33.6 Subscription identity management

33.6.1 Definition

Subscription identity management is the ability of the MS to prevent the establishment of MO (except MO emergency calls) and MT calls without a valid subscription.

33.6.2 Conformance requirement

An MS can only be operated, if a valid IMSI is present.

33.6.3 Test purpose

- 1) To verify that during an established call: either
 - 1.1) on removal of the SIM from an MS, the MS will perform an IMSI detach; or
 - 1.2) after removing the power source from the MS, removing the SIM, and restoring the power source to the MS, the MS may perform an IMSI detach.
- 2) To verify that an MS without SIM card will not establish a MO call which is not an emergency call.
- 3) To verify that an MS without SIM card will not accept an incoming call.

33.6.4 Method of test

33.6.4.1 Initial conditions

Void.

33.6.4.2 Procedure

- a) A call is set up.
- b) (Reserved).
- c) Either:
 - (i) the SIM is removed; or
 - (ii) where this is not possible, the power source is removed from the MS, the SIM is removed and the power source is restored to the MS.

The SS observes whether or not the MS performs IMSI detach.

- d) An attempt to establish a MO call is made (not an emergency call).
- e) An attempt to establish a MT call is made.

33.6.5 Test requirements

- 1) Either:
 - 1.1) in step c(i), the MS shall perform an IMSI detach; or
 - 1.2) in step c(ii), the MS may perform an IMSI detach.
- 2) In step d) the MS shall not attempt to set up a new call via the Um interface.
- 3) In step e), the MS shall not respond to the attempt to set up a new call via the Um interface.

33.7 Barring of outgoing calls

33.7.1 Definition

The barring of outgoing calls is an optional feature. It is the ability of the MS to prevent all MO calls except emergency calls.

33.7.2 Conformance requirement

An MS may have an optional facility to bar outgoing calls. Such barring facility shall not prevent the transmission on emergency calls.

33.7.3 Test purpose

To verify that an MS for which a local facility to bar outgoing calls has been declared as being implemented, is able to establish an emergency call if this facility is activated.

33.7.4 Method of test

33.7.4.1 Initial conditions

Void.

33.7.4.2 Procedure

- a) The local facility to bar outgoing calls is activated.
- b) Via MMI, the MS is actioned to establish an emergency call.

33.7.5 Test requirements

- 1) The MS shall establish an emergency call.

33.8 Prevention of unauthorized calls

33.8.1 Definition

The prevention of unauthorized calls is an optional feature in the MS. It is the ability of the MS to prevent unauthorized use by using a key or keyword protection facility. When activated the MS does not prevent the establishment of except emergency calls.

33.8.2 Conformance requirement

An MS may have an optional facility to prevent unauthorized use. Such facility shall not prevent the transmission on emergency calls.

33.8.3 Test purpose

To verify that an MS for which a local facility to prevent unauthorized use has been declared to be implemented, is able to establish an emergency call, if this facility is activated.

33.8.4 Method of test

33.8.4.1 Initial conditions

33.8.4.2 Procedure

- a) The local facility to restrict operation such that the MS can only be operated by using a key or a keyword is activated. The most restrictive situation is created.
- b) Via MMI, the MS is actioned to establish an emergency call.

33.8.5 Test requirements

- 1) The MS shall establish an emergency call.

34 Short message service (SMS)

Ref.: 3GPP TS 03.40, 3GPP TS 04.11 (point to point)
3GPP TS 03.41, 3GPP TS 04.12 (cell broadcast)

34.1 General

The purpose of these tests is to verify that the MS can handle GSM functions when submitting or receiving Short Messages (SM) between MS and a short message service centre as described in 3GPP TS 03.40.

The procedures are based upon services provided by the Mobility Management (MM) sublayer which is not tested in this case.

The SMS comprises three basic services. The SMS point to point services shall work in an active MS at any time independent of whether or not there is a speech or data call in progress. The SMS cell broadcast service only works when the MS is in idle mode.

The manufacturer shall declare whether SMS messages are stored in the SIM and/or the ME. This shall be referred to as the SMS message store in the following tests.

A timeout of 60s is applied throughout the tests with respect to the retransmission of CP-Data messages. This timeout is based on the maximum TR1M + 15s. The 15s is sufficient time to verify that the MS does not initiate more than the maximum number of retransmissions.

Unless otherwise stated default message contents from subclause 26.6.14 applies for GSM 900 and default message contents from subclause 26.6.15 applies for DCS 1 800 and default message contents from subclause 26.6.16 applies for GSM 450 and default message contents from subclause 26.6.17 applies for GSM 480 and default message contents from subclause 26.6.18 applies for PCS 1 900 and default message contents from subclause 26.6.19 applies for GSM 750 and default message contents from subclause 26.6.20 applies for GSM 850 and default message contents from subclause 26.6.21 applies for GSM 710 and default message contents from subclause 26.6.22 applies for T-GSM 810.

For the test cases in section 34.4 the default message contents shall be set as in "GPRS default conditions" clause 40.

34.2 Short message service point to point

34.2.1 SMS mobile terminated

34.2.1.1 Conformance requirements

An active MS shall be able to receive short message TPDU (SMS-DELIVER) at any time, independently of whether or not there is a speech or data call in progress. A report will always be returned to the SC, confirming that the MS has received the short message.

Reference

3GPP TS 03.40; 3.1.

34.2.1.2 Test purpose

To verify the ability of a MS to receive and decode the SMS where provided for the point to point service.

34.2.1.3 Method of test

Initial Conditions

System simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

Specific PICS Statements:

- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements:

- Description of the basic procedures to display a mobile terminated short message.
- Support for call control state U10.

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) The SS initiates the transmission of a short message using a paging request. Upon response of the MS to the paging the SS assigns an SDCCH, authenticates the MS and activates ciphering. Then the SS establishes SAPI 3 by sending a SABM frame with SAPI 3 on the SDCCH.

When a UA frame (SAPI 3) is received in response, the SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU).

- b) The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- c) The SS sends a CP-ACK to the MS with no further CP-DATA messages and the SS initiates channel release.
- d) Steps a), b) and c) are repeated but the first CP-DATA message from the MS is not acknowledged. The second CP-DATA message from the MS is acknowledged by a CP-ACK.
- e) Steps a) and b) are repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. The SS ensures that the MS disconnects the link within 60 s after the first CP-DATA not acknowledged by the SS. The 60 s is sufficient time to wait to verify that the MS does not send more than the maximum allowed (3) CP-DATA retransmissions.
- f) The SMS message store shall be cleared manually by the operator.
- g) A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The SS sends a SABM frame with SAPI-3 on the SACCH associated to the TCH.

When a UA frame (SAPI-3) is received in response, the SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU). The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

- h) The SS sends a CP-ACK to the MS with no further CP-DATA messages and the SS initiates channel release. The SMS message store shall be cleared manually by the operator.
- i) Steps g) and h) are repeated but the first CP-DATA message from the MS is not acknowledged. The second CP-DATA message from the MS is acknowledged by a CP-ACK.
- j) Step g) is repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. After a duration of 60 s after the first CP-DATA not acknowledged the SS initiates the channel release. The 60 s is sufficient time to wait to verify that the MS does not send more than the maximum allowed (3) CP-DATA retransmissions (during a call in progress).

- k) A data or speech call is established on a TCH with the SS and the state U10 of call control shall be entered. The SS sends a SABM frame with SAPI-3 on the SACCH associated to the TCH. After the UA response on SAPI-3, the speech call is cleared by the SS with a disconnect message. (The call clearing is continued on the FACCH in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA RPDU (SMS DELIVER TPDU) message. The information element of the CP-DATA message is RP-DATA.

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the MS with no further CP-DATA messages and the SS initiates channel release.

The SMS message store shall be cleared manually by the operator.

- l) A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The SS sends a SABM frame with SAPI-3 on the SACCH associated to the TCH. After the UA response on SAPI-3, the speech call shall be cleared from the MS. (The call clearing is continued on the FACCH in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA message. The information element of the CP-DATA message is RP-DATA RPDU (SMS DELIVER TPDU).

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the MS with no further CP-DATA messages and the SS initiates channel release.

The SMS message store shall be cleared manually by the operator.

Maximum Duration of Test

20 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | MS shall respond to SABM in step 10 |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 13 | SS | | Waits max 25 s for CP-ACK |
| 14 | MS -> SS | CP-ACK | |
| 15 | SS | | Waits max 60 s for RP-ACK RPDU |
| 16 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 17 | SS -> MS | CP-ACK | |
| 18 | MS | | There should be no further CP-DATA messages until the MS aborts the RR connection (disconnection of layer 2). |
| 19 | MS | | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 20 | SS -> MS | PAGING REQUEST | |
| 21 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 23 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 24 | SS -> MS | AUTHENTICATION REQUEST | |
| 25 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 26 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 27 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 28 | SS | | SS starts ciphering. |
| 29 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 30 | MS -> SS | UA (SAPI=3) | The MS shall respond to the SABM |
| 31 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 32 | SS | | Waits max 25 s for CP-ACK |
| 33 | MS -> SS | CP-ACK | |
| 34 | SS | | Waits max 60 s for RP-ACK RPDU |
| 35 | MS -> SS | CP-DATA | First CP-DATA from MS, contains RP-ACK RPDU |
| 36 | SS | | First CP-DATA message not acknowledged by SS |
| 37 | MS -> SS | CP-DATA | Retransmitted CP-DATA from MS contains RP-ACK RPDU |
| 38 | SS -> MS | CP-ACK | Second CP_DATA message is acknowledged |
| 39 | MS | | There should be no further CP-DATA messages until the MS aborts the RR connection (disconnection of layer 2). |
| 40 | MS | | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 41 | SS -> MS | PAGING REQUEST | |
| 42 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 43 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 44 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 45 | SS -> MS | AUTHENTICATION REQUEST | |
| 46 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 47 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 48 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 49 | SS | | SS starts ciphering. |
| 50 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 51 | MS -> SS | UA (SAPI=3) | The MS shall respond to the SABM |
| 52 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 53 | SS | | Waits max 25 s for CP-ACK |
| 54 | MS -> SS | CP-ACK | |
| 55 | SS | | Waits max 60 s for RP-ACK RPDU |
| 56 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 57 | SS | | First CP-DATA message not acknowledged by SS |
| 58 | MS -> SS | CP-DATA | Retransmitted CP-DATA from MS contains RP-ACK RPDU |
| 59 | SS | | Retransmitted CP-DATA message not acknowledged by SS |
| 60 | MS | | Depending upon the maximum number of CP-DATA retransmissions implemented, step 58 and 59 may be repeated. |
| 61 | MS -> SS | DISC | The main signalling link is released within 60 s after the first CP-DATA message not acknowledged by SS. |
| 62 | MS | | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 63 | SS | | A data or speech call is established on a TCH and the state U10 of call control is entered. |
| 64 | SS -> MS | SABM (SAPI=3) | Sent on SACCH associated with the TCH |
| 65 | MS -> SS | UA (SAPI=3) | The MS shall respond to the SABM |
| 66 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 67 | SS | | Waits max 25 s for CP-ACK |
| 68 | MS -> SS | CP-ACK | |
| 69 | SS | | Waits max 60 s for RP-ACK RPDU |
| 70 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 71 | SS -> MS | CP-ACK | |
| 72-1 | SS -> MS | DISCONNECT | Disconnect the active call |
| 72-2 | MS -> SS | RELEASE | |
| 72-3 | SS -> MS | RELEASE COMPLETE | |
| 72-4 | MS | | There should be no further CP-DATA messages until the MS aborts the RR connection (disconnection of layer 2) |
| 73 | MS | | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 74 | MS | | Clear the SMS message store |
| 75 | SS | | A data or speech call is established on a TCH and the state U10 of call control is entered. |
| 76 | SS -> MS | SABM (SAPI=3) | Sent on SACCH associated with the TCH |
| 77 | MS -> SS | UA (SAPI=3) | The MS shall respond to the SABM |
| 78 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 79 | SS | | Waits max 25 s for CP-ACK |
| 80 | MS -> SS | CP-ACK | |
| 81 | SS | | Waits max 60 s for RP-ACK RPDU |
| 82 | MS -> SS | CP-DATA | First CP-DATA from MS, contains RP-ACK RPDU |
| 83 | SS | | First CP-DATA message not acknowledged by SS |
| 84 | MS -> SS | CP-DATA | Retransmitted CP-DATA message contains RP-ACK RPDU |
| 85 | SS -> MS | CP-ACK | Second CP-DATA message is acknowledged |
| 86-1 | SS -> MS | DISCONNECT | Disconnect the active call |
| 86-2 | MS -> SS | RELEASE | |
| 86-3 | SS -> MS | RELEASE COMPLETE | |
| 86-4 | MS | | There should be no further CP-DATA messages until the MS aborts the RR connection (disconnection of layer 2) |
| 87 | MS | | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 88 | MS | | Clear the SMS message store |
| 89 | SS | | A data or speech call is established on a TCH and the state U10 of call control is entered. |
| 90 | SS -> MS | SABM (SAPI=3) | Sent on SACCH associated with the TCH |
| 91 | MS -> SS | UA (SAPI=3) | The MS shall respond to the SABM |
| 92 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 93 | SS | | Waits max 25 s for CP-ACK |
| 94 | MS -> SS | CP-ACK | |
| 95 | SS | | Waits max 60 s for RP-ACK RPDU |
| 96 | MS -> SS | CP-DATA | First CP-DATA from MS, contains RP-ACK RPDU |
| 97 | SS | | First CP-DATA message not acknowledged by SS |
| 98 | MS -> SS | CP-DATA | Transmitted CP-DATA message contains RP-ACK RPDU |
| 99 | SS | | Retransmitted CP-DATA message not acknowledged by SS |
| 100 | MS | | Depending on the maximum number of CP-DATA retransmissions implemented, step 98-99 may be repeated. The maximum number of retransmissions may however not exceed three. |
| 101 | SS -> MS | CHANNEL RELEASE | The main signalling link is released after a duration of 60 s after the first CP-DATA message not acknowledged by SS. |
| 102 | MS | | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 103 | MS | | Clear the SMS message store |
| 104 | SS | | A data or speech call is established on a TCH and the state U10 of call control is entered. |
| 105 | SS -> MS | SABM (SAPI=3) | Sent on SACCH associated with the TCH |
| 106 | MS -> SS | UA (SAPI=3) | The MS shall respond to the SABM |
| 107 | SS -> MS | DISCONNECT | The speech call is cleared by the SS. The call clearing is continued on the FACCH in parallel to the following exchange of messages related to SMS. |
| 108 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 109 | SS | | Waits max 25 s for CP-ACK |
| 110 | MS -> SS | CP-ACK | <p>Waits max 60 s for RP-ACK RPDU Contains RP-ACK RPDU</p> <p>There should be no further CP-DATA messages until the MS aborts the RR connection (disconnection of layer 2). The MS shall indicate that an SM has arrived. NOTE: Time values for SS wait time are chosen sufficiently high to be sure that the MS has enough time to respond to the different messages.

Specific Message Contents:

SMS DELIVER TPDU

| Information element | Comment | Value |
|---------------------|-------------------------------------|-------------|
| TP-MTI | SMS DELIVER | "00"B |
| TP-MMS | more messages are waiting in SC | "0"B |
| TP-RP | no reply path | "0"B |
| TP-UDHI | TP-UD contains only the SM | "0"B |
| TP-SRI | no status report returned | "0"B |
| TP-OA | an international number coded E.164 | |
| TP-PID | default | "00000000"B |
| TP-DCS | default alphabet | "00000000"B |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40) | |
| TP-UDL | 160 | |
| TP-UD (140 octets) | text of message (160 characters) | |

NOTE: The 160 characters shall include at least one occurrence of each character in the default alphabet (see 3GPP TS 03.40 annex 2).

34.2.2 SMS mobile originated

34.2.2.1 Conformance requirements

An active MS shall be able to submit short message TPDU (SMS-SUBMIT) at any time, independently of whether or not there is a speech or data call in progress.

Reference

3GPP TS 03.40; subclause 3.1.

34.2.2.2 Test purpose

To verify that the MS is able to correctly send a short message where the SMS is provided for the point to point service. The test also verifies that the MS is capable of simultaneously receive a network originated SM whilst sending a mobile originated SM.

34.2.2.3 Method of test

Initial Conditions

System simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

Specific PICS Statements

- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Description of the basic procedures to display a mobile originated short message.
- Support for call control state U10.
- Maximum length (characters) of a mobile originated short message.

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) The MS shall be set up to send a SM to the SS. The SS responds to the channel request message by allocating an SDCCH. The SS answers correctly to the SABM on SAPI 0 and then performs the authentication and ciphering procedures.
- b) The SS responds with a UA frame SAPI-3 to the MS.
- c) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message.
- d) The SS sends a channel release message to the MS.
- e) Steps a) and b) are repeated. The SS is configured not to send the CP-ACK message. Then maximum 3 CP-DATA retransmissions may occur. The SS ensures that the MS disconnects the link within 60 s after the first CP-DATA not acknowledged by the SS. The 60 s is sufficient time to wait to verify that the MS does not send more than the maximum CP-DATA retransmissions and that TRIM has expired. Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored.
- f) Steps a) and b) are repeated. On receipt of the CP-DATA from the MS the SS sends a CP-ERROR message containing a "Network Failure" cause. Then the SS initiates channel release. Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored.

- g) A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The MS is setup to send an SM to the SS. After the reception of the CM SERVICE REQUEST, the SS sends a CM SERVICE ACCEPT message. The SS responds with a UA frame SAPI-3 to the SABM with SAPI-3 received from the MS.
- h) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message. Then the SS sends a channel release message to the MS.
- i) Step g) is repeated. The SS is configured not to send the CP-ACK message or to respond to any other CM requests. Then maximum 3 CP-DATA retransmissions may occur. After a duration of 60 s after the first CP-DATA not acknowledged the SS initiates channel release. The 60 s is sufficient time to wait to verify that the MS does not send more than the maximum CP-DATA retransmissions (during a call in progress). Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored.
- j) The SS is configured to receive a mobile originated SM. Steps a) and b) are repeated and, using the end of the CP-DATA message from the MS as a trigger, the SS sends a SM to the MS. In this case a new transaction identifier shall be used in the CP messages of SMS mobile terminated. Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored.
- k) The MS is set up to send an SM to the SS. On receipt of the CM SERVICE REQUEST the SS sends a CM SERVICE REJECT message with the reject cause set to "Service Option not supported" or "Service Option temporarily out of order". After 5 s the SS initiates channel release. Any remaining message in the outbox should be removed. All requests from the MS during this time shall be ignored.

Maximum Duration of Test

20 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Other procedures which can be completed with an SDDCH" NECI = 0 |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 3 | MS -> SS | CM SERVICE REQUEST | SS assigns an SDCCH Message is contained in SABM on SAPI 0. CM service type set to "Short message transfer" |
| 4 | SS -> MS | AUTHENTICATION REQUEST | SRES specifies correct value. |
| 5 | MS -> SS | AUTHENTICATION RESPONSE | |
| 6 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 7 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 8 | SS | | SS starts ciphering. |
| 9 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 |
| 10 | SS -> MS | UA (SAPI=3) | |
| 11 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 12 | SS -> MS | CP-ACK | |
| 13 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 14 | SS | | Waits max 25 s for CP-ACK |
| 15 | MS -> SS | CP-ACK | |
| 16 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| 17 | MS -> SS | DISC (SAPI=0) | MS shall respond to channel release with a layer 2 DISC frame with SAPI 0 |
| 18 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Other procedures which can be completed with an SDDCH" (NECI=0) |
| 19 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 20 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM on SAPI 0. |
| 21 | SS -> MS | AUTHENTICATION REQUEST | SRES specifies correct value. |
| 22 | MS -> SS | AUTHENTICATION RESPONSE | |
| 23 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 24 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 25 | SS | | SS starts ciphering. |
| 26 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 |

| Step | Direction | Message | Comments |
|-------------------|-----------|-------------------------|--|
| 27 | SS -> MS | UA (SAPI=3) | |
| 28 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 29 | SS | | SS configured not to send CP-ACK |
| 30 | MS -> SS | CP-DATA | Retransmitted CP-DATA message |
| 31 | MS | | Depending on the maximum number of CP-DATA retransmissions implemented, step 30 may be repeated. The maximum number of retransmissions may however not exceed three. |
| 31a (Optional) | MS -> SS | CP-ERROR | The MS may send CP-ERROR if TR1M expires |
| 32a | MS -> SS | DISC (SAPI = 0) | The main signalling link is released within 60 s after the first CP-DATA message not acknowledged by SS. |
| 32b | MS | | Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored. |
| 33 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Other procedures which can be completed with an SDDCH" (NECI=0) |
| 34 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 35 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM. CM service type set to "short message transfer" |
| 36 | SS -> MS | AUTHENTICATION REQUEST | |
| 37 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 38 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 39 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 40 | SS | | SS starts ciphering. |
| 41 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 |
| 42 | SS -> MS | UA (SAPI=3) | |
| 43 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 44 | SS -> MS | CP-ERROR | Sent containing "Network Failure" cause. |
| 45 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| 45a | MS -> SS | DISC (SAPI = 0) | MS shall respond to channel release with a layer 2 DISC frame with SAPI 0. |
| 45b | MS | | Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored. |
| 46 | SS | | A data or speech call is established on a TCH and the state U10 of call control is entered. |
| 47 | MS | | The MS is set up to send an SM |
| 48 | MS -> SS | CM SERVICE REQUEST | Sent in a layer 2 frame on the FACCH. CM service type set to "short message transfer" |
| 49 | SS -> MS | CM SERVICE ACCEPT | |
| 50 | MS -> SS | SABM (SAPI=3) | Sent on SACCH associated with the TCH |
| 51 | SS -> MS | UA (SAPI=3) | |
| 52 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 53 | SS -> MS | CP-ACK | |
| 54 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 55 | SS | | Waits max 25 s for CP-ACK |
| 56 | MS -> SS | CP-ACK | |
| 57 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| 58 | MS -> SS | DISC (SAPI =0) | The MS shall respond to channel release with a layer 2 DISC frame with SAPI 0. |
| 59 | SS | | A data or speech call is established on a TCH and the state U10 of call control is entered. |
| 60 | MS -> SS | CM SERVICE REQUEST | Sent in a layer 2 frame on the FACCH. CM service type set to "short message transfer" |
| 61 | SS -> MS | CM SERVICE ACCEPT | |
| 62 | MS -> SS | SABM (SAPI=3) | Sent on SACCH associated with the TCH |
| 63 | SS -> MS | UA (SAPI=3) | |
| 64 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 65 | SS | | SS configured not to send CP-ACK |
| 66 | MS -> SS | CP-DATA | Transmitted CP-DATA message |

| Step | Direction | Message | Comments |
|-------------------|----------------|-------------------------|---|
| 67 | MS | | Depending on the maximum number of CP-DATA retransmissions implemented, step 66 may be repeated. The maximum number of retransmissions may however not exceed three. Any other CM requests from the MS shall be ignored. |
| 67a (Optional) | MS->SS | CP-ERROR | The MS may send CP-ERROR if TR1M expires |
| 68 | SS -> MS | CHANNEL RELEASE | The main signalling link is released after a duration of 60 s after the first CP-DATA message not acknowledged by SS. |
| 69 69a | MS -> SS MS | DISC (SAPI =0) | The MS shall respond to channel release Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored. |
| 70 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Other procedures which can be completed with an SDDCH" (NECI=0) |
| 71 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 72 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM. CM service type set to "short message transfer" |
| 73 | SS -> MS | AUTHENTICATION REQUEST | |
| 74 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 75 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 76 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 77 | SS | | SS starts ciphering. |
| 78 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 |
| 79 | SS -> MS | UA (SAPI=3) | |
| 80 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 81 | SS | | The SS sends an SM to the MS triggered by the end of the CP-DATA message from the MS |
| 82 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 83 | MS | | The MS shall correctly receive the SM and indicate that a message has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed. In the MO case the MS shall send the CP-ACK message with transaction identifier assigned to this transfer. In the MT case the MS shall send a CP-ACK message and a CP-DATA message containing the RP-ACK RPDU. The transaction identifier shall be the same as chosen by the SS for the MT transfer. |
| 83a | MS | | Any remaining message in the outbox should be removed prior to the next step. All requests from the MS during this time shall be ignored. |
| 84 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Other procedures which can be completed with an SDDCH" (NECI=0) |
| 85 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 86 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM. CM service type set to "short message transfer" |
| 87 | SS -> MS | CM SERVICE REJ | Reject cause set to "Service Option not supported" or "Service Option temporarily out of order" |
| 88 | MS | | The MS shall not establish SAPI-3 |
| 89 | SS -> MS | CHANNEL RELEASE | Sent 5 s after CM SERVICE REJ |
| 90 | MS | | Any remaining message in the outbox should be removed. All requests from the MS during this time shall be ignored. |

NOTE: Time values for SS wait times are chosen sufficiently high to be sure that the MS has enough time to respond to the different messages.

Specific Message Contents:

SMS SUBMIT TPDU

| Information element | Comment | Value |
|------------------------|--|-------------|
| TP-MTI | SMS SUBMIT | "01"B |
| TP-VPF | not checked | |
| TP-RP | no reply path | "0"B |
| TP-UDHI | not checked | |
| TP-SRR | not checked | |
| TP-MR | not checked | |
| TP-RD | not checked | |
| TP-DA | not checked (an E164 number) | |
| TP-PID | default | "00000000"B |
| TP-DCS | default alphabet | "00000000"B |
| TP-VP | not checked | |
| TP-UDL | as applicable | |
| TP-UD (140 octets max) | maximum number of characters (text of message) as defined by the manufacturer (see PICS/PIXIT) | |

34.2.3 Test of memory full condition and memory available notification:

The Memory Available Notification provides a means for the MS to notify the network that it has memory available to receive one or more short messages. The SMS status field in the SIM contains status information on the "memory available" notification flag.

34.2.3.1 Conformance requirement

1. When a mobile terminated message is Class 2, the MS shall ensure that the message has been transferred to the SMS data field in the SIM before sending an acknowledgement to the SC. The MS shall return a protocol error message if the short message cannot be stored in the SIM and there is other short message storage available in the MS. If all the short message storage in the MS is already in use, the MS shall return "memory capability exceeded".
2. When the MS rejects a short message due to lack of available memory capability the need to transfer notification shall be stored in the SIM.
3. If the memory capability becomes available because memory is cleared, the value of the memory capability exceeded notification flag in the SIM is read. If the flag is set, the MS notifies the network that memory capability is now available. After a positive acknowledgement from the network, the ME unsets the memory capability exceeded notification flag in the SIM.

References

3GPP TS 03.40, subclause 9.2.3.10, 3GPP TS 03.38, clause 4.

3GPP TS 03.40, subclause 10.3 (operation 14).

3GPP TS 03.40, subclause 10.3 (operation 14).

34.2.3.2 Test purpose

1. To verify that the MS sends the correct acknowledgement when its memory in the SIM becomes full.
2. To verify that the MS sends the correct acknowledgement when its memory in the ME and the SIM becomes full, and sets the "memory exceeded" notification flag in the SIM.
3. To verify that the MS performs the "memory available" procedure when its message store becomes available for receiving short messages, and only at this moment.

