new location updating procedure.

On receipt of the new LOCATION UPDATING REQUEST, the SS sends a correctly coded LOCATION UPDATING ACCEPT allocating a new TMSI.

The SS verifies that the MS sends a TMSI REALLOCATION COMPLETE message. The SS then initiates the RR connection release.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | MM STATUS | Reject cause IE specifies reject cause value #96. |
| 7 | MS | | The MS aborts the RR connection (it initiates release of L2 on SAPI 0) using the L2 DISC / UA exchange. |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the IMSI of the MS. |
| 11 | SS -> MS | LOCATION UPDATING ACCEPT | see below |
| 12 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 13 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents

LOCATION UPDATING ACCEPT - first occurrence

| Information element | value/remark |
|----------------------------------|-----------------------------|
| Location area identification | LAI of cell B |
| Comprehension required IE length | 0000 0000 1 |
| unrecognized IE contents | xxxx xxxx (arbitrary octet) |

LOCATION UPDATING ACCEPT - second occurrence

| Information element | value/remark |
|------------------------------|-------------------------|
| Location area identification | specifies LAI of cell B |
| Mobile Identity | specifies a TMSI |

26.5.5.3 Non-semantical mandatory IE errors / CC

26.5.5.3.1 Non-semantical mandatory IE errors / CC / missing mandatory IE

26.5.5.3.1.1 Non-semantical mandatory IE errors / CC / missing mandatory IE / disconnect message

26.5.5.3.1.1.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows: If the message is a DISCONNECT message, a RELEASE message shall be returned with cause value # 96 "invalid mandatory information" and normal call clearing applies.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.3.1.1.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a DISCONNECT message in which the mandatory cause IE is missing shall return a RELEASE message with cause value #96 "invalid mandatory information".

26.5.5.3.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in the CC-state U10, "active".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a DISCONNECT message in which the (mandatory) cause IE is missing. The SS verifies that the MS returns a RELEASE message specifying cause value #96. The SS then sends a RELEASE COMPLETE message and performs the RR connection release.

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | DISCONNECT | The mandatory cause IE is missing. |
| 2 | MS -> SS | RELEASE | The cause IE indicates cause value #96 |
| 3 | SS -> MS | RELEASE COMPLETE | |
| 4 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents

None.

26.5.5.3.1.2 Non-semantical mandatory IE errors / CC / missing mandatory IE / general case

26.5.5.3.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows: If the message is not a SETUP, RELEASE, DISCONNECT, RELEASE COMPLETE, HOLD REJECT or RETRIEVE REJECT message, it shall ignore the message except for the fact that it returns a STATUS message specifying cause value #96.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

26.5.5.3.1.2.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a STATUS message in which the mandatory cause IE and call state IE are missing shall ignore the message except for the fact that it return a STATUS message with cause value #96 "invalid mandatory information" (that the MS does not change state is checked by use of the status enquiry procedure).

26.5.5.3.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in the CC-state U10, "active".

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has an MT call in the CC-state U10, "active".

Test Procedure

The SS sends a STATUS message in which the mandatory cause IE and call state IE are missing. The SS verifies that the MS returns a STATUS message with cause value #96 "invalid mandatory information". Then the SS sends a STATUS ENQUIRY message and checks that the MS returns a STATUS message indicating cause value #30 and call state U10, "active".

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | STATUS | The mandatory cause IE and call state IE are missing. |
| 2 | MS -> SS | STATUS | The cause IE indicates cause value #96 |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

26.5.5.3.2 Non-semantic mandatory IE errors / CC / comprehension required

26.5.5.3.2.1 Conformance requirements

When a CC message containing an IE unknown in the message, but encoded as "comprehension required" (see 3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5) is received, the MS shall proceed as follows: When the message is not one of the messages listed in 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 8.5.1, 8.5.2 and 8.5.3, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a STATUS message with cause value #96 "invalid mandatory information".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 8.5 and 10.5.

26.5.5.3.2.2 Test purpose

To verify that an MS supporting the call control protocol for at least one BC having a call control entity in state U3 ignores a CONNECT message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a STATUS message with cause value #96 "invalid mandatory information".

26.5.5.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U3.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

Test Procedure

The SS sends a CONNECT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns a STATUS message specifying cause value #96 "invalid mandatory information". The SS checks by use of the status enquiry procedure that the MS did not change the state.

Maximum duration of test

5 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS -> MS | CONNECT | See below. |
| 2 | MS -> SS | STATUS | TI refers to the call in progress; cause IE indicates cause value #96. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the call in progress. |
| 4 | MS -> SS | STATUS | TI refers to the call in progress; Cause IE indicates cause value #30. Call state IE indicates state U3. |

Specific message contents

CONNECT

| Information element | value/remark |
|---------------------|-----------------------------|
| Unknown IEI | 0000 0000 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

26.5.6 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown IE, comprehension not required

26.5.6.1 Unknown information elements in the non-imperative message part / MM

26.5.6.1.1 Unknown IE, comprehension not required / MM / IE unknown in the protocol

26.5.6.1.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 8.6.1, 8.6.2 and 10.5.

26.5.6.1.1.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message and unknown in the MM protocol which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.6.1.1.3 Method of test

Initial conditions

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IE of which is unknown in the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | SS | | The RF level of cell B is lowered until the MS selects cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 7 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific message contents

LOCATION UPDATING ACCEPT

| Information element | value/remark |
|------------------------------|----------------------------------|
| Location area identification | LAI of cell A |
| Unknown IEI | 1010 xxx0 (where x is arbitrary) |
| Mobile Identity IEI | |
| length | 5 |
| Type of identity | TMSI |
| Identity | 4 octets of "new" TMSI |

26.5.6.1.2 Unknown IE, comprehension not required / MM / IE unknown in the message

26.5.6.1.2.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 8.6.1, 8.6.2 and 10.5.

26.5.6.1.2.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but known in the MM protocol, which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.6.1.2.3 Method of test

Initial conditions

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message but is used as the location area identification IEI in other messages of the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | SS | | The RF level of cell B is lowered until the MS selects cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 7 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific message contents

LOCATION UPDATING ACCEPT

| Information element | value/remark |
|------------------------------|--|
| Location area identification | LAI of cell A |
| Unknown IEI | 0001 0011 |
| length | 2 |
| unknown IE contents | xxxx xxxx xxxx xxxx (2 arbitrary octets) |
| Mobile Identity IEI | |
| length | 5 |
| Type of identity | TMSI |
| Identity | 4 octets of "new" TMSI |

26.5.6.2 Unknown information elements in the non-imperative message part / CC

26.5.6.2.1 Unknown information elements in the non-imperative message part / CC / Call establishment

26.5.6.2.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

26.5.6.2.1.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of the CC message being a CALL PROCEEDING message received by the MS in state U1.

26.5.6.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U1.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

Test Procedure

The SS sends a CALL PROCEEDING message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a called party BCD number IE in other messages of the protocol. The SS verifies by use of the status enquiry procedure that the MS did not change the state.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | SS -> MS | CALL PROCEEDING | See below. |
| 2 | SS -> MS | STATUS ENQUIRY | TI refers to the call in progress. |
| 3 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U3. |

Specific message contents

CALL PROCEEDING

| Information element | value/remark |
|---------------------|-----------------------------|
| Unknown IEI | 0101 1110 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

26.5.6.2.2 Unknown information elements in the non-imperative message part / CC / disconnect

26.5.6.2.2.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

26.5.6.2.2.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a DISCONNECT message received by the MS in state U10.

26.5.6.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS has a call control entity in CC state U19.

Test Procedure

The SS sends a DISCONNECT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a connected number IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE message; the SS verifies by use of the status enquiry procedure that the MS has entered state U19.

Maximum duration of test

5 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS -> MS | DISCONNECT | See below. Cause IE indicates cause value #30. Call state IE indicates state U19. |
| 2 | MS -> SS | RELEASE | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents

DISCONNECT

| Information element | value/remark |
|---------------------|-----------------------------|
| Unknown IEI | 0100 1100 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

26.5.6.2.3 Unknown information elements in the non-imperative message part / CC / release

26.5.6.2.3.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

26.5.6.2.3.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE message received by the MS having sent in state U10 a DISCONNECT message.

26.5.6.2.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The MS is made to send a DISCONNECT message. The SS responds with a RELEASE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a high layer compatibility IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE COMPLETE message; the SS then releases the RR connection.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | MS | | The MS is made to initiate call clearing. |
| 2 | MS -> SS | DISCONNECT | |
| 3 | SS -> MS | RELEASE | See below. |
| 4 | MS -> SS | RELEASE COMPLETE | |
| 5 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents

RELEASE

| Information element | value/remark |
|---------------------|-------------------|
| Unknown IEI | 0111 1101 |
| length | 1 |
| unknown IE contents | 1 arbitrary octet |

26.5.6.2.4 Unknown information elements in the non-imperative message part / CC / release complete

26.5.6.2.4.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

26.5.6.2.4.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE COMPLETE message received by the MS in state U19.

26.5.6.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a DISCONNECT message. The SS verifies that the MS responds with a RELEASE message. The SS answers with a RELEASE COMPLETE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for an auxiliary states IE in other messages of the protocol. The SS verifies that the MS releases the link after some time.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | DISCONNECT | |
| 2 | MS -> SS | RELEASE | |
| 3 | SS -> MS | RELEASE COMPLETE | See below. |
| 4 | MS | | The MS aborts the RR connection (it initiates release of L2 on SAPI 0) |

Specific message contents

RELEASE COMPLETE

| Information element | value/remark |
|---------------------|-------------------|
| Unknown IE | 0010 0100 |
| length | 1 |
| unknown IE contents | 1 arbitrary octet |

26.5.6.3 Unknown IE in the non-imperative message part, comprehension not required / RR

26.5.6.3.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 8.6.1, 8.6.2 and 10.5.

26.5.6.3.2 Test purpose

To verify that the MS ignores an IE which is unknown in a message for Radio Resource Management in the special cases of CIPHERING MODE COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE.

26.5.6.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

Test Procedure

In the normal call establishment the CIPHERING MODE COMMAND and ASSIGNMENT COMMAND contain additional IEs unknown in the message which are not encoded as "comprehension required", and therefore should be ignored by the MS. After sending an ASSIGNMENT COMPLETE, the subsequent CHANNEL RELEASE received by the MS also contains an IE unknown in a message which is not encoded as "comprehension required". The MS should ignore this IE.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | See specific message contents |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents |
| 8 | MS -> SS | ASSIGNMENT COMPLETE | On the dedicated channel |
| 9 | SS -> MS | CHANNEL RELEASE | See specific message contents |
| 10 | SS | | The SS checks the release of the main signalling link at layer 2 level. |

Specific message contents

None.

Step 5: CIPHERING MODE COMMAND

| | |
|------------------------|----------------------------|
| Cipher mode setting | |
| - algorithm identifier | cipher with A5/1 |
| - SC | start ciphering |
| Cipher Response | IMEI shall not be included |
| Unknown IE (type 2) | 1001 0010 |

Step 7: ASSIGNMENT COMMAND

| | |
|----------------------------|--|
| Channel Description | TCH/F + ACCHs |
| Channel Type | arbitrarily selected, but not zero |
| Timeslot number | arbitrarily selected |
| Training sequence code | RF hopping channel |
| Hopping | 0 |
| MAIO | 0 |
| HSN | arbitrarily selected |
| Power Command | 1101 1010 |
| First Unknown IE (Type 2) | For GSM 450 mobiles, range 128 encodes ARFCNs 267 and 275. For GSM 480 mobiles, range 128 encodes ARFCNs 315 and 322. For GSM 710 mobiles, range 128 encodes ARFCNs 470 and 490. For GSM 750 mobiles, range 128 encodes ARFCNs 470 and 490. For T-GSM 810 mobiles, range 128 encodes ARFCNs 470 and 490. For GSM 850 mobiles, range 128 encodes ARFCNs 160 and 180. For PGSM and EGSM mobiles, bit map 0 encodes ARFCNs 30 and 50. For DCS 1 800 and PCS 1 900 mobiles, the variable bit map format encodes ARFCNs 650 and 750. |
| Cell Channel Description | |
| Second Unknown IE (Type 4) | 0110 1001 |
| - IEI | 2 |
| - length | xxxx xxxx xxxx xxxx, where x is arbitrarily coded. |
| - contents | For GSM450 mobiles, indicates ARFCN 275 only. For GSM 480 mobiles, indicates ARFCN 322 only. For GSM 710 mobiles, indicates ARFCN 490 only. For GSM 750 mobiles, indicates ARFCN 490 only. For T-GSM 810 mobiles, indicates ARFCN 490 only. For GSM 850 mobiles, indicates ARFCN 180 only. For PGSM and EGSM mobiles, indicates ARFCN 50, only. For DCS 1 800 and PCS 1 900 mobiles, indicates ARFCN 750, only. |
| Mobile Allocation | |

Step 9: CHANNEL RELEASE

| | |
|---------------------|---|
| RR Cause | normal event |
| Unknown IE (type 4) | 0111 0010 |
| - IEI | 5 |
| - length | xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx, where x is arbitrarily coded. |
| - contents | |

26.5.7 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / spare bits

26.5.7.1 Spare bits / RR

26.5.7.1.1 Spare bits / RR / paging channel

26.5.7.1.1.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

26.5.7.1.1.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the P1 Rest Octets IE of a PAGING REQUEST TYPE 1 message. That the spare bits are ignored is checked by addressing the MS in that PAGING REQUEST message and verifying that the MS responds to that paging.

26.5.7.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message containing at least one octet in the P1 rest octets IE that is different from 0010 1011.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|------------|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | See below. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents

PAGING REQUEST TYPE 1

| Information element | Value/remark |
|-------------------------------------|--|
| L2 pseudo length | k+3 where k is the sum of the length of the mobile identity 1 IE |
| Page Mode | Normal paging |
| Channels needed for Mobiles 1 and 2 | |
| Channel (first) | Any channel |
| Channel (second) | (spare) |
| Mobile identity 1 | IMSI or TMSI of MS under test |
| Mobile identity 2 | Omitted |
| P1 rest octets | not all octets are "0010 1011" |

26.5.7.1.2 Spare bits / RR / BCCH

26.5.7.1.2.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

26.5.7.1.2.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case where these spare bits are contained in the SI3 and SI4 messages. That the MS ignores the value of the spare bits is checked by changing the LAI in those message and observing the MS initiating a location update though the spare bits do not all have the default value.