34.2.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters

Mobile Station:

The MS shall be in the idle updated state.

The SMS message storage shall not be full

The MS shall be connected to the SIM simulator. The following shall be present in the SIM simulator:

- EF_{SMS} with at least one record;
- EF_{SMSstatus}, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
- Service no. 4 (SMS) in EF_{SST} set to allocated and activated.

For storing of Class 1 Short Messages the MS shall be set up to store Short Messages in the ME memory (by way of MMI, as described in PICS/PIXIT statement).

Specific PICS Statements

- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Description of the basic procedures to display a mobile originated short message.
- Description of the procedure to fill up MS memory (internal/external) to leave only memory for a limited number of SMS.

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) step a) of subclause 34.2.5.3 (test of Class 2 Short Messages) is repeated until the MS sends a negative acknowledgement (RP-ERROR). The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the SIM.
- b) a Class 1 Short Message is sent to the MS.
- c) step b) is repeated until the MS sends a negative acknowledgement (RP-ERROR). The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the SIM.
- d) a Short Message is sent to the MS with the DCS field of the SMS-DELIVER TPDU set to 0.
- e) the SS prompts the operator to read a short message and to remove one or more messages from the message store of the MS.
- f) the SS waits for a CHANNEL REQUEST from the MS, and sends an IMMEDIATE ASSIGNMENT allocating an SDCCH.
- g) the SS answers correctly to the SABM on SAPI 0.
- h) the SS answers correctly to the SABM on SAPI 3.
- i) the SS answers to the RP-SMMA from the MS with a CP-DATA containing a RP-ACK RPDU.
- j) after the MS has acknowledged the CP-DATA with a CP-ACK, the SS releases the channel with a CHANNEL RELEASE message. The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been unset on the SIM.
- k) step e) is repeated.

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 2 Short Message |
| 13 | SS | | Waits max 25 s for CP-ACK |
| 14 | MS -> SS | CP-ACK | |
| 15 | SS | | Waits max 60 s for RP-ACK RPDU |
| 16 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 17 | SS -> MS | CP-ACK | |
| 18 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. Step 1-18 is repeated until MS sends a negative acknowledgement (RP-ERROR) in step 16. The RP-ERROR RPDU cause field shall be "Protocol error, unspecified" if there is message capability in the ME, or "Memory capability exceeded" if there is no message capability in the ME. If the total memory store of the MS is full, the ME shall set the "memory capability exceeded" notification flag on the SIM. |
| 19 | SS -> MS | PAGING REQUEST | |
| 20 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 21 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 22 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 23 | SS -> MS | AUTHENTICATION REQUEST | |
| 24 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 25 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 26 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 27 | SS | | SS starts ciphering. |
| 28 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 29 | MS -> SS | UA (SAPI=3) | |
| 30 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 1 Short Message |
| 31 | SS | | Waits max 25 s for CP-ACK |
| 32 | MS -> SS | CP-ACK | |
| 33 | SS | | Waits max 60 s for RP-ACK RPDU |
| 34 | MS -> SS | CP-DATA | Shall contain RP-ACK RPDU if there is memory capability in the ME. If not it shall contain RP-ERROR RPDU which cause field shall be "memory capability exceeded". If the total memory store of the MS now becomes full at this step, the ME shall set the "memory cap. exceed" notification flag on the SIM. |
| 35 | SS -> MS | CP-ACK | |
| 36 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. Step 19-36 is repeated until the MS sends an RP-ERROR. The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the SIM. |
| 37 | SS -> MS | PAGING REQUEST | |
| 38 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 39 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 40 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 41 | SS -> MS | AUTHENTICATION REQUEST | |
| 42 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 43 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 44 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |

| Step | Direction | Message | Comments |
|------|-----------|------------------------|---|
| 45 | SS | | SS starts ciphering. |
| 46 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 47 | MS -> SS | UA (SAPI=3) | |
| 48 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) with TP-DCS set to 0 |
| 49 | SS | | Waits max 25 s for CP-ACK |
| 50 | MS -> SS | CP-ACK | |
| 51 | SS | | Waits max 60 s for RP-ACK RPDU |
| 52 | MS -> SS | CP-DATA | Shall contain RP-ERROR RPDU with error cause "memory capability exceeded". |
| 53 | SS -> MS | CP-ACK | |
| 54 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| 55 | SS | | Prompts the operator to remove one or more messages from the short message store of the MS. |
| 57 | MS -> SS | CHANNEL REQUEST | Establishment cause "Other services which can be completed with an SDCCH" (NECI=0). |
| 58 | SS -> MS | IMMEDIATE ASSIGNMENT | SS allocates an SDCCH |
| 59 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM. CM service type information element is set to "Short message transfer". |
| 60 | SS -> MS | CM SERVICE ACCEPT (UA) | SAPI 0 |
| 61 | MS -> SS | SABM (SAPI=3) | MS shall establish SAPI 3 |
| 62 | SS -> MS | UA (SAPI=3) | |
| 63 | MS -> SS | CP-DATA | Contains RP-SMMA RPDU |
| 64 | SS -> MS | CP-ACK | |
| 65 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 66 | MS -> SS | CP-ACK | Acknowledge of CP-DATA containing the RP-ACK RPDU. The ME shall unset the "memory capability exceeded" notification flag on the SIM. |
| 67 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been unset on the SIM. |
| 68 | SS | | Prompts the operator to remove one or more messages from the message store of the MS. |
| 69 | MS | | Shall not attempt to send a RP-SMMA RPDU. This is verified by checking that the MS does not send a CHANNEL REQUEST message with the establishment cause "Other services which can be completed with an SDCCH" |

NOTE: Time values for SS wait time are chosen sufficiently high to be sure that the MS has enough time to respond to the different messages.

Specific Message Contents:

SMS-DELIVER TPDU in step 12

| Information element | Comment | Value |
|---------------------|--|-------------|
| TP-MTI | SMS DELIVER | "00"B |
| TP-MMS | more messages are waiting in SC | "0"B |
| TP-RP | no reply path | "0"B |
| TP-UDHI | TP-UD contains only the SM | "0"B |
| TP-SRI | no status report returned | "0"B |
| TP-OA | an international number coded E.164 | |
| TP-PID | default | "00000000"B |
| TP-DCS | default alphabet, class 2 | "11110010"B |
| TP-SCTS | always set to the current time of the system simulator (cf. 3GPP TS 03.40) | |
| TP-UDL | 160 | |
| TP-UD (140 octets) | text of message (160 characters) | |

SMS-DELIVER TPDU in step 30

same as in step 12 except:

| | | |
|--------|---------------------------|-------------|
| TP-DCS | default alphabet, class 1 | "11110001"B |
|--------|---------------------------|-------------|

SMS-DELIVER TPDU in step 48

same as in step 12 except:

| | | |
|--------|------------------|-------------|
| TP-DCS | default alphabet | "00000000"B |
|--------|------------------|-------------|

34.2.4 Test of the status report capabilities and of SMS-COMMAND:

This test applies to MSs which support the status report capabilities.

34.2.4.1 Conformance requirement

The SMS offers the SC the capabilities of informing the MS of the status of a previously sent mobile originated short message. This is achieved by the SC returning a status report TPDU (SMS-STATUS-REPORT) to the originating MS.

SMS-COMMAND enables an MS to invoke an operation at the SC.

The MS shall increment TP-MR by 1 for each SMS-SUBMIT or SMS-COMMAND being submitted.

References

3GPP TS 03.40; subclause 3.2.9.

3GPP TS 03.40; subclause 9.2.3.6.

34.2.4.2 Test purpose

- 1) To verify that the MS is able to accept a SMS-STATUS-REPORT TPDU.
- 2) To verify that the MS is able to use the SMS-COMMAND functionality correctly and sends an SMS-COMMAND TPDU with the correct TP-Message-Reference.

34.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) The MS is made to send a Mobile Originated short message as in steps a) to d) of test 34.2.2 (SMS Mobile originated).
- b) The SS establishes a data link on SAPI-3 with the MS, then sends a CP-DATA message containing a RP-DATA RPDU itself containing an SMS-STATUS-REPORT TPDU.

- c) The SS sends a CHANNEL RELEASE message.
- d) The MS is made to send an SMS-COMMAND message enquiring about the previously submitted short message.
- e) The SS responds to the MS so as to enable it to establish a data link on SAPI-3 on an SDCCH.
- f) The SS acknowledges the CP-DATA message from the MS with a CP-ACK followed by a CP-DATA message containing an RP-ACK RPDU.
- g) After receiving the CP-ACK from the MS, the SS releases the channel by using a CHANNEL RELEASE message.
- h) The MS is made to send an SMS-COMMAND message requiring to delete the previously submitted short message.
- i) steps e) to g) are repeated.

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Other procedures which can be completed with an SDCCH " (NECI=0) |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 3 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM. |
| 4 | SS -> MS | AUTHENTICATION REQUEST | |
| 5 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 6 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 7 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 8 | SS | | SS starts ciphering. |
| 9 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 |
| 10 | SS -> MS | UA (SAPI=3) | |
| 11 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 12 | SS -> MS | CP-ACK | |
| 13 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 14 | SS | | Waits max 25 s for CP-ACK |
| 15 | MS -> SS | CP-ACK | |
| 16 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| 17 | SS -> MS | PAGING REQUEST | |
| 18 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 19 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 20 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 22 | SS -> MS | AUTHENTICATION REQUEST | |
| 23 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 24 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 25 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 26 | SS | | SS starts ciphering. |
| 27 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 28 | MS -> SS | UA (SAPI=3) | |
| 29 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS-STATUS-REPORT TPDU) |
| 30 | MS -> SS | CP-ACK | |
| 31 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 32 | SS -> MS | CP-ACK | |
| 33 | SS -> MS | CHANNEL RELEASE | |
| 34 | MS | | The MS is made to send an SMS-COMMAND message enquiring about the previously submitted SM |
| 35 | MS -> SS | CHANNEL REQUEST | Establishment cause "Other services which can be completed with an SDCCH". |
| 36 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 37 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM. |
| 38 | SS -> MS | AUTHENTICATION REQUEST | |
| 39 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|--|
| 40 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 41 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 42 | SS | | SS starts ciphering. |
| 43 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 |
| 44 | SS -> MS | UA (SAPI=3) | |
| 45 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS-COMMAND TPDU) which shall contain the correct TP-MR |
| 46 | SS -> MS | CP-ACK | |
| 47 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 48 | MS -> SS | CP-ACK | |
| 49 | SS -> MS | CHANNEL RELEASE | |
| 50 | MS | The MS is made to send an SMS-COMMAND | message requiring to delete the previously submitted SM. |
| 51 | MS -> SS | CHANNEL REQUEST | Establishment cause "Other services which can be completed with an SDCCH". |
| 52 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 53 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM. |
| 54 | SS -> MS | AUTHENTICATION REQUEST | |
| 55 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 56 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 57 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 58 | SS | | SS starts ciphering. |
| 59 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 |
| 60 | SS -> MS | UA (SAPI=3) | |
| 61 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS-COMMAND TPDU) which shall contain the correct TP-MR |
| 62 | SS -> MS | CP-ACK | |
| 63 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 64 | MS -> SS | CP-ACK | |
| 65 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents:

SMS SUBMIT TPDU

| Information element | Comment | Value |
|------------------------|------------------------------|-------------|
| TP-MTI | SMS SUBMIT | "01"B |
| TP-VPF | not checked | |
| TP-RP | no reply path | "0"B |
| TP-UDHI | not checked | |
| TP-SRR | status report is requested | "1"B |
| TP-MR | not checked | |
| TP-RD | not checked | |
| TP-DA | not checked (an E164 number) | |
| TP-PID | default | "00000000"B |
| TP-DCS | default alphabet | "00000000"B |
| TP-VP | not checked | |
| TP-UDL | as applicable | |
| TP-UD (140 octets max) | maximum number of characters | |

SMS-STATUS-REPORT TPDU (SS to MS in step 29):

| Information element | Comment | Value |
|---------------------|---|-------------|
| TP-MTI | SMS-STATUS-REPORT | "10"B |
| TP-MR | same as previous SMS-SUBMIT | |
| TP-MMS | no more messages | "1"B |
| TP-SRQ | result of SMS-SUBMIT | "0"B |
| TP-RA | same as the Destination address of the SMS-SUBMIT | |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40) | |
| TP-DT | any legal value (cf. 3GPP TS 03.40) | |
| TP-ST | SM received | "00000000"B |

first SMS-COMMAND TPDU (MS to SS in step 44)

| Information element | Comment | Value |
|---------------------|--|-------------|
| TP-MTI | SMS-COMMAND | "10"B |
| TP-MR | TP-MR in previous SMS-SUBMIT plus "1" | |
| TP-SRR | status report requested (3GPP TS 03.40 9.2.3.19) | "1"B |
| TP-PID | default | "00000000"B |
| TP-CT | Enquiry relating to previously submitted short message | "00000000"B |
| TP-MN | not checked (TP-MR in previous SMS-SUBMIT) | |
| TP-DA | not checked (an E164 number) | |
| TP-CDL | not checked | |
| TP-CD | not checked | |

second SMS-COMMAND TPDU (MS to SS in step 60)

| Information element | Comment | Value |
|---------------------|--|-------------|
| TP-MTI | SMS-COMMAND | "10"B |
| TP-MR | TP-MR in previous SMS-COMMAND plus "1" | |
| TP-SRR | status report not requested | "0"B |
| TP-PID | default | "00000000"B |
| TP-CT | Delete previously submitted short message | "00000010"B |
| TP-MN | not checked (TP-MR in previous SMS-SUBMIT) | |
| TP-DA | not checked (an E164 number) | |
| TP-CDL | not checked | |
| TP-CD | not checked | |

34.2.5 Test of message class 0 to 3

34.2.5.1 Short message class 0

34.2.5.1.1 Conformance requirement

When a mobile terminated message is class 0 and the MS has the capability of displaying short messages, the MS shall display the message immediately and send an acknowledgement to the SC when the message has successfully reached the MS irrespective of whether there is memory available in the SIM or ME. The message shall not be automatically stored in the SIM or ME.

References

3GPP TS 03.38, clause 4.

34.2.5.1.2 Test purpose

To verify that the MS will accept and display but not store a class 0 message, and that it will accept and display a class 0 message if its message store is full.

NOTE: failure of this test in a mobile could cause it to reject a class 0 message when its SMS memory becomes full. This could lead to unwanted repetitions between the MS and the service centre.

34.2.5.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall be empty.

Specific PICS Statements

- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Description of the basic procedures to display a mobile terminated short message.
- Description of the procedure to fill up all MS memory (internal/external) to leave only memory for a limited number of SMS.

Foreseen Final State of MS

Idle, updated.

Test Procedure

- The SS sends a class 0 message by using the method described in step a) of subclause 34.2.1 but with the TPDU described in this subclause.
- The MS message store shall be filled (for example by using the method of 34.2.3 test of the memory available notification) with the same SMS-DELIVER TPDU except that TP-DCS is set to class 1.
- The SS sends a class 0 message as in step a).

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 0 Short Message |
| 13 | MS -> SS | CP-ACK | |
| 14 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 15 | SS -> MS | CP-ACK | |
| 16 | SS -> MS | CHANNEL RELEASE | |
| 17 | MS | | The content of the short message shall be displayed by the ME. The MS shall not store the message. This can be checked by verifying that it is impossible to retrieve any short messages from the MS message store. |
| 18 | SS | | The MS message store shall be filled (for example by using the method of 34.2.3) with Class 1 SMS-DELIVER TPDU. |
| 19 | SS -> MS | PAGING REQUEST | |
| 20 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 21 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 22 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 23 | SS -> MS | AUTHENTICATION REQUEST | |
| 24 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 25 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 26 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 27 | SS | | SS starts ciphering. |
| 28 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 29 | MS -> SS | UA (SAPI=3) | |
| 30 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 0 Short Message |
| 31 | MS -> SS | CP-ACK | |
| 32 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 33 | SS -> MS | CP-ACK | |
| 34 | SS -> MS | CHANNEL RELEASE | |
| 35 | MS | | The content of the short message shall be displayed by the ME. |

Specific Message Contents:

SMS-DELIVER TPDU (containing a class 0 message) (SS to MS):

| Information element | Comment | Value |
|---------------------|-------------------------------------|--------------|
| TP-MTI | SMS-DELIVER | "00"B |
| TP-MMS | more messages are waiting in SC | "0"B |
| TP-RP | no reply path | "0"B |
| TP-UDHI | TP-UD contains only the SM | "0"B |
| TP-SRI | no status report returned | 0 |
| TP-OA | an international number coded E.164 | |
| TP-PID | default | "00000000"B |
| TP-DCS | default alphabet, class 0 | "1111 0000"B |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40) | |
| TP-UDL | 160 | |
| TP-UD (140 octets) | text of message (160 characters) | |

SMS-DELIVER TPDU (containing a class 1 message to fill the MS message store) (SS to MS):

| Information element | Comment | Value |
|---------------------|-------------------------------------|--------------|
| TP-MTI | SMS-DELIVER | "00"B |
| TP-MMS | more messages are waiting in SC | "0"B |
| TP-RP | no reply path | "0"B |
| TP-UDHI | TP-UD contains only the SM | "0"B |
| TP-SRI | no status report returned | 0 |
| TP-OA | an international number coded E.164 | |
| TP-PID | default | "00000000"B |
| TP-DCS | default alphabet, class 1 | "1111 0001"B |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40) | |
| TP-UDL | 160 | |
| TP-UD (140 octets) | text of message (160 characters) | |

34.2.5.2 Test of class 1 short messages

34.2.5.2.1 Conformance requirement

When a mobile terminated message is class 1, the MS shall send an acknowledgement to the SC when the message has successfully reached the MS and can be stored, either in the ME or in the SIM.

References

3GPP TS 03.38, clause 4.

34.2.5.2.2 Test purpose

This procedure verifies that the MS acts correctly on receiving a class 1 message, i.e. that it stores the message in the ME or SIM and sends an acknowledgement (at RP and CP-Layer).

34.2.5.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall not be full.

For storing of class 1 Short Messages, the MS shall be set up to store Short Messages in the ME memory if supported, otherwise the message may be stored in the SIM (by way of MMI, as described in PICS/PIXIT statement).

Specific PICS Statements

- Support for Short message MT/PP (TSPC_Serv_TS21).
- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Description of the basic procedures to display a mobile terminated short message.

-

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) the SS delivers a Short Message of class 1 to the MS as specified in subclause 34.2.1, step a).
- b) the Short Message is recalled (e.g. by means of the MMI).

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 1 Short Message |
| 13 | MS -> SS | CP-ACK | |
| 14 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 15 | SS -> MS | CP-ACK | |
| 16 | SS -> MS | CHANNEL RELEASE | |
| 17 | MS | | The short message shall be recalled and displayed at the MS. |

Specific Message Contents:

SMS-DELIVER TPDU (containing a class 1 message) (SS to MS):

| Information element | Comment Value |
|---------------------|--|
| TP-MTI | SMS-DELIVER "00"B |
| TP-MMS | more messages are waiting in SC "0"B |
| TP-RP | no reply path "0"B |
| TP-UDHI | TP-UD contains only the SM"0"B |
| TP-SRI | no status report returned 0 |
| TP-OA | an international number coded E.164 |
| TP-PID | default "00000000"B |
| TP-DCS | default alphabet, class 1 "1111 0001"B |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40) |
| TP-UDL | 160 |
| TP-UD (140 octets) | text of message (160 characters) |

34.2.5.3 Test of class 2 short messages

34.2.5.3.1 Definition

Class 2 Short Messages are defined as SIM specific, and the MS shall ensure that a message of this class is stored on the SIM.

34.2.5.3.2 Conformance requirement

When a mobile terminated message is Class 2, the MS shall ensure that the message has been correctly transferred to the SMS data field in the SIM before sending an acknowledgement to the SC. The MS shall return a "protocol error, unspecified" error message if the short message cannot be stored in the SIM and there is other short message storage available at the MS. If all the short message storage at the MS is already in use, the MS shall return "memory capacity exceeded".

Reference(s)

3GPP TS 03.40, subclause 9.2.3.10; 3GPP TS 03.38, clause 4; 3GPP TS 11.11, subclause 10.3.3.

34.2.5.3.3 Test purpose

This procedure verifies that the MS acts correctly on receiving a class 2 message, i.e. that it stores the message correctly in the SIM, and if this is not possible, returns a protocol error message, with the correct error cause, to the network.

There are 2 cases:

- 1) If the MS supports storing of short messages in the SIM and in the ME, and storage in the ME is not full, and the short message cannot be stored in the SIM, the error cause shall be "protocol error, unspecified".
- 2) If the MS supports storing of short messages in the SIM and not in the ME, and storage in the ME is not full, and the short message cannot be stored in the SIM, the error cause shall be "memory capacity exceeded".

NOTE: If the MS supports storing of short messages in the SIM and the ME, and storage in the ME is full, and the short message cannot be stored in the SIM, the error cause shall be "memory capacity exceeded". This case is not tested in this test.

34.2.5.3.4 Test method

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The ME message store shall be empty.

The ME shall be connected to the SIM simulator. The following shall be present in the SIM simulator:

- EF_{SMS} with at least two free records and one full record;
- EF_{SMSstatus}, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
- Service no. 4 (SMS) in EF_{SST} set to allocated and activated;

For storing of Class 1 Short Messages the MS shall be set up to store Short Messages in the ME memory (by way of MMI, as described in PICS/PIXIT statement).

Specific PICS Statements

- Support for Short message MT/PP (TSPC_Serv_TS21).
- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) the SS delivers a Short Message of class 2 to the MS as specified in subclause 34.2.1, step b).
- b) following an attempt by the ME to store the short message in a free record of EF_{SMS} in the SIM, the SIM simulator returns the status response "OK" ("90 00").
- c) step a) is repeated.
- d) following an attempt by the ME to store the short message in a free record of EF_{SMS} in the SIM, the SIM simulator returns the status response "memory problem" ("92 40").

Note: the ME may retry to store the short message several times to recover the memory problem. The SIM simulator shall return the status response "memory problem" ("92 40") for each attempt, even for a different record.

- e) the SIM simulator indicates if an attempt was made in steps a) and c) to store the messages and if the messages are stored according to the requirement.

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 2 Short Message |
| 13 | MS -> SS | CP-ACK | |
| 14 | ME | | The ME shall correctly store the short message in a free record of EFSMS in the SIM, i.e. - the ME shall use a free record - the first byte of the record shall indicate "message received by MS from network" <ul style="list-style-type: none"> - the TS-Service-Centre-Address shall be correctly stored - the TPDU shall be identical to that sent by the SS - bytes following the TPDU shall be set to "FF" |
| 15 | SIM | | The SIM simulator returns the status response "OK" ("90 00"). The SIM simulator shall indicate if an attempt was made by the ME to store the short message in the SIM. Contains RP-ACK RPDU. |
| 16 | MS -> SS | CP-DATA | |
| 16A | SS -> MS | CP-ACK | |
| 17 | SS -> MS | CHANNEL RELEASE | |
| 18 | SS -> MS | PAGING REQUEST | |
| 19 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 21 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 22 | SS -> MS | AUTHENTICATION REQUEST | |
| 23 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 24 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 25 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 26 | SS | | SS starts ciphering. |
| 27 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 28 | MS -> SS | UA (SAPI=3) | |
| 29 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 2 Short Message |
| 30 | MS -> SS | CP-ACK | |
| 31 | ME | | The ME shall attempt to store the short message in a free record of EFSMS in the SIM. |
| 32 | SIM | | The SIM simulator returns the status response "memory problem" ("92 40"). The SIM simulator shall indicate if an attempt was made by the ME to store the short message in the SIM. Note: the ME may retry to store the short message several times to recover the memory problem. The SIM simulator shall return the status response "memory problem" ("92 40") for each attempt, even for a different record. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 33 | MS -> SS | CP-DATA | Contains RP-ERROR RPDU with error cause "protocol error, unspecified" if the MS supports storing of short messages in the ME, or error cause "memory capacity exceeded" if not. |
| 33A | SS -> MS | CP-ACK | |
| 34 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents:

SMS-DELIVER TPDU (containing a class 2 message) (SS to MS):

| Information element | Comment Value |
|---------------------|--|
| TP-MTI | SMS-DELIVER "00"B |
| TP-MMS | more messages are waiting in SC "0"B |
| TP-RP | no reply path "0"B |
| TP-UDHI | TP-UD contains only the SM"0"B |
| TP-SRI | no status report returned0 |
| TP-OA | an international number coded E.164 |
| TP-PID | default"00000000"B |
| TP-DCS | default alphabet, class 2 "1111 0010"B |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40) |
| TP-UDL | 160 |
| TP-UD (140 octets) | text of message (160 characters) |

34.2.5.4 Test of class 3 short messages

For further study.

34.2.6 Test of short message type 0 (Ph2, R96...R99 and REL-4)

34.2.6.1 Conformance requirement

When a mobile terminated message is type 0, the MS shall acknowledge receipt of the short message to the SC but may discard its contents.

Note: Ideally the MS is able to receive the type 0 message irrespective of whether there is memory available in the SIM or ME and does not indicate the receipt of the type 0 short message to the user. The message should not be automatically stored in the SIM or ME.

This test shall apply to all MSs that have a Ph2, R96...R99 or REL-4 short message type 0 implementation.

References

3GPP TS 03.40 / 3GPP TS 23.040, subclause 9.2.3.9.

34.2.6.2 Test purpose

To verify that the MS will acknowledge receipt of the short message to the SC. The MS should discard its contents.

NOTE: failure of this test in a mobile could cause it to reject a type 0 message when the network is trying to reach the MS. This could lead to unwanted repetitions between the MS and the service centre.

34.2.6.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen Final State of MS

Idle, updated.

Test Procedure

The SS sends a type 0 message by using the method described in step a) of section 34.2.1 but with the TPDU described in this section.

Maximum Duration of Test

1 minute

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU), type 0 Short Message |
| 13 | MS -> SS | CP-ACK | |
| 14 | MS -> SS | CP-DATA | Contains RP-ACK TP-Protocol-Identifier (TP-PID). |
| 15 | SS -> MS | CP-ACK | |
| 16 | SS -> MS | CHANNEL RELEASE | |
| 17 | MS | | Ideally the MS is able to receive the type 0 message irrespective of whether there is memory available in the SIM or ME and does not indicate the receipt of the type 0 short message to the user. The message should not be automatically stored in the SIM or ME. |

Specific Message Contents:

SMS-DELIVER TPDU (containing a type 0 message) (SS to MS):

| Information element | Comment Value |
|---------------------|--|
| TP-MIT | SMS-DELIVER "00"B |
| TP-MMS | more messages are waiting in SC "0"B |
| TP-RP | no reply path "0"B |
| TP-UDHI | TP-UD contains only the SM"0"B |
| TP-SRI | no status report returned0 |
| TP-OA | an international number coded E.164 |
| TP-PID | Type 0: "01000000"B |
| TP-DCS | default alphabet "0000 0000"B |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40 / 3GPP TS 23.040) |
| TP-UDL | 160 |
| TP-UD (140 octets) | text of message (160 characters) |

34.2.6a Test of short message type 0 (\geq REL 5)

34.2.6a.1 Conformance requirement

When a mobile terminated message is type 0, the MS shall acknowledge receipt of the short message to the SC but shall discard its contents. This means that

- the MS shall be able to receive the type 0 short message irrespective of whether there is memory available in the SIM or ME or not,
- the MS shall not indicate the receipt of the type 0 short message to the user,
- the short message shall neither be stored in the SIM nor ME.

This test shall apply to all MSs that have a \geq REL-5 short message type 0 implementation.

References

3GPP TS 23.040, subclause 9.2.3.9.

34.2.6a.2 Test purpose

To verify that the MS will acknowledge receipt of the short message to the SC. The MS shall discard its contents. This means that

- the MS shall be able to receive the type 0 short message irrespective of whether there is memory available in the SIM or ME or not,
- the MS shall not indicate the receipt of the type 0 short message to the user,
- the short message shall neither be stored in the SIM nor ME.

NOTE: failure of this test in a MS could cause it to reject a type 0 message when the network is trying to reach the MS. This could lead to unwanted repetitions between the MS and the service centre. In addition service affecting restrictions could happen to the customer.

34.2.6a.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

the ME- and SIM message store shall be empty.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) The SS sends a type 0 short message by using the method described in step a) of clause 34.2.1 but with the TPDU described in this section.
- b) The ME- and SIM short message store shall be filled (for example by using the method of clause 34.2.3 test of the memory available notification).
- c) The SS sends a type 0 short message as in step a).

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments | |
|------|-----------|-------------------------|---|---|
| 1 | SS -> MS | PAGING REQUEST | Establishment cause is "Answer to paging" SS assigns an SDCCH Message is contained in SABM. SRES specifies correct value. SS starts deciphering after sending the message. Shall be sent enciphered. All following messages shall be sent enciphered. SS starts ciphering. SS establishes SAPI 3 | |
| 2 | MS -> SS | CHANNEL REQUEST | | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | | |
| 4 | MS -> SS | PAGING RESPONSE | | |
| 5 | SS -> MS | AUTHENTICATION REQUEST | | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | | |
| 7 | SS -> MS | CIPHERING MODE COMMAND | | |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | | |
| 9 | SS | | | |
| 10 | SS -> MS | SABM (SAPI=3) | Contains RP-DATA RPDU (SMS DELIVER TPDU), type 0 Short Message Contains RP-ACK TP-Protocol-Identifier (TP-PID). The MS shall discard the type 0 short message. This means that the MS does not indicate the receipt of the type 0 short message to the user. The MS shall not store the message in the SIM or ME. This can be checked by verifying that it is impossible to retrieve any short messages from the ME- and SIM message store. | |
| 11 | MS -> SS | UA (SAPI=3) | | |
| 12 | SS -> MS | CP-DATA | | |
| 13 | MS -> SS | CP-ACK | | |

| 15 | SS -> MS | CP-ACK | | |
| 16 | SS -> MS | CHANNEL RELEASE | | |
| 17 | MS | | | |
| 18 | SS | | | The ME- and SIM message store shall be filled (for example by using the method of clause 34.2.3). |
| 19 | SS -> MS | PAGING REQUEST | | Establishment cause is "Answer to paging" SS assigns an SDCCH Message is contained in SABM. SRES specifies correct value. SS starts deciphering after sending the message. Shall be sent enciphered. All following messages shall be sent enciphered. SS starts ciphering. SS establishes SAPI 3 |
| 20 | MS -> SS | CHANNEL REQUEST | | |
| 21 | SS -> MS | IMMEDIATE ASSIGNMENT | | |
| 22 | MS -> SS | PAGING RESPONSE | | |
| 23 | SS -> MS | AUTHENTICATION REQUEST | | |
| 24 | MS -> SS | AUTHENTICATION RESPONSE | | |
| 25 | SS -> MS | CIPHERING MODE COMMAND | | |
| 26 | MS -> SS | CIPHERING MODE COMPLETE | | |
| 27 | SS | | | |
| 28 | SS -> MS | SABM (SAPI=3) | | |
| 29 | MS -> SS | UA (SAPI=3) | | |
| 30 | SS -> MS | CP-DATA | | |
| 31 | MS -> SS | CP-ACK | | |
| 32 | MS -> SS | CP-DATA | | |
| 33 | SS -> MS | CP-ACK | | |
| 34 | SS -> MS | CHANNEL RELEASE | | |
| 35 | MS | | | |

Specific Message Contents:

SMS-DELIVER TPDU (containing a type 0 message) (SS to MS):

| Information element | Comment Value |
|---------------------|--|
| TP-MIT | SMS-DELIVER "00"B |
| TP-MMS | more messages are waiting in SC "0"B |
| TP-RP | no reply path "0"B |
| TP-UDHI | TP-UD contains only the SM"0"B |
| TP-SRI | no status report returned0 |
| TP-OA | an international number coded E.164 |
| TP-PID | Type 0: "01000000"B |
| TP-DCS | default alphabet "0000 0000"B |
| TP-SCTS | any legal value (cf. 3GPP TS 03.40 / 3GPP TS 23.040) |
| TP-UDL | 160 |
| TP-UD (140 octets) | text of message (160 characters) |

34.2.7 Test of the replace mechanism for SM type 1-7

34.2.7.1 Definition

This test shall apply to MSs which support:

- Replace Short Messages; and
- display of received Short Messages.

34.2.7.2a Conformance requirement for MS with implementation up to and including Rel. 97

On receipt of a short message, the MS shall check to see if the associated Protocol Identifier contains a Replace Short Message Type code. If such a code is present, then the MS will check the associated SC address (RP-OA) and originating address (TP-OA) and replace any existing stored message having the same Protocol Identifier code, SC address and originating address with the new short message.

Reference(s)

3GPP TS 03.40; subclause 9.2.3.9.

34.2.7.2b Conformance requirement for MS with implementation after Rel.98 and later

On receipt of a short message, the MS shall check to see if the associated Protocol Identifier contains a Replace Short Message Type code. If such a code is present, then the MS will check the originating address and replace any existing stored message having the same Protocol Identifier code and originating address with the new short message and other parameter values. If there is no message to be replaced, the MS shall store the message in the normal way. The MS may also check the SC address as well as the Originating Address. However, in a network which has multiple SCs, it is possible for a Replace Message type for a SM to be sent via different SCs and so it is recommended that the SC address should not be checked by the MS unless the application specifically requires such a check.

Reference(s)

3GPP TS 03.40 / 3GPP TS 23.040, subclause 9.2.3.9.

34.2.7.3 Test purpose

This procedure verifies the correct implementation of the replace mechanism for Replace Short Messages.

NOTE: The test will not check the correct SC address for any releases.

34.2.7.4 Test method

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall be empty.

Specific PICS Statements

-

PIXIT Statements

- Description of the basic procedures to display a mobile terminated short message.

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) two different numbers n and m are drawn randomly between 1 and 7. Two different addresses for TP-Originating-Address (TPOA1 and TPOA2) are drawn.
- b) the SS delivers a short message to the MS as specified in subclause 34.2.1 step a). In the SMS-DELIVER TPDU, the TP-Protocol-Identifier parameter is "Replace Short Message Type n", the TP-Originating-Address is TPOA1, and the RP-Originating-Address is RPOA.
- c) step b) is repeated but with a different TP-Originating-Address (TPOA2), and different contents of TP-User-Data in the SMS-DELIVER TPDU. The other parameters are the same as in step b).
- d) step c) is repeated but with the TP-Protocol-Identifier equal to "Replace Short Message Type m", and contents of TP-User-Data different from the former two messages. The other parameters are the same as in step c).
- e) step d) is repeated but the contents of TP-User-Data are different from that used in step d).
- f) the SS prompts the operator to display the Short Messages stored in the MS.

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) TP-PID is "Replace Short Message Type n", TP-OA is TPOA1 and RP-OA is RPOA |
| 13 | MS -> SS | CP-ACK | |
| 14 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 14A | SS -> MS | CP-ACK | |
| 15 | SS -> MS | CHANNEL RELEASE | |
| 16 | SS -> MS | PAGING REQUEST | |
| 17 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 19 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 20 | SS -> MS | AUTHENTICATION REQUEST | |

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 21 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 22 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 23 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 24 | SS | | SS starts ciphering. |
| 25 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 26 | MS -> SS | UA (SAPI=3) | |
| 27 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) TP-PID is "Replace Short Message Type n", TP-OA is TPOA2 and RP-OA is RPOA, TP-UD different from step 12 |
| 28 | MS -> SS | CP-ACK | |
| 29 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 29A | SS -> MS | CP-ACK | |
| 30 | SS -> MS | CHANNEL RELEASE | |
| 31 | SS -> MS | PAGING REQUEST | |
| 32 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 33 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 34 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 35 | SS -> MS | AUTHENTICATION REQUEST | |
| 36 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 37 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 38 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 39 | SS | | SS starts ciphering. |
| 40 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 41 | MS -> SS | UA (SAPI=3) | |
| 42 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) TP-PID is "Replace Short Message Type m", TP-OA is TPOA2 and RP-OA is RPOA, TP-UD different from step 12 and 27 |
| 43 | MS -> SS | CP-ACK | |
| 44 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 45 | SS -> MS | CP-ACK | |
| 46 | SS -> MS | CHANNEL RELEASE | |
| 47 | SS -> MS | PAGING REQUEST | |
| 48 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 49 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 50 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 51 | SS -> MS | AUTHENTICATION REQUEST | |
| 52 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 53 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 54 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 55 | SS | | SS starts ciphering. |
| 56 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 57 | MS -> SS | UA (SAPI=3) | |
| 58 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) TP-PID is "Replace Short Message Type m", TP-OA is TPOA2 and RP-OA is RPOA, TP-UD different from step 42 |
| 59 | MS -> SS | CP-ACK | |
| 60 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 61 | SS -> MS | CP-ACK | |
| 62 | SS -> MS | CHANNEL RELEASE | |
| 63 | SS | | Prompts the operator to display the Short Messages stored in the MS. Only the Short Messages delivered in step 12, 27 and 58 shall be retrievable and displayed |

Specific Message Contents:

SMS-DELIVER TPDU

| Information element | Comment | Value |
|---------------------|---|-------------|
| TP-MTI | SMS-DELIVER | "00"B |
| TP-MMS | no more messages are waiting in SC | "1"B |
| TP-RP | no Reply Path | "0"B |
| TP-UDHI | TP-UD contains only the SM | "0"B |
| TP-SRI | no Status Report returned | "0"B |
| TP-OA | an international number coded E.164 (see test method description) | |
| TP-PID | binary 01000xxx, xxx represents n resp. m (see test method description) | |
| TP-DCS | default alphabet | "00000000"B |
| TP-SCTS | the time when the message was submitted according to 3GPP TS 03.40 | |
| TP-UDL | 160 | |
| TP-UD (140 octets) | text of message (160 characters) (see test method description) | |

34.2.8 Test of the reply path scheme

34.2.8.1 Definition

This test applies to MSs which support:

- reply procedures (the class of MSs for which this is mandatory is described in 3GPP TS 03.40, annex 4);
- displaying of received Short Messages: and
- submitting Short Messages.

Steps b) and d) are only executed for MSs which support storing of Short messages.

34.2.8.2 Conformance requirement

When a replying MS receives an original mobile terminated short message it has:

- originating SME = TP-Originating Address in the SMS-DELIVER TPDU;
- original SC = RP-Originating Address in the RP-MT-DATA.

When submitting the reply mobile originated short message, the replying MS should use parameters as follows:

- TP-Destination Address in SMS-SUBMIT TPDU = originating SME;
- RP-Destination Address in RP-MO-DATA = original SC.

Reference(s)

3GPP TS 03.40 annex 4, clauses 5 and 6.

34.2.8.3 Test purpose

This procedure verifies that the MS is able to send a Reply Short Message back to the correct originating SME even if in the meantime it receives another Short Message.

34.2.8.4 Test method

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall be empty.

Specific PICS Statements

-

PIXIT Statements

- Description of the basic procedures to display a mobile terminated short message.
- Description of the basic procedures to send a mobile originated short message.

Foreseen Final State of MS

Idle, updated.

Test Procedure

- a) the SS delivers a Short Message as specified in subclause 34.2.1, step b) with TP-Reply-Path set to 1.
- b) step a) is repeated but with:
 - different TP-Originating-Address for the originating SME;
 - different RP-Originating-Address for the original SC; and
 - different message contents TP-User-Data.
- c) one of the two Short Messages is displayed (e.g. by means of the MMI) and the Reply Short Message is submitted (e.g. by means of the MMI).
- d) step c) is repeated for the other Short Message.

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9 | SS | | SS starts ciphering. |
| 10 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 11 | MS -> SS | UA (SAPI=3) | |
| 12 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) TP-RP set to 1 |
| 13 | MS -> SS | CP-ACK | |
| 14 | MS -> SS | CP-DATA | Contains RP-ACK RPDU. |
| 14A | SS -> MS | CP-ACK | |
| 15 | SS -> MS | CHANNEL RELEASE | |
| 16 | SS -> MS | PAGING REQUEST | |
| 17 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Answer to paging" |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 19 | MS -> SS | PAGING RESPONSE | Message is contained in SABM. |
| 20 | SS -> MS | AUTHENTICATION REQUEST | |
| 21 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 22 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 23 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 24 | SS | | SS starts ciphering. |
| 25 | SS -> MS | SABM (SAPI=3) | SS establishes SAPI 3 |
| 26 | MS -> SS | UA (SAPI=3) | |

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 27 | SS -> MS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) TP-OA, RP-OA and TP-UD different from step 12 Contains RP-ACK RPDU. One of the two Short Messages is displayed and the Reply Short Message is submitted. |
| 28 | MS -> SS | CP-ACK | |
| 29 | MS -> SS | CP-DATA | |
| 29A | SS -> MS | CP-ACK | |
| 30 | SS -> MS | CHANNEL RELEASE | |
| 31 | MS | | |
| 32 | MS -> SS | CHANNEL REQUEST | |
| 33 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH Message is contained in SABM. SRES specifies correct value. SS starts deciphering after sending the message. Shall be sent enciphered. All following messages shall be sent enciphered. SS starts ciphering. MS establishes SAPI 3 Contains RP-DATA RPDU (SMS SUBMIT TPDU) RP-DA = RP-OA corresponding to the message displayed TP-DA = TP-OA corresponding to the message displayed Contains RP-ACK RPDU Waits max 25 s for CP-ACK The main signalling link is released. The other Short Message is displayed and the Reply Short Message is submitted. SS assigns an SDCCH Message is contained in SABM. SRES specifies correct value. SS starts deciphering after sending the message. Shall be sent enciphered. All following messages shall be sent enciphered. SS starts ciphering. MS establishes SAPI 3 Contains RP-DATA RPDU (SMS SUBMIT TPDU) RP-DA = RP-OA corresponding to the Message displayed TP-DA = TP-OA corresponding to the message displayed Contains RP-ACK RPDU Waits max 25 s for CP-ACK The main signalling link is released. |
| 34 | MS -> SS | CM SERVICE REQUEST | |
| 35 | SS -> MS | AUTHENTICATION REQUEST | |

34.2.9 Multiple SMS mobile originated

34.2.9.1 MS in idle mode

This test applies to MS supporting the ability of sending multiple short messages on the same RR connection when there is no call in progress.

34.2.9.1.1 Conformance requirements

For a R99 or earlier MS only:

If another short message or a memory available notification is to be sent, an originating SMR entity in the UE may choose to continue to use the same RRC connection. When the MS chooses to use the same RR connection, then:

- the MS shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (e.g. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the MS shall transmit the CP-ACK for the old MM connection;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the MS shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

For a Rel-4 or later MS only:

In the case of a SMS transfer via the CS domain, when the UE chooses to use the same RR or CS signalling connection, then:

- the UE shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (i.e. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the UE may transmit the CP-ACK for the old MM connection; the UE shall not transmit the final CP-ACK after the new CP-DATA;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the UE shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

3GPP TS 04.13; subclause 5.6

34.2.9.1.2 Test purpose

To verify that the MS is able to correctly send multiple short messages on the same RR connection when using an SDCCH.

34.2.9.1.3 Method of test

Initial conditions

System simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

Specific PICS Statements

- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Description of how to enter multiple SMS.
- Description of the basic procedures to display a mobile originated short message.

Foreseen final state of MS

Idle, updated.

Test procedure

- a) The MS shall be set up to send 3 short messages as multiple SM to the SS. The SS responds to the channel request message by allocating an SDCCH. The SS answers correctly to the SABM on SAPI 0 and then performs the authentication and ciphering procedures.
- b) The SS responds with a UA frame SAPI-3 to the MS.
- c) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The Transaction Identifier used on this MM connection is 'x'.
- d) the MS shall transmit a CM SERVICE REQUEST for the new CM connection (for the second short message) before the final CP-ACK (the one that acknowledges the CP-DATA that carried the RP-ACK before) for the old MM connection is transmitted. The MS shall not initiate establishment of the new MM connection before the final CP-DATA (i.e. the one carrying the RP-ACK for the first short message) has been received. Before transmission of the first CP-DATA on the new MM connection:

The MS may transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be y, where $y \neq x$ (see step c)). Thereby, the UE can transmit the final CP-ACK after either the sending of the CM SERVICE REQUEST for the new CM connection or the reception of the CM SERVICE ACCEPT for the new CM connection or not to send a CP-ACK at all, thus three cases are possible. These cases are specified using two branches for the transmission of the final CP-ACK where the transmission of the final CP-ACK for the old MM connection is optional. The two branches are specified in

the expected sequence table like A and B respectively. The SS waits for the UE to transmit the final CP-ACK. If received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to transmit the first CP-DATA on the new MM connection (branch A). If the final CP-ACK is not received within 5 s then the SS transmits the CM SERVICE ACCEPT and then waits for the UE to send the final CP-ACK (optional) and/or the first CP-DATA on the new MM connection (branch B).

- e) Void.
- f) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU.
- g) The MS shall transmit a CM SERVICE REQUEST for the new CM connection (for the third short message) before the final CP-ACK (the one that acknowledges the CP-DATA that carried the RP-ACK before) for the old MM connection is transmitted. Before transmission of the first CP-DATA on the new MM connection:

The MS may transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be z, where $z <> y$ (see step c)). Thereby, the UE can transmit the final CP-ACK after either the sending of the CM SERVICE REQUEST for the new CM connection or the reception of the CM SERVICE ACCEPT for the new CM connection or not to send a CP-ACK at all, thus three cases are possible. These cases are specified using two branches for the transmission of the final CP-ACK where the transmission of the final CP-ACK for the old MM connection is optional. The two branches are specified in the expected sequence table like A and B respectively. The SS waits for the UE to transmit the final CP-ACK. If received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to transmit the first CP-DATA on the new MM connection (branch A). If the final CP-ACK is not received within 5 s then the SS transmits the CM SERVICE ACCEPT and then waits for the UE to send the final CP-ACK (optional) and/or the first CP-DATA on the new MM connection (branch B).

- h) Void
- i) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU.
- j) The SS waits a maximum of 5 s after sending CP-DATA for the CP-ACK message from the MS.
- k) The SS sends a Channel Release message to the MS.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | MS -> SS | CHANNEL REQUEST | Establishment cause is "Other procedures which can be completed with an SDCCH" NECI = 0 |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns an SDCCH |
| 3 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM on SAPI 0. CM service type set to "Short message transfer" |
| 4 | SS -> MS | AUTHENTICATION REQUEST | |
| 5 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value. |
| 6 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message. |
| 7 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 8 | SS | | SS starts ciphering. |
| 9 | MS -> SS | SABM (SAPI=3) | MS establishes SAPI 3 on DCCH |
| 10 | SS -> MS | UA (SAPI=3) | |
| 11 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 11, 12, 13 and 15 shall be x. |
| 12 | SS -> MS | CP-ACK | |
| 13 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 14 | MS -> SS | CM SERVICE REQUEST | CM service type set to "Short message transfer". |

| Step | Direction | Message | Comments |
|---------------------|-----------|--------------------|---|
| 15 | MS -> SS | CP-ACK | The one that acknowledges the CP-DATA which carried the RP-ACK RPDU. If CP-ACK received then continue at A16. If CP-ACK is not received within 5 s from the CM SERVICE REQUEST was sent in step 14 then goto step B16-1. |
| Branch A A16 | SS -> MS | CM SERVICE ACCEPT | After having sent the CM SERVICE ACCEPT then goto step 17. |
| Branch B B16-1 | SS->MS | CM SERVICE ACCEPT | This branch is chosen if the MS does not send a CP-ACK within 5 s of step 14. |
| B16-2 (optional) | MS->SS | CP-ACK | The one that acknowledges the CP-DATA which carried the RP-ACK RPDU. |
| 17 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 17, 18, 19 and 21 shall be y where $y < x$ (see step 11). |
| 18 | SS -> MS | CP-ACK | Contains RP-ACK RPDU CM service type set to "Short message transfer". The one that acknowledges the CP-DATA which carried the RP-ACK RPDU. If CP-ACK received then continue at A22 If CP-ACK is not received within 5 s from the CM SERVICE REQUEST was sent in step 20 then goto step B22-1. |
| 19 | SS -> MS | CP-DATA | |
| 20 | MS -> SS | CM SERVICE REQUEST | |
| 21 | MS -> SS | CP-ACK | |
| Branch A A22 | SS -> MS | CM SERVICE ACCEPT | After having sent the CM SERVICE ACCEPT then goto step 23. |
| Branch B B22-1 | SS->MS | CM SERVICE ACCEPT | This branch is chosen if the MS does not send a CP-ACK within 5 s of step 20. |
| B22-2 (optional) | MS->SS | CP-ACK | The one that acknowledges the CP-DATA which carried the RP-ACK RPDU |
| 23 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 23, 24, 25 and 26 shall be z, where $z < y$ (see step 17). |
| 24 | SS -> MS | CP-ACK | Contains RP-ACK RPDU Shall be sent within 5 s of step 25 The main signalling link is released. MS shall respond to channel release with a layer 2 DISC frame with SAPI 0 |
| 25 | SS -> MS | CP-DATA | |
| 26 | MS -> SS | CP-ACK | |
| 27 | SS -> MS | CHANNEL RELEASE | |
| 28 | MS -> SS | DISC (SAPI=0) | |

Specific message contents:

SMS SUBMIT TPDU

| Information element | Comment | Value |
|-------------------------|---|-------|
| TP-MTI | SMS SUBMIT | '01'B |
| TP-VPF | not checked | |
| TP-RP | no reply path | '0'B |
| TP-UDHI | not checked | |
| TP-SRR | not checked | |

| TP-UDL | as applicable | |
| TP-UD (140 octets max.) | the user data consist of an arbitrarily chosen amount of octets | |

34.2.9.2 MS in active mode

This test applies to MS supporting the ability of sending multiple short messages when there is a call in progress.

34.2.9.2.1 Conformance requirements

For a R99 or earlier MS only:

If another short message or a memory available notification is to be sent, an originating SMR entity in the UE may choose to continue to use the same RRC connection. When the MS chooses to use the same RR connection, then:

- the MS shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (e.g. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the MS shall transmit the CP-ACK for the old MM connection;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the MS shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

For a Rel-4 or later MS only:

In the case of a SMS transfer via the CS domain, when the UE chooses to use the same RR or CS signalling connection, then:

- the UE shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (i.e. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the UE may transmit the CP-ACK for the old MM connection; the UE shall not transmit the final CP-ACK after the new CP-DATA;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the UE shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

3GPP TS 04.11; subclause 5.4.

3GPP TS 04.13; subclause 5.6.

34.2.9.2.2 Test purpose

To verify that the MS is able to correctly send multiple short messages on the same RR connection when sent parallel to a call.

34.2.9.2.3 Method of test

Initial conditions

System simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

Specific PICS Statements

- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Description of how to enter multiple SMS.
- Description of the basic procedures to display a mobile originated short message.
- Support for state U10 of call control.

Foreseen final state of MS

Idle, updated.

Test procedure

- A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The MS is set up to send 3 short messages as multiple SM to the SS. After the reception of the CM SERVICE REQUEST, the SS sends a CM SERVICE ACCEPT message. The SS responds with a UA frame SAPI-3 to the SABM with SAPI-3 received from the MS.
- Steps c) to k) of the test procedure in subclause 34.2.9.1.3 are repeated.

Maximum duration of test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------------|-----------|--------------------|--|
| 1 | SS | | A data or speech call is established on a TCH and the state U10 of call control is entered. |
| 2 | MS | | The MS is set up to send 3 short messages as multiple SM |
| 3 | MS -> SS | CM SERVICE REQUEST | Sent in a layer 2 frame on the FACCH. CM service type set to "short message transfer" |
| 4 | SS -> MS | CM SERVICE ACCEPT | |
| 5 | MS -> SS | SABM (SAPI=3) | Sent on SACCH associated with the TCH |
| 6 | SS -> MS | UA (SAPI=3) | |
| 7 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 7, 8, 9 and 11 shall be x. |
| 8 | SS -> MS | CP-ACK | |
| 9 | SS -> MS | CP-DATA | Contains RP-ACK RPDU |
| 10 | MS -> SS | CM SERVICE REQUEST | Sent in a layer 2 frame on the FACCH. CM service type set to "short message transfer" |
| 11 | MS -> SS | CP-ACK | The one that acknowledges the CP-DATA which carried the RP-ACK RPDU. If CP-ACK received then continue at A12. If CP-ACK is not received within 5 s from the CM SERVICE REQUEST was sent in step 10 then goto step B12-1. |
| Branch A A12 | SS -> MS | CM SERVICE ACCEPT | After having sent the CM SERVICE ACCEPT then goto step 13. |
| Branch B | | | |
| B12-1 | SS->MS | CM SERVICE ACCEPT | This branch is chosen if the MS does not send a CP-ACK within 5 s of step 10. |
| B12-2 (optional) | MS->SS | CP-ACK | The one that acknowledges the CP-DATA which carried the RP-ACK RPDU. |
| 13 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 13, 14, 15 and 17 shall be y where y <> x (see step 7). |
| 14 | SS -> MS | CP-ACK | |

| Step | Direction | Message | Comments |
|------------------|-----------|--------------------|---|
| 15 | SS -> MS | CP-DATA | Contains RP-ACK RPDU Sent in a layer 2 frame on the FACCH. CM service type set to "short message transfer" The one that acknowledges the CP-DATA which carried the RP-ACK RPDU. If CP-ACK received then continue at A18 If CP-ACK is not received within 5 s from the CM SERVICE REQUEST was sent in step 16 then goto step B18-1. |
| 16 | MS -> SS | CM SERVICE REQUEST | |
| 17 | MS -> SS | CP-ACK | |
| Branch A A18 | | | |
| Branch B | | | |
| B18-1 | SS->MS | CM SERVICE ACCEPT | This branch is chosen if the MS does not send a CP-ACK within 5 s of step 16. The one that acknowledges the CP-DATA which carried the RP-ACK RPDU. |
| B18-2 (optional) | MS->SS | CP-ACK | |
| 19 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 19, 20, 21 and 22 shall be z, where z <> y (see step 13). Contains RP-ACK RPDU Shall be sent within 5.5 s (5 sec + 10% tolerance) of step 21 The main signalling link is released. MS shall respond to channel release with a layer 2 DISC frame with SAPI 0. |
| 20 | SS -> MS | CP-ACK | |
| 21 | SS -> MS | CP-DATA | |
| 22 | MS -> SS | CP-ACK | |
| 23 | SS -> MS | CHANNEL RELEASE | |
| 24 | MS -> SS | DISC (SAPI = 0) | |

Specific Message Contents:

SMS SUBMIT TPDU

| Information element | Comment | Value |
|-------------------------|---|-------|
| TP-MTI | SMS SUBMIT | '01'B |
| TP-VPF | not checked | |
| TP-RP | no reply path | '0'B |
| TP-UDHI | not checked | |
| TP-SRR | not checked | |
| TP-MR | not checked | |
| TP-RD | not checked | |
| TP-DA | not checked (an E164 number) | |
| TP-PID | not checked | |
| TP-DCS | not checked | |
| TP-VP | not checked | |
| TP-UDL | as applicable | |
| TP-UD (140 octets max.) | the user data consist of an arbitrarily chosen amount of octets | |

34.3 Short message service cell broadcast

This test applies to all MSs.