26.5.7.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS simulates a BCCH where continuously for at least 30 s at least one octet of the SI3 Rest Octets IE in all SYSTEM INFORMATION TYPE 3 messages and at least one octet of the SI4 Rest Octets IE in all SYSTEM INFORMATION TYPE 4 messages is different from 0010 1011 and the location area identification IE denotes a

location area different from the current location area held by the MS. The SS verifies that the MS sends a CHANNEL REQUEST message on the RACH including the establishment cause "location updating". The SS responds with an IMMEDIATE ASSIGNMENT REJECT message.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | SS -> MS | | The SS starts sending modified SYSTEM INFORMATION TYPE 3 and SYSTEM INFORMATION TYPE 4 messages (as defined below) continuously for at least 30 s on the BCCH. Establishment cause = "location updating (SDCCH needed). This message may be received during the 30 s. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents

SYSTEM INFORMATION TYPE 3

| Information element | value/remark |
|------------------------------|--|
| L2 pseudo length | 18 |
| cell identity | as required |
| location area identification | denoting a new location area |
| control channel description | as required, but with the spare bits arbitrarily selected and at least one spare bit set to 1. |
| cell options | as required, but with (spare) bit 8 set to 1 |
| cell selection parameters | as required |
| RACH control parameters | as required |
| SI3 rest octets | at least one octet is different from "0010 1011" |

SYSTEM INFORMATION TYPE 4

| Information element | value/remark |
|------------------------------|--|
| L2 pseudo length | 12 |
| location area identification | denoting a new location area |
| cell selection parameters | as required |
| RACH control parameters | as required |
| SI4 rest octets | at least one octet is different from "0010 1011" |

26.5.7.1.3 Spare bits / RR / AGCH

26.5.7.1.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

26.5.7.1.3.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the Page Mode IE, the Spare Half Octet IE, the Channel Description IE, the Timing Advance IE, the IA Rest Octet IE, and in the IAR Rest Octet IE.

26.5.7.1.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT message containing arbitrary spare bits in the Page Mode IE, in the Spare Half Octet IE, in the Channel Description IE, in the Timing Advance IE, and in the IA Rest Octet IE.

It is checked that the MS answers on the dedicated channel with a PAGING RESPONSE message and releases the main signalling link after a CHANNEL RELEASE message.

After a new paging of the MS an IMMEDIATE ASSIGNMENT REJECT is sent to test the spare bits in the IAR Rest Octet IE.

The MS is then paged again to check the idle state.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | see below |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | The SS checks that the MS releases the main signalling link and waits 10 s for a cell reselection of the MS |
| 6 | SS | | |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | normal, waiting time = 0, except the IAR Rest Octet IE (see below) |
| 10 | SS | | |
| 11 | SS -> MS | PAGING REQUEST TYPE 1 | The SS waits six seconds |
| 12 | MS -> SS | CHANNEL REQUEST | Addressing the MS under test |
| | | | To check that the MS has reached the idle state after the IMMEDIATE ASSIGNMENT REJECT |

Specific message contents

IMMEDIATE ASSIGNMENT

| Information element | Value/remark |
|------------------------|--|
| L2 pseudo length | sum of the length of all IE except L2 pseudo length and IA Rest Octets |
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | Immediate Assignment |
| Page mode | xx00 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| Dedicated mode or TBF | x000 (where "x" is set to 1) |
| Channel description | normal, no hopping, the two spare bits before ARFCN are chosen arbitrarily with at least one bit set to 1. |
| Request reference | normal (derived from the CHANNEL REQUEST) |
| Timing advance | xx00 0000 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| Mobile allocation | chosen so that, together with the channel description |
| Length | 0 |
| IA rest octets | |
| first octet | 00xx xxxx (where "xx xxxx" is arbitrary but different to 10 1011) |
| other octets | xxxx xxxx (where "xxxx xxxx" is arbitrary but different to 0010 1011) |

IMMEDIATE ASSIGNMENT REJECT

| Information element | Value/remark |
|---------------------|---|
| L2 pseudo length | 19 |
| Page mode | normal |
| Spare half octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit is set to 1) |
| Request reference 1 | addressing the MS under test |
| Wait indication 1 | 0 s |
| ... | Other Request References and Wait Indications arbitrary |
| IAR rest octets | |
| Octet 1 to 3 | xxxx xxxx (where "xxxx xxxx" is arbitrary but different to 0010 1011) |

26.5.7.1.4 Spare bits / RR / Connected Mode

26.5.7.1.4.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

26.5.7.1.4.2 Test purpose

To verify that the MS in the MM-state "MM-Connection active" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cell Channel Description IE and in the Power Command IE.

26.5.7.1.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters, except:

GSM 450 mobiles are assigned to ARFCN 293 in step 10.

GSM 480 mobiles are assigned to ARFCN 340 in step 10.

GSM 710, GSM 750 and T-GSM 810 mobiles are assigned to ARFCN 511 in step 10.

GSM 850 mobiles are assigned to ARFCN 251 in step 10.

PGSM and EGSM mobiles are assigned to ARFCN 124 in step 10.

DCS 1 800 and PCS 1 900 mobiles are assigned to ARFCN 801 in step 10.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

In the procedure of a normal call establishment the ASSIGNMENT COMMAND will be modified to test the spare bits in the Cell Channel Description IE and in the Power Command IE.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | SS -> MS | SETUP | |
| 8 | MS -> SS | CALL CONFIRMED | |
| A9 | MS -> SS | ALERTING | |
| B9 | MS -> SS | CONNECT | |
| 10 | SS -> MS | ASSIGNMENT COMMAND | see below on the dedicated channel The SS checks that the MS release the main signalling link |
| 11 | MS -> SS | ASSIGNMENT COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | |
| 13 | SS | | |

Specific message contents

ASSIGNMENT COMMAND

For GSM 450 mobiles

| Information element | Value/remark |
|-------------------------------------|--|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) |
| Mobile Allocation | indicate ARFCN 293 only (using the Range 128 format). indicates ARFCN 293 only |

For GSM 480 mobiles

| Information element | Value/remark |
|-------------------------------------|--|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) |
| Mobile Allocation | indicate ARFCN 340 only (using the Range 128 format). indicates ARFCN 340 only |

For GSM 710 or GSM 750 or T-GSM 810 mobiles

| Information element | Value/remark |
|--------------------------------------|--|
| Channel Description Power Command | normal, hopping HSN=63, MAIO=0 xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description Octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) |
| Mobile Allocation | indicate ARFCN 511 only (using the Range 128 format). indicates ARFCN 511 only |

For GSM 850 mobiles

| Information element | Value/remark |
|--------------------------------------|--|
| Channel Description Power Command | normal, hopping HSN=63, MAIO=0 xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description Octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) |
| Mobile Allocation | indicate ARFCN 251 only (using the Range 128 format). Indicates ARFCN 251 only |

For PGSM and EGSM mobiles

| Information element | Value/remark |
|--------------------------------------|--|
| Channel Description Power Command | normal, hopping HSN=63, MAIO=0 xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description octet 2 | 00xx 1000 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| octet 3 to 17 (inclusive) | all bits set to zero |
| Mobile Allocation | indicates ARFCN 124 only |

For DCS 1 800 or PCS 1 900 mobiles

| Information element | Value/remark |
|--------------------------------------|---|
| Channel Description Power Command | normal, hopping, HSN=63, MAIO=0 xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description octet 2 | 10xx 111? (where "xx" is arbitrary, with at least 1 bit set to 1). Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) |
| Mobile Allocation | indicate ARFCN 801 only (using the variable bit map format). indicates ARFCN 801 only |

26.5.7.2 Spare bits / MM

26.5.7.2.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.

26.5.7.2.2 Test purpose

To verify that the MS in the MM-state "wait net cmd" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cipher Key Seq. Number IE or in the Identity Type IE.

26.5.7.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Specific PICS statements:

-

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

After the establishment of the RR-connection, in the AUTHENTICATION REQUEST message the spare bits of the Ciphering Key Sequence Number and of the Spare Half Octet IE will be randomly chosen. The spare bits of the Identity Type IE and the Spare Half Octet IE in the IDENTITY REQUEST message will also be chosen arbitrarily.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | see below |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | AUTHENTICATION REQUEST | see below |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | |
| 7 | SS -> MS | IDENTITY REQUEST | with the right TMSI |
| 8 | MS -> SS | IDENTITY RESPONSE | |
| 9 | SS -> MS | CHANNEL RELEASE | The SS checks that the MS release the main signalling link |
| 10 | SS | | |

Specific message contents

AUTHENTICATION REQUEST

| Information element | Value/remark |
|-------------------------------|--|
| Ciphering Key Sequence Number | x000 (where "x" is set to 1) |
| Spare Half Octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit set to 1) |
| Auth. Parameter RAND | standard value |

IDENTITY REQ

| Information element | Value/remark |
|---------------------|--|
| Identity Type | x100 (where "x" is set to 1) |
| Spare Half Octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit set to 1) |

26.5.7.3 Spare bits / CC

26.5.7.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.

26.5.7.3.2 Test purpose

To verify that the MS in the MM-state "connection established" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Calling Party BCD Number IE, Calling Party Subaddress IE, Called Party Subaddress IE, Cause IE and Progress Indicator IEs.

26.5.7.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Specific PICS statements:

- Support of speech (TSPC_AddInfo_Full_rate_version_1, TSPC_AddInfo_Half_rate_version_1)

PIXIT Statements:

-

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

After the establishment of the MM-connection, in the SETUP message the spare bits of the Calling Party BCD Number, Calling Party Subaddress and Called Party Subaddress will be arbitrarily chosen and also in the DISCONNECT message the spare bits of the Progress Indicator IE and of the Cause IE will be arbitrarily chosen.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments | |
|------|-----------|-------------------------|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test | |
| 2 | MS -> SS | CHANNEL REQUEST | | |

26.5.8 Default contents of messages

Default requirements for messages that are not mentioned in this subclause are given in subclause 26.8.4.

CHANNEL RELEASE

| Information element | Value/remark |
|---------------------|--------------|
| RR cause | Normal event |

CHANNEL REQUEST

DISCONNECT (SS -> MS)

| Information element | Value/remark |
|---------------------|------------------------------------|
| Cause | |
| Coding standard | Standard defined for the GSM PLMNS |
| Location | user |
| Cause value | #16 |

IDENTITY REQUEST

| Information element | Value/remark |
|---------------------|-------------------|
| Identity type | Depending on test |
| Spare half octet | 0000 |

IMMEDIATE ASSIGNMENT

| Information element | Value/remark |
|---------------------|--|
| L2 pseudo length | n, where n is the L2 pseudo length of the message |
| Page mode | arbitrary |
| Spare half octet | 0000 |
| Channel description | a valid description of an SDCCH + SACCH |
| Request reference | Corresponding to the last CHANNEL REQUEST received from the MS |
| Timing advance | arbitrary |
| Mobile allocation | chosen so that, together with the channel description IE, it describes a valid SDCCH + SACCH |
| Starting time | Omitted |
| IA rest octets | m octets, each coded as H'2B, where $m = 22 - n$ |

IMMEDIATE ASSIGNMENT REJECT

| Information element | Value/remark |
|---------------------|--|
| L2 pseudo length | 19 |
| Page mode | arbitrary |
| Spare half octet | 0000 |
| Request reference 1 | corresponding to the last CHANNEL REQUEST received from the MS |
| Wait indication 1 | 0 s |
| Request reference 2 | arbitrary |
| Wait indication 2 | 0 s |
| Request reference 3 | arbitrary |
| Wait indication 3 | 0 s |
| Request reference 4 | arbitrary |
| Wait indication 4 | 0 s |
| IA rest octets | 3 octets, each coded as H'2B |

PAGING REQUEST TYPE 1

| Information element | Value/remark |
|-------------------------------------|--|
| L2 pseudo length | n where n is the sum of the mobile identity 1 IE and 3 |
| Page Mode | Normal paging |
| Channels needed for Mobiles 1 and 2 | |
| Channel (first) | Any channel |
| Channel (second) | (spare) |
| Mobile identity 1 | IMSI or TMSI of MS under test |
| Mobile identity 2 | Omitted |
| P1 rest octets | m octets, each coded as H'2B, where $m = 22 - n$ |

PAGING RESPONSE

RELEASE COMPLETE (MS -> SS)

No default requirements defined for this message.

26.6 Test of the elementary procedures for radio resource management

NOTE: For SS implementor: if tests are concatenated, it is important that unused fields in IMMEDIATE ASSIGNMENT REJECT messages do not use Request References that relate to CHANNEL REQUEST messages recently transmitted by the MS.

26.6.1 Immediate assignment

The immediate assignment procedure is used by the network to establish a dedicated control channel for the MS and network to communicate the detail of the service requested. If the Mobile Station does not implement the procedure correctly, radio resources can be wasted as the Mobile Station might use the wrong channels.

26.6.1.1 Immediate assignment / SDCCH or TCH assignment

26.6.1.1.1 Conformance requirement

1. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the SDCCH/8 described in the IMMEDIATE ASSIGNMENT message.
2. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the TCH/FACCH described in the IMMEDIATE ASSIGNMENT message.

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2.

26.6.1.1.2 Test purpose

To verify that the MS can correctly set up a dedicated SDCCH control channel and that the MS can correctly set up a dedicated TCH/FACCH control channel.

26.6.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, except that CCCH_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

- MS supports SDCCH only (TSPC_AddInfo_SDCCHOnly)
- MS supports GSM HR (TSPC_AddInfo_HalfRate)

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST message the SS assigns an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

If TCH/F is supported by the MS, the test is repeated with the SS assigning a TCH/F (Signalling).

If TCH/H is supported by the MS, the test is repeated with the SS assigning a TCH/H (Signalling).

Maximum Duration of Test

6 s per value of the execution timer.

Expected Sequence

This sequence is performed for execution counter, K = 1, 2, 3 (unless the TCH is not supported).

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--------------------------------------|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Channel Type: see below |
| 4 | MS -> SS | PAGING RESPONSE | Shall be sent on the correct channel |
| 5 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

IMMEDIATE ASSIGNMENT

K=1, SDCCH test: Channel Type = SDCCH/8.

K=2, TCH/F (Signalling) test: Channel Type = Bm + ACCHs.

K=3, TCH/H (Signalling) test: Channel Type = Lm + ACCHs, subchannel arbitrarily chosen.

26.6.1.2 Immediate assignment / extended assignment

NOTE 2: In these tests the SS must send the immediate assignment messages in due time to allow for the MS to receive them and send a PAGING RESPONSE rather than another random access. This applies to the whole of clause 26.

26.6.1.2.1 Conformance requirements

1. The MS shall go to the allocated SDCCH/4 and send a PAGING RESPONSE message containing its identity and its classmark.
2. The MS shall go to the allocated SDCCH/8 and send a PAGING RESPONSE message containing its identity and its classmark.
3. The MS shall correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.
4. The MS shall only react to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.

26.6.1.2.2 Test purpose

To verify that the MS goes to the allocated SDCCH/4 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS goes to the allocated SDCCH/8 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS can correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.