34.3.1 Conformance requirements

If the MS supports SMS-CB, it is responsible for recombination of the four blocks received via the radio path into a single block which constitutes the cell broadcast short message.

In idle mode, the MS listens to the BCCH and to the paging sub-channel for the paging group it belongs to. The MS is required to receive and analyse the paging messages and immediate assignment messages sent on the paging subchannel corresponding to its paging subgroup.

Reference

3GPP TS 03.41; clause 8.

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.2.1 and 3.3.2.1.

34.3.2 Test purpose

This test verifies that an MS supporting SMS-CB is able to receive SMS-CB messages.

This test verifies that an MS is able to respond to a paging requested during the transmission of a cell broadcast short message.

34.3.3 Test method

Initial conditions

System Simulator:

1 cell, default parameters, except BS_PA_MFRMS = 2.

The SS provides a BCCH/CCCH to support the MS in idle mode.

Periodic location updating is disabled.

Mobile Station:

The MS shall be in the idle updated state.

Specific PICS Statements

-

PIXIT Statements

- Description of the basic procedures to display a cell broadcasted short message.

Foreseen Final State of MS

Idle, updated.

Test Procedure

- Three Cell Broadcast (CB) messages are sent by the SS on the CBCH with serial numbers 0,1,1.
- Step a) is repeated, but the SS pages the MS during the transmission of the second CB message. This shall be achieved by paging the MS immediately after the first block of the CB message has been sent. The SS shall ensure that the page is transmitted on the radio interface prior to the transmission of the 4th block of the CB message.

NOTE: The use of BS_PA_MFRMS = 2 ensures that this can be achieved irrespective of the IMSI.

The MS shall respond to the page.

Maximum Duration of Test

-

Expected Sequence

Since the SMS-CB messages are sent continuously, a table is not applicable in this test.

Specific Message Contents:

Cell broadcast test message content

| Information element | Comment Value |
|----------------------|--|
| Serial Number | "00"B |
| - Geographical scope | see test procedure |
| - Message code | "0000000000"B or "0000000001"B |
| - Update number | as applicable |
| Message identifier | "0"B |
| Data Coding Scheme | Default alphabet, English |
| Page parameter | "0001 0001"B |
| Contents of message | 93 user characters using 93 different characters of default 7 bit coded alphabet |

SYSTEM INFORMATION TYPE 4

As default except:

| Information element | Value/remark |
|--------------------------------|---|
| CBCH Channel Description | SDDCH/4 + SACCH/C4 or CBCH (SDDCH/4) |
| - Channel type and TDMA offset | time slot zero |
| - Timeslot number | 5 (same as BCC) |
| - Training sequence code | Single RF channel |
| - Hopping channel | Channel number 263 (for GSM 450 MS) Channel number 310 (for GSM 480 MS) Channel number 20 (for GSM 900 MS) Channel number 590 (for DCS 1 800 and PCS 1 900 MS) Channel number 457 (for GSM 710, GSM 750 and T-GSM 810 MS) Channel number 147 (for GSM 850 MS) |
| -Channel selector | |
| CBCH Mobile Allocation | Not included |

34.4 Short message service point to point over GPRS

34.4.1 SMS mobile terminated

34.4.1.1 Definition

34.4.1.2 Conformance requirements

An active MS shall be able to receive a short message TPDU (SMS-DELIVER) at any time, independently of whether or not there is a speech or data call in progress. A report shall always be returned to the SC; either confirming that the MS has received the short message, or informing the SC that it was impossible to deliver the short message TPDU to the MS, including the reason why.

References

3GPP TS 23.040 clauses 3.1, 9.2.3.16.

34.4.1.3 Test purpose

To verify the ability of a MS to receive and decode the SM where provided for the point to point service.

34.4.1.4 Method of test

Initial Conditions

- System simulator:
 - 1 cell, default parameters.
- Mobile Station:
 - the MS shall be in GMM-state "GMM-REGISTERED";

- the SMS message storage shall be empty.

Specific PICS Statements

- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Support for session management state "PDP-ACTIVE".
- Maximum number of retransmissions of an unacknowledged CP-DATA message.

Test procedure

- The SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU).
- The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- The SS sends a CP-ACK to the MS with no further CP-DATA messages.
- Steps a), b) and c) are repeated but the first CP-DATA message from the MS is not acknowledged. The second CP-DATA message from the MS is acknowledged by a CP-ACK.

- Steps a) and b) are repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. The SS check during 60 s that the MS does not send more than the maximum allowed (3) CP-DATA retransmissions.

- The SMS message store shall be cleared manually by the operator.

- A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered.

The SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU). The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

- The SS sends a CP-ACK to the MS with no further CP-DATA. The SMS message store shall be cleared manually by the operator.

- Steps g) and h) are repeated but the first CP-DATA message from the MS is not acknowledged. The second CP-DATA message from the MS is acknowledged by a CP-ACK.

- Step g) is repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. The SS check during 60 s that the MS does not send more than the maximum allowed (3) CP-DATA retransmissions. (60 s the sufficient wait time while PDP context in progress).

- The SS initiates a PDP context deactivation (The PDP context deactivation is continued in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA RPDU (SMS DELIVER TPDU) message. The information element of the CP-DATA message is RP-DATA.

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the MS with no further CP-DATA.

The SMS message store shall be cleared manually by the operator.

- A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. The PDP context shall be cleared from the MS. (The PDP context deactivating is continued in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA message. The information element of the CP-DATA message is RP-DATA RPDU (SMS DELIVER TPDU).

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the MS with no further CP-DATA messages.

The SMS message store shall be cleared manually by the operator.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 2 | SS | | Waits max 25 s for CP-ACK |
| 3 | MS -> SS | CP-ACK | |
| 4 | SS | | Waits max 60 s for RP-ACK RPDU |
| 5 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 6 | MS <- SS | CP-ACK | |
| 7 | MS | | There should be no further CP-DATA message. |
| 8 | MS | | The MS shall indicate that an SM has arrived. |
| 9 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 10 | SS | | Waits max 25 s for CP-ACK |
| 11 | MS -> SS | CP-ACK | |
| 12 | SS | | Waits max 60 s for RP-ACK RPDU |
| 13 | MS -> SS | CP-DATA | First CP-DATA from MS, contains RP-ACK RPDU |
| 14 | SS | | First CP-DATA message not acknowledged by SS |
| 15 | MS -> SS | CP-DATA | Retransmitted CP-DATA from MS, contains RP-ACK RPDU |
| 16 | MS <- SS | CP-ACK | Second CP_DATA message is acknowledged |
| 17 | MS | | There should be no further CP-DATA messages |
| 18 | MS | | The MS shall indicate that an SM has arrived. |
| 19 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 20 | SS | | Waits max 25 s for CP-ACK |
| 21 | MS -> SS | CP-ACK | |
| 22 | SS | | Waits max 60 s for RP-ACK RPDU |
| 23 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 24 | SS | | First CP-DATA message not acknowledged by SS |
| 25 | | CP-DATA | Retransmitted CP-DATA from MS, contains RP-ACK RPDU |
| 26 | SS | | Retransmitted CP-DATA message not acknowledged by SS |
| 27 | MS | | Depending upon the maximum number of CP-DATA retransmissions implemented, step 25 and 26 may be repeated. |
| 28 | MS | | The SS verifies within 60 s after the first CP-DATA message not acknowledged by SS that the MS does not retransmit more than the maximum allowed. |
| 29 | MS | | The MS shall indicate that an SM has arrived. |
| 30 | MS, SS | {PDP Context Activation} | Macro. PDP context activation from the MS. |
| 31 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 32 | SS | | Waits max 25 s for CP-ACK |
| 33 | MS -> SS | CP-ACK | |
| 34 | SS | | Waits max 60 s for RP-ACK RPDU |
| 35 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 36 | MS <- SS | CP-ACK | |
| 37 | MS <- SS | DEACTIVATE PDP CONTEXT REQUEST | Deactivates the existing PDP context. |
| 38 | MS -> SS | DEACTIVATE PDP CONTEXT ACCEPT | |
| 39 | MS | | The MS shall indicate that an SM has arrived. |
| 40 | MS | | Clear the SMS message store |
| 41 | MS | {PDP Context Activation} | Macro. PDP context activation from the MS. |
| 42 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 43 | SS | | Waits max 25 s for CP-ACK |
| 44 | MS -> SS | CP-ACK | |
| 45 | SS | | Waits max 60 s for RP-ACK RPDU |
| 46 | MS -> SS | CP-DATA | First CP-DATA from MS, contains RP-ACK RPDU |
| 47 | SS | | First CP-DATA message not acknowledged by SS |
| 48 | MS -> SS | CP-DATA | Retransmitted CP-DATA message, contains RP-ACK RPDU |
| 49 | MS <- SS | CP-ACK | Second CP-DATA message is acknowledged |
| 50 | MS <- SS | DEACTIVATE PDP CONTEXT REQUEST | Deactivates an existing PDP context. |
| 51 | MS -> SS | DEACTIVATE PDP CONTEXT ACCEPT | |
| 52 | MS | | The MS shall indicate that an SM has arrived. |
| 53 | MS | | Clear the SMS message store |
| 54 | MS | {PDP Context Activation} | Macro. PDP context activation from the MS. |
| 55 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 56 | SS | | Waits max 25 s for CP-ACK |
| 57 | MS -> SS | CP-ACK | |
| 58 | SS | | Waits max 60 s for RP-ACK RPDU |
| 59 | MS -> SS | CP-DATA | First CP-DATA from MS, contains RP-ACK RPDU |
| 60 | SS | | First CP-DATA message not acknowledged by SS |
| 61 | MS -> SS | CP-DATA | Transmitted CP-DATA message, contains RP-ACK RPDU |
| 62 | SS | | Retransmitted CP-DATA message not acknowledged by SS |
| 63 | MS | | Depending on the maximum number of CP-DATA retransmissions implemented, step 61 and 62 may be repeated. The maximum number of retransmissions may however not exceed three. |
| 64 | MS | | The SS verifies within 60 s after the last CP-DATA retransmission that the MS does not retransmit more than the maximum allowed. |
| 65 | MS | | The MS shall indicate that an SM has arrived. |
| 66 | MS | | Clear the SMS message store |
| 67 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 68 | MS <- SS | DEACTIVATE PDP CONTEXT REQUEST | The PDP context is deactivated by the SS. The PDP context deactivating is continued in parallel to the following exchange of messages related to SMS. |
| 69 | MS -> SS | DEACTIVATE PDP CONTEXT ACCEPT | This message may be transmitted after this step timing. |
| 70 | SS | | Waits max 25 s for CP-ACK |
| 71 | MS -> SS | CP-ACK | |
| 72 | SS | | Waits max 60 s for RP-ACK RPDU |
| 73 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 74 | MS <- SS | CP-ACK | |
| 75 | MS | | The MS shall indicate that an SM has arrived. |
| 76 | MS | | Clear the SMS message store |
| 77 | MS | {PDP Context Activation} | Macro. PDP context activation from the MS. |
| 78 | MS -> SS | DEACTIVATE PDP CONTEXT REQUEST | The PDP context is deactivated by the MS. The PDP context deactivation is continued in parallel to the following |
| 79 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 80 | MS <- SS | DEACTIVATE PDP CONTEXT ACCEPT | |
| 81 | SS | | Waits max 25 s for CP-ACK |
| 82 | MS -> SS | CP-ACK | |
| 83 | SS | | Waits max 60 s for RP-ACK RPDU |
| 84 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 85 | MS <- SS | CP-ACK | |
| 86 | MS | | The MS shall indicate that an SM has arrived. |
| 87 | MS | | Clear the SMS message store |

NOTE: Time values for SS wait time are chosen sufficiently high to be sure that the MS has enough time to respond to the different messages.

Specific Message Contents

SMS DELIVER TPDU (not containing a type 0 message)

| Information element | Comment Value |
|---|---|
| TP-PID | Different from Type 0: "01000000"B 160 text of message (160 characters) |
| TP-UDL | |
| TP-UD (140 octets) | |
| NOTE: The 160 characters in TP-UD shall include at least one occurrence of each character in the default alphabet (see 3GPP TS 23.038, clause 6.2.1). | |

34.4.2 SMS mobile originated

34.4.2.1 Definition

34.4.2.2 Conformance requirements

A GPRS MS shall be able to submit short message TPDU (SMS-SUBMIT) at any time, independently of whether or not there is a PDP context in progress.

References

3GPP TS 24.011 clause 5.3.2.2.

3GPP TS 23.040 clause 3.1, 9.2.3.16.

34.4.2.3 Test purpose

To verify that a GPRS MS is able to correctly send a short message where the SMS is provided for the point to point service.

34.4.2.4 Method of test

Initial Conditions

- System simulator:
 - 1 cell, default parameters.
- Mobile Station:
 - the MS shall be in GMM-state "GMM-REGISTERED";
 - the SMS message storage shall be empty.

Specific PICS Statements

- SMS messages are stored in the SIM (TSPC_AddInfo_StoreRcvSMSSIM).
- SMS messages are stored in the ME (TSPC_AddInfo_StoreRcvSMSME).

PIXIT Statements

- Support for state PDP-ACTIVE of session management.
- Maximum number of retransmissions of an unacknowledged CP-DATA message.

Test procedure

- a) The MS shall be set up to send a short message to the SS. The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for CP-ACK message.
- b) The MS shall be set up to send a short message to the SS. This time the SS will not acknowledge the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS. The MS retransmits the CP-DATA message.

Now, the CP-DATA message will be acknowledged by a CP-ACK from the SS, followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for CP-ACK message.

- c) The MS shall be set up to send a short message to the SS. The SS is configured not to send any CP-ACK to acknowledge the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS. Then maximum 3 CP-DATA retransmissions may occur. Following the last CP-DATA retransmission from the MS, the SS checks that the MS does not retransmit more than the maximum allowed.
- d) The MS shall be set up to send a short message to the SS. On receipt of the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS, the SS sends a CP-ERROR message containing a “Network Failure” cause. The SS verifies within 60 seconds that the MS does not re-send any CP-DATA messages.
- e) A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. The MS shall be set up to send a short message to the SS. The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for CP-ACK message.
- f) The MS shall be set up to send a short message to the SS. The SS is configured not to send CP-ACK to acknowledge the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS. The MS retransmits the CP-DATA message. Now, the CP-DATA message will be acknowledged by a CP-ACK from the SS, followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for CP-ACK message.
- g) The MS shall be set up to send a short message to the SS. The SS is configured not to send any CP-ACK to acknowledge the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS. Then maximum 3 CP-DATA retransmissions may occur. Following the last CP-DATA retransmission from the MS, the SS checks that the MS does not retransmit more than the maximum allowed.
- h) The MS shall be set up to send a short message to the SS. On receipt of the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS, the SS sends a CP-ERROR message containing a “Network Failure” cause. The SS verifies that within 60 seconds the MS does not re-send any CP-DATA messages.
- i) The MS shall be set up to send a short message to the SS. On receipt of the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS, the SS requests the deactivation of the previously active PDP context by sending DEACTIVATE PDP CONTEXT REQUEST, the MS responds with DEACTIVATE PDP CONTEXT ACCEPT. The SS responds with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for CP-ACK message.
- j) A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. The MS shall be set up to send a short message to the SS. On receipt of the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS, the SS requests the deactivation of the previously active PDP context by sending DEACTIVATE PDP CONTEXT REQUEST, the MS responds with DEACTIVATE PDP CONTEXT ACCEPT. This time the SS will not acknowledge the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS. The MS retransmits the CP-DATA message. Now, the CP-DATA message will be acknowledged by a CP-ACK from the SS, followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for CP-ACK message.
- k) A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. The MS shall be set up to send a short message to the SS. On receipt of the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS, the SS requests the deactivation of the previously active PDP context by sending DEACTIVATE PDP CONTEXT REQUEST, the MS responds with DEACTIVATE PDP CONTEXT ACCEPT. The SS is configured not to send any CP-ACK to acknowledge the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS. Then maximum 3 CP-DATA retransmissions may occur. Depending on the maximum number of automatic repeat, MO SMS sending may be repeated. Following the last CP-DATA retransmission from the MS, the SS checks that the MS does not retransmit more than the maximum allowed.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------|---|
| 1 | MS | | The MS is set up to send an SM. |
| 2 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 3 | SS → MS | CP-ACK | |
| 4 | SS → MS | CP-DATA | Contains RP-ACK RPDU. |
| 5 | SS | | Wait max 25 s for CP-ACK. |
| 6 | MS → SS | CP-ACK | |
| 7 | MS | | The MS is set up to send an SM. |
| 8 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 9 | SS | | SS configured not to send CP-ACK. |
| 10 | MS → SS | CP-DATA | Retransmitted CP-DATA from MS. |
| 11 | SS → MS | CP-ACK | |
| 12 | SS → MS | CP-DATA | Contains RP-ACK RPDU. |
| 13 | SS | | Wait max 25 s for CP-ACK. |
| 14 | MS → SS | CP-ACK | |
| 15 | MS | | The MS is set up to send an SM. |
| 16 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 17 | SS | | SS configured not to send any CP-ACK. |
| 18 | MS → SS | CP-DATA | Retransmitted CP-DATA from MS. |
| 19 | MS | | Depending upon the maximum number of CP-DATA retransmissions implemented, step 18 may be repeated. The maximum number of retransmissions shall however not exceed three. |
| 20 | SS | | The SS verifies within 60 s after the first CP-DATA message not acknowledged by SS that the MS does not retransmit more than the maximum allowed. |
| 21 | MS | | The MS is set up to send an SM. |
| 22 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 23 | SS → MS | CP-ERROR | Containing "Network Failure" cause. |
| 24 | | | The SS verifies within 60 s after step 22 that the MS does not re-send any CP-DATA messages. |
| 25 | MS | | A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. |
| 26 | MS | | The MS is set up to send an SM. |
| 27 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 28 | SS → MS | CP-ACK | |
| 29 | SS → MS | CP-DATA | Contains RP-ACK RPDU. |
| 30 | SS | | Wait max 25 s for CP-ACK. |
| 31 | MS → SS | CP-ACK | |
| 32 | MS | | The MS is set up to send an SM. |
| 33 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 34 | SS | | SS configured not to send CP-ACK. |
| 35 | MS → SS | CP-DATA | Retransmitted CP-DATA from MS. |
| 36 | SS → MS | CP-ACK | |
| 37 | SS → MS | CP-DATA | Contains RP-ACK RPDU. |
| 38 | SS | | Wait max 25 s for CP-ACK. |
| 39 | MS → SS | CP-ACK | |
| 40 | MS | | The MS is set up to send an SM. |
| 41 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 42 | SS | | SS configured not to send any CP-ACK. |
| Step | Direction | Message | Comments |
| 43 | MS → SS | CP-DATA | Retransmitted CP-DATA from MS. |

| | | | |
|-------------|------------------|--------------------------------|---|
| 44 | MS | | Depending upon the maximum number of CP-DATA retransmissions implemented, step 43 may be repeated. The maximum number of retransmissions shall however not exceed three. |
| 45 | SS | | The SS verifies within 60 s after the first CP-DATA message not acknowledged by SS that the MS does not retransmit more than the maximum allowed. |
| 46 | MS | | The MS is set up to send an SM. |
| 47 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 48 | SS → MS | CP-ERROR | Containing "Network Failure" cause. |
| 49 | | | The SS verifies within 60 s after step 47 that the MS does not re-send any CP-DATA messages. |
| 50 | MS | | The MS is set up to send an SM. |
| 51 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 52 | SS → MS | DEACTIVATE PDP CONTEXT REQUEST | The PDP context is deactivated by the SS. The PDP context deactivation is continued in parallel to the following exchange of messages related to SMS. |
| 53 | MS → SS | DEACTIVATE PDP CONTEXT ACCEPT | |
| 54 | SS → MS | CP-ACK | |
| 55 | SS → MS | CP-DATA | Contains RP-ACK RPDU. |
| 56 | SS | | Wait max 25 s for CP-ACK. |
| 57 | MS → SS | CP-ACK | |
| 58 | MS | | A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. |
| 59 | MS | | The MS is set up to send an SM. |
| 60 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 61 | SS → MS | DEACTIVATE PDP CONTEXT REQUEST | The PDP context is deactivated by the SS. The PDP context deactivation is continued in parallel to the following exchange of messages related to SMS. |
| 62 | MS → SS | DEACTIVATE PDP CONTEXT ACCEPT | |
| 63 | SS | | SS configured not to send CP-ACK. |
| 64 | MS → SS | CP-DATA | Retransmitted CP-DATA from MS. |
| 65 | SS → MS | CP-ACK | |
| 66 | SS → MS | CP-DATA | Contains RP-ACK RPDU. |
| 67 | SS | | Wait max 25 s for CP-ACK. |
| 68 | MS → SS | CP-ACK | |
| 69 | MS | | A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. |
| 70 | MS | | The MS is set up to send an SM. |
| 71 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU). |
| 72 | SS → MS | DEACTIVATE PDP CONTEXT REQUEST | The PDP context is deactivated by the SS. The PDP context deactivation is continued in parallel to the following exchange of messages related to SMS. |
| 73 | MS → SS | DEACTIVATE PDP CONTEXT ACCEPT | |
| 74 | SS | | SS configured not to send any CP-ACK. |
| Step | Direction | Message | Comments |
| 75 | MS → SS | CP-DATA | Retransmitted CP-DATA from MS. |

| | | | |
|---|----|--|---|
| 76 | MS | | Depending upon the maximum number of CP-DATA retransmissions implemented, step 75 may be repeated. The maximum number of retransmissions shall however not exceed three. |
| 77 | SS | | |
| NOTE: Time values for SS wait times are chosen sufficiently high to be sure that the MS has enough time to respond to the different messages. | | | |

Specific Message Contents

34.4.3 Test of the status report capabilities and of SMS-COMMAND over GPRS:

This test applies to MSs which support the status report capabilities.

34.4.3.1 Definition

34.4.3.2 Conformance requirement

The SMS offers the SC the capabilities of informing the MS of the status of a previously sent mobile originated short message. This is achieved by the SC returning a status report TPDU (SMS-STATUS-REPORT) to the originating MS.

SMS-COMMAND enables an MS to invoke an operation at the SC.

The MS shall increment TP-MR by 1 for each SMS-SUBMIT or SMS-COMMAND being submitted.

References

- 3GPP TS 23.040 clauses 3.2.9 and 9.2.3.6.

34.4.3.3 Test purpose

- 1) To verify that the MS is able to accept a SMS-STATUS-REPORT TPDU.
- 2) To verify that the MS is able to use the SMS-COMMAND functionality correctly and sends an SMS-COMMAND TPDU with the correct TP-Message-Reference.

34.4.3.4 Method of test

Initial conditions

- System Simulator:
 - 1 cell, default parameters.
- Mobile Station:
 - the MS shall be in GMM-state "GMM-REGISTERED".

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

- a) The MS is made to send a Mobile Originated short message.

- b) The SS sends a CP-DATA message containing a RP-DATA RPDU itself containing an SMS-STATUS-REPORT TPDU.
- c) The MS is made to send an SMS-COMMAND message enquiring about the previously submitted short message.
- d) The SS acknowledges the CP-DATA message from the MS with a CP-ACK followed by a CP-DATA message containing an RP-ACK RPDU.
- e) The MS is made to send an SMS-COMMAND message requiring to delete the previously submitted short message.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------|--|
| 1 | MS → SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) Contains RP-ACK RPDU Waits max 25 s for CP-ACK |
| 2 | SS → MS | CP-ACK | |
| 3 | SS → MS | CP-DATA | |
| 4 | SS | | |
| 5 | MS → SS | CP-ACK | |
| 6 | SS → MS | CP-DATA | Contains RP-DATA RPDU (SMS-STATUS-REPORT TPDU) Contains RP-ACK RPDU |
| 7 | MS → SS | CP-ACK | |
| 8 | MS → SS | CP-DATA | |
| 9 | SS → MS | CP-ACK | |
| 10 | MS | | The MS is made to send an SMS-COMMAND message enquiring about the previously submitted SM Contains RP-DATA RPDU (SMS-COMMAND TPDU) which shall contain the correct TP-MR Contains RP-ACK RPDU |
| 11 | MS → SS | CP-DATA | |
| 12 | SS → MS | CP-ACK | |
| 13 | SS → MS | CP-DATA | |
| 14 | MS → SS | CP-ACK | The MS is made to send an SMS-COMMAND message requiring to delete the previously submitted SM. Contains RP-DATA RPDU (SMS-COMMAND TPDU) which shall contain the correct TP-MR Contains RP-ACK RPDU |
| 15 | MS | | |
| 16 | MS → SS | CP-DATA | |
| 17 | SS → MS | CP-ACK | |
| 18 | SS → MS | CP-DATA | |
| 19 | MS → SS | CP-ACK | |

Specific Message Contents

SMS SUBMIT TPDU

| Information element | Comment Value |
|---------------------|---------------------------------|
| TP-SRR | status report is requested "1"B |

SMS-STATUS-REPORT TPDU (SS to MS in step 6):

| Information element | Comment Value |
|---------------------|---|
| TP-MR | same as previous SMS-SUBMIT |
| TP-MMS | no more messages "1"B |
| TP-SRQ | result of SMS-SUBMIT "0"B |
| TP-RA | same as the Destination address of the SMS-SUBMIT |
| TP-ST | SM received "00000000"B |

First SMS-COMMAND TPDU (MS to SS in step 10)

| Information element | Comment Value |
|---------------------|--|
| TP-MR | TP-MR in previous SMS-SUBMIT plus "1" status report requested "1"B Enquiry relating to previously submitted short message "00000000"B not checked (TP-MR in previous SMS-SUBMIT) |
| TP-SRR | |
| TP-CT | |
| TP-MN | |

Second SMS-COMMAND TPDU (MS to SS in step 15)

| Information element | Comment Value |
|---------------------|--|
| TP-MR | TP-MR in previous SMS-COMMAND plus "1" Delete previously submitted short message "00000010"B not checked (TP-MR in previous SMS-SUBMIT) |
| TP-CT | |
| TP-MN | |

34.4.4 Test of capabilities of simultaneously receiving a short message whilst sending a mobile originated short message

34.4.4.1 Definition

34.4.4.2 Conformance requirements

An active MS shall be able to receive a short message TPDU (SMS-DELIVER) at any time, independently of whether or not there is an SMS mobile originated call (SMS-SUBMIT or SMS-COMMAND) in progress.

Reference(s):

3GPP TS 03.40 / 3GPP TS 23.040 clause 3.1, 9.2.3.16.

3GPP TS 04.11 / 3GPP TS 24.011 clause 3.2.

34.4.4.3 Test purpose

The test verifies that the MS is capable of simultaneously receiving a network originated SM whilst sending a mobile originated SM.

34.4.4.4 Method of test

Initial Conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- the MS shall be in GMM-state "GMM-REGISTERED";
- the SMS message storage shall be empty.

Specific PICS Statements

-

PIXIT Statements

Test procedure

The MS is triggered to send an SM to the SS. Upon the reception of the CP-DATA, the SS sends an SM to the MS.

The MS shall use the correct transaction identifiers and correctly receive the SM and indicate that a message has arrived.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------|--|
| 1 | MS | | The MS is triggered to send an SM. |
| 2 | MS -> SS | CP-DATA | Contains RP-DATA RPDU (SMS SUBMIT TPDU) |
| 3 | SS | | The SS sends an SM to the MS triggered by the end of the CP-DATA message from the MS |
| 4 | MS <- SS | CP-DATA | Contains RP-DATA RPDU (SMS DELIVER TPDU) |
| 5 | MS -> SS | CP-ACK | |
| 6 | MS -> SS | CP-DATA | Contains RP-ACK RPDU |
| 7 | MS <- SS | CP-ACK | |
| 8 | MS <- SS | CP-ACK | |
| 9 | MS <-SS | CP-DATA | Contains RP-ACK RPDU |
| 10 | MS -> SS | CP-ACK | |

Specific Message Contents

None.

34.4.5 Void

34.4.6 Concatenated MO SMS over GPRS

Concatenation allows short messages to be concatenated to form a longer message.

34.4.6.1 Conformance requirement

This facility allows short messages to be concatenated to form a longer message.

The Information-Element-Data field contains information set by the application in the SMS-SUBMIT so that the receiving entity is able to re-assemble the short messages in the correct order. Each concatenated short message contains a reference number, which together with the originating address and Service Centre address allows the receiving entity to discriminate between concatenated short messages sent from different originating SMEs and/or SCs

References

3GPP TS 23.040 Clause 9.2.3.24.1

34.4.6.2 Test purpose

To verify that MS is able to send longer messages (user data exceeding 140 octets) using concatenation feature.

34.4.6.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters

Mobile Station:

The MS shall be in GMM-state "GMM-REGISTERED"

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

- a) The MS is made to send a short message with user data exceeding 140 octets

- b) Repeat steps c) to e) for $n=1..N$; N is the total number of segments in SM triggered in step a)
- c) MS sends CP-DATA containing RP-DATA with "TP User Data" as n th segment of SM
- d) The SS responds to the CP-DATA in step c) with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU
- e) The SS waits a maximum of 25 s for CP-ACK message
- f) Check for 60 s that no CP-DATA is received from the MS.

Maximum Duration of Test

-

Expected sequence

| Step | Direction | Message | Comments |
|-----------------|-----------|---------|---|
| 1 | MS | | MS is setup to send SM with user data exceeding 140 octets |
| 2 | MS → SS | CP-DATA | Repeat steps 2 to 6 for $n = 1..N$ Contains RP-DATA with "TP User Data" as n th segment of SM. See specific message contents below |
| 3 | SS → MS | CP-ACK | |
| 4 | SS → MS | CP-DATA | Contains RP-ACK RPDU |
| 5 | SS | | Waits max 25 s for CP-ACK |
| 6 | MS → SS | CP-ACK | Depends on the MS implementation if the CP-ACK is received. |
| (Optional) 7 | SS | | Check for 60 s that no CP-DATA is received from the MS. |

Specific Message Contents

TP USER DATA (8 bits / 16 bits concatenation reference numbers) in step 2

| Information element | Comment Value |
|---|---|
| UDHL | 05 (8 bits) / 06 (16 bits) |
| IEI | 00 (8 bits) / 08 (16 bits) |
| IEI-Length | 03 (8 bits) / 04 (16 bits) |
| IEI Data | |
| MR | M , any value between 0 to 255 (8 bits) / 65535 (16 bits) |
| MAX SEGMENT COUNT | N , Total number of segments |
| SEQUENCE NUMBER | n , segment number |
| TP-UD (<=134 (8 bit) / 133 (16 bit) octets) | User data in n th segment of SM |

34.4.7 Concatenated MT SMS over GPRS

Concatenation allows short messages to be concatenated to form a longer message

34.4.7.1 Conformance requirement

This facility allows short messages to be concatenated to form a longer message.

The Information-Element-Data field contains information set by the application in the SMS-DELIVER so that the receiving entity is able to re-assemble the short messages in the correct order. Each concatenated short message contains a reference number, which together with the originating address and Service Centre address allows the receiving entity to discriminate between concatenated short messages sent from different originating SMEs and/or SCs

The TP elements in the SMS-DELIVER PDU, apart from TP-UDL and TP-UD, should remain unchanged for each SM that forms part of a concatenated SM; otherwise this may lead to irrational behavior.

References

3GPP TS 23.040 Clause 9.2.3.24.1

34.4.7.2 Test purpose

To verify that MS is able to combine concatenated message segments to form a long message.

34.4.7.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters

Mobile Station:

The MS shall be in GMM-state "GMM-REGISTERED"

The SMS message storage shall be empty.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

- a) Repeat steps b) to d) for $n= 1..N$; N is the total number of segments in SM
- b) The SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA (SMS DELIVER TPDU) with "TP User Data" as the n th segment of SM
- c) The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- d) The SS sends a CP-ACK to the MS.

Maximum Duration of Test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------|--|
| 1 | SS → MS | CP-DATA | Repeat steps 1 to 4 for $n = 1..N$ RP-DATA with "TP User Data" as the n th segment of SM Wait for CP-ACK for 25 s Waits max 60 s for RP-ACK RPDU SS prompts operator to verify stored long message |
| 2 | MS → SS | CP-ACK | |
| 3 | MS → SS | CP-DATA | |
| 4 | SS → MS | CP-ACK | |
| 5 | MS | | |

Specific Message Contents

TP USER DATA in step 1

| Information element | Comment Value |
|----------------------|---|
| UDHL | 05 |
| IEI | 00 |
| IEI-Length | 03 |
| IEI Data | |
| MR | 00 |
| MAX SEGMENT COUNT | N , Total number of segments |
| SEQUENCE NUMBER | n , segment number |
| TP-UD (<=134 octets) | user data equal to 134 octets for $n = 1, N-1$ and user data less than or equal to 134 octets for $n = N$ |

34.4.8 Short Messaging Service – Handling of unknown, unforeseen, and erroneous protocol data

34.4.8.1 CP Error Handling

34.4.8.1.1 Conformance requirements

- a) The Mobile Station shall ignore a CP message (CP-DATA, CP-ACK, CP-ERROR) received with TI value "111".
 - b) Whenever a CP-ACK message is received specifying a Transaction Identifier which is not associated with an active SM transfer, the mobile station shall discard the message and return a CP-ERROR message with cause #81, "Invalid Transaction Identifier" using the received Transaction Identifier, if an appropriate connection exists
 - c) The Mobile Station shall ignore a CP-ERROR message that is received specifying a Transaction Identifier, which is not associated with an active SM transfer.
 - d) The Mobile Station shall ignore a CP-DATA message that is received specifying a Transaction Identifier which is not associated with an active SM transfer and with transaction identifier flag set to "1".
 - e) If the Mobile Station receives a message with message type not defined for the PD or not implemented by the receiver, it shall ignore the message and return a CP-ERROR message with cause #97 "message type non-existent or not implemented", if an appropriate connection exists.
 - f) If the Mobile Station receives a message not consistent with the protocol state, the Mobile Station shall ignore the message and return a CP-ERROR message with cause #98 "Message type not compatible with the short message protocol state", if an appropriate connection exists.
 - g) When on receipt of a message:
 - h) an "imperative message part" error; or
 - a "missing mandatory IE" error.
- is diagnosed or when a message containing a syntactically incorrect mandatory IE is received, the mobile station shall proceed as follows.
- When the corresponding SM transfer is not seen as successfully transferred, i.e. the transaction is not completed, the mobile station shall ignore the message and return a CP-ERROR message with cause #96 "invalid mandatory information", if an appropriate connection exists.

Reference

3GPP TS 24.011 clause 9.2

34.4.8.1.2 Test purpose

- a) To Verify that MS ignores CP-DATA message with TI value "111".
- b) To verify that MS ignores CP-ACK message with TI value not associated with active SMS transfer and sends CP-ERROR with cause # 81
- c) To verify that MS ignores CP-ERROR with TI value not associated with active SMS transfer
- d) To verify MS response when received CP-DATA with TI value not associated with active SMS transfer and "TI" flag set to '1'B
- e) To verify that MS ignores a message with "message type" not defined for the PD '1001'B and returns CP-ERROR with cause#97
- f) To verify that MS ignores a message not consistent with protocol state and returns CP-ERROR with cause#98
- g) To Verify that MS ignores CP-DATA with "missing mandatory IE" and returns CP-ERROR with cause#96 when the corresponding SM transaction is not completed

34.4.8.1.3 Method of test

Initial Conditions

System simulator:

1 cell, default parameters

Mobile Station:

The MS shall be in GMM-state "GMM-REGISTERED"

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

- a) The SS sends CP-DATA with TI value '111'B. Check for no response from MS for 60 s.
- b) The MS shall be set up to send a short message to the SS. The MS sends CP-DATA containing RP-DATA (SMS SUBMIT PDU). SS send CP-ACK with TI value different from the TI value in CP-DATA received from MS. MS sends CP-ERROR with cause #81 (Invalid Transaction Identifier).
- c) The MS shall be set up to send a short message to the SS. The MS sends CP-DATA containing RP-DATA (SMS SUBMIT PDU). SS send CP-ERROR with TI value different from the TI value in CP-DATA received from MS. SS sends CP-ACK and then CP-DATA containing RP-ACK. The SS waits a maximum of 25 s for the CP-ACK message.
- d) The MS shall be set up to send a short message to the SS. The MS sends CP-DATA containing RP-DATA (SMS SUBMIT PDU). SS sends CP-ACK and then sends CP-DATA with TI value different from the TI value in CP-DATA received from MS. MS shall not send CP-ACK.
- e) SS sends a message with PD value '1001'B and message type '00000010'B. MS sends CP-ERROR with cause #97 (Message type non-existent or not implemented).
- f) The MS shall be set up to send a short message to the SS. MS sends CP-DATA (SMS SUBMIT PDU). SS sends CP-ACK twice. MS sends CP-ERROR with cause #98 (Message type not compatible with the short message protocol state)
- g) The MS shall be set up to send a short message to the SS. MS sends CP-DATA (SMS SUBMIT PDU). SS sends CP-ACK and then sends CP-DATA with "CP-User data" IE missing. MS sends a CP-ERROR message with cause #96 ("invalid mandatory information").

Maximum Duration of Test

10 min

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------|--|
| 1 | SS → MS | CP-DATA | With TI value set to '111'B. |
| 2 | SS | | Check for no response from the MS for 60 s |
| 3 | MS | | The MS is set up to send an SM |
| 4 | MS → SS | CP-DATA | Containing RP-DATA (SMS SUBMIT PDU) |
| 5 | SS → MS | CP-ACK | With TI value different from CP-DATA in step 4. |
| 6 | MS → SS | CP-ERROR | Cause #81 |
| | | | Complete the transaction initiated by MS. |
| 7 | MS | | The MS is set up to send an SM |
| 8 | MS → SS | CP-DATA | Containing RP-DATA (SMS SUBMIT PDU) |
| 9 | SS → MS | CP-ERROR | With TI value different from CP-DATA in step 8. |
| 10 | SS → MS | CP-ACK | |
| 11 | SS → MS | CP-DATA | Containing RP-ACK |
| 12 | SS | | Wait 25 s for CP-ACK. |
| 13 | MS → SS | CP-ACK | |
| 14 | MS | | The MS is set up to send an SM |
| 15 | MS → SS | CP-DATA | Containing RP-DATA (SMS SUBMIT PDU) |
| 16 | SS → MS | CP-ACK | |
| 17 | SS → MS | CP-DATA | With TI different from CP-DATA in step 15 and containing RP-ACK |
| 18 | SS | | Check for no CP-ACK within 25 s |
| | | | Complete the transaction initiated by MS. |
| 19 | SS → MS | CP-Message | Message type '00000010'B and PD '1001'B |
| 20 | MS → SS | CP-ERROR | Cause #97 |
| 21 | MS | | The MS is set up to send an SM |
| 22 | MS → SS | CP-DATA | Containing RP-DATA (SMS SUBMIT PDU) |
| 23 | SS → MS | CP-ACK | |
| 24 | SS → MS | CP-ACK | |
| 25 | MS → SS | CP-ERROR | Cause #98 |
| | | | Complete the transaction initiated by MS. |
| 26 | MS | | The MS is set up to send an SM |
| 27 | MS → SS | CP-DATA | Containing RP-DATA (SMS SUBMIT PDU) |
| 28 | SS → MS | CP-ACK | |
| 29 | SS → MS | CP-DATA | With TI flag set to '1'B, TI value same as the TI value of CP-DATA in step 27 and Missing "CP-User-Data" IE. |
| 30 | MS → SS | CP-ERROR | Cause#96 |
| | | | Complete the transaction initiated by MS. |

34.4.8.2 RP Error Handling

34.4.8.2.1 Conformance Requirement

- a) Whenever any RP-ACK message is received specifying a Message Reference which is not associated with an active SM transfer, the mobile station shall discard the message and return an RP-ERROR message with cause #81, "Invalid short message transfer reference value" using the received Message Reference, if an appropriate connection exists.

If the MS is attached to GPRS and the circuit-switched domain, and an SMS transfer via GPRS fails either due to a reception of an RP-ERROR message with cause #69 or due to the complete lack of network response, then the MS shall take the following actions:

The MS shall use the circuit-switched domain instead of GPRS for SMS transfer for an implementation dependent time. When a different PLMN is selected, if the MS preferred method is the sending of SMS over GPRS, the MS shall revert to trying an SMS transfer via GPRS.

- b) When an RP-ERROR message is received specifying a Message Reference, which is not associated with an active SM transfer, the mobile station shall discard the message.

- c) If the Mobile Station receives a RP-message indicating a value of the message type indicator (MTI) defined as reserved, it shall ignore the message and return an RP-ERROR message with cause #97 "message type non-existent or not implemented", if an appropriate connection exists.
- d) If the Mobile Station receives a message (except RP-ERROR) not consistent with the protocol state, the Mobile Station shall ignore the message and return a RP-ERROR message with cause #98 "Message type not compatible with Short Message protocol state", if an appropriate connection exists.
- e) If the Mobile Station receives an RP-ERROR message not consistent with the protocol state, the Mobile Station shall ignore the message.
- f) When on receipt of a message:
 - an "imperative message part" error; or
 - a "missing mandatory IE" error;is diagnosed or when a message containing a syntactically incorrect mandatory IE is received, the mobile station shall (except for the case of a reserved value of the MTI as defined above) proceed as follows:
 - when the message is an RP-DATA or RP-ACK, the mobile station shall ignore the message and return an RP-ERROR message with cause #96 "invalid mandatory information", if an appropriate connection exists.

Reference

3GPP TS 24.011 clauses 2.6, 9.3

34.4.8.2.2 Test Purpose

- a) To verify that MS ignores RP-ACK with message reference which is not associated with active SM transfer and sends RP-ERROR with cause #81, "Invalid short message transfer reference value"
- b) To verify that MS ignores RP-ERROR with message reference which is not associated with active SM transfer
- c) To verify that MS ignores a RP-message with reserved MTI value and sends RP-ERROR with cause #97 "message type non-existent or not implemented"
- d) To verify that MS ignores the RP-ACK when SMR is in idle state and sends RP-ERROR with cause #98 "Message type not compatible with Short Message protocol state"
- e) To verify that MS ignores RP-ERROR when SMR is in idle state
- f) To verify that MS ignores RP-DATA with "missing mandatory IE" and sends RP-ERROR with cause #96, "Invalid mandatory information"

34.4.8.2.3 Method of test

Initial Conditions

System simulator:

1 cell, default parameters

Mobile Station:

The MS shall be in GMM-state "GMM-REGISTERED"

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

- a) The MS shall be set up to send a short message to the SS. MS sends CP-DATA containing RP-DATA (SMS SUBMIT PDU). SS sends CP-ACK and CP-DATA containing RP-ACK with "RP Message Reference (RP-MR)" different from RP-MR in RP_DATA received. MS sends RP-ERROR with cause # 81, "Invalid short message transfer reference value", if an appropriate connection exists. The MS may switch to CS domain for completing the transaction.
- b) The MS shall be set up to send a short message to the SS. MS sends CP-DATA containing RP-DATA (SMS SUBMIT PDU). SS sends CP-ACK and CP-DATA containing RP-ERROR with "RP Message Reference (RP-MR)" different from RP-MR in RP_DATA received. Check for no CP-ACK 60 s. MS may switch to CS domain.
- c) The SS sends CP-DATA containing RP-Message with TP-MTI value '010'B, "Reserved". MS sends CP-DATA containing RP-ERROR with cause#97, "message type not compatible with short message state"
- d) The SS sends CP-DATA containing RP-ACK when there is no active SMS transfer. MS sends CP-DATA containing RP-ERROR with cause#98, "Message type not compatible with short message protocol state"
- e) The SS sends CP-DATA containing RP-ERROR when there is no active SMS transfer.
- f) The SS sends CP-DATA containing "RP-DATA without RP-User Data IE". MS sends CP-DATA containing RP-ERROR with cause#96, "Invalid mandatory information"

Maximum Duration of Test

35 Low battery voltage detection

35.1 Definition

Low battery or shutdown voltage detection is used to trigger inhibition of all RF transmission before the MS supply voltage reaches a level where effective use of the radio frequency spectrum is no longer guaranteed.

35.2 Conformance requirement

1. The MS shall not make ineffective use of the radio frequency spectrum. In no case shall the MS exceed the transmitted levels as defined in 3GPP TS 05.05 for extreme operation.

3GPP TS 05.05, subclause D.2.2.

2. The MS shall inhibit all RF transmission when the power supply voltage is below the manufacturer declared approximate shutdown voltage.

3GPP TS 05.05, subclause D.2.2.

35.3 Test purpose

1. To verify that the MS does not make ineffective use of the RF spectrum.
2. To verify that the MS inhibits all RF transmission when the battery voltage falls below the manufacturer declared shutdown level.

35.4 Method of test

35.4.1 Initial conditions

The SS transmits a BCCH with a location updating time set to 0,1 hours.

The SS sends a paging request message to the MS.

The MS responds with a channel request message.

The SS sends an immediate assignment message establishing an SDCCH.

35.4.2 Procedure

- a) The SS gradually reduces the power supply voltage until the MS ceases the production of RF output.

The RF output spectrum shall be monitored for any anomalies while the supply voltage is being reduced.

NOTE 1: The declared approximate shutdown voltage gives an indication of the voltage where the MS will cease RF output.

NOTE 2: If any anomalies occur, then additional testing using the transmitter tests at the voltage where the anomaly occurred is performed to determine in an objective manner, whether or not the conformance requirement is met.

- c) After 7 minutes, the SS sends a paging message to the MS.

- d) The SS observes whether or not the MS produces any RF output.

This measurement is performed over the relevant transmit band.

The spectrum analyser is set to:

Bandwidth: 3 MHz.

Peak Hold.

- e) The SS modifies the location area of the BCCH.

- f) For 7 minutes, the SS observes whether or not the MS produces any RF output.

NOTE 3: It is anticipated that the MS might attempt location updating.

- g) The MS is switched off and on.

- h) The SS pages the MS.

- i) The SS observes whether or not the MS produces any RF output.

35.5 Test requirement

1. In step a) no anomalies shall occur.
2. In step a), the MS shall cease the production of RF output.
3. In steps d), f) and i), the MS shall not produce any RF output above -30 dBm.

36 Individual equipment type requirements and interworking - special conformance testing functions

Refer to 3GPP TS 04.14 for complete specification

37 to 39 Void

Void

40 GPRS default conditions, message contents and macros

Editor's note: From Rel-9 the PBCCH and PCCCH are removed from chapter 40.x but temporary test cases may still exist in 51.010 referencing to the macros using PBCCH and PCCCH.

40.1 Default test conditions

The following default test conditions shall apply if not otherwise stated within an individual test description.

The testcases for higher layers shall use the second set of default test conditions for channel combination v), xi) and xiii) as specified in subclause 40.3.

In the tables following, decimal values will normally be used. Where a hexadecimal value is used, it indicated with an "H". A binary value will be indicated with a "B".

For MSs that cannot be configured to send an exact number of octets in RLC data blocks of uplink data transfer, test cases specifying 'uplink transfer of **n** octets data' shall be interpreted as 'uplink transfer of *at least n* octets data', unless otherwise stated in the test case.

Rel-6 network simulation shall apply unless otherwise stated in the test case.

NOTE 1: In case when NC mode is different from NC2 and PBCCH is not present in the cell and where neighbour cells are indicated in the testcase and are indeed activated, the MS shall read system information on the target cell (e.g. SI3, SI4) for cell reselection calculations . In these cases, the MS may temporarily suspend ongoing TBF (see 3GPP TS 04.60/3GPP TS 44.060 sub-clause 5.5.1.4.2). Test case implementation should take this into account i.e. that blocks or control messages sent by SS are missed during these SI refreshes.

NOTE 2: In addition:

- When the MS is performing autonomous cell reselection or
- when a PACKET CELL CHANGE ORDER is received by MS and the IMMEDIATE_REL bit is set to "0" or
- when PACKET CELL CHANGE CONTINUE is received by MS and relevant PACKET NEIGHBOUR CELL DATA messages are not received

the MS may continue operation in the old cell and acquire certain system information for the target cell (as per 04.60/44.060). In cases listed above ongoing TBF might be suspended temporarily as well. Test case implementation should take this into account i.e. that blocks or control messages sent by SS are missed during these SI refreshes.

List of affected testcases (by NOTE 2):

42.4.2.3.4, 42.4.4.1, 42.4.4.2, 42.4.4.5, 42.4.5.1, 42.4.5.2, 42.4.5.4, 42.4.5.5, 42.4.5.6, 42.4.5.7, 42.4.5.9, 42.4.6.1, 42.4.8.1.4, 42.4.8.1.6, , 44.2.1.1.7, 44.2.2.1.8, , 44.2.3.1.1a, 44.2.3.1.6, 44.2.3.1.7, 44.2.3.2.8, 44.2.3.2.9, 44.2.7.3.5, 46.2.2.1.5, 47.3.1.1, 47.3.1.2, 47.3.1.3, 47.3.2.1, 47.3.2.2, 47.3.3.1.1, 47.3.3.1.2, 47.3.4.2, 47.4.1.

NOTE 3: 'One phase access' test cases may not be fully executed for MS requesting 'Two phases access'.

The resulting step "If the MS requests two phase access the Test Case is terminated" should be interpreted as "Test case is not applicable for the MS".

List of affected testcases (by NOTE 3):

41.2.3.4, 41.2.3.5, 41.2.3.6, 41.2.3.7, 41.2.3.8, 41.2.3.9, 41.2.3.10, 41.2.3.11.

| Input level | 53 dB μ Vemf() | 53 dB μ Vemf() | 53 dB μ Vemf() |
| BA ARFCN | | | |
| | ARFCNs 438, 447, 457, 467, 477, 487, 497, 502, 507 broadcast in SI 2 For multiband tests, the ARFCNs 438, 447, 457, 467, 477, 487, 497, 502, 507 are broadcast in SI 2 of the GSM 700 cell and SI 2ter of the PCS1900 cell. The 515, 590, 600, 655, 700, 710, 740, 780, 810 are broadcast in SI 2 of the PCS1900 cell and SI 2ter of the GSM850 cell. | ARFCNs 515, 590, 600, 655, 700, 710, 740, 780, 810 broadcast in SI 2 For multiband tests, the ARFCNs 137, 147, 157, 177, 197, 207, 217, 227, 237 are broadcast in SI 2 of the GSM 850 cell and SI 2ter of the PCS1900 cell. The 515, 590, 600, 655, 700, 710, 740, 780, 810 are broadcast in SI 2 of the PCS1900 cell and SI 2ter of the GSM850 cell. | ARFCNs 137, 147, 157, 177, 197, 207, 217, 227, 237 broadcast in SI 2. |

40.1.6 Default settings for cell F

The default settings for cell F are identical to those of cell A with the following exceptions:

| | GSM 900 | DCS 1 800 |
|---|---|---|
| Downlink Input Level | 53 dB μ Vemf() | 53 dB μ Vemf() |
| Serving cell, BCCH/CCCH carrier | | |
| Channel ARFCN | 120 | 810 |
| Serving cell, PDTCH (PBCCH not present), SDCCH, TCH | | |
| Channel ARFCN | 55 | 775 |
| Cell identity | 0006H | 0006H |
| Neighbouring cells BCCH/CCCH carriers | | |
| Channel ARFCN | 5, 20, 80, 90,100, 110,122,124 | 515, 590, 600, 700, 780, 870, 875, 885 |
| Input level | 53 dB μ Vemf() | 53 dB μ Vemf() |
| BA ARFCN | | |
| | Both P-GSM and E-GSM ARFCNs are broadcast: GSM ARFCNs 5, 20, 80, 90,100, 110, 120, 122, 124 broadcast in SI 2 E-GSM ARFCNs 985, 989, 995, 1010, 1014 broadcast in SI 2bis | ARFCNs 515, 590, 600, 700, 780, 810, 870, 875, 885 broadcast in SI 2. |
| | For multiband tests, the ARFCNs 5, 20, 80, 90,100, 110, 120, 122, 124 are broadcast in SI 2 of GSM cell and in SI 2ter of DCS cell. The ARFCNs 515, 590, 600, 700, 780, 810, 870, 875, 885 are broadcast in SI 2 of DCS cell and in SI 2ter of GSM cell | |

| | GSM 700, T-GSM 810 | PCS 1 900 | GSM 850 |
|--|---|---|---|
| Downlink Input Level | 53 dB μ Vemf() | 53 dB μ Vemf() | 53 dB μ Vemf() |
| Serving cell, BCCH/CCCH carrier | | | |
| Channel ARFCN | 487 | 810 | 237 |
| Serving cell, PDTCH (PBCCH not present), SDCCH | | | |
| Channel ARFCN | 477 | 775 | 187 |
| Cell identity | 0006H | 0006H | 0006H |
| Neighbouring cells BCCH/CCCH carriers | | | |
| Channel ARFCN | 438, 447, 457, 467, 477, 497, 502, 507 | 515, 590, 600, 655, 700, 710, 740, 780 | 137, 147, 157, 177, 197, 207, 217, 227 |
| Input level | 53 dB μ Vemf() | 53 dB μ Vemf() | 53 dB μ Vemf() |
| BA ARFCN | | | |
| | ARFCNs 438, 447, 457, 467, 477, 487, 497, 502, 507 broadcast in SI 2 | ARFCNs 515, 590, 600, 655, 700, 710, 740, 780, 810 broadcast in SI 2 | ARFCNs 137, 147, 157, 177, 197, 207, 217, 227, 237 broadcast in SI 2. |
| | For multiband tests, the ARFCNs 438, 447, 457, 467, 477, 487, 497, 502, 507 are broadcast in SI 2 of the GSM 700 cell and SI2ter of the PCS1900 cell. The 515, 590, 600, 655, 700, 710, 740, 780, 810 are broadcast in SI 2 of the PCS1900 cell and SI 2ter of the GSM850 cell. | | |
| | | For multiband tests, the ARFCNs 137, 147, 157, 177, 197, 207, 217, 227, 237 are broadcast in SI 2 of the GSM 850 cell and SI2ter of the PCS1900 cell. The 515, 590, 600, 655, 700, 710, 740, 780, 810 are broadcast in SI 2 of the PCS1900 cell and SI 2ter of the GSM850 cell. | |

40.2 Default message contents

40.2.1 System Information messages

40.2.1.1 Cell A

With the SYSTEM INFORMATION messages, the information elements are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

NOTE: BCCH can send 1 instance of SYSTEM INFORMATION 13.