To verify that the MS only reacts to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

26.6.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-retrans is set to 7.

Mobile Station:

The MS is in the "idle, updated" state. with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with a TMSI allocated.

Test Procedure

In the first part of the test, the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the n-th CHANNEL REQUEST message (n being arbitrarily chosen by the SS from the set {1, 2 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message, which references one of the last 3 CHANNEL REQUEST messages from the MS. The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

In the second part of the test, the SS again pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the k-th CHANNEL REQUEST message (k being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, instead of referencing one of the last 3 CHANNEL REQUEST messages from the MS, references an earlier CHANNEL REQUEST message. The MS shall then ignore the IMMEDIATE ASSIGNMENT EXTENDED message and continue to send CHANNEL REQUEST messages until the Max-Retrans value has been reached. Then a period of 7 seconds shall elapse in order to allow the MS to perform cell reselection (this allows for the time between the last CHANNEL REQUEST message and the beginning of cell reselection).

In the third part of the test, the CCCH_CONF of the SS is set to non-combined and the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the r-th CHANNEL REQUEST message (r being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, in the second request reference, references one of the last 3 CHANNEL REQUEST messages from the MS. The associated Channel Description allocates SDCCH(S) (S being arbitrarily chosen by the SS from the set {0,1 ... 7}). The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

Maximum Duration of Test

90 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | n CHANNEL REQUESTs (n being arbitrarily chosen from {1... 8}) are sent, all with Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | see note 1. |
| 5 | MS -> SS | PAGING RESPONSE | |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | ----- | ----- | The SS waits 12 s to allow the MS to perform cell reselection. |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 9 | MS -> SS | CHANNEL REQUEST | k CHANNEL REQUESTs (k being arbitrarily chosen from the set {4, 5, 8}) are sent all with Establ. Cause = "Answer to paging". |
| 10 | MS -> SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | see note 2. |
| 12 | MS -> SS | CHANNEL REQUEST | 8-k CHANNEL REQUESTs are sent, all with Establ. Cause = "Answer to paging". |
| 13 | MS -> SS | CHANNEL REQUEST | |
| 14 | SS | | The SS verifies that the MS does not transmit any Layer 2 frames for at least 3 s. |
| 15 | SS | | The SS sets CCCH_CONF to non-combined. |
| 16 | SS | | The SS waits 40 s to allow the MS to perform cell reselection and to read the BCCH information. |
| 17 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 18 | MS -> SS | CHANNEL REQUEST | r CHANNEL REQUESTs (r being arbitrarily chosen from {4, 5... 8}) are sent, all with Establ. Cause = "Answer to paging". |
| 19 | MS -> SS | CHANNEL REQUEST | |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | see note 3. |
| 21 | MS -> SS | PAGING RESPONSE | |
| 22 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

NOTE 1: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {max (1,n-2) ... n}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 2: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {1 ... k-3}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 3: The second Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {r-2, r-1, r}, its value being arbitrarily chosen by the SS. The first Request Reference shall be different from any Request Reference the MS has generated in this test.

26.6.1.3 Immediate assignment / assignment rejection

26.6.1.3.1 Conformance requirements

1. The MS shall respond to the Paging Request message by sending a Channel Request message with establishment cause set to "Answer to Paging". After the reception of IMMEDIATE ASSIGNMENT REJECT, the MS shall not transmit during the time indicated in the "Wait Indication" field of the IMMEDIATE ASSIGNMENT REJECT message, and then it shall answer to the new paging requests.
2. After an assignment rejection, the MS shall perform a cell reselection (idle mode operation) and the MS shall not transmit unless a different cell is selected.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.3 and 3GPP TS 04.13 subclause 5.2.2.

26.6.1.3.2 Test purpose

To verify that the MS can accept an IMMEDIATE ASSIGNMENT REJECT.

To verify that the MS can respond to paging after an IMMEDIATE ASSIGNMENT REJECT is received on a different cell.

26.6.1.3.3 Method of test

Initial Conditions

System Simulator:

2 cells with the same LAI, Max-Retrans is 7.

Mobile Station:

The MS is camped on cell A and is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

The MS is camped on cell B and is in the "idle, updated" state, with a TMSI allocated.

Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the n-th CHANNEL REQUEST (n being an integer from the set {1, 2 ... 8}, arbitrarily chosen by the SS) the SS sends an IMMEDIATE ASSIGNMENT REJECT message, which references one of the last 3 CHANNEL REQUESTs from the MS, and with the Wait Indication set to x seconds (x being an integer from the set {5, 6 ... 255}, arbitrarily chosen by the SS). The SS continues to send paging messages for that mobile station in every block of the mobile station's paging subgroup for x+2 s. The MS shall not answer to the PAGING REQUEST TYPE 1 messages sent before x seconds have elapsed. The MS may respond to any one of the PAGING REQUEST TYPE 1 messages sent after x seconds have elapsed, but at the latest it shall respond to the first PAGING REQUEST TYPE 1 sent after x+1 seconds have elapsed.

The SS responds to this CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message with the Wait Indication set to 255 s.

Immediately afterwards the SS changes the power levels so the MS selects cell B. After 20 s have elapsed the SS pages the MS in cell B and the MS shall answer to this page. In order to avoid another cell reselection the SS then sends another IMMEDIATE ASSIGNMENT REJECT.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|--|-----------|-----------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | <p>n CHANNEL REQUESTs (n being arbitrarily chosen from the set {1, 2 ... 8}) are sent, all with Establ. Cause = "Answer to paging"</p> <p>1st, 3rd and 4th Request References are different to all n Request References received from the MS under test. 2nd Request Reference: see note 1. 2nd Wait Indication = x seconds (x being arbitrarily chosen from the set {5, 6 ... 255}).</p> <p>The SS repeatedly pages the MS (on its paging subchannel) until a CHANNEL REQUEST message is received from the MS.</p> <p>(note 2).</p> <p>Establ. | k+5 | MS -> SS | CHANNEL REQUEST | |
| k+6 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| NOTE 1: The Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer from the set {max(1,n-2) ... n}, its value being arbitrarily chosen by the SS. | | | |
| NOTE 2: the value of k is not important in this test. | | | |

Specific Message Contents

None.

26.6.1.4 Immediate assignment / ignore assignment

26.6.1.4.1 Conformance requirements

1. An MS waiting for a response from the network, following the sending of a CHANNEL REQUEST, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong frame number.
2. An MS is waiting for an assignment of its own, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong random access information.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2

26.6.1.4.2 Test purpose

To verify that the MS ignores an assignment for another MS while it is waiting for an assignment of its own.

26.6.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS, which reacts with CHANNEL REQUESTs. The SS responds to the first CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT containing a wrong Request Reference (in the first run of the test the frame number is wrong, in the repetition it is the random access info that is wrong). It is verified for 2 s that the MS does not start signalling on the SDCCH. The MS shall ignore the assignment and send another CHANNEL REQUEST message. In order to avoid cell reselection the SS now answers with a correct IMMEDIATE ASSIGNMENT REJECT and repeats the test once.

Maximum Duration of Test

12 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Frame number in Request Reference is 2 too high. The MS shall not start signalling on the assigned SDCCH. This is verified for a period of 2 s. |
| 4 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 6 | SS | | SS waits for 6 s. |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 8 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | Random access info in Request Reference is wrong. The MS shall not start signalling on the assigned SDCCH. This is verified for a period of 2 s. |
| 10 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

26.6.1.5 Immediate assignment after immediate assignment reject

26.6.1.5.1 Conformance requirement

Following an IMMEDIATE ASSIGNMENT REJECT message, the MS shall listen for IMMEDIATE ASSIGNMENTS until T3126 expires.

Reference

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.3

26.6.1.5.2 Test purpose

To verify that the MS correctly responds to an IMMEDIATE ASSIGNMENT message sent after an IMMEDIATE ASSIGNMENT REJECT message.

26.6.1.5.3 Method of test

Initial conditions

System Simulator:

1 cell;

CCCH_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs";

Max retrans is set to 7;

TX-integer is set to 7;

Mobile Station:

The MS is in "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

"idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the third CHANNEL REQUEST the SS sends an IMMEDIATE ASSIGNMENT REJECT message which references the first CHANNEL REQUEST from the MS and has the Wait Indication IE set to 6 s.

Between 0,75 s and 1,25 s after sending the IMMEDIATE ASSIGNMENT REJECT message the SS sends an IMMEDIATE ASSIGNMENT message referencing the second CHANNEL REQUEST message, and assigning an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

Maximum duration of test

10 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | first request. |
| 3 | MS -> SS | CHANNEL REQUEST | second request. |
| 4 | MS -> SS | CHANNEL REQUEST | third request. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJ | references the first request from MS, Wait Indication IE set to 6 s. |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | references the second request from the MS Channel type set to SDCCH/8 message sent between 0,75 s and 1,25 s after the completion of step 5. |
| 7 | MS -> SS | PAGING RESPONSE | |
| 8 | SS -> MS | CHANNEL RELEASE | shall be sent on the correct channel. |

Specific message contents

None.

26.6.1.6 Immediate assignment / implicit rejection

26.6.1.6.1 Conformance requirement

The network may at any time include an implicit reject indication for the PS domain or the CS domain within an IMMEDIATE ASSIGNMENT message using the *IA Rest Octets* IE (see sub-clause 10.5.2.16) or within an IMMEDIATE ASSIGNMENT REJECT or an IMMEDIATE ASSIGNMENT EXTENDED message using the *Feature Indicator* IE (see sub-clause 10.5.2.76) or within a PAGING REQUEST TYPE 1 message using the *P1 Rest Octets* IE (see sub-clause 10.5.2.23) or within a PAGING REQUEST TYPE 2 message using the *P2 Rest Octets* IE (see sub-clause 10.5.2.24) or within a PAGING REQUEST TYPE 3 message using the *P3 Rest Octets* IE (see sub-clause 10.5.2.25).

The RR entity of a mobile station configured for “low access priority” (see 3GPP TS 23.060), when attempting to establish a CS connection other than in case of an emergency call or when the mobile station is a member of an authorized special access class or sending a paging response shall, while ignoring MS identities included within PAGING REQUEST messages, start listening to the downlink CCCH until successfully decoding one of the RR messages listed in sub-clause 3.3.1.1.1a. If the RR message indicates an implicit reject for the CS domain (see sub-clause 3.3.1.1.1a) the mobile station shall abort the immediate assignment procedure and initiate the Implicit Reject procedure (see sub-clause 3.3.1.1.3.2a).

If the mobile station initiates this procedure due to implicit reject indication received for the CS domain (respectively PS domain) it starts timer T3234 (respectively timer T3236) and returns to idle mode. The mobile station is not allowed to make a mobile originated access attempt for the CS domain (respectively PS domain) in the same cell until T3234 (respectively T3236) expires or is stopped. If the mobile station receives a PAGING REQUEST message while T3234/T3236 is running it shall stop T3234/T3236 and respond to the PAGING REQUEST message.

Reference

3GPP TS 44.018 subclauses 3.3.1.1.1a, 3.3.1.1.2 and 3.3.1.1.3.2a.

26.6.1.6.2 Test purpose

To verify that the MS, if configured for LAP, activates the implicit reject timer when it reads a CCCH block that indicates that implicit reject condition is indicated.

To verify that the MS does not make any access attempt when the implicit reject timer is active

To verify that the MS, if configured for LAP, when waiting for a response to its initial or subsequent access attempt, detects an implicit reject condition but does not detect an access response within the allowed access response time window, will abort its access attempt and start the implicit reject timer.

26.6.1.6.3 Method of test

Initial conditions

System Simulator:

1 cell;

Mobile Station:

The MS is switched off.

The MS is configured for “low access priority”

Max retrans is set to 7

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

"idle, updated", with TMSI allocated.

Test Procedure

The MS is switched on and initiates the location updating procedure. When receiving the first CHANNEL REQUEST the SS issues a paging message that is not addressed to the MS but contains an indication that implicit reject is active. The MS reads the implicit rejection flag and starts timer T3234. SS checks that MS does not send further CHANNEL REQUESTs until minimum value of T3234 and re-attempts location updating procedure after maximum value of T3234. The SS sends an IMMEDIATE ASSIGNMENT message which includes the implicit reject flag. The MS aborts the immediate assignments procedure and starts timer T3234. SS checks that MS does not send another CHANNEL REQUEST until minimum value of T3234 and re-attempts location updating procedure after maximum value of T3234. MS performs a successful location updating procedure.

Maximum duration of test

7 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|----------------|------------------------------|---|
| 1 | MS MS | CHANNEL REQUEST | Make the MS perform the location updating procedure Mobile may send up to MaxRetrans+1 CHANNEL REQUEST until PAGING REQUEST TYPE 1 in step 2 is received. 1st Mobile Identity does not contain TMSI of MS but with the Implicit Reject CS bit set to "1". Timer T3234 (random value drawn from the following set: {10.0, 10.1, 10.2, ...200.0} seconds) is active. |
| 2 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 3 | MS | | |
| 4 | MS MS -> SS | CHANNEL REQUEST | MS discards all further CHANNEL REQUESTS from access attempt Not received within 10 seconds after step 2. May be sent within 10 and 200 seconds. Shall be sent after 200 seconds. "Establishment cause": Location updating. The Implicit Reject CS bit set to "1". Timer T3234 (random value drawn from the following set: {10.0, 10.1, 10.2, ...200.0} seconds) is active. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS | | |
| 7 | MS -> SS | CHANNEL REQUEST | Not received within 10 seconds after step 5. May be sent within 10 and 200 seconds. Shall be sent after 200 seconds. "Establishment cause": Location updating. "location updating type" = normal After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 9 | MS -> SS | LOCATION UPDATING REQUEST | |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 11 | SS -> MS | CHANNEL RELEASE | |

Specific message contents

None.

26.6.1.7 Void

26.6.2 Test of paging

The Paging procedure is used by the network to cause the Mobile Station to establish a radio connection. Normally the Mobile Station listens to its paging subchannel, but this can be modified by the use of different page modes. The correct implementation of the paging procedure in the Mobile Station is essential for the basic establishment of a connection.

26.6.2.1 Normal paging

26.6.2.1.1 Paging / normal / type 1

26.6.2.1.1.1 Conformance requirements

1. The MS shall respond correctly to various PAGING REQUEST TYPE 1 messages, when the page mode is set to normal paging, in the following cases:
 - 1.1 The MS is addressed with its IMSI in the first Mobile Identity field. The optional Mobile Identity field is not present.
 - 1.2. The MS is addressed with its TMSI in the first Mobile Identity field. The optional Mobile Identity field specifies an IMSI different from that of the MS.
 - 1.3. The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field addresses the MS by its IMSI.