40.2.1.1.1 Contents of information elements in SYSTEM INFORMATION TYPE 1 to 13 messages.

| | |
|---|--|
| (CBCH) Channel Description | Not present. |
| (CBCH) Mobile Allocation | Not present. |
| Cell Channel Description | |
| - Format identifier | For GSM 900: Bit map 0. For DCS 1 800 and PCS 1 900: Range 512. For GSM 700 and GSM 850: Range 128. |
| - Cell Allocation ARFCN | For GSM 900: Channel Numbers 10, 37, 40, 50, 60 and 80. For DCS1800: Channel Numbers 520, 530, 540 and 550. For PCS 1 900: Channel Numbers 520, 530, 540 and 550 For GSM 700, T-GSM 810: Channel Numbers 447, 457, 477, 487, 497 and 509. For GSM 850: Channel Numbers 159, 161, 163, 165, 187 and 207. |
| Cell Identity | |
| - Cell Identity Value | 0001Hex |
| Cell Options | |
| - Power Control Indicator | Power Control Indicator is not set. |
| - DTX Indicator | MS shall not use DTX. |
| - Radio_Link_Timeout | 8 SACCH blocks. |
| Cell Selection Parameters | |
| - Cell_Reselect_Hysteresis | 12 dB. |
| - MX_TXPWR_MAX_CCH | Power control level 10. |
| - ACS | For SI3, spare (set to '0'); for SI4, No additional cell parameters are present in SYSTEM INFORMATION messages 7 and 8. |
| - NECI | New establishment causes are supported. |
| - RXLEV_ACCESS_MIN | Minimum level. |
| Control Channel Description | |
| - MSCR bit | 1 (MSC is R99 onwards) |
| - Attach-Detach allowed For Non Combined | MS shall apply IMSI attach and detach procedure. |
| - BS_AG_BLK_RES | |
| - CCCH_CONF | 3 blocks reserved for access grant. 000 (1 basic physical channel used for CCCH, not combined with SDCCHs.) |
| For Combined | |
| - BS_AG_BLK_RES | 2 blocks reserved for access grant. |
| - CCCH_CONF | 001 (1 basic physical channel used for CCCH, combined with SDCCHs.) |
| - BS_PA_MFRMS | 6 multiframe periods for transmission of paging messages. |
| - T3212 Time-out value | 0 |
| L2 pseudo length | |

| < TSC > | Arbitrarily chosen (default 5) |
| { 00< ARFCN >} | 00 (ARFCN no hopping) |
| - ARFCN } | As for "Serving cell, PDTCH (PBCCH not present), SDCCH " in section 40.1.1 for the current cell |
| In case of Dynamic Allocation: | |
| { 01 < Dynamic Allocation > | Dynamic Allocation struct : |
| < Extended Dynamic Allocation > | 0 (Dynamic allocation) |
| 0 1< P0 > | 0 |
| < USF_GRANULARITY > | 0 (one block) |
| {0 1< UPLINK_TFI_ASSIGNMENT > | 1 (uplink TFI assignment) |
| - UPLINK_TFI_ASSIGNMENT } | 00000 |
| {0 1< RLC_DATA_BLOCKS_GRANTED >} | 0 (no RLC_DATA_BLOCKS_GRANTED, open-ended TBF) |
| {0 1< TBF_STARTING_TIME >} | 0 (no starting time) |
| {0 1< Timeslot Allocation > | 0 (No power control parameters) |
| | One slot arbitrarily chosen, the following USF_TNx shall be corresponding to the chosen value x (default timeslot 4 assigned) |
| {0 1< USF_TN0>} | 0 (timeslot 0 not assigned) |
| {0 1< USF_TN1>} | 0 (timeslot 1 not assigned) |
| {0 1< USF_TN2>} | 0 (timeslot 2 not assigned) |
| {0 1< USF_TN3>} | 0 (timeslot 3 not assigned) |
| {0 1< USF_TN4>} | 1 (timeslot 4 assigned) |
| - USF_TN4 | arbitrarily chosen (default 000) |
| {0 1< USF_TN5>} | 0 (timeslot 5 not assigned) |
| {0 1< USF_TN6>} | 0 (timeslot 6 not assigned) |
| {0 1< USF_TN7>}} | 0 (timeslot 7 not assigned) |
| In case of Single Block Allocation: | |
| { 10 <Single Block Allocation> | Single Block Allocation struct: |
| - TIMESLOT_NUMBER | 100 |
| {0 1 | 1 (ALPHA, GAMMA_TN present) |
| - < ALPHA > | 0 |
| - < GAMMA_TN > } | |
| {0 1} | 0 (P0, BTS_PWR_CTRL_MODE, PR_MODE not present) |
| - TBF_STARTING_TIME | 0 (Absolute Starting Time, indicating current frame + 104 frames) |
| - | |
| For R99 network simulation: | |
| Additions for Rel.99 | 1 |
| - Packet Extended TA flag | 0 not present |
| spare padding | Spare Padding |

40.2.3.5 PACKET DOWNLINK ASSIGNMENT message:

| | |
|-------------------------------------|--|
| MESSAGE_TYPE | 000010 |
| PAGE_MODE | 00 Normal Paging |
| {0 1< PERSISTENCE_LEVEL > | 0 (no persistence level present) |
| Referenced Address | |
| - | 1 (address is TLLI) |
| - TLLI | Same as the value received from MS |
| MAC_MODE | 00 Dynamic Allocation |
| RLC_MODE | 0 Acknowledged mode |
| CONTROL_ACK | 0 |
| TIMESLOT_ALLOCATION | arbitrarily chosen (default timeslot 4) |
| Packet Timing Advance | |
| { 0 1< TIMING_ADVANCE_VALUE > | 1 (timing advance value) |
| - TIMING_ADVANCE_VALUE } | 30 bit periods |
| { 0 1< TIMING_ADVANCE_INDEX > | 0 (no timing advance index) |
| <TIMING_ADVANCE_TIMESLOT_NUMBER > } | |
| {0 1<Frequency Parameters>} | Not present in case MS is in DTM mode otherwise present when required for channel assignment |
| For PBCCH not present case: | |
| < TSC > | Arbitrarily chosen (default 5) |
| { 00< ARFCN >} | 00 (ARFCN no hopping) |
| - ARFCN } | As for "Serving cell, PDTCH (PBCCH not present), SDCCCH " in section 40.1.1 for the current cell |
| {0 1<DOWNLINK_TFI_ASSIGNMENT>} | 1 (assign downlink TFI) |
| - DOWNLINK_TFI_ASSIGNMENT | 00001(Binary) |
| {0 1<Power Control Parameters>} | 1 (Power Control Parameters present) |
| - ALPHA | 0, 5 |
| - GAMMA for allocated timeslots | For GSM 700, T-GSM 810, GSM 850 and GSM 900: +8 dBm Dor DCS 1800 and PCS 1900: +6 dBm (default timeslot 4) |
| {0 1<TBF_STARTING_TIME>} | 0 (starting time not present) |
| {0 1<Measurement Mapping>} | 0 (no measurement mapping) |
| For R99 network simulation: | |
| Additions for Rel.99 | 1 |
| - EGPRS settings flag | 0 not present |
| - Packet Extended TA flag | 0 not present |
| - COMPACT reduced MA | 0 not present |
| spare padding | Spare Padding |

40.2.3.6 PACKET DOWNLINK DUMMY CONTROL BLOCK message:

| | |
|---------------------|-----------------------------|
| MESSAGE_TYPE | 100101 |
| PAGE_MODE | 00 Normal Paging |
| Persistence Level | 1 Persistence Level Present |
| - PERSISTENCE_LEVEL | 0000 Radio Priority 1 |
| - PERSISTENCE_LEVEL | 0000 Radio Priority 2 |
| - PERSISTENCE_LEVEL | 0000 Radio Priority 3 |
| - PERSISTENCE_LEVEL | 0000 Radio Priority 4 |
| Spare padding | Spare Padding |

40.2.3.7 Packet Timeslot Reconfigure

PACKET TIMESLOT RECONFIGURE message (dynamic allocation without assigning a new TBF):

| | |
|---|--|
| MESSAGE_TYPE | 000111 |
| PAGE_MODE | Normal Paging |
| 0<GLOBAL_TFI> | 0 The TFI value of the uplink TBF or downlink TBF which this message applies to (default 00101) |
| CHANNEL_CODING_COMMAND | 0, message escape arbitrarily chosen from valid values (default CS-1) |
| Global Packet Timing Advance | |
| - {0 1<TIMING_ADVANCE_VALUE>} | 1 (timing advance value present) |
| - TIMING_ADVANCE_VALUE | 30 bit periods |
| - {0 1<UPLINK_TIMING_ADVANCE_INDEX> | 0 (no uplink timing advance index) |
| <UPLINK_TIMING_ADVANCE_TIMESLOT_NUMBER> | The MS stops the operation of the continuous timing advance procedure. |
| - {0 1<DOWNLINK_TIMING_ADVANCE_INDEX> | 0 (no downlink timing advance index) |
| <DOWNLINK_TIMING_ADVANCE_TIMESLOT_NUMBER> | The MS stops the operation of the continuous timing advance procedure. |
| R> | |
| DOWNLINK_RLC_MODE | Same as in the Test PDP context used |
| CONTROL_ACK | 0 |
| {0 1<DOWNLINK_TFI_ASSIGNMENT> | 0 |
| {0 1<UPLINK_TFI_ASSIGNMENT> | 0 |
| DOWNLINK_TIMESLOT_ALLOCATION | arbitrarily chosen from valid values (default 00010000) |
| {0 1<Frequency Parameters>} | 0 (use current parameters) |
| Dynamic allocation | 0 |
| - Extended Dynamic Allocation | 0 (Dynamic allocation) |
| - {0 1<P0><PR_MODE>} | 0 |
| - USF_GRANULARITY | 0, one block |
| - {0 1<RLC_DATA_BLOCKS_GRANTED>} | 0 (no RLC_DATA_BLOCKS_GRANTED, open-ended TBF) |
| - {0 1<TBF_STARTING_TIME>} | 0 (no starting time) |
| - | |
| - ALPHA | 1 (Timeslot Allocation with Power Control Parameters) |
| - {0 1<USF_TN0><GAMMA_TN0> | one slot arbitrarily chosen and different from current slot, the following USF_TNx and GAMMA_TNx shall be corresponding to the chosen value, default timeslot 3. |
| - {0 1<USF_TN1><GAMMA_TN1> | 0.5 |
| - {0 1<USF_TN2><GAMMA_TN2> | 0 (timeslot 0 not assigned) |
| - {0 1<USF_TN3><GAMMA_TN3> | 0 (timeslot 1 not assigned) |
| - USF_TN3 | 0 (timeslot 2 not assigned) |
| - GAMMA_TN3 | 1 (timeslot 3 assigned) |
| | arbitrarily chosen and different from current value, default 4 |
| | For GSM 700, T-GSM 810, GSM 850 and GSM 900, +8 dBm |
| | For DCS 1 800, +6 dBm |
| | For PCS 1 900, +6 dBm |
| - {0 1<USF_TN4><GAMMA_TN4> | 0 (timeslot 4 not assigned) |
| - {0 1<USF_TN5><GAMMA_TN5> | 0 (timeslot 5 not assigned) |
| - {0 1<USF_TN6><GAMMA_TN6> | 0 (timeslot 6 not assigned) |
| - {0 1<USF_TN7><GAMMA_TN7> | 0(timeslot 7 not assigned) |
| spare padding | Spare Padding |

For assignment of an uplink TBF while a downlink TBF has been established, the address information should be changed to DOWNLINK_TFI of Global_TFI. UPLINK_TFI_ASSIGNMENT is present.

40.2.4 Default contents of Layer 3 messages

This clause contains the default values of L3 messages, which unless indicated otherwise in clause 40, shall be transmitted by the system simulator and which are required to be received from the MS under test.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "Hex", or a binary value, indicated by a "Binary" is used.

40.2.4.1 ACTIVATE PDP CONTEXT ACCEPT message:

| | |
|--|--|
| Protocol discriminator | 1010 (SM message for GPRS service) |
| Activate PDP context accept message identity | 01000010 |
| Negotiated LLC SAPI | As per corresponding Activate PDP Context Request |
| Negotiated QoS | Minimum |
| Radio priority | Arbitrary chosen |
| Spare half octet | Spare half octet |
| PDP address | Returned only if PDP address from corresponding Activate PDP Context Request is not static |

40.2.4.2 ACTIVATE PDP CONTEXT REJECT message:

| | |
|--|------------------------------------|
| Protocol discriminator | 1010 (SM message for GPRS service) |
| Activate PDP context reject message identity | 01000011 |
| SM cause | Insufficient resources |

40.2.4.3 ATTACH ACCEPT message:

| | |
|--|--|
| Protocol discriminator | 1000 (MM message for GPRS service) |
| Skip indicator | 0000 |
| Attach accept message identity | 00000010 |
| Attach result | Copy back attach type (GPRS attach (MS class C)) |
| Force to standby | not indicated (subject to CR) |
| Periodic RA update timer | timer is deactivated |
| Radio priority for SMS | priority level 3 |
| Spare half octet | Spare half octet |
| Routing area identification | |
| - MCC | 001 (decimal) |
| - MNC | For GSM 900 / DCS 1800: 01 (decimal) For GSM 700 / T-GSM 810 / GSM 850 / PCS 1900: 011 (decimal) |
| - LAC | 0001H |
| - RAC | 05H |
| P-TMSI signature | P-TMSI signature |
| Negotiated READY timer value | 32 seconds |
| Allocated P-TMSI | P-TMSI |
| For R99 network simulation: T3302 value | 0 |

40.2.4.4 ATTACH REJECT message:

| | |
|--|----------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Attach reject message identity | 00000100 |
| GMM cause | Regular deactivation |
| For R99 network simulation: T3302 value | 0 |

40.2.4.5 AUTHENTICATION AND CIPHERING REJECT message:

| | |
|--|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Authentication and ciphering reject message identity | 00010100 |

40.2.4.6 AUTHENTICATION AND CIPHERING REQUEST message:

| | |
|---|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Authentication and ciphering request message identity | 00010010 |
| Ciphering algorithm | Ciphering not used |
| IMEISV request | not requested |
| Force to standby | not indicated |
| A&C reference number | Arbitrary |
| Authentication parameter RAND | Arbitrary |
| GPRS ciphering key sequence number | Arbitrary |

40.2.4.7 CHANNEL RELEASE message:

| | |
|------------------------|--------------------------|
| Protocol Discriminator | 0110 (RR Management). |
| Skip Indicator | 0000 |
| Message Type | 00001101 |
| RR Cause | |
| - RR Cause Value | Normal event. |
| GPRS RESUMPTION IE | Present (see note below) |
| - ACK field | 1 |

NOTE: Only in case the MS performed GPRS suspension procedure prior to the CS session, then the GPRS RESUMPTION IE shall be present in the CHANNEL RELEASE message.

40.2.4.8 DEACTIVATE PDP CONTEXT ACCEPT message:

| | |
|--|------------------------------------|
| Protocol discriminator | 1010 (SM message for GPRS service) |
| Deactivate PDP context accept message identity | 01010100 |

40.2.4.9 DETACH ACCEPT message (for mobile terminated detach):

| | |
|---------------------------------|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Detach request message identity | 00000110 |

40.2.4.10 DETACH REQUEST message (mobile terminated detach):

| | |
|---------------------------------|------------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Detach request message identity | 00000101 |
| Detach type | re-attach not required |
| Force to standby | not indicated |

40.2.4.11 GMM INFORMATION message:

| | |
|----------------------------------|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| GMM information message identity | 00100001 |

40.2.4.12 GMM STATUS message:

| | |
|-----------------------------|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| GMM status message identity | 00100000 |
| GMM cause | Arbitrary |

40.2.4.13 IDENTITY REQUEST message:

| | |
|-----------------------------------|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Identity request message identity | 00010101 |
| Identity type | IMSI |
| Force to standby | not indicated |

40.2.4.14 IMMEDIATE ASSIGNMENT messages

40.2.4.14.1 IMMEDIATE ASSIGNMENT message (Packet Downlink Construction):

| | |
|------------------------------------|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the IA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 11. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111111 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Dedicated mode or TBF | |
| - T/D | Temporary Block Flow |
| - Downlink | 1 Resources assigned in IA Rest Octets |
| - TMA | 0 No meaning |
| Packet Channel Description | Dependant upon the test case. |
| Request Reference | Copy of last received by the SS. |
| Timing Advance | |
| - Timing advance value | 30 bit periods. |
| Mobile Allocation | |
| - Length | 0 |
| Starting Time | Not present. |
| IA rest octets | |
| - | HH |
| - | 01 (Packet Downlink Assignment) |
| - Packet Downlink Assignment | |
| - TLLI | (The value received from MS) |
| - | 1 |
| - TFI_ASSIGNMENT | Any value not used before |
| - RLC_MODE | RLC unacknowledged mode |
| {0 1 < ALPHA > | 1 ALPHA present |
| - ALPHA } | 0.5 |
| - GAMMA | For GSM 700, T-GSM 810, GSM 850 and GSM 900: +8 dBm |
| | For DCS 1 800 and PCS 1 900: +6 dBm |
| - POLLING | 0 No polling |
| - TA_VALID | 1 Timing Advance value in TA IE is valid |
| { 0 1 < TIMING_ADVANCE_INDEX > } | 0 Timing Advance Index not present |
| { 0 1 < TBF_STARTING_TIME > } | 0 TBF Starting Time not present |
| {0 1} | 0 P0, BTS_PWR_CTRL_MODE, PR_MODE not present |
| - spare padding | Spare Padding |

40.2.4.14.2 IMMEDIATE ASSIGNMENT message (Packet Uplink construction):

| | |
|------------------------------------|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the IA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 11. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111111 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Dedicated mode or TBF | |
| - T/D | 1 Temporary Block Flow |
| - Downlink | 0 No meaning |
| - TMA | 0 No meaning |
| Packet Channel Description | Dependant upon the test case. |
| Request Reference | Copy of last received by the SS. |
| Timing Advance | |
| - Timing advance value | 30 bit periods. |
| Mobile Allocation | |
| - Length | 0 |
| Starting Time | Not present. |
| IA rest octets | |
| - | HH |
| - | 00 (Packet Uplink Assignment) |
| - Packet Uplink Assignment | 1 |
| - TFI_ASSIGNMENT | Any value not used before |
| - POLLING | 0 |
| - | 0 Dynamic Allocation |
| - USF | Any value not used before |
| - USF_GRANULARITY | 0 (transmit one RLC block) |
| { 0 1 } | 0 (P0, BTS_PWR_CTRL_MODE , PR_MODE not present) |
| - CHANNEL_CODING_COMMAND | 00 CS-1 shall be used |
| - TLLI_BLOCK_CHANNEL_CODING | 1 MS shall used the coding scheme as specified by CHANNEL_CODING_COMMAND |
| { 0 1 < ALPHA > } | 1 ALPHA present |
| - ALPHA | 0.5 |
| - GAMMA | For GSM 700, T-GSM 810, GSM 850 and GSM 900: +8 dBm |
| { 0 1 < TIMING_ADVANCE_INDEX > } | For DCS 1 800 and PCS 1 900: +6 dBm |
| { 0 1 < TBF_STARTING_TIME > } | 0 Timing Advance Index not present |
| - spare padding | 0 TBF Starting Time not present |
| | Spare Padding |

40.2.4.14.3 IMMEDIATE ASSIGNMENT message (Single block allocation construction):

| | |
|----------------------------|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the IA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 11. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111111 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Dedicated mode or TBF | |
| - T/D | 1 Temporary Block Flow |
| - Downlink | 0 No meaning |
| - TMA | 0 No meaning |
| Packet Channel Description | Dependant upon the test case. |
| Request Reference | Copy of last received by the SS. |
| Timing Advance | |
| - Timing advance value | 30 bit periods. |
| Mobile Allocation | |
| - Length | 0 |
| Starting Time | Not present. |
| IA rest octets | |
| - | HH |
| - | 00 (Packet Uplink Assignment) |
| - Packet Uplink Assignment | 0 |
| {0 1 < ALPHA >} | 1 ALPHA present |
| - ALPHA | 0.5 |
| - GAMMA | For GSM 700, T-GSM 810, GSM 850 and GSM 900: +8 dBm |
| - | For DCS 1 800 and PCS 1 900: +6 dBm |
| - | 01 |
| - TBF_STARTING_TIME | Indicating Absolute Starting Time (calculated by the SS within a range of +50 to + 250 from current frame) |
| { L H } | L (P0, BTS_PWR_CTRL_MODE , PR_MODE not present) |
| - spare padding | Spare Padding |

40.2.4.15 IMMEDIATE ASSIGNMENT EXTENDED message:

| | |
|------------------------|--|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the IAX rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 18. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111001 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Channel Description 1 | Dependant upon the test case. |
| Request Reference 1 | Pertaining to last Channel Request sent by the MS. |
| Timing Advance 1 | |
| - Timing advance value | Dependant upon the test case. |
| Channel Description 2 | Dependant upon the test case. |
| Request Reference 2 | Not pertaining to any Channel Requests sent by the MS. |
| Timing Advance 2 | |
| - Timing advance value | Dependant upon the test case. |
| Mobile Allocation | |
| - Length | 0 |
| Starting Time | Not present. |
| IAX rest octets | All bits set to spare. |

40.2.4.16 IMMEDIATE ASSIGNMENT REJECT message:

| | |
|------------------------|--------------------------------------|
| L2 pseudo length | 19 |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111010 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Request Reference 1 | Copy of last received by the SS. |
| Wait Indication 1 | 0 seconds. |
| Request Reference 2 | Not pertaining to the MS under test. |
| Wait Indication 2 | 0 seconds. |
| Request Reference 3 | Not pertaining to the MS under test. |
| Wait Indication 3 | 0 seconds. |
| Request Reference 4 | Not pertaining to the MS under test. |
| Wait Indication 4 | 0 seconds. |
| IAR rest octets | All bits set to spare. |

40.2.4.17 MODIFY PDP CONTEXT REQUEST message:

| | |
|---|---|
| Protocol discriminator | 1010 (SM message for GPRS service) |
| Modify PDP context request message identity | 01001000 |
| Radio priority | |
| Spare half octet | Spare half octet |
| Requested LLC SAPI | As per corresponding Activate PDP Context Request |
| New QoS | Higher than the minimum QoS |

40.2.4.18 PAGING REQUEST TYPE 1 message:

| | |
|---------------------------------|--|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the P1 rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 9. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00100001 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Channels needed | |
| - first channel | 00 (indicating packet paging). |
| - second channel | 00 (indicating packet paging). |
| Mobile Identity 1 | |
| - odd/even indication | Even. |
| - Type of Identity | P-TMSI. |
| - Identity Digits | P-TMSI previously allocated to MS. |
| Mobile Identity 2 | Not present. |
| P1 rest octets | |
| - {L H<NLN(PCH)>} | L (no Notification List Number(PCH)) |
| - {L H<Priority1>} | L (no priority specified for mobile Id 1) |
| - {L H<Priority2>} | L (no priority specified for mobile Id 2) |
| - Packet Page Indication 1 | Packet Paging |
| - Packet Page Indication 2 | L |
| - {L H<Group Call Information>} | L (no Group call Information) |
| - {L H<NLN status>} | L (no Notification List Number status) |
| - spare padding | Spare Padding |

40.2.4.19 PAGING REQUEST TYPE 2 message:

| | |
|----------------------------|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the P2 rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 11. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00100010 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Channels needed | |
| - first channel | 00 (indicating packet paging). |
| - second channel | 00 (indicating packet paging). |
| Mobile Identity 1 | |
| - TMSI value | P-TMSI previously allocated to MS. |
| Mobile Identity 2 | |
| - TMSI value | P-TMSI not allocated to MS. |
| Mobile Identity 3 | |
| - TMSI value | IMSI not relevant to the MS under test |
| P2 rest octets | |
| - {L H<CN3>} | H (channel needed for mobile Id 3 present) |
| - CN3 | Indicating packet paging |
| - {L H<NLN>} | L (no notification list number) |
| - {L H<Priority1>} | L (no priority specified for mobile Id 1) |
| - {L H<Priority2>} | L (no priority specified for mobile Id 2) |
| - {L H<Priority3>} | L (no priority specified for mobile Id 3) |
| - {L H<NLN status>} | L (no notification list number status) |
| - Packet Page Indication 3 | Packet Paging |
| - spare padding | Spare Padding |

40.2.4.20 PAGING REQUEST TYPE 3 message:

| | |
|------------------------|--|
| L2 pseudo length | 19 |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00100100 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Channels needed | |
| - first channel | 00 (indicating packet paging). |
| - second channel | 00 (indicating packet paging). |
| Mobile identity 1 | |
| - TMSI value | P-TMSI previously allocated to MS. |
| Mobile identity 2 | |
| - TMSI value | P-TMSI not allocated to MS. |
| Mobile identity 3 | |
| - TMSI value | P-TMSI not allocated to MS. |
| Mobile identity 4 | |
| - TMSI value | P-TMSI not allocated to MS. |
| P3 rest octets | |
| - {L H<CN3><CN4>} | H (channel needed for mobile Id 3 and 4 present) |
| - CN3 | Indicating packet paging |
| - CN4 | Indicating packet paging |
| - {L H<NLN>} | L (no notification list number) |
| - {L H<Priority1>} | L (no priority specified for mobile Id 1) |
| - {L H<Priority2>} | L (no priority specified for mobile Id 2) |
| - {L H<Priority3>} | L (no priority specified for mobile Id 3) |
| - {L H<Priority4>} | L (no priority specified for mobile Id 4) |
| - {L H<NLN status>} | L (no notification list number status) |
| - spare padding | Spare Padding |

40.2.4.21 PDCH ASSIGNMENT COMMAND message (downlink):

| Information Element | Value/Remarks |
|--|---|
| Protocol Discriminator | RR Management |
| Skip indicator | 0000 (Binary) |
| Message Type | 00101010 (Binary) |
| Description of the Channel, after time | |
| - Channel Description | |
| - Channel Type and TDMA offset | TCH/F + ACCH's |
| - Timeslot Number | Slot 2 |
| - Training Sequence Code | Same as the BCC |
| - Hopping channel | Single RF channel |
| - ARFCN | Same as BCCH carrier |
| - RR Packet Downlink Assignment | |
| - LENGTH_IN_OCTETS | 400 |
| - MAC_MODE | 00 (Dynamic allocation) |
| - RLC_MODE | 1 (RLC unacknowledged mode) |
| - TIMESLOT_ALLOCATION | Slot 2 |
| - Packet Timing Advance | |
| - { 0 1 <TIMING_ADVANCE_VALUE> } | 1 (TIMING_ADVANCE_VALUE present) |
| - TIMING_ADVANCE_VALUE | 30 bit periods |
| - { 0 1 <TIMING_ADVANCE_INDEX> } | 0 (TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER not present) |
| - { 0 1 <Power Control Parameters> } | 1 (Power Control Parameters present) |
| - ALPHA | 0.5 |
| - { 0 1 <GAMMA_TN0> } | 0 (GAMMA_TN0 not present) |
| - { 0 1 <GAMMA_TN1> } | 0 (GAMMA_TN1 not present) |
| - { 0 1 <GAMMA_TN2> } | 1 (GAMMA_TN2 present) |
| - GAMMA_TN2 | For GSM 700, T-GSM 810, GSM 850 and GSM 900: +8 dBm |
| | For DCS 1 800 and PCS 1 900: +6 dBm |
| - { 0 1 <GAMMA_TN3> } | 0 (GAMMA_TN3 not present) |
| - { 0 1 <GAMMA_TN4> } | 0 (GAMMA_TN4 not present) |
| - { 0 1 <GAMMA_TN5> } | 0 (GAMMA_TN5 not present) |
| - { 0 1 <GAMMA_TN6> } | 0 (GAMMA_TN6 not present) |
| - { 0 1 <GAMMA_TN7> } | 0 (GAMMA_TN7 not present) |
| - { 0 1 <DOWNLINK_TFI_ASSIGNMENT> } | 1 (Assign downlink TFI) |
| - DOWNLINK_TFI_ASSIGNMENT | 00011 (Binary) |
| - { 0 1 <MEASUREMENT_STARTING_TI> } | 0 (No measurement information) |
| - N_SPARE_BITS | Spare padding |

40.2.4.22 REQUEST PDP CONTEXT ACTIVATION message (mobile originated detach):

| | |
|---|------------------------------------|
| Protocol discriminator | 1010 (SM message for GPRS service) |
| Request PDP context activation message identity | 01000100 |
| Offered PDP address | Arbitrarily chosen |

40.2.4.23 ROUTING AREA UPDATE ACCEPT message:

| | |
|---|---|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Routing area update accept message identity | 00001001 |
| Force to standby | not indicated |
| Update result | RA updated |
| Periodic RA update timer | Timer is deactivated |
| Routing area identification | |
| - MCC | 001 (decimal) |
| - MNC | For GSM 900 / DCS 1800: 01 (decimal) |
| | For GSM 700 / T-GSM 810 / GSM 850 / PCS 1900: 011 (decimal) |
| - LAC | 0001H |
| - RAC | 05H |
| For R99 network simulation: T3302 value | 0 |

40.2.4.24 ROUTING AREA UPDATE REJECT message:

| | |
|---|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Routing Area Update reject message identity | 00001011 |
| GMM cause | Congestion |
| Force to standby | Not indicated |
| For R99 network simulation: T3302 value | 0 |

40.2.4.25 RR-CELL CHANGE ORDER message:

| Information Element | Value/Remarks |
|-------------------------|---|
| Protocol Discriminator | RR Management |
| Skip indicator | 0000 (Binary) |
| Message Type | 00001000 (Binary) |
| Cell description | |
| - PLMN colour code, NCC | 1 |
| - BS colour code, BCC | 5 |
| - BCCH ARFCN | As for "Serving cell, PDTCH (PBCCH not present),SDCCH" in section 40.1.1 for the current cell |
| NC mode for target cell | |
| - NC mode | 00 (binary, NC0 mode) |
| Spare half octet | Spare Padding |

40.2.4.26 SM STATUS message:

| Information Element | Value/Remarks |
|----------------------------|------------------------------------|
| Protocol discriminator | 1010 (SM message for GPRS service) |
| SM status message identity | 01010101 |
| SM cause | Arbitrary |

40.2.4.27 DETACH ACCEPT message (for mobile originated detach):

| Information Element | Value/Remarks |
|---------------------------------|---------------------|
| Protocol discriminator | MM message for GPRS |
| Skip indicator | 0000 |
| Detach request message identity | 00000110 |
| Force to Standby | 001 (indicated) |
| Spare half octet | Spare Padding |

40.2.4.28 DTM Assignment Command

| | |
|---|--|
| Protocol discriminator | 0110 |
| Skip Indicator | 0000 |
| Message Type | 01001100 |
| Power Command | 00001010 FPC not in use, Power control level 10 |
| Description of the CS Channel | |
| - Channel Description | |
| - Channel Type and TDMA offset | TCH/F + ACCH's |
| - Timeslot Number | 3 |
| - Training Sequence Code | Same as the BCCH |
| - Hopping channel | Single RF channel |
| - ARFCN | default |
| GPRS broadcast information | |
| - Length in Octets | 5 Octets |
| - GPRS Cell Options | |
| - NMO | 00 Network Mode 1 |
| - T3168 | 011 2 seconds |
| - T3192_VALUE | 010 1.5 seconds |
| - DRX_TIMER_MAX | 000 |
| - ACCESS_BURST_TYPE | 1 11 bit access burst |
| - CONTROL_ACK_TYPE | 1 RLC/MAC Control block |
| - BS_CV_MAX | 0111 |
| -Optional extension information | 0 Extension information not present |
| For R99/Rel 4 network simulation: | |
| Optional extension information | 1 Extension information present |
| - Extension length | R99: 000011 Rel 4: 000101 Rel 6: 000111 |
| - {0 1 <Extension Information>} | 0 EGPRS not supported by the cell. |
| - PFC_FEATURE_MODE | 0 Packet Flow Context Procedures not supported |
| - DTM_SUPPORT | 1.....The cell supports DTM procedures |
| - BSS_PAGING_COORDINATION | 0 Circuit-Switched paging coordination not supported in cell |
| end R99 | |
| For Rel 4 network simulation | |
| - CCN_ACTIVE | 0 CCN is disabled in the cell |
| - NW_EXT_UTBF | 0 Ext UL TBF not supported in the cell |
| For Rel6 network simulation | |
| - MULTIPLE_TBF_CAPABILITY | 0 not supported in the cell |
| - EXT_UTBF_NODATA | 0 not supported in the cell |

40.2.4.32 Assignment Command

| | |
|--|---|
| RR management Protocol Discriminator | 0110 |
| Skip Indicator | 0000 |
| Message Type | 00101110 |
| Description of the First Channel, after time | |
| - Channel Description | |
| - Channel Type and TDMA offset | TCH/F + ACCH's |
| - Timeslot Number | 3 |
| - Training Sequence Code | Same as the BCCH |
| - Hopping channel | Single RF channel |
| - ARFCN | default |
| Power Command | 00001010 FPC not in use, Power control level 10 |

40.2.4.33 Handover Command

| | |
|--|--|
| RR management Protocol Discriminator | 0110 |
| Skip Indicator | 0000 |
| Message Type | 00101011 |
| Cell Description | |
| - Network Colour Code | 1 |
| - Base Station Colour Code | 5 |
| - BCCH Carrier Number | Dependant upon the test case |
| Description of the First Channel, after time | |
| - Channel Description | |
| - Channel Type and TDMA offset | TCH/F + ACCH's |
| - Timeslot Number | Dependant upon the test case |
| - Training Sequence Code | Same as the BCCH |
| - Hopping channel | Single RF channel |
| - ARFCN | Dependant upon the test case |
| Handover Reference | 01010101 |
| Power Command and Access Type | 00001010 Handover access mandatory, FPC not in use, Power control level 10 |
| Synchronization Indication | |
| - Report Observed Time Difference | Shall not be included. |
| - Synchronization Indication | "Non synchronized". |
| - Normal Cell Indication | Ignore out of range timing advance. |

40.2.4.34 Physical Information

| | |
|------------------------|-----------------|
| Protocol Discriminator | 0110 |
| Skip Indicator | 0000 |
| Message Type | 00101101 |
| Timing advance | 30 bit periods. |

40.2.4.35 Connect Acknowledge

| | |
|------------------------|-------------------------------|
| Protocol Discriminator | 0011 |
| Transaction Identifier | |
| TI value | As used in the SETUP message. |
| TI flag | 0 |
| Message Type | 0X001111 |

40.2.4.36 Location Updating Accept

| | |
|---------------------------------------|--|
| Protocol Discriminator | 0101 |
| Skip Indicator | 0000 |
| Location Updating Accept message type | 00000010 |
| Location Area Identification | |
| MCC | 001 (decimal) |
| MNC | 01 (decimal) for GSM 900, DCS 1800 011 (decimal) for GSM 700, T-GSM 810, GSM 850, PCS 1900 |
| LAC | 0001H |

40.2.4.37 System Information Type 6

| | |
|--|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the SI 6 rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 11. 0110 (radio resources management messages) |
| RR management Protocol Discriminator | 0000 |
| Skip Indicator | 00011110 |
| System Information Type 6 Message Type | |
| Cell Identity | Same as the BCCH |
| Location Area Identification | Same as the BCCH |
| Cell Options | Same as the BCCH |
| NCC Permitted | Same as the BCCH |
| SI 6 Rest Octets | For DTM not present case |
| - {L H <PCH and NCH info>} | L (no PCH and NCH info) |
| - {L H <VBS/VGCS options : bit(2)>} | L (no VBS/VGCS options) |
| - < DTM_support : bit == L > | L (DTM not supported) |
| < DTM_support : bit == H | |
| - < Band indicator > | Same as the BCCH |
| - < implicit spare > | 1011 |
| SI 6 Rest Octets | For DTM present case |
| - {L H <PCH and NCH info>} | L (no PCH and NCH info) |
| - {L H <VBS/VGCS options : bit(2)>} | L (no VBS/VGCS options) |
| - < DTM_support : bit == L > | H (DTM supported) |
| < DTM_support : bit == H | |
| - < RAC : bit (8) > | Same as the BCCH |
| - < MAX_LAPDm : bit (3) > | 000 (Any message segmented in up to 5 LAPDm frames) |
| - < Band indicator > | Same as the BCCH |
| - L H < GPRS_MS_TXPWR_MAX_CCH : bit (5)> | H (GPRS_MS_TXPWR_MAX_CCH present) |
| GPRS_MS_TXPWR_MAX_CCH | 01010 |
| - < implicit spare > | 1 |

40.2.4.38 DTM Information

| | |
|--------------------------------------|---|
| RR management Protocol Discriminator | 0110 (radio resources management messages) |
| Skip Indicator | 0000 |
| DTM Information Message Type | 01001101 |
| Routeing Area Identification | Same as the BCCH |
| DTM Information Rest Octets | |
| - < LENGTH_IN_OCTETS : bit(8) > | 00000011 |
| - < MAX_LAPDm : bit (3) > | 000 (Any message segmented in up to 5 LAPDm frames) |
| - < GPRS_MS_TXPWR_MAX_CCH: bit (5) > | arbitrarily chosen |
| - < Cell identity: bit (16) > | Cell Identity of the Serving Cell |

40.2.4.39 PS Handover

| | |
|--------------------------------------|---|
| PAGE_MODE | default |
| Global TFI | TFI of mobile station uplink TBF |
| CONTAINER_ID | 00 PS Handover to A/Gb Mode Payload |
| PS Handover RR Info flag | 00 PS Handover RR Info |
| PS Handover Radio Resources IE | present |
| Handover Reference | 0 |
| ARFCN | default ARFCN for BCCH of cell B |
| SI | 01 Synchronized |
| NCI | 0 |
| BSIC | BSIC of cell B |
| 0 <CCN_ACTIVE> | not present |
| 0 <3G_CCN_ACTIVE> | not present |
| 0 <CCN Support Description> | not present |
| Frequency Parameters | default PDTCH of cell B |
| NETWORK_CONTROL_ORDER | 2 |
| 0 <Global Packet Timing Advance> | not present |
| EXTENDED_DYNAMIC_ALLOCATION | 0 |
| RLC_RESET | 0 |
| 0 <PO> | not present |
| 0 <Uplink Control Timeslot> | not present |
| 0 GPRS mode | Uplink TBF assignment for default PDTCH of cell B |
| 0 <NAS Container for PS Handover IE> | not present |

40.3 Default GPRS Conditions and Message Contents for the Higher Layer Test Cases

This clause details default conditions and messages that shall be used for the higher layer test cases (GPRS Mobility Management, Session Management and SMDCP).

These alternate conditions and messages are derived from the standard defaults via the changes listed in the following sub-clause. They aim to produce default conditions with permitted channel combinations of:

- FCCH+SCH+BCCH+CCCH+SDCCH/4+SACCH/4 (v. from 3GPP TS 05.02 'Permitted Channel Combinations onto a Basic Physical Channel').
- PDTCH+PACCH+PTCCH (xiii. From 3GPP TS 05.02 'Permitted Channel Combinations onto a Basic Physical Channel').

Where values have not been specified the equivalent overall default values should be used. If values need to be removed from the overall defaults then these should be specified as 'OMITTED'.

40.3.1 Default Test Conditions for the Higher Layer Test Cases

| Network dependant parameters | |
|------------------------------|---|
| CCCH_CONF | 1 basic physical channel for CCCH combined with SDCCH |
| BS_AG_BLKRES | 0 blocks reserved |
| BS_PA_MFRMS | 5 multiframes |
| IMSI Attach-detach | IMSI attach / detach not allowed |

40.3.2 Default Message for the Higher Layer Test Cases

40.3.2.1 Default Contents of System Information Messages for the Higher Layer Test Cases

Default Contents of Information Elements in SYSTEM INFORMATION TYPE 1 to 13 Messages Used for the Higher Layer Test Cases.

| | |
|-----------------------------|---|
| Control Channel Description | |
| - BS_AG_BLKRES | 0 blocks reserved for access grant. |
| - CCCH_CONF | 1 basic physical channel used for CCCH, combined with SDCCHs. |
| - BS_PA_MFRMS | 5 multiframe periods for transmission of paging messages. |
| - Attach-Detach allowed | IMSI attach / detach not allowed |

Normal Case

| | |
|-------------------------------|---|
| SI 13 Rest Octets | For PBCCH not present case |
| Routing Area Code(RAC) | 00000101(Binary) |
| SPLIT_PG_CYCLE(SPGC_CCCH_SUP) | Supported |
| PRIORITY_ACCESS_THR | Packet access allowed for priority level 1 to 4 |
| NETWORK_CONTROL_ORDER | Normal MS control, no measurement reporting |
| GPRS Cell Options | |
| Network Mode of Operation | NMO 1 |
| T3168 | 2 seconds |
| T3192 | 1.5 seconds |
| DRX_TIMER_MAX | Non-DRX not supported |
| ACCESS_BURST_TYPE | 11 bits access burst |
| CONTROL_ACK_TYPE | RLC/MAC control block |
| BS_CV_MAX | 7 |
| PAN_DEC | 3 |
| PAN_INC | 3 |
| PAN_MAX | 010(Binary) |
| GPRS Power Control Parameters | |
| ALPHA | |
| T_AVG_W | 12 |
| T_AVG_T | 12 |
| PC_MEAS_CHAN | BCCH |
| N_AVG_I | 7 |
| INT_MEAS_CHANNEL_LIST_AVAIL | Not Available |

40.3.3 Contents Of Packet System Information Messages for the Higher Layer Test Cases

40.3.4 Contents of Layer 2 Messages for the Higher Layer Test Cases

PACKET UPLINK ASSIGNMENT message:

| | |
|-----------------------------|----------------------------------|
| {0 1<Frequency Parameters>} | 1 (Frequency Parameters present) |
| - Frequency Parameters | |
| - ARFCN | ARFCN of the CCCH |
| Single Block Allocation | 01 (Single Block Allocation) |
| - TIMESLOT_NUMBER | 010 |
| | 1 (ALPHA, GAMMA_TN present) |

PACKET DOWNLINK ASSIGNMENT message:

| | |
|-----------------------------|----------------------------------|
| {0 1<Frequency Parameters>} | 1 (Frequency Parameters present) |
| - Frequency Parameters | |
| - ARFCN | ARFCN of the CCCH |

40.3.5 Contents of Layer 3 Messages for the Higher Layer Test Cases

IMMEDIATE ASSIGNMENT message:

| | |
|----------------------------|------------------------|
| Packet Channel Description | |
| - TN | 2 (Chosen arbitrarily) |
| - ARFCN | ARFCN of the CCCH |

IMMEDIATE ASSIGNMENT EXTENDED message:

| | |
|---|---|
| Channel Description 1 - Channel Type and TDMA offset - Timeslot Number - ARFCN | SDCCH/4, with subchannel chosen arbitrarily by the test house. 0 ARFCN of the CCCCH |
|---|---|

40.3.6 Timer tolerance for higher layer test cases

The timers specified in the test cases in section 44, 45 and 46 shall take into account the delay in the establishment of uplink and/or downlink TBF required as per the test sequence. Timer tolerance = Timer Value +/- 10% +/- Delay to establish TBF.

40.4 Macros

40.4.1 Overview

The present document presents macros for GPRS test cases. It is intended to be a working document forming part of the GPRS Test Specifications.

40.4.1.1 Definition

A macro is a name or sentence, possibly followed by an argument list, that is equated to a text to which it is to be expanded, possibly with the substitution of actual arguments.

Macros may be used to simplify the writing and reading of the test cases or to avoid the repetition of common sentences, message contents or message sequences. The macros defined in this subclause can be used throughout the test cases.

The definition of the macros is done in alphabetical order.

40.4.1.2 Syntax

40.4.1.2.1 Message contents

Any macro referencing message contents shall use the following table:

| Macro reference (arguments) | | |
|-----------------------------|---------------------|---------------|
| SI | Information Element | Value/Remarks |
| | | |

The table must contain:

Macro reference: word or sentence that gives the name to the macro. It may include a list of arguments with actual values for some IE's.

SI: the System Information messages whose content is referenced. Several SIs can be referenced in this column. The defined IE value(s) refers to the SI(s) in the same row.

Information Element: IE which value is specified.

Value/Remarks: value and any other comment specific to the IE's. In particular, the mapping between an argument value and its coding shall be specified in this column (see note).

NOTE: If possible, only the meaning of the value will be shown and not the value itself; this avoids updating when the core specifications are modified.

40.4.1.2.2 Message sequence

Any macro referencing message contents shall use the following table:

| Step | Direction | Message | Comments |
|------|-----------|---------------------|-------------------|
| | | { Macro reference } | Macro (arguments) |
| | | | |

The table must contain:

Macro reference: word or sentence that gives the name to the macro. It may include a list of arguments with actual values for some parameters used within the macro.

Step: Number of the message. Letters may be used for general values: the same rules as in 3GPP TS 11.10 apply.

Direction: it must be either:

- "MS → SS": for an uplink message or a macro containing only uplink message(s);
- "SS → MS": for a downlink message or a macro containing only downlink message(s);
- "SS ↔ MS": for a macro containing both uplink and downlink message(s);
- "MS": for an action performed on the mobile side; or
- "SS": for an action performed on the system simulator side.

Message: Message name or macro reference.

Comments: any other comment specific to the message. In particular, value of certain bits/fields of the correspondent message.

The symbol ':' can be used to indicate that the previous and following message or sequence of messages (both previous and following must appear) is sent an unknown number of times, probably referenced with a letter on the 'step' column.

40.4.2 Default message contents

40.4.2.1 GPRS not supported

| SI | Information Element | Value/Remarks |
|------------------------------|---------------------|--------------------|
| SI 3 SI 4 SI 7 SI 8 | GPRS Indicator | GPRS not supported |

40.4.2.2 GPRS supported

| SI | Information Element | Value/Remarks |
|------------------------------|---------------------|----------------|
| SI 3 SI 4 SI 7 SI 8 | GPRS Indicator | GPRS supported |

40.4.2.3 GPRS supported using BCCH

| (P)SI | Information Element | Value/Remarks |
|-------|---------------------|-------------------|
| SI 13 | [Bit after RA_CODE] | PCCCH not present |

40.4.2.4 Max retrans set to {1, 2, 4, 7}

| (P)SI | Information Element | Value/Remarks |
|---|--|--|
| SI 1 SI 2 SI 2bis SI 3 SI 9 | RACH Control Parameters - Max retrans | Maximum 1 retransmission, maximum 2 retransmissions, maximum 4 retransmissions or maximum 7 retransmissions |

40.4.3 Macro message sequences

40.4.3.1 Acknowledged downlink data

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|----------|
| | SS ↔ MS | { Acknowledged downlink data } | Macro |
| 1 | SS → MS | { Downlink data } | Macro |
| 2 | MS → SS | PACKET DOWNLINK ACK/NACK | |

40.4.3.2 Classmark and measurement

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|----------------------------------|
| | MS → SS | { Classmark and measurement } | Macro |
| 1a | MS → SS | MEASUREMENT REPORT | |
| 2a | MS → SS | CLASSMARK CHANGE | Mobile Station Classmark 2 and 3 |
| 1b | MS → SS | CLASSMARK CHANGE | Mobile Station Classmark 2 and 3 |
| 2b | MS → SS | MEASUREMENT REPORT | |
| 3 | MS → SS | { Measurement reporting } | Macro |

40.4.3.3 Downlink data

| Step | Direction | Message | Comments |
|------|-----------|-------------------|--------------------|
| | SS → MS | { Downlink data } | Macro |
| 1 | SS → MS | RLC DOWNLINK DATA | FBI bit set to '0' |
| 2 | SS → MS | RLC DOWNLINK DATA | |
| ⋮ | ⋮ | ⋮ | |
| N | SS → MS | RLC DOWNLINK DATA | $n \geq 1$ |

40.4.3.4 Downlink data transfer

| Step | Direction | Message | Comments |
|-----------------------------------|-----------|----------------------------------|---|
| | SS ↔ MS | { Downlink data transfer } | Macro |
| a. RLC unacknowledged mode | | | |
| 1 | SS → MS | { Downlink data } | Macro |
| 2 | SS → MS | RLC DOWNLINK DATA | FBI bit set to '1' and valid RRBP field |
| 3 | MS → SS | PACKET CONTROL ACKNOWLEDGMENT | In the uplink block specified by the RRBP field |
| b. RLC acknowledged mode | | | |
| 1 | SS ↔ MS | { Acknowledged downlink data } | Macro |
| 2 | SS ↔ MS | { Acknowledged downlink data } | Macro |
| ⋮ | ⋮ | ⋮ | |
| N | SS ↔ MS | { Acknowledged downlink data } | Macro. $n \geq 1$ |
| n+1 | SS → MS | RLC DOWNLINK DATA | |
| n+2 | SS → MS | RLC DOWNLINK DATA | |
| ⋮ | ⋮ | ⋮ | |
| M | SS → MS | RLC DOWNLINK DATA | $m \geq n+1$. FBI bit set to '1' and valid RRBP field |
| m+1 | MS → SS | PACKET DOWNLINK ACK/NACK | In the uplink block specified by the RRBP field. Final Ack Indicator bit set to '1' |

40.4.3.5 Measurement reporting

| Step | Direction | Message | Comments |
|---|-----------|---------------------------|----------|
| | MS → SS | { Measurement reporting } | Macro |
| 1 | MS → SS | MEASUREMENT REPORT | See note |
| 2 | MS → SS | MEASUREMENT REPORT | |
| ⋮ | ⋮ | ⋮ | |
| N | MS → SS | MEASUREMENT REPORT | |
| NOTE: These messages are sent continuously on the ACCH. As no short messages are sent, this sequence should not be temporarily interrupted by other messages also sent on the same channel. However, other messages may be sent on the main DCCH. | | | |

40.4.3.6 Uplink data transfer

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------------|---|
| | MS ↔ SS | { Uplink data transfer } | Macro (arguments: see note 4) |
| 1 | MS → SS | RLC UPLINK DATA | See notes 1 and 2 |
| 2a | MS → SS | RLC UPLINK DATA | See note 3 |
| 2b | SS → MS | PACKET UPLINK ACK/NACK | |
| 3a | MS → SS | RLC UPLINK DATA | |
| 3b | SS → MS | PACKET UPLINK ACK/NACK | |
| ⋮ | ⋮ | ⋮ | $n \geq 1$. CV set to '0' Final Ack Indicator bit = '1' and valid RRBP field In the uplink block specified by the RRBP field |
| N | MS → SS | RLC UPLINK DATA | |
| N+1 | SS → MS | PACKET UPLINK ACK/NACK | |
| N+2 | MS → SS | PACKET CONTROL ACKNOWLEDGEMENT | |

NOTE 1: SI bit set to '0' in all data blocks.

NOTE 2: The SS sends a PACKET UPLINK ACK/NACK message at least every $k-1$ RLC UPLINK DATA messages, being k the window size with a value of 64 blocks.

NOTE 3: The field CV in the RLC UPLINK DATA messages verifies:

$$CV' = \text{round}\left(\frac{TBC - BSN' - 1}{NTS}\right)$$

$$CV = \begin{cases} CV' & x \leq BS_CV_MAX \\ 15 & \text{otherwise} \end{cases}$$

where:

- TBC: total number of RLC data blocks that will be transmitted in the TBF;
- BSN': absolute block sequence number of the RLC data block, from 0 to (TBC - 1);
- NTS: number of timeslots assigned to the uplink TBF, with range 1 to 8;
- the function round() rounds upwards to the nearest integer;
- BS_CV_MAX is a parameter broadcast in the system information;
- the division operation is non-integer and results in zero only for (TBC - BSN' - 1) = 0.

NOTE 4: In the case of Dynamic MAC mode, the macro reference in the corresponding test case may contain a certain frequency (in seconds⁻¹ or frames⁻¹) for the SS to indicate the USF allocated to the mobile so that the MS is allowed to transmit. Otherwise, mobile's USF is indicated in every available block.