- 1.4 The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field contains the correct TMSI of the MS.
2. An MS shall ignore PAGING REQUEST TYPE 1 messages with incorrect information, when the page mode is set to normal paging, in the following case:
 - 2.1 The MS is addressed with its TMSI in the first Mobile Identity field, but the type of identity in this field is set to "No Identity". The optional Mobile Identity field is not present.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2, 3GPP TS 05.02 subclause 6.5.

26.6.2.1.1.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 1 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 1 message. It is tested that the MS ignores fill paging.

26.6.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS 5 times with different PAGING REQUEST TYPE 1 messages on the paging subchannel which corresponds to the MS's IMSI.

In the first 4 cases, where the MS is addressed by its IMSI or its TMSI, the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

In the last case, it is tested that the MS does not answer to paging that does not address it.

Maximum Duration of Test

2 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS, 2nd Mobile Ident not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 3. |
| 5 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 s to allow the MS to perform cell reselection. |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of MS, 2nd Mobile Ident contains IMSI of another MS. |
| 8 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 9 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 9. |

26.6.2.1.2 Paging / normal / type 2

26.6.2.1.2.1 Conformance requirements

1. The MS shall respond correctly (by sending CHANNEL REQUEST messages with an Establishment Cause set to "Answer to Paging") to various PAGING REQUEST TYPE 2 messages, when the page mode is set to normal paging, in the following cases:
 - 1.1 The MS is addressed in the first TMSI field.
 - 1.2 The MS is addressed in the second TMSI field.
 - 1.3 The MS is addressed in the optional Mobile Identity field with its TMSI.
 - 1.4 The MS is addressed in the optional Mobile Identity field with its IMSI.
2. The MS shall ignore PAGING REQUEST TYPE 2 messages with incorrect information, when the page mode is set to normal paging, in the following case:
 - 2.1 The MS is addressed in the optional Mobile Identity field with its TMSI, but the type of identity in this field is set to "No Identity".

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.

26.6.2.1.2.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 2 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 2 message. It is tested that the MS ignores a PAGING REQUEST TYPE 2 message that does not address it.

26.6.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS 5 times with different PAGING REQUEST TYPE 2 messages on the paging subchannel which corresponds to the MS's IMSI.

In the first 4 cases, where the MS is addressed by its IMSI or by its TMSI, the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second request by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

In the last case, it is tested that the MS does not answer to paging that does not address it.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses MS, 2nd TMSI addresses another MS, Mobile Identity IE not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 3. |
| 5 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 s to allow the MS to perform cell reselection. |
| 7 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses MS, Mobile Identity IE not present. |
| 8 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 9 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 9. |
| 11 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 12 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 s to allow the MS to perform cell reselection. |
| 13 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses another MS, Mobile Identity IE contains TMSI of MS. |
| 14 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 15 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 15 |
| 17 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 18 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 s to allow the MS to perform cell reselection |
| 19 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses another MS, Mobile Identity IE contains IMSI of MS. |
| 20 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging" |
| 21 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging" |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 21 |
| 23 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 24 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 s to allow the MS to perform cell reselection |
| 25 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses another MS, Mobile Identity IE contains TMSI of MS but with type of identity set to "no identity". |
| 26 | ----- | ----- | During 1 second, the SS checks that the MS does not produce any Layer 3 messages. |

Specific Message Contents

None.

26.6.2.1.3 Paging / normal / type 3

26.6.2.1.3.1 Conformance requirements

An MS shall respond correctly to various PAGING REQUEST TYPE 3 messages, when the page mode is set to normal paging. The MS shall send CHANNEL REQUEST messages, with an Establishment Cause set to "Answer to Paging", until the network answers. The number of CHANNEL REQUEST messages shall be limited by the parameter Max-retrans. After the assignment procedure, the MS shall send a PAGING RESPONSE message on the channel assigned by the network.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.

26.6.2.1.3.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 3 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested.

26.6.2.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS 4 times with different PAGING REQUEST TYPE 3 messages on the paging subchannel which corresponds to the MS's IMSI.

In all the cases the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second request by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 3 | 1st TMSI addresses MS; 2nd, 3rd and 4th TMSIs address other MSs. |
| 2 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 3. |
| 5 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 s to allow the MS to perform cell reselection. |
| 7 | SS -> MS | PAGING REQUEST TYPE 3 | 2nd TMSI addresses MS; 1st, 3rd and 4th TMSIs address other MSs. |
| 8 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |
| 9 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Answer to paging". |

None.

26.6.2.2 Paging / extended

26.6.2.2.1 Conformance requirements

1. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 1 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
2. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 2 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
3. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 3 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
4. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT message on the paging subchannel which corresponds to the MS's identity.
5. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT EXTENDED message on the paging subchannel which corresponds to the MS's identity.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1; 3GPP TS 05.02, subclause 6.5.

26.6.2.2.2 Test purpose

To test that the MS is operating in the extended page mode when this is ordered by the SS in either a PAGING REQUEST message or an IMMEDIATE ASSIGNMENT message.

26.6.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT on the paging subchannel which corresponds to the MS's identity. The random reference is different to those used by the Mobile Station in the last two CHANNEL REQUEST messages. (Phase 2 requires a Mobile Station to react on an IMMEDIATE ASSIGNMENT after a rejection.) The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT EXTENDED on the paging subchannel which corresponds to the MS's identity. The random references are different to those used by the Mobile Station in the last three CHANNEL REQUEST messages. The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 3 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 3 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL

REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 2 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

Maximum Duration of Test

10 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|----------------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile Ident: IMSI of another MS, page mode = "extended paging". |
| 2 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen Mobile Ident: TMSI of the MS. |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 s. page mode = normal. |
| 6 | SS SS -> MS | IMMEDIATE ASSIGNMENT | SS waits for 5 s. Sent in the paging subblock of MS under test. Page mode = "extended paging", Request reference chosen arbitrarily by the SS, but different from all references used earlier in this test sequence. |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: TMSI of the MS. |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | MS -> SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 s. page mode = normal. |
| 12 | SS | -- | SS waits for 5 s. |
| 13 | SS -> MS | IMMEDIATE ASSIGNMENT EXT | Sent in the paging subblock of MS under test. Page mode = "extended paging", Request references chosen arbitrarily by the SS, but different from all references used earlier in this test sequence. |
| 14 | SS -> MS | PAGING REQUEST TYPE 3 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: TMSI of the MS. |
| 15 | MS -> SS | CHANNEL REQUEST | |
| 16 | MS -> SS | CHANNEL REQUEST | |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 s page mode = normal. |
| 18 | SS | -- | SS waits for 5 s. |
| 19 | SS -> MS | PAGING REQUEST TYPE 3 | Sent in the paging subblock of MS under test. Page mode = "extended paging". |
| 20 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: IMSI of the MS. |
| 21 | MS -> SS | CHANNEL REQUEST | |
| 22 | MS -> SS | CHANNEL REQUEST | |
| 23 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 s page mode = normal. |
| 24 | SS | -- | SS waits for 5 s |
| 25 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in the paging subblock of MS under test. Page mode = "extended paging". |
| 26 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: IMSI of the MS. |
| 27 | MS -> SS | CHANNEL REQUEST | |
| 28 | MS -> SS | CHANNEL REQUEST | |
| 29 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 s. |

Specific Message Contents

None.

26.6.2.3 Paging / reorganization

26.6.2.3.1 Paging / reorganization / procedure 1

26.6.2.3.1.1 Conformance requirements

1. An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH_CONF set to "1 basic physical channel used for CCCH combined with SDCCH", and BS_AG_BLK_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.
3. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH_CONF set to "2 basic physical channels used for CCCH, not combined with SDCCHs" and BS_AG_BLK_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1; 3GPP TS 05.02, subclause 6.5.

26.6.2.3.1.2 Test purpose

To test that the MS correctly determines its new paging subchannel when the CCCH structure is changed from non-combined to combined and when the number of CCCHs is changed.

26.6.2.3.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, CCCH_CONF set to "1 basic physical channel used for CCCH, not combined with SDCCHs", a legal combination of BS_AG_BLK_RES and BS_PA_MFRMS is chosen arbitrarily by the SS, with the exception that BS_PA_MFRMS shall not be set to 9.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined/default range that ensures its paging channel changes when the broadcast parameters are changed.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED message on the MS's paging subchannel, with the page mode element set to "paging reorganization" and Request References that do not pertain to the MS. Before the MS's original paging subchannel re-occurs, the SS pages it on the CCCH corresponding to the Mobile Station's IMSI with a PAGING REQUEST TYPE 2 message (page mode = normal paging) containing the MS's TMSI in some paging block which does not belong to the Mobile Station's paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) on an arbitrarily selected paging subchannel.

Then the SS starts sending messages (PAGING REQUEST TYPE 1 or PAGING REQUEST TYPE 2 or PAGING REQUEST TYPE 3 or IMMEDIATE ASSIGNMENT or IMMEDIATE ASSIGNMENT EXTENDED or IMMEDIATE ASSIGNMENT REJECT) with page mode set to "paging reorganization" on all paging subchannels.

After 5 s (to ensure T3126 expires) the SS pages the MS with its TMSI on an arbitrarily selected paging subchannel (on the CCCH corresponding to the Mobile Station's IMSI). The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

The SS changes the paging parameters.

Then the SS sets the page mode to "normal paging".

The SS then waits for the duration of five 51-TDMA multiframes (4 to allow the MS to read all the system information type 1, 2, 3, and 4 messages on the BCCH, and one to calculate the new paging group). Not before 5 s after the last IMMEDIATE ASSIGNMENT REJECT message addressing the MS (to ensure T3126 expires), the MS is paged with a PAGING REQUEST TYPE 1 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) and then waits 5 s (to ensure T3126 expires).

Then the MS is paged with a PAGING REQUEST TYPE 2 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

60 s.

Expected Sequence

This sequence is performed for execution counter, $K = 1, 2$.

| Step | Direction | Message | Comments |
|------|-----------|----------------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Sent on the MS's paging channel. Page mode set to "paging reorganization". Request Reference not pertaining to the MS. |
| 2 | SS -> MS | PAGING REQUEST TYPE 2 | Sent before the MS's original paging subchannel re-occurs, but later than the next paging block of that CCCH. |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 0 s. |
| 6 | ----- | ----- | |
| 7 | SS -> MS | PAGING REQUEST TYPE 2 | All L3 messages sent on any paging subchannel are paging fill frames specify "paging re organization. Sent on an arbitrarily selected paging subchannel Page mode "paging reorganization" Not sent before 5 s after step 5. |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 0 s. |
| 11 | | | Change of paging parameters in SYS INFO 3 as described below for $K=1, 2$. |
| 12 | | | The SS waits until it has sent all system information messages (page mode is still paging reorganization). |
| 13 | ----- | ----- | All L3 messages sent on any paging subchannel specify "normal paging. |
| 14 | ----- | ----- | Wait 3 s. |
| 15 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the new paging subchannel of the MS. Not sent before 5 s after step 10. |
| 16 | MS -> SS | CHANNEL REQUEST | |
| 17 | MS -> SS | CHANNEL REQUEST | |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 0 s. |
| 19 | SS -> MS | PAGING REQUEST TYPE 2 | Sent on the new paging subchannel of the MS. Not sent before 5 s after step 18. |
| 20 | MS -> SS | CHANNEL REQUEST | |
| 21 | MS -> SS | CHANNEL REQUEST | |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

For execution counter K :

$K=1$:

SYSTEM INFORMATION TYPE 3 shall have the Control Channel Description IE changed to:

| | |
|--------------|--|
| CCCH_CONF | "1 basic physical channel used for CCCH, combined with SDCCHs" |
| BS_AG_BLKRES | 2 |
| BS_PA_MFRMS | 9 |

$K=2$:

SYSTEM INFORMATION TYPE 3 shall have the Control Channel Description IE changed to:

| | |
|--------------|--|
| CCCH_CONF | "2 basic physical channel used for CCCH, not combined with SDCCHs" |
| BS_AG_BLKRES | 2 |
| BS_PA_MFRMS | 9 |

26.6.2.3.2 Paging / reorganization / procedure 2

26.6.2.3.2.1 Conformance requirement

An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent in a former Access Grant block.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1.

26.6.2.3.2.2 Test purpose

To test that the MS is operating in the "paging reorganization" page mode when this is ordered by the SS and the MS is paged in its former access grant channel.

26.6.2.3.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 1, with the constraint that BS_AG_BLK_RES > 0, a legal combination of CCCH_CONF, BS_AG_BLK_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined/default range that ensures its paging channel changes when the broadcast parameters are changed.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED on the MS's paging subchannel, with the page mode element set to "paging reorganization". The MS is then paged immediately in a former Access Grant block with a PAGING REQUEST TYPE 2 message. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

5 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------------|--|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Page mode set to "paging reorganization" |
| 2 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in a former access grant block. |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

26.6.2.4 Paging / same as before

26.6.2.4.1 Conformance requirements

An MS, after first receiving a message on its paging subchannel with page mode set to "extended paging" and then the next message on its paging subchannel with page mode set to "same as before", shall remember the page mode from the previous message and answer to paging messages in the next but one paging sub block.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1; 3GPP TS 05.02, subclause 6.5.

26.6.2.4.2 Test purpose

To test that the MS remembers the page mode from the previous paging request message.

26.6.2.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT REJECT on the MS's paging subchannel, with the page mode element set to "extended paging". In the next but one subblock on the same CCCH, nothing addresses the MS. When the MS's specific paging subchannel reoccurs, a PAGING REQUEST TYPE 3 is sent, not addressing the MS under test and with

page mode set to "same as before". In the next but one subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying paging reorganization and addressing the MS. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

10 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Page mode set to "extended paging". |
| 2 | SS -> MS | XXXX | In the next but one subblock nothing addresses the MS. This is sent in the next paging subblock on the MS's specific paging subchannel. The page mode is set to "same as before", and the MS under test is not addressed. |
| 3 | SS -> MS | PAGING REQUEST TYPE 3 | |
| 4 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 5 | MS -> SS | CHANNEL REQUEST | |
| 6 | MS -> SS | CHANNEL REQUEST | |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

26.6.2.5 Paging / multislot CCCH

26.6.2.5.1 Conformance requirements

The MS shall respond correctly to a PAGING REQUEST TYPE 1 message, when the page mode is set to normal paging, when a multislot CCCH is used and the MS is addressed with its IMSI in the first Mobile Identity field, the optional Mobile Identity field being not present.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2, 3GPP TS 05.02 subclause 6.5.

26.6.2.5.2 Test purpose

- 1) To test that the MS is able to determine its CCCH group and paging group correctly in the case of a CCCH configuration on more than one timeslot when it is paged on a timeslot other than 0. The MS is addressed with a PAGING REQUEST TYPE 1 message when the page mode is set to normal paging. The MS is paged with its IMSI in the 1st Mobile Identity field, the optional Mobile Identity field being not present, is the only way of addressing tested.
- 2) To test that in such conditions the MS answers to the paging message on the timeslot on which the paging message was sent.

26.6.2.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, a legal combination of CCCH_CONF, BS_AG_BLKs_RES and BS_PA_MFRMS is chosen arbitrarily under the following constraint:

CCCH_CONF is in the set:

- 2 basic physical channels used for CCCH, not combined with SDCCHs
- 3 basic physical channels used for CCCH, not combined with SDCCHs
- 4 basic physical channels used for CCCH, not combined with SDCCHs

Mobile Station:

The IMSI last 3 digits are so that the CCCH_GROUP of the MS under test is other than 0. According to subclause 6.5.2 of recommendation 3GPP TS 05.02, this means that:

$(\text{IMSI mod } 1000) \bmod (\text{BS_CC_CHANS} \times N)$ is greater or equal to N , where
 $N = \text{BS_PA_MFRMS} \times (9 - \text{BS_AG_BLKS_RES})$.

The MS is in the "idle, updated" state.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

"Idle updated".

Test Procedure

The SS pages the MS once with a PAGING REQUEST TYPE 1 message on the timeslot and paging subchannel which correspond to the MS's IMSI.

The MS shall send the CHANNEL REQUEST on the same timeslot as the paging message.

The SS sends an IMMEDIATE ASSIGNMENT on the same timeslot as the paging message.

Maximum Duration of Test

10 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS, 2nd Mobile Ident not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". on the same timeslot as the paging message. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | on the same timeslot as the paging message. |
| 4 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 5 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

None.

26.6.2.6 Paging / EAB active

26.6.2.6.1 Conformance requirements

Upon receipt of a paging request message, or other message containing information to trigger the establishment of a RR connection, and if access to the network is allowed, the addressed mobile station shall, when camped on a cell as specified in 3GPP TS 23.022, initiate the immediate assignment procedure as specified in sub-clause 3.3.1. The establishment of the main signalling link is then initiated by use of an SABM with information field containing the PAGING RESPONSE message (see sub-clause 3.1.5). The MM sublayer in the mobile station is informed that the RR entity has entered the dedicated mode.

For a mobile originated access attempt, a mobile station configured for EAB shall perform a preliminary access barring check (see sub-clause 3.3.1.4). If the preliminary access barring check indicates network access is barred then access to the network is not allowed. Otherwise, the mobile station shall proceed according to the remainder of this sub-clause.

References

3GPP TS 44.018, subclause 3.3.2 and 3.3.1.1.1

26.6.2.6.2 Test purpose

To verify that the MS, configured for Extended Access class Barring, responds to paging messages when EAB is being broadcast by the network.

26.6.2.6.3 Method of test

Initial Conditions

System Simulator:

The SYSTEM INFORMATION TYPE 21 is sent on the BCCH. The SI 21 Rest Octets information element is configured with: EAB Authorization Mask set to "xxxxxxxx1" and EAB Subcategory set to "00".

Mobile Station:

The MS is switched off.

The MS is configured for "Extended Access Barring"

The MS belong to access class 0

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

MS is camped on the cell.

Test Procedure

The MS is switched on. The SS checks for 120 s that the MS doesn't access the cell.

The SS pages the MS with PAGING REQUEST TYPE 1 messages on the paging subchannel which corresponds to the MS's IMSI. The MS shall answer to the paging by sending CHANNEL REQUEST.. The SS responds by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

Maximum Duration of Test

2 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | MS | | MS is switched On |
| 2 | SS | | The SS verifies for 120 sec that the MS does not send CHANNEL REQUEST. |
| 3 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS. |
| 4 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 7 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

SYSTEM INFORMATION TYPE 3 broadcast in the cell:

Same as default content except

| Information Element | Value/remark |
|---------------------------------|---|
| SI 3 Rest Octets | |
| SYSTEM INFORMATION 21 Indicator | H (SYSTEM INFORMATION TYPE 21 message is available) |
| SI21_POSITION | 0 (SYSTEM INFORMATION TYPE 21 message is sent on BCCH Norm) |

SYSTEM INFORMATION TYPE 21 broadcast in the cell:

Same as default content except

| Information Element | Value/remark |
|------------------------|---|
| SI 21 Rest Octets | |
| EAB Authorization Mask | 'xxxxxxx1' (MSs configured for EAB and a member of Access Class 0 are barred) |
| EAB Subcategory | '00' (applicable to all mobile stations configured for EAB) |

26.6.3 Test of measurement report

When an RR-connection exists, the MS shall send measurement reports. These reports contain reception characteristics from serving and neighbouring cells. The measurement report procedure is described in subclause 3.4.1.2 of 3GPP TS 04.08 / 3GPP TS 44.018.

NOTE 8: The capability to calculate RxLev and RxQual is tested in clauses 15 and 16. In this test only the signalling aspect is verified.

26.6.3.1 Measurement / no neighbours

26.6.3.1.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH block and the measurement valid indication shall be set to valid (0) within the second block at the latest.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

26.6.3.1.2 Test purpose

To test that, when the SS gives absolutely no information about neighbouring cells, the MS does not report on neighbouring cells.

26.6.3.1.3 Method of test

Initial Conditions

System Simulator:

8 cells with the following settings:

| | | Transmitter | | | | | | | |
|---------------|-----------|-------------|-----------|-------|-------|-------|-------|-------|-------|
| | | Serving | Neighbour | | | | | | |
| | | S1 | N1 | N2 | N3 | N4 | N5 | N6 | N7 |
| Level | | -60 | -85 | -80 | -75 | -55 | -50 | -45 | -40 |
| Ncc | | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bcc | | 3 | 5 | 7 | 1 | 3 | 5 | 7 | 1 |
| ARFCN | GSM 450 | 260 | 264 | 268 | 272 | 276 | 280 | 284 | 288 |
| | GSM 480 | 307 | 311 | 315 | 319 | 323 | 327 | 331 | 335 |
| | GSM 710 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | GSM 750 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | T-GSM 810 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | GSM 850 | 129 | 135 | 141 | 147 | 153 | 159 | 165 | 171 |
| | GSM 900 | 002 | 008 | 014 | 020 | 026 | 032 | 038 | 044 |
| | DCS 1 800 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 |
| PCS 1 900 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 | |
| Cell Identity | | 0001H | 0002H | 0003H | 0004H | 0005H | 0006H | 0007H | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. The BA is indicated as empty. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that no measurement results have been obtained.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, $k = 1, 2$.

Since when $k = 1$, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when $k = 2$ an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

DCS 1 800 or PCS 1 900 begin:

SYSTEM INFORMATION TYPE 5:

| Information Element | value/remark |
|-----------------------------------|---|
| Protocol Discriminator | RR management |
| Message Type | Sys Info 5. |
| Neighbour Cells Description | |
| - Format | 1 024 range |
| - BCCH Allocation Sequence number | 1 |
| - EXT IND | $k = 1$. Information Element carries the complete BA. $k = 2$. Information Element carries only a part of the BA. |
| - W(i) | null. |

| | GSM 480 | 307 | 311 | 315 | 319 | 323 | 327 | 331 | 335 |
| | GSM 710 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | GSM 750 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | T-GSM 810 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | GSM 850 | 129 | 135 | 141 | 147 | 153 | 159 | 165 | 171 |
| | GSM 900 | 002 | 008 | 014 | 020 | 026 | 032 | 038 | 044 |
| | DCS 1 800 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 |
| PCS 1 900 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 | |
| Cell Identity | | 0001H | 0002H | 0003H | 0004H | 0005H | 0006H | 0007H | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 and 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. All 8 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 s in these that measurement results for the 6 strongest carriers have been obtained.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, $k = 1, 2$.

Since when $k = 1$, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when $k = 2$ an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

SYSTEM INFORMATION TYPE 5:

| BCCH_FREQ_NCELL_3 | Shall not correspond to N1 or N2 |
| BSIC_NCELL_3 | Corresponds to that of BCCH_FREQ_NCELL_3 |
| RXLEV_NCELL_4 | See note 1 |
| BCCH_FREQ_NCELL_4 | Shall not correspond to N1 or N2 |
| BSIC_NCELL_4 | Corresponds to that of BCCH_FREQ_NCELL_4 |
| RXLEV_NCELL_5 | See note 1 |
| BCCH_FREQ_NCELL_5 | Shall not correspond to N1 or N2 |
| BSIC_NCELL_5 | Corresponds to that of BCCH_FREQ_NCELL_5 |
| RXLEV_NCELL_6 | See note 1 |
| BCCH_FREQ_NCELL_6 | Shall not correspond to N1 or N2 |
| BSIC_NCELL_6 | Corresponds to that of BCCH_FREQ_NCELL_6 |

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.
When the Indication is set to 'Not Valid', then NOTE 1 applies to ALL fields of the Measurement Results IE.

26.6.3.3 Measurement / barred cells and non-permitted NCCs

26.6.3.3.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORTs on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the messages shall contain measurement results only for the 4 BCCH carriers on which the MS is allowed to report.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

26.6.3.3.2 Test purpose

To test that, when a combination of normal neighbours, barred cells and non-permitted NCCs is "on air", the MS reports only on normal neighbours.

26.6.3.3.3 Method of test

Initial Conditions

System Simulator:

8 cells with the following settings:

| | | Transmitter | | | | | | | |
|-----------------------|---------------|-------------|-----------|-------|-------|-------|-------|-------|-------|
| | | Serving | Neighbour | | | | | | |
| | | S1 | N1 | N2 | N3 | N4 | N5 | N6 | N7 |
| | Level dBm | -60 | -85 | -80 | -75 | -55 | -50 | -45 | -40 |
| | NCC | 1 | 1 | 1 | 2 | 3 | 4 | 1 | 1 |
| | BCC | 3 | 5 | 7 | 1 | 3 | 5 | 7 | 1 |
| | Cell Identity | 0001H | 0002H | 0003H | 0004H | 0005H | 0006H | 0007H | 0008H |
| A R F C N | GSM 450 | 260 | 264 | 268 | 272 | 276 | 280 | 284 | 288 |
| | GSM 480 | 307 | 311 | 315 | 319 | 323 | 327 | 331 | 335 |
| | GSM 710 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | GSM 750 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | T-GSM 810 | 439 | 445 | 451 | 457 | 463 | 469 | 475 | 481 |
| | GSM 850 | 129 | 135 | 141 | 147 | 153 | 159 | 165 | 171 |
| | GSM 900 | 002 | 008 | 014 | 020 | 026 | 032 | 038 | 044 |
| | DCS 1 800 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 |
| | PCS 1 900 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

NOTE 1: The BA sent in SYSTEM INFORMATION TYPE 5 does not include N1, N4 and N5. N1 may be the case of a barred cell, N3 simulates the case where another operator is transmitting on the same frequency (e.g. in border areas), N4 & N5 simulate the case where other operators are transmitting on other frequencies.

Mobile Station:

The MS is in the active state of a call (U10).

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 and 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. 5 of the 8 BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 4 strongest permitted carriers have been obtained (one of the carriers in the BA belongs to a non-permitted NCC).

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, k = 1, 2.

Since when k = 1 SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when k = 2 an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

NOTE 2: These actual values are not checked.

NOTE 3: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest. When the Indication is set to 'Not Valid', then NOTE 2 applies to ALL fields of the Measurement Results IE.

26.6.3.4 Measurement / DTX

26.6.3.4.1 Conformance requirements

After the sending of the HANDOVER COMPLETE, the MS shall continuously send measurement reports in every SACCH blocks, the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the order of values in the MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers among those monitored by the MS. Further, in a quiet environment, the DTX_USED field shall be set by the MS to "DTX used".

In the serving cell, the DTX indicator is set to "MS shall use discontinuous transmission".

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

The MS has just completed a handover into the serving cell, S1.

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress on an arbitrary cell, the MS is handed over to cell S1. On cell S1, the SS sends SYSTEM INFORMATION TYPE 5 and 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH with all 8 of the BCCHs "on air" indicated in the BA. Cell S1 also indicates that DTX shall be used. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 6 strongest carriers have been obtained and that DTX has been used. (The MS is positioned in an environment free from acoustic noise.)

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed twice for execution counter, $k = 1, 2$.

Since when $k = 1$, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when $k = 2$ an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

| - BCCH_FREQ_NCELL_5 | Shall not correspond to N1 or N2 |
| - BSIC_NCELL_5 | Corresponds to that of BCCH_FREQ_NCELL_5 |
| - RXLEV_NCELL_6 | See note 1 |
| - BCCH_FREQ_NCELL_6 | Shall not correspond to N1 or N2 |
| - BSIC_NCELL_6 | Corresponds to that of BCCH_FREQ_NCELL_6 |

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block after the HANDOVER COMPLETE message at the latest. When the Indication is set to 'Not Valid', then NOTE 1 applies to ALL fields of the Measurement Results IE.

NOTE 3: The DTX_used flag must only be checked from the MEASUREMENT REPORT occurring 2 complete SACCH multiframes after the MS has received SYSTEM INFORMATION TYPE 6. This is necessary to give the MS one SACCH multiframe to apply DTX and the second to transmit the updated MEASUREMENT REPORT.

NOTE 4: The BA_used flag must only be checked from the MEASUREMENT REPORT occurring 1 complete SACCH multiframe after the MS has received SYSTEM INFORMATION TYPE 5 (and SYSTEM INFO TYPE 5BIS in the case of k=2). This is necessary to give the MS one SACCH multiframe to transmit the updated MEASUREMENT REPORT.

26.6.3.5 Measurement / Frequency Formats

26.6.3.5.1 Conformance Requirement

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the values in the MEASUREMENT REPORT message shall contain measurement results for the cells on which the mobile is allowed to report.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

26.6.3.5.2 Test Purpose

To test that, when the SS gives information about neighbouring cells, the MS reports appropriate results.

26.6.3.5.3 Method of test

Initial Conditions

System Simulator:

2 cells with the following settings:

| | | Transmitter | |
|---------------|-----------|-------------|-----------|
| | | Serving | Neighbour |
| | | S1 | N1 |
| Level | | -60 | -85 |
| Ncc | | 1 | 1 |
| Bcc | | 3 | 5 |
| ARFCN | GSM 450 | 260 | 264 |
| | GSM 480 | 307 | 311 |
| | GSM 710 | 439 | 445 |
| | GSM 750 | 439 | 445 |
| | T-GSM 810 | 439 | 445 |
| | GSM 850 | 129 | 135 |
| | GSM 900 | 002 | 008 |
| | DCS 1 800 | 715 | 805 |
| | PCS 1 900 | 715 | 805 |
| Cell Identity | | 0001H | 0002H |

With the exception of the Cell Allocation, the rest of the parameters for both cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed three times.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5bis and 6 on the SACCH. Both of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that the appropriate measurement results have been obtained as specified in the Specific Message Contents.

For each iteration of the test the frequency format of the BA list contained in the System Information 5 and 5bis message shall change according to the specific message contents.

Maximum Duration Of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, K = 1, 2, 3.

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION 5bis, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

SYSTEM INFORMATION TYPE 5:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest. When the Indication is set to 'Not Valid', then NOTE 1 applies to ALL fields of the Measurement Results IE.

26.6.3.6 Measurement / multiband environment

26.6.3.6.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MEASUREMENT REPORT message shall contain measurement results for up to the 6 strongest BCCH carriers among those with known and allowed NCC part of BSIC on which the mobile is asked to report.

| | DCS 1 800 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 |
| PCS 1 900 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | 810 | |
| Cell Identity | | 0001H | 0002H | 0003H | 0004H | 0005H | 0006H | 0007H | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1, 2 and 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed once.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5ter & 6 on the SACCH. All 8 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 s in these that measurement results for the 6 strongest carriers, on which the mobile is asked to report, have been obtained.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 5ter, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

SYSTEM INFORMATION TYPE 2ter:

| Information Element | value/remark |
|--|---|
| Additional Multiband information - Multiband reporting | Minimum 2 cells reported from each band supported excluding the frequency band of the serving cell. |
| Extension of the BCCH Frequency list - Format identifier - BCCH Allocation Sequence - BCCH Allocation ARFCN | See table below 0 ARFCN 514, 530, 549, 602, 665, 686, 762, 810 |

| Band | Format | BCCH Allocation ARFCN |
|-----------|-------------|--|
| GSM 450 | Range 512 | 514, 530, 549, 602, 665, 686, 762, 810 |
| GSM 480 | Range 512 | 514, 530, 549, 602, 665, 686, 762, 810 |
| GSM 710 | Range 1 024 | 2, 8, 14, 20, 26, 32, 38, 44 |
| GSM 750 | Range 1 024 | 2, 8, 14, 20, 26, 32, 38, 44 |

26.6.3.7 Measurement / new cell reporting

26.6.3.7.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MS shall report a new strongest cell in the measurement report at the latest 5 s after a new strongest cell (which is part of the BA(SACCH)) has been activated under the following network conditions: Initial serving cell at RXLEV= -70 dBm, with 6 neighbours at RXLEV= -75 dBm. Then the new BCCH carrier is switched on at RXLEV= -60 dBm.

NOTE: Because of test equipment limitations it is acceptable to activate the new carrier to replace one of the 6 neighbours.

| | GSM 710 | 439 | 445 | 451 | 457 | 463 | 469 | 475 |
| | GSM 750 | 439 | 445 | 451 | 457 | 463 | 469 | 475 |
| | T-GSM 810 | 439 | 445 | 451 | 457 | 463 | 469 | 475 |
| | GSM 850 | 129 | 135 | 141 | 147 | 153 | 159 | 165 |
| | GSM 900 | 002 | 008 | 014 | 020 | 026 | 032 | 038 |
| | DCS 1 800 | 514 | 530 | 602 | 665 | 762 | 686 | 549 |
| PCS 1 900 | 514 | 530 | 602 | 665 | 762 | 686 | 549 | |
| Cell Identity | | 0001H | 0002H | 0003H | 0004H | 0005H | 0006H | 0007H |

With the exception of the Cell Allocation, the rest of the parameters for all seven cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

The test is performed in two steps a) and b).

Step a)

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 on the SACCH. All 7 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 s in these that measurement results for the 6 strongest carriers have been obtained.

Step b)

The SS replaces neighbour cell N1 with neighbour cell N7 with a signal strength of -60 dBm, in order to have the following new settings:

| | | Transmitter | | | | | | |
|---------------|-----------|-------------|-----------|-------|-------|-------|-------|-------|
| | | Serving | Neighbour | | | | | |
| | | S1 | N1 | N2 | N3 | N4 | N5 | N6 |
| Level | | -70 | -60 | -75 | -75 | -75 | -75 | -75 |
| Ncc | | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bcc | | 3 | 1 | 7 | 1 | 3 | 5 | 7 |
| ARFCN | GSM 450 | 260 | 288 | 268 | 272 | 276 | 280 | 284 |
| | GSM 480 | 307 | 335 | 315 | 319 | 323 | 327 | 331 |
| | GSM 710 | 439 | 481 | 451 | 457 | 463 | 469 | 475 |
| | GSM 750 | 439 | 481 | 451 | 457 | 463 | 469 | 475 |
| | T-GSM 810 | 439 | 481 | 451 | 457 | 463 | 469 | 475 |
| | GSM 850 | 129 | 162 | 141 | 147 | 153 | 159 | 165 |
| | GSM 900 | 002 | 044 | 014 | 020 | 026 | 032 | 038 |
| | DCS 1 800 | 514 | 810 | 602 | 665 | 762 | 686 | 549 |
| PCS 1 900 | 514 | 810 | 602 | 665 | 762 | 686 | 549 | |
| Cell Identity | | 0001H | 0008H | 0003H | 0004H | 0005H | 0006H | 0007H |

With a maximum delay of 5 s, the neighbour cell N7 is included in the measurement report messages.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

SYSTEM INFORMATION TYPE 5:

| BSIC_NCELL_2 | Corresponds to that of BCCH_FREQ_NCELL_2 |
| RXLEV_NCELL_3 | See note 1 |
| BCCH_FREQ_NCELL_3 | Shall correspond to S1 or N2 or N3 or N4 or N5 or N6 or N7 |
| BSIC_NCELL_3 | Corresponds to that of BCCH_FREQ_NCELL_3 |
| RXLEV_NCELL_4 | See note 1 |
| BCCH_FREQ_NCELL_4 | Shall correspond to S1 or N2 or N3 or N4 or N5 or N6 or N7 |
| BSIC_NCELL_4 | Corresponds to that of BCCH_FREQ_NCELL_4 |
| RXLEV_NCELL_5 | See note 1 |
| BCCH_FREQ_NCELL_5 | Shall correspond to S1 or N2 or N3 or N4 or N5 or N6 or N7 |
| BSIC_NCELL_5 | Corresponds to that of BCCH_FREQ_NCELL_5 |
| RXLEV_NCELL_6 | See note 1 |
| BCCH_FREQ_NCELL_6 | Shall correspond to S1 or N2 or N3 or N4 or N5 or N6 or N7 |
| BSIC_NCELL_6 | Corresponds to that of BCCH_FREQ_NCELL_6 |

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest. When the Indication is set to 'Not Valid', then NOTE 1 applies to ALL fields of the Measurement Results IE.

NOTE 3: Cell S1 shall be included in the Measurement Report sent by the MS.

26.6.3.8 Enhanced Measurement /all neighbours present

26.6.3.8.1 Conformance requirements

When in dedicated mode or group transmit mode, the mobile station regularly sends either MEASUREMENT REPORT or ENHANCED MEASUREMENT REPORT messages to the network.

The Mobile Station shall use ENHANCED MEASUREMENT REPORT messages instead of MEASUREMENT REPORT messages if that is indicated by the parameter REPORT_TYPE and if at least one BSIC is allocated to each BA (list) frequency

For Enhanced Measurement Reporting, cells shall be reported if they are among the at least 6 strongest carriers, and BSIC is successfully decoded and valid (see sub-clause 10.1.1) or, if indicated by the parameter INVALID_BSIC_REPORTING, with known and allowed NCC part. The neighbour cells shall be reported according to the priority defined in sub-clause 8.4.8.1. For other radio access technology/mode, RXLEV is replaced by the relevant measurement quantity (see sub-clause 8.1.5);

For report with the ENHANCED MEASUREMENT REPORT message, the Neighbour Cell list is the concatenation of the GSM Neighbour Cell list and the 3G Neighbour Cell list (if any).

Reference

TS 45.008 clause 10.1.4.1

Mobile Station

The MS is in the active state of a call (U10).

Specific PICS statements

-

PIXIT statements

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT INFORMATION message on the SACCH. The Report Type parameter on the SACCH indicated ENHANCED MEASUREMENT REPORT. All 7 of the BCCHs "on air" are indicated in the BA and 3G Neighbour Cell Description is indicated in the MEASUREMENT INFORMATION message. The MS shall send ENHANCED MEASUREMENT REPORT back to the SS, and it shall be indicated within 20 s in these that measurement results for the 6 strongest carriers.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT INFORMATION message are sent continuously on SACCH, a table is not applicable in this test.

NOTE 2: These actual values are not checked.

26.6.3.9 Enhanced Measurement Report / Measurement Parameters

26.6.3.9.1 Conformance requirements

The BA (list) which is the initial basis for the measurements is derived from information received on the BCCH in System Information 2 and optionally 2bis and/or 2ter and on the SACCH in System Information 5 and optionally 5bis and/or 5ter. MEASUREMENT INFORMATION and SI2quater messages may add information for the GSM Neighbour Cell List and provide 3G Neighbour Cell list. The Mobile Station shall use ENHANCED MEASUREMENT REPORT messages instead of MEASUREMENT REPORT messages if that is indicated by the parameter REPORT_TYPE and if at least one BSIC is allocated to each BA (list) frequency.

The network may request the MS to report serving cell and neighbour cell measurements with Enhanced Measurement Report message by the parameter REPORT_TYPE, provided that BSIC for all GSM neighbour cells has been sent to the MS (See 3GPP TS 44.018). This reporting is referred as Enhanced Measurement Reporting.

The MS shall use the SCALE value as indicated by the parameter SCALE_ORD in the MEASUREMENT INFORMATION. The MS shall indicate the used SCALE value in each individual ENHANCED MEASUREMENT REPORT or PACKET ENHANCED MEASUREMENT REPORT message.

References

3GPP TS 44.018 subclauses 3.2.2.1 and 3.4.1.2

3GPP TS 45.008 subclauses 8.4.8

26.6.3.9.2 Test purpose

To test that the MS reports appropriate results using Enhanced Measurement Report message when REPORT_TYPE is set to 0 in Measurement Information (System Information 2quater respectively).

To verify that an MS, in dedicated mode, use the SCALE value as indicated by the parameter SCALE_ORD in the MEASUREMENT INFORMATION.

26.6.3.9.3 Method of test

Initial Conditions

System Simulator:

5 cells with the following settings:

| | | Transmitter | | | | |
|---------------|-----------|-------------|-----------|-------|-------|-------|
| | | Serving | Neighbour | | | |
| | | S1 | N1 | N2 | N3 | N4 |

| Cell Identity | | 0001H | 0002H | 0003H | 0004H | 0005H |

The parameters for all five cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A with the following exceptions:

- the Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells only have one entry for the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Specific PICS statements:

-

PIXIT statements:

-

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

Step a)

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT INFORMATION messages on the SACCH. The Report Type parameter on the SACCH indicates ENHANCED MEASUREMENT REPORT and SERVING_BAND_REPORTING is set to 3. Serving cell and 4 neighbour cells "on air" are indicated in the BA and no 3G Neighbour Cell Description is indicated in the MEASUREMENT INFORMATION message. The MS shall send ENHANCED MEASUREMENT REPORTs back to the SS, and all carriers present in the BA List shall be indicated within 20 s in these that measurement results.

Step b)

Then the SS sends MEASUREMENT INFORMATION message including the request the use of SCALE_ORD parameter. The MS shall send Enhanced Measurement Report back to the SS and indicate the use of SCALE_ORD parameter. The SS checks that the offset is correctly applied by the MS.

Maximum Duration of Test

5 minutes.

Expected Sequence

Since System Information 5, System Information 6 and Measurement Information are sent on SACCH a table is not applicable in this test.

NOTE 1: The actual values are not checked.

NOTE 2: the RxLev must 10 dB lower than before sending the Measurement Information (b)

26.6.3.10 Enhanced Measurement Report / EMR Reporting after Handover

26.6.3.10.1 Conformance requirements

1. The BA (list) which is the initial basis for the measurements is derived from information received on the BCCH in System Information 2 and optionally 2bis and/or 2ter and on the SACCH in System Information 5 and optionally 5bis and/or 5ter. MEASUREMENT INFORMATION and SI2quater messages may add information for the GSM Neighbour Cell List and provide 3G Neighbour Cell list. The Mobile Station shall use ENHANCED MEASUREMENT REPORT messages instead of MEASUREMENT REPORT messages if that is indicated by the parameter REPORT_TYPE and if at least one BSIC is allocated to each BA (list) frequency
2. When in dedicated mode or group transmit mode, the mobile station regularly sends either MEASUREMENT REPORT or ENHANCED MEASUREMENT REPORT messages to the network. These messages contain measurement results about reception characteristics from the current cell and from neighbour cells.
3. The Mobile Station shall use ENHANCED MEASUREMENT REPORT messages instead of MEASUREMENT REPORT messages if that is indicated by the parameter REPORT_TYPE and if at least one BSIC is allocated to each BA (list) frequency.

3GPP TS 45.008 subclauses 8.4.8

26.6.3.10.2 Test purpose

1. To verify that an MS, in dedicated mode, on a cell A, after receiving a Measurement Information on SACCH with one BSIC allocated to each BA(list) frequency with REPORT_TYPE set to 0 sends ENHANCED MEASUREMENT REPORT.
2. To verify that the MS after switching to a new cell via handover procedure continues to send ENHANCED MEASUREMENT REPORT only after receiving a new Measurement Information.

26.6.3.10.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with same LAI default parameters

Mobile Station:

The MS is in the active state of a call (U10)

Specific PICS statements:

-

PIXIT statements:

-

Test Procedure

With the MS having a call in progress on cell A, the SS sends SYSTEM INFORMATION TYPE 5 & 6 on the SACCH.

The SS sends a Measurement Information with Report Type = 0 to trigger the MS to send Enhanced Measurement Report. Measurement results for cell B shall be indicated there.

The MS is handed over to cell B. The MS sends MEASUREMENT REPORT until it receives the MEASUREMENT INFORMATION. The measurement results for cell A shall be indicated.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 0 | MS -> SS | | The MS is in the active state of a call on cell A. |
| 1 | SS -> MS | MEASUREMENT INFORMATION | |
| 2 | MS -> SS | ENHANCED MEASUREMENT REPORT | Measurement results for cell B are present |
| 3 | SS -> MS | HANDOVER COMMAND | Contains the parameters for cell B |
| 4 | MS -> SS | HANDOVER ACCESS | Repeated on every burst of the uplink main DCCH (and optionally the SACCH) until reception of PHYSICAL INFORMATION. |
| 5 | SS -> MS | PHYSICAL INFORMATION | Sent after reception of n HANDOVER ACCESS messages. |
| 6 | MS -> SS | SABM | Sent without information field. |
| 7 | SS -> MS | UA | |
| 8 | MS -> SS | HANDOVER COMPLETE | |
| 9 | MS -> SS | MEASUREMENT REPORT | |
| 10 | SS -> MS | MEASUREMENT INFORMATION | |
| 11 | MS -> SS | ENHANCED MEASUREMENT REPORT | Measurement results for cell A to be reported with in 20 sec of step10. |

26.6.4 Test of the channel assignment procedure

An intracell change of channel can be requested by upper layers in order to change the channel type, or it may be initiated by the RR-sublayer, e.g. for an intra cell handover. This change is performed using the channel assignment procedure. If the procedure is incorrectly implemented in the MS, the establishment and maintenance of connections is endangered. This applies for the successful case and for the assignment failure: the MS's correct return to the old channel after assignment failure is a necessary part of the GSM system design.

26.6.4.1 Dedicated assignment / successful case

26.6.4.1.1 Conformance requirements

1. Upon receipt of the ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).
2. MM-messages and CM-messages using SAPI=0 sent from the mobile station to the network can be duplicated by the data link layer in the following case:
 - a channel change of dedicated channels is required (assignment or handover procedure) and the last layer 2 frame has not been acknowledged by the peer data link layer before the mobile station leaves the old channel.

In this case, the mobile station does not know whether the network has received the message correctly. Therefore, the mobile station has to send the message again after the new dedicated channel is established.

3. An ASSIGNMENT COMMAND message may indicate a frequency change in progress, with a starting time and possibly alternative channel descriptions.

In the case of the reception of an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.

4. The MS shall establish the link with the power level specified in the ASSIGNMENT COMMAND message.

The MS shall confirm the power control level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period.

5. The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the Mobile Allocation IE or the Frequency List IE at the time of accessing the new channel using the last received Cell Allocation.
6. After receipt of the ASSIGNMENT COMMAND the MS shall perform the assignment and return an ASSIGNMENT COMPLETE without undue delay.

References

- 1, 3, 5. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.3.
2. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.1.4.3.
4. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.3; 3GPP TS 05.08, subclause 4.2.
6. 3GPP TS 04.13, subclause 5.2.4.

26.6.4.1.2 Test purpose

1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition.

1.1 from non-hopping SDCCH to hopping TCH/F using a different timeslot;

- 1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot;
- 1.3 from non-hopping TCH/F to non-hopping TCH/F using a different timeslot;
- 1.4 from non-hopping TCH/F to hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
- 1.5 from hopping TCH/H to non-hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
- 1.6 from non-hopping TCH/H to hopping TCH/F using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.
2. To verify that an MS supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.
3. To verify that, if an MS supporting TCH has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.
4. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned channel, reports the power level specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.
5. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, is able in the case of frequency hopping to decode the Mobile Allocation and Frequency List IEs correctly and applies the specified frequencies using the correct Cell Allocation.
6. To verify that after receipt of the ASSIGNMENT COMMAND the MS returns an ASSIGNMENT COMPLETE without undue delay.

26.6.4.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters except:

| | BCCH ARFCN | Throughout the test, the CA broadcast in System Information 1 is |

| | | Note that the actual CA of the cell contains other frequencies. |

Mobile Station:

The MS is in the "idle, updated" state with a TMSI allocated.

Specific PICS statements

- MS supports GSM HR (TSPC_AddInfo_Halfrate)

PIXIT statements

-

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS and allocates an SDCCH. Then 2 different channels are assigned with ASSIGNMENT COMMANDs. Each time the MS shall switch to the assigned channel, establish the link and send an ASSIGNMENT COMPLETE message.

Then the SS sends a AUTHENTICATION REQUEST message. The MS shall answer with an AUTHENTICATION RESPONSE message, which is not acknowledged on L2 by the SS. Immediately after the AUTHENTICATION RESPONSE message is received, the SS sends an ASSIGNMENT COMMAND. The MS shall switch to the assigned channel, establish the link with the commanded power level and send as ASSIGNMENT COMPLETE message. Then MS shall repeat the AUTHENTICATION RESPONSE message, with the same N(SD) value.

Then the SS sends an ASSIGNMENT COMMAND, which includes a Starting Time IE. The MS shall react as specified above, but this shall be done at the time specified in Starting Time IE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the channel assignment procedure is performed another three times, with half rate channels involved, and again it is checked that the MS correctly completes the procedures, before the SS initiates the channel release procedure.

Maximum Duration of Test

30 s.

Expected Sequence

NOTE: 3GPP TS 04.08 / 3GPP TS 44.018 appears to be unclear as to whether timer T3240 shall or shall not be started as a result of the AUTHENTICATION REQUEST message sent in step 10. To allow a variety of test equipment implementations, the IDENTITY REQUEST message is included in order to avoid an unexpected expiry of timer T3240 prior to the end of the expected sequence.

| Step | Direction | Message | Comments |

| PCS 1 900 | Range 128 | 673, 675, 679, 682, 691, 698, 729, 732, 744 |

Step 12

ASSIGNMENT COMMAND:

| | |
|--------------------------------|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies - See table below |
| Starting Time | Not included |

| ASSIGNMENT COMMAND | |
|--------------------|---|
| Band | Mobile Allocation |
| | ARFCNs |
| GSM 450 | 271, 273, 279, 281, 282, 284, 287 and 289 |
| GSM 480 | 318, 320, 326, 328, 329, 331, 334 and 336 |
| GSM 710 | 482, 483, 500, 501, 502, 503, 506, 508 |
| GSM 750 | 482, 483, 500, 501, 502, 503, 506, 508 |
| T-GSM 810 | 482, 483, 500, 501, 502, 503, 506, 508 |
| GSM 850 | 172, 173, 200, 201, 202, 203, 235, 241 |
| GSM 900 | 45, 46, 73, 74, 75, 76, 108, 114 |
| DCS 1 800 | 773, 775, 779, 829, 832, 844 |
| PCS 1 900 | 673, 675, 679, 729, 732, 744 |

Step 17

ASSIGNMENT COMMAND:

| | |
|--|--|
| Channel Description - Channel Type and TDMA offset - Timeslot Number - Training Sequence Code - Hopping - ARFCN | TCH/F (N+5) mod 8 Chosen arbitrarily Single RF Channel See table below |
| Power Command - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

| ASSIGNMENT COMMAND | |
|--------------------|---------------------|
| Band | Channel Description |
| | ARFCN |
| GSM 450 | 259 |
| GSM 480 | 306 |
| GSM 710 | 447 |
| GSM 750 | 447 |
| T-GSM 810 | 447 |
| GSM 850 | 137 |
| GSM 900 | 10 |
| DCS 1 800 | 734 |
| PCS 1 900 | 634 |

Step B20

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description - Channel Type TDMA offset - Timeslot Number - Training Sequence Code - Hopping - MAIO - HSN | TCH/H Chosen arbitrarily (N+6) mod 8 Chosen arbitrarily RF hopping channel Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. 0 |
| Power Command - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | See table below |
| Mobile Allocation | Not included |
| Starting Time | Not included |

| ASSIGNMENT COMMAND | | |
|--------------------|--------------------------|-----------------------------------|
| Band | Cell Channel Description | |
| | Format | ARFCNs |
| GSM 450 | Range 128 | 259, 267, 275, 279, 287 and 289 |
| GSM 480 | Range 128 | 306, 314, 322, 326, 334 and 336 |
| GSM 710 | Range 128 | 447, 471, 489, 500, 506, 508 |
| GSM 750 | Range 128 | 447, 471, 489, 500, 506, 508 |
| T-GSM 810 | Range 128 | 447, 471, 489, 500, 506, 508 |
| GSM 850 | Range 128 | 137, 161, 179, 200, 235, 241 |
| GSM 900 | Bitmap 0 | 10, 34, 52, 73, 108, 114 |
| DCS 1 800 | Range 1 024 | 734, 741, 759, 766, 773, 832, 844 |
| PCS 1 900 | Range 1 024 | 634, 641, 659, 666, 673, 732, 744 |

Step B24

ASSIGNMENT COMMAND:

| | |
|--------------------------|--|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step B26

ASSIGNMENT COMMAND:

| | |
|--------------------------------|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | See table below |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN See table below |
| Starting Time | Not included |

| ASSIGNMENT COMMAND | | | |
|---------------------------|---------------------------------|---------------|--------------------------|
| Band | Cell Channel Description | | Mobile Allocation |
| | Format | ARFCNs | ARFCN |
| GSM 450 | Range 128 | 261, 263 | 261 |
| GSM 480 | Range 128 | 308, 310 | 308 |
| GSM 710 | Range 128 | 454, 457 | 454 |
| GSM 750 | Range 128 | 454, 457 | 454 |
| T-GSM 810 | Range 128 | 454, 457 | 454 |
| GSM 850 | Range 128 | 144, 147 | 144 |
| GSM 900 | Bitmap 0 | 17, 20 | 17 |
| DCS 1 800 | Variable bitmap | 741, 747 | 741 |
| PCS 1 900 | Variable bitmap | 641, 647 | 641 |

26.6.4.2 Dedicated assignment / failure

26.6.4.2.1 Dedicated assignment / failure / failure during active state

26.6.4.2.1.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3.3.

3GPP TS 05.08 subclause 4.2.

3GPP TS 05.05 subclause 4.1.1.

26.6.4.2.1.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel, reporting use of the last power level used on the old channel.

This is tested in the special cases of a transition:

- from TCH/F to hopping TCH/F in state U10 if the MS supports TCH/F and call control;
- from TCH/H to hopping TCH/H in state U10 if the MS supports TCH/H and call control.

26.6.4.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters. The SS orders the MS to use a power level P, where P is a power level within the range supported by the Type of MS.

Mobile Station:

The MS is in the active state (U10) of a mobile terminated call.

Specific PICS statements

- MS supports GSM HR (TSPC_AddInfo_Halfrate)

- Power class (TSPC_Type_xxx)

PIXIT statements

-

Foreseen Final State of the MS

The active state (U10) of a mobile terminated call.

Test Procedure

The MS is in the active state (U10) of a mobile terminated call. The SS sends an ASSIGNMENT COMMAND allocating a new TCH/F, but does not activate the new channel. It is checked that the MS triggers the establishment of the main signalling link on the old channel and then sends an ASSIGNMENT FAILURE.

Maximum Duration of Test

30 s.

Expected Sequence

The test is repeated for execution counter k = 1, and for k=2 if the MS supports TCH/H.

| Step | Direction | Message | Comments |
|------|-----------|--------------------|---|
| 1 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, if k = 1, Channel Type = TCH/H, if k = 2. Power level specified in power command is different from P, again where P is a power level within the range supported by the Type of MS. The MS attempts (and fails) to establish a signalling link on the new channel. The MS re-establishes the signalling link on the old channel. RR cause value = "protocol error unspecified". The SS checks that the MS reports power level P in the L1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM. |
| 2 | | | |
| 3 | MS -> SS | ASSIGNMENT FAILURE | |
| 4 | SS | | |

Specific Message Contents

None.

26.6.4.2.2 Dedicated assignment / failure / general case

26.6.4.2.2.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3.3.

26.6.4.2.2.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel.

This is tested in the special cases of a transition:

- from SDCCH to hopping TCH/F; this test part is only applicable if the MS supports TCH/F.
- from non-hopping SDCCH to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.
- from hopping TCH/F to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.

NOTE: Subclause 26.6.8.4 contains the case of an assignment failure SDCCH -> SDCCH.

26.6.4.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

Specific PICS statements

- MS supports GSM HR (TSPC_AddInfo_Halfrate)

PIXIT statements

-

Foreseen Final State of the MS

The MS is "idle updated".

Test Procedure

A mobile terminated RR connection is established on an SDCCH. The SS sends an ASSIGNMENT COMMAND message allocating a hopping TCH/F, but does not activate the assigned channels. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the test sequence is repeated another two times, with half rate channels involved, and again it is checked that the MS correctly returns to the old channels, before the SS initiates the channel release procedure.

Maximum Duration of Test

30 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Channel Type: SDCCH. |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| 6 | | | The MS re-establishes the signalling link on the old channel. |
| 7 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = "protocol error unspecified". |
| A | | | This test part is performed if the MS does not support TCH/H. |
| A8 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| B | | | This test part is performed if the MS supports TCH/H (see PICS). |
| B8 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B9 | | | The MS re-establishes the signalling link on the old channel. |
| B10 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = "protocol error unspecified". |
| B11 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, hopping. |
| B12 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the assigned channel after establishment of the main signalling link. |
| B13 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B14 | | | The MS re-establishes the signalling link on the old channel. |
| B15 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = "protocol error unspecified". |
| B16 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific Message Contents

None.

26.6.5 Test of handover

With the Handover procedure, it is possible to completely alter the channels allocated to a MS. This makes it possible in particular to switch a call in progress from one cell to another. The procedure is always initiated by the network and with the MS in a dedicated mode.

Subclauses 26.6.5.1 to 26.6.5.4 contain generic test procedures to be used for executing successful Handover tests. Table 26.6-1 contains a summary of the different combinations of parameters which have to be tested, together with a reference to the appropriate generic test procedure. If a test uses a channel rate which the MS under test does not support, the test shall be skipped.

Table 26.6-1

| From | To | Timing Adv. | Start Time | Syn ? | State of call | Subclause | Exec Counter |
|----------------|----------------|----------------|------------|-------|---------------|-----------|--------------|
| TCH/F, no FH | TCH/F, no FH | 20 | none | no | U10 | 26.6.5.1 | 1 |
| TCH/F, no FH | TCH/F, FH | arbitrary | none | no | U10 | 26.6.5.1 | 2 |
| TCH/F, FH | TCH/F, no FH | 20 | 1,1s | no | U10 | 26.6.5.1 | 3 |
| TCH/F, no FH | TCH/H, FH | arbitrary | none | no | U10 | 26.6.5.1 | 4 |
| TCH/H, FH | TCH/H, FH | 20 | 1,1s | no | U10 | 26.6.5.1 | 5 |
| TCH/H, FH | TCH/H, no FH | 20 | none | no | U10 | 26.6.5.1 | 6 |
| TCH/H, no FH | TCH/H, FH | arbitrary | none | no | U10 | 26.6.5.1 | 7 |

Table 26.6-2

| | TCH/FS | TCH/HS | SDCCH |
|---|--------|--------|-------|
| n | 10-20 | 5-10 | 2-5 |

In addition to the successful case of Handover, 2 unsuccessful cases shall be tested. These tests are described in subclauses 26.6.5.8 and 26.6.5.9.

26.6.5.1 Handover / successful / active call / non-synchronized

26.6.5.1.1 Conformance requirements

The MS shall correctly apply the handover procedure in the non-synchronized case when a call is in progress and when handover is performed from a TCH/F without frequency hopping towards a TCH/F without frequency hopping.

The MS shall correctly apply the handover procedure in the non-synchronized case when a call is in progress and when handover is performed from a TCH/H without frequency hopping to a TCH/H with frequency hopping. This does not apply to MSs not supporting TCH/H.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.

3GPP TS 04.13 subclause 5.2.6.2.

26.6.5.1.2 Test purpose

To test that when the MS is ordered to make a non-synchronized handover it continuously sends access bursts on the main DCCH (and optionally the SACCH) until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly handles the values of any Starting Time IE in the HANDOVER COMMAND message in the case when none of the information elements referring to before the starting time are present. To test that the MS correctly handles the Timing Advance IE in the PHYSICAL INFORMATION message. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

26.6.5.1.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with same LAI, default parameters except:

| Band | Cell A | | Cell B | | Both Cells Format |
|-----------|------------|---|------------|--|-------------------|
| | BCCH ARFCN | Cell Allocation | BCCH ARFCN | Cell Allocation | |
| GSM 450 | 263 | 259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291 | 274 | 260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291 | Range 128 |

| GSM 900 | 20 | 10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114 | 40 | 14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114 | Range 128 |
| DCS 1 800 | 747 | 734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844 | 764 | 739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844 | Range 256 |
| PCS 1 900 | 647 | 634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744 | 664 | 639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744 | Range 256 |

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

Mobile Station:

The MS is in the active state (U10) of a call on cell A.

Specific PICS statements

- MS supports Speech (TSPC_TS1x_Speech)

PIXIT statements

- supported radio interface rates: 12kbps, 6kbps, 3,6kbps

Foreseen Final State of the MS

The active state (U10) of a call on cell A.

Test Procedure

This procedure is repeated for execution counter M = 1 to 8 (see table 26.6-1).

The MS is in the active state (U10) of a call. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall (at the time defined by the Starting Time information element, if included in the message) begin to send access bursts on the new DCCH (and optionally the SACCH) of the target cell. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.6-1 of subclause 26.6.5. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANOVER COMPLETE message, before "x" ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for an execution counter M = 1, 2, 3 for an MS which only supports TCH/F.

This sequence is performed for an execution counter M = 1, 2.. 8 for an MS which supports TCH/F and H

| Step | Direction | Message | Comments |
|------|-----------|----------------------|--|
| 0 | MS -> SS | | The MS and SS are in the active state of a call on the channel described below. |
| 1 | SS -> MS | HANOVER COMMAND | See Specific message contents. |
| 2 | MS -> SS | HANOVER ACCESS | Repeated on every burst of the uplink main DCCH (and optionally the SACCH) until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANOVER COMMAND. If the HANOVER COMMAND includes a starting time IE then the first HANOVER ACCESS message shall be transmitted in the indicated frame (unless the indicated frame is not used by that channel, in which case the next frame used by that channel shall be used). |
| 3 | SS -> MS | PHYSICAL INFORMATION | Sent after reception of n HANOVER ACCESS messages. See specific message contents. |
| 4 | MS -> SS | SABM | Sent without information field. |
| 5 | SS -> MS | UA | |
| 6 | MS -> SS | HANOVER COMPLETE | The message shall be ready to be transmitted before "x" ms after the completion of step 3. |
| 7 | MS -> SS | | The MS and SS are in the active state of a call on the channel described below. |

Specific Message Contents For Mobiles Supporting Speech

For M = 1:

Step 0: The MS and SS are using a full rate TCH in non-hopping mode on cell A.

Specific Message Contents For Mobiles not Supporting Speech

If the mobile station supports half rate, then the 12 kbps radio interface rate is not used for this test. With this restriction, the radio interface rate is selected arbitrarily from those supported.

The message contents shall be the same for the Mobile Station supporting speech , except for:

M = 3:

|-----------------------|--|
| Mode of first channel | Data, with half rate radio interface rate that is supported. |

26.6.5.2 Handover / successful / call under establishment / non-synchronized

26.6.5.2.1 Conformance requirements

The MS shall correctly apply the handover procedure from SDCCH/8, TCH/F or TCH/H with or without frequency hopping to SDCCH/8, TCH/F or TCH/H with or without frequency hopping in the non-synchronized case during call establishment. The mobile shall correctly apply the handover procedures from non frequency hopping SDCCH/4 to SDCCH/8, TCH/F or TCH/H with or without frequency hopping. If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.1.4.2, 3.4.4 and 9.1.15.

3GPP TS 04.13, subclause 5.2.6.2.

26.6.5.2.2 Test purpose

To test that when the MS is ordered to make a non-synchronized handover, it continuously sends access bursts on the main DCCH (and optionally the SACCH) until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.

26.6.5.2.3 Method of test

Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

Cell A has:

BCCH ARFCN = See table below.

Cell Allocation = See table below

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN_PERM = 00001010.

Cell B has:

BCCH ARFCN = See table below.

Cell Allocation = See table below

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, see table below for format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

| Band | Cell A | | Cell B | | Both Cells Format |
|-----------|---------------|---|---------------|--|----------------------|

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

Specific PICS statements

- MS supports Speech (TSPC_TS1x_Speech)

PIXIT statements

- supported radio interface rates: 12kbps, 6kbps, 3,6kbps

Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

Test Procedure

This procedure is repeated for execution counter $M = 1, 2 \dots 10$ (See table 26.6-1.)

A Mobile Originating Call is initiated on Cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH (and optionally the SACCH) to cell B. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.6-1 of subclause 26.6.5. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANOVER COMPLETE message before x ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of " x " depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

The sequence is performed for execution counter $M = 1, 2 \dots 10$ (unless a particular TCH is not supported).

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | ----- | ----- | A MO call is initiated on cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Originating call, NECI not set to 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | See specific message contents. |
| 4 | MS -> SS | CM SERVICE REQUEST | CM Service Type = Mobile Originating Call Establishment. |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | MS -> SS | SETUP | Last L2 frame not acknowledged by the SS. |
| 8 | SS -> MS | HANOVER COMMAND | See specific message contents. |
| 9 | MS -> SS | HANOVER ACCESS | Repeated on every burst of the uplink main DCCH (and optionally the SACCH) until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANOVER COMMAND |
| 10 | SS -> MS | PHYSICAL INFORMATION | Sent after reception of n HANOVER ACCESS message. Timing Advance as specified in table 26.6-1 of subclause 26.6.5. |
| 11 | MS -> SS | SABM | Sent without information field. |
| 12 | SS -> MS | UA | |
| 13 | MS -> SS | HANOVER COMPLETE | This message shall be ready to be transmitted before " x " ms after the completion of step 10. |
| 14 | MS -> SS | SETUP | Same N(SD) as in step 7. |
| 15 | SS -> MS | CHANNEL RELEASE | |

| Mode of first channel | Data, with half rate radio interface rate which is supported. |

26.6.5.3 Handover / successful / active call / finely synchronized

26.6.5.3.1 Conformance requirements

The MS shall correctly apply the handover procedure from TCH/F with frequency hopping to TCH/F without frequency hopping in the finely synchronized case when a call is in progress.

The MS shall correctly apply the handover procedure from TCH/H with frequency hopping to TCH/H without frequency hopping in the finely synchronized case when a call is in progress. This requirement does not apply to MSs not supporting TCH/H.

3GPP TS 05.05 subclause 4.1.1.

3GPP TS 05.10, subclause 6.6.

26.6.5.3.2 Test purpose

To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell, it sends 4 access bursts on the main DCCH (and optionally on the SACCH) and then activates the channel correctly, taking into account the value of any Starting Time information element, power command and correctly calculating the timing advance to use. To test the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

26.6.5.3.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters, except:

The BCCH of cell A is sent k bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is y bit periods. k and y are selected such that $0 < (2k+y) \bmod 256 < 60$.

| | Cell B BCCH ARFCN |
|-----------|----------------------|
| GSM 450 | 274 |
| GSM 480 | 321 |
| GSM 710 | 477 |
| GSM 750 | 477 |
| T-GSM 810 | 477 |
| GSM 850 | 167 |
| GSM 900 | 40 |
| DCS 1 800 | 764 |
| PCS 1 900 | 647 |

Mobile Station:

The MS is in the active state (U10) of a call (on cell A). The MS is using a power level P . Where P is a power level within the supported range of that type of MS.

Specific PICS statements

- TSPC_Type_xxx (all appropriate power classes)
- MS supports Speech (TSPC_TS1x_Speech)

PIXIT statements

- supported radio interface rates: 12kbps, 6kbps, 3,6kbps

Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B).

Test Procedure

This procedure is repeated for execution counter $M = 1$ to 2. (See table 26.6-1.)

The MS is in the active state (U10) of a call on cell A. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall (at the time specified in the Starting Time information element, if included) send 4 access bursts, in 4 successive slots on the new DCCH to cell B (Note: Before completion of the 4 access bursts on the DCCH, additional access bursts may also be sent on the SACCH). Then the MS shall establish a signalling link indicating the correct Timing Advance and power level and send a HANOVER COMPLETE message.

The MS shall be "ready to transmit" a HANOVER COMPLETE message before "x" ms after the end of the HANOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter $M = 1$ for an MS which only supports TCH/F.

This sequence is performed for execution counter $M = 1$ to 2 for an MS which supports TCH/F and H.

| Step | Direction | Message | Comments |
|---|-----------|-------------------|---|
| 0 | MS -> SS | | M = 1, The MS and SS are using a full rate TCH in hopping mode on cell A. M = 2, The MS and SS are using a half rate TCH in hopping mode on cell A. |
| 1 | SS -> MS | HANDOVER COMMAND | See Specific Message Contents. |
| 2 | MS -> SS | HANDOVER ACCESS | See specific message contents. Four messages. |
| 3 | MS -> SS | HANDOVER ACCESS | are transmitted to Cell B in 4 successive slots. |
| 4 | MS -> SS | HANDOVER ACCESS | on the new DCCH. |
| 5 | MS -> SS | HANDOVER ACCESS | Before completion of the 4 access bursts on the new DCCH, additional access bursts may also be sent on the SACCH |
| 6 | MS -> SS | SABM | Sent without information field. |
| 7 | SS -> MS | UA | |
| 8 | MS -> SS | HANDOVER COMPLETE | This message shall be ready to be transmitted before "x" ms after the completion of step 1. See specific message contents. |
| 9 | SS | | The header of the next uplink SACCH is examined and the Timing Advance and Power Level indications are examined. The correct timing advance shall be indicated. A tolerance of ± 2 bit periods is allowed. The power level indication shall indicate the power level used in the handover command (see note). |
| 10 | MS, SS | | M = 1, The MS and SS are using a full rate TCH in non-hopping mode on cell B M = 2, The MS and SS are using a half rate TCH in non-hopping mode on cell B. |
| <p>NOTE: In case the Handover procedure is completed within 1 SACCH multiframe, the powerlevel indication, of the power level used in the handover command, will be done in the second uplink SACCH sent on the target cell. As the indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period, the first uplink SACCH header will indicate the powerlevel used by the MS on the old cell, if the Handover procedure is completed within 1 SACCH multiframe. In this case the powerlevel examination shall be done in the second uplink SACCH header sent on the target cell. Reference: 05.08/45.008 clause 4.2.</p> | | | |

26.6.5.4 Handover / successful / call under establishment / finely synchronized

26.6.5.4.1 Conformance requirements

The MS shall correctly apply the handover procedure from SDCCH/8 or TCH/F with or without frequency hopping to SDCCH4, SDCCH/8 or TCH/F with or without frequency hopping in the finely synchronized case, during call establishment.

If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

26.6.5.4.2 Test purpose

To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell, it sends 4 access bursts on the main DCCH (and optionally the SACCH) and then activates the channel correctly, taking into account the value of any Starting Time information element, power command and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. To verify the MS transmits the HANDOVER COMPLETE message without undue delay.

26.6.5.4.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters, except:

The BCCH of cell A is sent k bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is y bit periods. k and y are selected such that $0 < (2k + y) \bmod 256 < 60$.

The frame numbers of cells A and B shall be different by 100.

| Band | Cell A | | Cell B | |
|-----------|------------|---|------------|--|
| | BCCH ARFCN | Cell Allocation | BCCH ARFCN | Cell Allocation |
| GSM 450 | 263 | 259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291 | 274 | 260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291 |
| GSM 480 | 310 | 306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338 | 321 | 307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338 |

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A. The MS is using a power level P , where P is a power level within the supported range of that type of MS.

Specific PICS statements

- MS supports Speech (TSPC_TS1x_Speech)
- TSPC_Type_xxx (all appropriate power classes)

PIXIT statements

- supported radio interface rates: 12kbps, 6kbps, 3,6kbps

Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

Test Procedure

This procedure is repeated for execution counter $M = 1, 2, 3, 4$ (see table 26.6-1).

A Mobile Originating Call is initiated on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then (at the time specified in the Starting Time information element, if included) send 4 access bursts, in successive slots on the new DCCH to cell B (Note: Before completion of the 4 access bursts on the new DCCH, additional access bursts may also be sent on the SACCH). Then the MS shall establish

a signalling link indicating the correct timing advance and power level and send a HANOVER COMPLETE message. The MS shall be "ready to transmit" the HANOVER COMPLETE message before "x" ms after the end of the HANOVER COMMAND message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value "x" depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This procedure is repeated for execution counter M = 1, 2, 3, 4 (unless a particular TCH is not supported).

| Step | Direction | Message | Comments |
|-------|--|-------------------------|---|
| 1 | ----- | ----- | A MO call is initiated. |
| 2 | MS -> SS | CHANNEL REQUEST | Establish. Cause = "Originating call, NECI not set to 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | See Specific Message contents. |
| 4 | MS -> SS | CM SERVICE REQUEST | CM Service Type = Mobile Originating Call Establishment. |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | MS -> SS | SETUP | Last L2 frame not acknowledged by the SS. |
| 8 | SS -> MS | HANOVER COMMAND | See Specific Message Contents. |
| 9 | MS -> SS | HANOVER ACCESS | |
| 10 | MS -> SS | HANOVER ACCESS | |
| 11 | MS -> SS | HANOVER ACCESS | See Specific message contents. Four. |
| 12 | MS -> SS | HANOVER ACCESS | Messages are transmitted to cell B in 4 successive slots on the new DCCH. If the HANOVER COMMAND message includes a starting time IE then the first HANOVER ACCESS message shall be transmitted in the indicated frame (unless the starting time has elapsed). Before completion of the 4 access bursts on the new DCCH, additional access bursts may also be sent on the SACCH. |
| 13 | MS -> SS | SABM | Sent without information field. |
| 14 | SS -> MS | UA | |
| 15 | MS -> SS | HANOVER COMPLETE | The message shall be ready to be transmitted before "x" ms after the completion of step 8. |