40.4.3.7 Uplink dynamic allocation one phase access

| Step | Direction | Message | Comments |
|---|-----------|--|---|
| | | {Uplink dynamic allocation one phase access} | Macro parameters: n: the number of RLC data block to be transferred, USF_GRANULARITY : 1 or 4 blocks, RLC_DATA_BLOCKS_GRANTED : 9-261 (close-end), or absent (open-end) CHANNEL_CODING_COMMAND : CS-1, -2, -3, -4 TLLI_BLOCK_CHANNEL_CODING : CS-1 or as data block REL_OR_ABS_FN : absolute or relative frame number encoding for starting time TBF_STARTING_TIME |
| 0 | MS | | Trigger the MS initiating uplink transfer n octets data according to the test PDP context activated |
| 1 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | uplink dynamic allocation, Sent on AGCH. |
| NOTE: After step 2, the MS is not yet in the packet transfer mode. The contention resolution must be completed. | | | |

40.4.3.8 Uplink dynamic allocation one phase access with contention resolution

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| | | {Uplink dynamic allocation one phase access with contention resolution} | Macro parameters: n: the number of RLC data block to be transferred, USF_GRANULARITY : 1 or 4 blocks, RLC_DATA_BLOCKS_GRANTED : 9-261 (close-end), or absent (open-end) CHANNEL_CODING_COMMAND : CS-1, -2, -3, -4 TLLI_BLOCK_CHANNEL_CODING : CS-1 or as data block REL_OR_ABS_FN : absolute or relative frame number encoding for starting time TBF_STARTING_TIME |
| 0 | MS | | Trigger the MS initiating uplink transfer n octets data according to the test PDP context activated |
| 1 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | uplink dynamic allocation, Sent on AGCH. |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment. |
| 4A | MS -> SS | UPLINK RLC DATA BLOCK | For USF_GRANULARITY = 1, containing TLLI in the RLC/MAC header. |
| 4B1 | MS -> SS | UPLINK RLC DATA BLOCK | For USF_GRANULARITY = 4, containing TLLI in the RLC/MAC header. |
| 4B2 | MS -> SS | UPLINK RLC DATA BLOCK | For USF_GRANULARITY = 4, containing TLLI in the RLC/MAC header. |
| 4B3 | MS -> SS | UPLINK RLC DATA BLOCK | For USF_GRANULARITY = 4, containing TLLI in the RLC/MAC header. |
| 4B4 | MS -> SS | UPLINK RLC DATA BLOCK | For USF_GRANULARITY = 4, containing TLLI in the RLC/MAC header. |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH, containing TLLI received at step 4. |
| 6 | | | Wait for 3 block periods. |

40.4.3.9 Uplink dynamic allocation two phase access

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| | | {Uplink dynamic allocation two phase access} | Macro parameters: n: the number of RLC data block to be transferred, USF_GRANULARITY: 1 or 4 blocks, RLC_DATA_BLOCKS_GRANTED: 9-261 (close-end), or absent (open-end) CHANNEL_CODING_COMMAND: CS-1, -2, -3, -4 TLLI_BLOCK_CHANNEL_CODING: CS-1 or as data block, TBF_STARTING_TIME |
| 0 | MS | | Trigger the MS initiating uplink transfer n octets data according to the test PDP context activated |
| 1 | MS -> SS | CHANNEL REQUEST | Received on RACH. (PBCCH not preset case) |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to order the MS to follow the two phase access procedure. Sent on AGCH (PBCCH not present case) |
| 3 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 2. If the access type of the PACKET RESOURCE REQUEST specifies "Two Phase Access Req" check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used. In case of SMS over GPRS PEAK THROUGHPUT is not checked. |
| 4 | SS -> MS | PACKET UPLINK ASSIGNMENT | uplink dynamic allocation, no starting time (as default, otherwise use TBF_STARTING_TIME), Sent on PACCH of the same PDCH assigned in step 2. |

40.4.3.10 Completion of uplink RLC data block transfer

Steps 1A - 3A are applied for 1 uplink slot with USF granularity 1 block.

Steps 1B, 2B1-2B4 and 3B are applied for 1 uplink slot with USF granularity 4 blocks.

Steps 1C - 5C are applied for 2 uplink slots with USF granularity 1 block.

Steps 6 - 7 are common to the cases A, B and C.

| Step | Direction | Message | Comments |
|------------|----------------------|---|--|
| | | {Completion of uplink RLC data block transfer} | Macro parameters: USF_GRANULARITY : 1 or 4 blocks, the number of slots assigned in the uplink. |
| 1A,1B | SS -> MS | PACKET UPLINK ACK/NACK | The assigned USF assigned to the MS to the MS. |
| 2A | MS -> SS | UPLINK RLC DATA BLOCK | For USF_GRANULARITY = 1 Received on the assigned PDTCH. |
| 2B1 2B2 | MS -> SS MS -> SS | UPLINK RLC DATA BLOCK UPLINK RLC DATA BLOCK or PACKET UPLINK DUMMY CONTROL BLOCK | For USF_GRANULARITY = 4 Received on the assigned PDTCH. Received on the assigned PDTCH |
| 2B3 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET UPLINK DUMMY CONTROL BLOCK | Received on the assigned PDTCH |
| 2B4 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET UPLINK DUMMY CONTROL BLOCK | Received on the assigned PDTCH |
| 3A,3B | | | Repeat the steps 1A and 2A or 1B and 2B1-2B4 until the countdown value CV=0 in step 2A or in one of the steps 2B1 - 2B4. |
| 1C | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH 1, the assigned USF1 addressing the MS. |
| 2C | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH 2 on the same radio block as step 1C, the assigned USF2 addressing the MS. |
| 3C | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH 1. |
| 4C | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH 2. |
| 5C | | | Repeat steps 1C – 4C until the countdown value CV=0 in step 3C or step 4C. |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing valid RRBP. Sent on the PACCH of the assigned PDCH. |
| 7 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH. |

40.4.3.10.1 PACKET UPLINK ACK/NACK message in step 6:

| | |
|---|---|
| Ack/Nack Description - FINAL_ACK_INDICATION - STARTING_SEQUENCE_NUMBER - RECEIVED_BLOCK_BITMAP | 1 (final ACK) No information, ignored No information, ignored |
|---|---|

40.4.3.11 Void

40.4.3.12 Void

40.4.3.13 Void

40.4.3.14 Downlink TBF establishment

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|---|
| | | {Downlink TBF establishment} | Macro parameters: RLC mode TBF_STARTING_TIME |
| 1 | SS -> MS | PAGING REQUEST | 1 st Repeated Page info contains P-TMSI of the MS. Sent on PCH. ACCESS TYPE = " Page Response ". Received on RACH. Random Reference = pertaining to the message received in step 2. Dynamic allocation, Sent on AGCH. Sent on PACCH containing USF assigned to the MS. LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 3. Acknowledge the received RLC data block. Sent on uplink PACCH. Acknowledge the RLC control message. Received on uplink PACCH. Downlink Assignment, TLLI value as received. Sent on PCH. Three macro parameters as assigned in the test cases. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | |
| 7 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |

40.4.3.15 PDP Context Activation

Mobile initiated, for LLC mode unacknowledged:

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|----------|
| | | {PDP Context Activation} | |
| 1 | MS -> SS | Activate PDP Context Request | |
| 2 | SS -> MS | Activate PDP Context Accept | |

Mobile initiated, for LLC mode acknowledged:

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|---|
| | | {PDP Context Activation} | |
| 1 | MS -> SS | Activate PDP Context Request | |
| 2 | SS -> MS | Activate PDP Context Accept | |
| 3 | MS -> SS | SABM | Link establishment (When relevant to the test case, steps 3 and 4 are shown as a part of the test case) |
| 4 | SS -> MS | UA | |

40.4.3.16 PDP Context Deactivation

Mobile initiated:

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|----------|
| | | {PDP Context Deactivation} | |
| 1 | MS -> SS | Deactivate PDP Context Request | |
| 2 | SS -> MS | Deactivate PDP Context Accept | |

Network initiated:

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|----------|
| | | {PDP Context Deactivation} | |
| 1 | SS -> MS | Deactivate PDP Context Request | |
| 2 | MS -> SS | Deactivate PDP Context Accept | |

40.4.3.17 Inter-SGSN Routing Area Update

| Step | Direction | Message | Comments |
|------|-----------|----------------------------------|--|
| | | {Inter-SGSN Routing Area Update} | |
| 1 | | | Cell B is already activated with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 2 | MS -> SS | Routing Area Update Request | The updating type shall be "Combined RA/LA Updating" for Class B mobiles in Network Mode I and "RA Updating" for Class C mobiles supporting GPRS. |
| 3 | SS->MS | XID | XID with RESET |
| 4 | MS->SS | XID | XID response |
| 5 | SS -> MS | Routing Area Update Accept | |
| 6 | MS->SS | Routing Area Update Complete | If the Routing Area Update Accept sent in step 5 contains P-TMSI and/or receive N-PDU or new ready timer value, the MS sends Routing Area Update Complete message. |

NOTE: The MS may send an XID command any time. The SS shall send an XID response accepting the values proposed by the MS.

40.4.3.17a Inter-SGSN Routing Area Update – with PSHO

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| | | {Inter-SGSN Routing Area Update – with PSHO} | Macro parameters: Old XID : to reset with/without the old XID parameters |
| 1 | | | Cell B is already activated with a lower signal strength than cell A. All necessary information on target cell were sent to the MS - Relevant SI (SI1, SI3, SI13) |
| 2 | SS -> MS | PS HANDOVER COMMAND | Sent on the PACCH of the assigned PDCH. See specific message content (NAS Container IE present) |
| | | | The following messages are received on cell B. |

| | | | |
|-----------------------|----------|------------------------------|--|
| 3 | MS->SS | XID | XID response |
| 4 | MS->SS | ROUTING AREA UPDATE REQUEST | |
| 5 Optional Step | SS -> MS | XID | Performed if Old XID set to '0': XID Command – Empty to use default parameter |
| 6 Conditional Step | MS->SS | XID | If step 5 was performed: XID response |
| 7 | | | Cell B power is increased and Cell A power decreased (Cell B power > Cell A power) so the MS will remain on Cell B for the rest of the test. |
| 8 | SS -> MS | ROUTING AREA UPDATE ACCEPT | |
| 9 | MS->SS | ROUTING AREA UPDATE COMPLETE | |

NOTE 1: The MS may send an XID command any time. The SS shall send an XID response accepting the values proposed by the MS.

NOTE 2: The optional Steps 5 and 6 apply if the NAS container IE includes a “Reset without old XID parameters”,

Specific Message Contents

PS HANDOVER COMMAND message in step 2:

| | |
|---|--|
| As default message contents except <NAS Container for PS Handover IE> NAS_CONTAINER_LENGTH NAS_CONTAINER_Data: | Present Set accordingly Type of ciphering algorithm: same as before old XID : Reset with or without the old XID parameters |
|---|--|

40.4.3.18 PDP Context Modification

This procedure is always initiated by the network.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------------|----------|
| | | {PDP Context Modification} | |
| 1 | SS -> MS | Modify PDP Context | |
| 2 | MS -> SS | Modify PDP Context Accept | |

40.4.3.19 Location Update Procedure

This procedure is only initiated by mobile stations that are not operating in class mode C "GPRS".

| Step | Direction | Message | Comments |
|-----------------------|-----------|------------------------------------|---|
| | | {Location Update Procedure} | Macro parameters: MOBILE_IDENTITY |
| 1 | MS -> SS | LOCATION UPDATE REQUEST | |
| 2 | SS -> MS | AUTHENTICATION REQUEST | |
| 3 | MS -> SS | AUTHENTICATION RESPONSE | |
| 4 | SS -> MS | LOCATION UPDATE ACCEPT | |
| A5 (optional step) | MS -> SS | TMSI REALLOCATION COMPLETE | Step executed only when assigned mobile identity is of the type TMSI. |
| 5 | SS -> MS | CHANNEL RELEASE | GPRS RESUMPTION IE is present and the ACK field is set to 1 (see note below). |

NOTE: Only in case the MS performed GPRS suspension procedure prior to the CS session, then the GPRS RESUMPTION IE shall be present in the CHANNEL RELEASE message.

40.4.3.20 MT Call in GPRS cell

This procedure is initiated by the network while the MS is GPRS attached, one cell is active:

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------------|--|
| | | {MT Call while GPRS Attached} | Macro parameters: T : Duration of the call (in seconds) R : Binary acknowledge of a successful resumption of GPRS services |
| 1 | SS -> MS | PAGING REQUEST Type 1 | Page info contains TMSI of the MS, PAGE_MODE = "same as before", sent on downlink PCH |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | MS -> SS | CLASSMARK CHANGE | This step may be optionally performed by a R97 or R98 MS; this step shall be mandatorily performed by R99 and later MS. |
| 6 | MS -> SS | GPRS SUSPENSION REQUEST | |
| 7 | SS -> MS | AUTHENTICATION REQUEST | |
| 8 | MS -> SS | AUTHENTICATION RESPONSE | |
| 9 | SS -> MS | CIPHERING MODE COMMAND | |
| 10 | MS -> SS | CIPHERING MODE COMPLETE | |
| 11 | SS -> MS | SETUP | |
| 12 | MS -> SS | CALL CONFIRMED | |
| 13 | | | If the MS supports immediate connect then branch A applies. If not then branch B applies |

| | | | |
|-----|----------|---------------------|---|
| 14A | MS -> SS | CONNECT | Sent on the old channel |
| 15A | SS -> MS | ASSIGNMENT COMMAND | Timeslot and channel type arbitrarily chosen or PICS dependant |
| 16A | MS -> SS | ASSIGNMENT COMPLETE | Continues at step 20 |
| 14B | SS -> MS | ASSIGNMENT COMMAND | Timeslot and channel type arbitrarily chosen or PICS dependant |
| 15B | MS -> SS | ASSIGNMENT COMPLETE | Sent on the new channel. |
| 16B | MS -> SS | ALERTING | |
| 17B | MS | | An alerting indication as defined in a PICS/PIXIT statement is given by the MS |
| 18B | MS | | The MS is made to accept the call in the way described in a PICS/PIXIT statement |
| 19B | MS -> SS | CONNECT | |
| 20 | SS -> MS | CONNECT ACKNOWLEDGE | |
| 21 | MS | | The appropriate bearer channel is through connected in both directions. The channel is kept open for T seconds |
| 22 | SS -> MS | DISCONNECT | |
| 23 | MS -> SS | RELEASE | |
| 24 | SS -> MS | RELEASE COMPLETE | |
| 25 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. Resumption Field is set to R |

NOTE: In step1x and 10x, the test procedure follows **either** the 'a' branch **or** the 'b' branch.

This procedure is initiated by the network while the MS is GPRS attached, two GPRS cells are active:

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| | | {MT Call while GPRS Attached with Handover} | Macro parameters: T : Duration of the call (in seconds) Target Cell : Second cell for handover R : Binary acknowledge of a successful resumption of GPRS services: |
| 1 | SS -> MS | PAGING REQUEST Type 1 | Page info contains TMSI of the MS, PAGE_MODE = " same as before ", sent on downlink PCH |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | MS -> SS | CLASSMARK CHANGE | This step may be optionally performed by a R97 or R98 MS; this step shall be mandatorily performed by R99 and later MS. |
| 6 | MS -> SS | GPRS SUSPENSION REQUEST | |
| 7 | SS -> MS | AUTHENTICATION REQUEST | |
| 8 | MS -> SS | AUTHENTICATION RESPONSE | |
| 9 | SS -> MS | CIPHERING MODE COMMAND | |
| 10 | MS -> SS | CIPHERING MODE COMPLETE | |
| 11 | SS -> MS | SETUP | |
| 12 | MS -> SS | CALL CONFIRMED | |
| 13 | | | If the MS supports immediate connect then branch A applies. If the MS does not support immediate connect then branch B applies |

| | | | |
|-----|----------|----------------------|--|
| 14A | MS -> SS | CONNECT | Sent on the old channel |
| 14A | SS -> MS | ASSIGNMENT COMMAND | Timeslot and channel type arbitrarily chosen or PICS dependant |
| 16A | MS -> SS | ASSIGNMENT COMPLETE | Continues at step 20 |
| 14B | SS -> MS | ASSIGNMENT COMMAND | Timeslot and channel type arbitrarily chosen or PICS dependant |
| 15B | MS -> SS | ASSIGNMENT COMPLETE | Sent on the new channel. |
| 16B | MS -> SS | ALERTING | |
| 17B | MS | | An alerting indication as defined in a PICS/PIXIT statement is given by the MS |
| 18B | MS | | The MS is made to accept the call in the way described in a PICS/PIXIT statement |
| 19B | MS -> SS | CONNECT | |
| 20 | SS -> MS | CONNECT ACKNOWLEDGE | |
| 21 | MS | | The appropriate bearer channel is through connected in both directions. Wait for T/2 seconds |
| 22 | SS -> MS | HANDOVER COMMAND | Instructs the MS to move to an arbitrarily chosen timeslot on Target Cell |
| 23 | MS -> SS | HANDOVER ACCESS | Repeated on every burst of the uplink main DCCH until reception of the PHYSICAL INFORMATION message. Handover reference as included in the HANDOVER COMMAND. |
| 24 | SS -> MS | PHYSICAL INFORMATION | |
| 25 | MS -> SS | HANDOVER COMPLETE | Sent on the new channel after the establishment of the main signalling link on Target Cell |
| 26 | SS | | Wait for T/2 seconds |
| 27 | SS -> MS | DISCONNECT | |
| 28 | MS -> SS | RELEASE | |
| 29 | SS -> MS | RELEASE COMPLETE | |
| 30 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. Resumption Field is set to R |

NOTE: In step1x and 10x, the test procedure follows **either** the 'a' branch **or** the 'b' branch.

40.4.3.21 Uplink data

| Step | Direction | Message | Comments |
|------|-----------|------------------------|---|
| | MS ↔ SS | { Uplink data } | Macro (arguments: see note 2) |
| 1 | MS → SS | RLC UPLINK DATA | SI bit set to '0' |
| 2a | MS → SS | RLC UPLINK DATA | See notes 1 |
| ⋮ | ⋮ | ⋮ | |
| 2b | SS → MS | PACKET UPLINK ACK/NACK | till the required amount of blocks are received |
| ⋮ | ⋮ | ⋮ | |
| N | MS → SS | RLC UPLINK DATA | |
| N+1 | SS → MS | PACKET UPLINK ACK/NACK | |

NOTE 1: The SS sends a PACKET UPLINK ACK/NACK message at least every k-1 RLC UPLINK DATA messages, being k the window size with a value of 64 blocks.

NOTE 2: In the case of Dynamic MAC mode, the macro reference in the corresponding test case may contain a certain frequency (in seconds⁻¹ or frames⁻¹) for the SS to indicate the USF allocated to the mobile so that the MS is allowed to transmit. Otherwise, mobile's USF is indicated in every available block.

40.4.3.22 Bring MS in the active state (U10)

| Step | Direction | Message | Comments |
|-------------------|-----------|---|---|
| | | {Bring MS in active state (U10)} | Macro parameters: N : Timeslot used for traffic channel |
| 1 | SS -> MS | PAGING REQUEST Type 1 | Page info contains IMSI of the MS, sent on downlink PCH |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause : ANSWER TO PAGING |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 (Optional) | MS -> SS | CLASSMARK CHANGE | This step may be optionally performed by a R97 or R98 MS; this step shall be mandatorily performed by R99 and later MS. |
| | | | If DTM is not supported from the MS or the cell then step 6-1 is performed otherwise step 6-2 |
| 6-1 | MS -> SS | GRPS SUSPENSION REQUEST | |
| 6-2 (Optional) | MS -> SS | GRPS INFORMATION | The MS send this message to indicate Cell Update. This step is optional for MS with release up to Rel5 and it is mandatory for MS with release from Rel6 onwards. |
| 7 | SS -> MS | AUTHENTICATION REQUEST | |
| 8 | MS -> SS | AUTHENTICATION RESPONSE | |
| 9 | SS -> MS | CIPHERING MODE COMMAND | |
| 10 | MS -> SS | CIPHERING MODE COMPLETE | |
| 11 | SS -> MS | SETUP | |
| 12 | MS -> SS | CALL CONFIRMED | |
| 13 | | | If the MS supports immediate connect then branch A applies. If not then branch B applies |
| 14A | MS -> SS | CONNECT | Sent on the old channel |
| 15A | SS -> MS | ASSIGNMENT COMMAND | Timeslot N used, channel type arbitrarily chosen or PICS dependant |
| 16A | MS -> SS | ASSIGNMENT COMPLETE | Continues at step 20 |
| 14B | SS -> MS | ASSIGNMENT COMMAND | Timeslot N used, channel type arbitrarily chosen or PICS dependant |
| 15B | MS -> SS | ASSIGNMENT COMPLETE | Sent on the new channel. |
| 16B | MS -> SS | ALERTING | |
| 17B | MS | | An alerting indication as defined in a PICS/PIXIT statement is given by the MS |
| 18B | MS | | The MS is made to accept the call in the way described in a PICS/PIXIT statement |
| 19B | MS -> SS | CONNECT | |
| 20 | SS -> MS | CONNECT ACKNOWLEDGE | |

40.4.3.23 Completion of uplink RLC data block transfer in extended dynamic mode

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| | | {Completion of uplink RLC data block transfer in extended dynamic mode} | Macro parameters: USF_GRANULARITY : 1 or 4 blocks, the number of timeslots assigned in the uplink, the lowest numbered timeslot in the PDCH allocation. USF1 is assigned on TN1 (the lowest numbered timeslot), USF2 is assigned on TN2 etc. |
| 1 | SS -> MS | PACKET UPLINK ACK/NACK | Assigned USF1 addressing the MS. Sent on the lowest numbered timeslot in the PDCH allocation. |
| 2 | MS -> SS | UPLINK RLC DATA BLOCK | The MS shall send one UPLINK RLC DATA BLOCK on each assigned uplink timeslot within the same TDMA frame. For USF_GRANULARITY=4 this is repeated on four consecutive Radio blocks. |
| 3 | | | Repeat steps 1 and 2 until the countdown value CV=0 is received in step 2. |
| 4 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing valid RRBP. Sent on the lowest numbered timeslot in the PDCH allocation. |
| 5 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the lowest numbered timeslot in the PDCH allocation. |

40.4.3.23.1 PACKET UPLINK ACK/NACK message in step 4:

| | |
|----------------------------|-------------------------|
| Ack/Nack Description | |
| - FINAL_ACK_INDICATION | 1 (final ACK) |
| - STARTING_SEQUENCE_NUMBER | No information, ignored |
| - RECEIVED_BLOCK_BITMAP | No information, ignored |

40.5 Test PDP contexts

The following table defines Test PDP contexts required for test cases using packet services (e.g. GPRS, EGPRS, DTM). Test PDP context3 is the default Test PDP context which is used in the test cases where no particular Test PDP contexts are specified. Compression is always turned off if nothing else is stated explicitly in the test case.

If the MS does not include any PDP address, dynamic PDP address shall be assigned by the SS. The MS with Rel-8 behaviour shall not include the PDP address and the PDP address allocation is dynamic always.

Table 40.5 Test PDP contexts

| Maximum bit rate for uplink (extended) | 0 | 0 | 0 |
| Guaranteed bit rate for uplink (extended) | 0 | 0 | 0 |

NOTE 1: For compatibility purposes when performing R98 tests or earlier it is still allowed for the MS to request Precedence Class 2 (normal) and Mean Throughput Class 16 (10 000 000 octets/h).

NOTE 2: From Rel-8 onwards MS is not expected to support QoS parameter Reliability Class=2. therefore Test PDP contexts 11, 12 and 13 are not required for test cases using packet services.

41 GPRS Paging, TBF establishment/release and DCCH related procedures

41.1 RR / Paging

The paging procedure is used by the network to cause the MS to establish either an RR connection for circuit switched services or a downlink GPRS packet transfer. Normally the MS listens to its paging sub-channel when DRX is used, but this can be modified by the use of different page mode. The correct monitoring of its paging sub-channel on PCCCH or CCCH in different control channel configurations and correct implementation of the paging procedure in the MS are essential. They are the test objectives of this subclause.

41.1.1 Void

41.1.2 Void

41.1.3 Void

41.1.4 Void

41.1.5 RR / Paging / on CCCH for GPRS service

41.1.5.1 RR / Paging / on CCCH for GPRS service / normal paging

41.1.5.1.1 RR / Paging / on CCCH for GPRS service / normal paging with P-TMSI successful

41.1.5.1.1.1 Conformance requirements

1. The network initiates the paging procedure by sending a paging request message on an appropriate paging sub-channel on CCCH. Paging initiation using a paging sub-channel on CCCH is used when sending paging information to a mobile station and PCCCH is not present in the cell.
2. The mobile station in packet idle mode is required to receive and analyse the paging messages and immediate assignment messages sent on the paging sub-channels on CCCH corresponding to the paging groups determined for it in packet idle mode.
3. A PAGING REQUEST message may include more than one mobile station identification.
4. In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the P-TMSI (GPRS TMSI) or its IMSI. If the mobile station is identified by the P-TMSI, it shall indicate the receipt of a paging request to the MM sub-layer.

If the mobile station identified by its IMSI, it shall parse the message for a corresponding *Packet Page Indication* field:

- if the *Packet Page Indication* field indicates a paging procedure for RR connection establishment, or the field is not present in the message, the mobile station shall initiate the immediate assignment procedure;
- if the *Packet Page Indication* field indicates a packet paging procedure, the mobile station shall indicate the receipt of a paging request to the MM sub-layer.

5. The mobile station initiates the packet access procedure by scheduling the sending of CHANNEL REQUEST messages on RACH.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.3.2.1.1, 3.5.1.1, 3.5.1.2 and 3.5.2.1.

3GPP TS 05.02, subclause 6.5.6.

41.1.5.1.1.2 Test purpose

1. To verify that the MS in packet idle mode, GPRS attached state, is able to determine its CCCH group and PAGING group and that the MS responds correctly with CHANNEL REQUEST on RACH with cause value of 'packet access' upon receipt of a PAGING REQUEST TYPE 1 message for packet access with paging mode set to normal.
2. To verify that the MS is able to respond to PAGING REQUEST TYPE 1 for packet access when the MS is addressed with its P-TMSI, but another field of the paging message contains an IMSI different from that of the MS.
3. To verify that the MS is able to respond to PAGING REQUEST TYPE 2 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain a TMSI and an IMSI different from that of the MS.
4. To verify that the MS is able to respond to PAGING REQUEST TYPE 3 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain TMSIs different from that of the MS.

41.1.5.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH absent, Max-Retrans = 2, BS_AG_BLK_RES = 2, BS_PA_MFRMS = 6, SPLIT_PG_CYCLE is supported on CCCH in the cell.

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated, SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. for a R99 or later MS the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- MS operation mode A (TSPC_operation_mode_A)
- MS operation mode B (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The test is repeated three times. Each time the MS is paged for the packet paging procedure through a different paging request type message. After receiving a CHANNEL REQUEST with the establishment cause 'one phase access', an open-end TBF is assigned. A USF is assigned to the MS to enable it to transfer an uplink RLC data block. The received data block is acknowledged by the SS with , Final Ack Indicator = '1' , a valid RRBP. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test sequence is repeated for $k = 1 \dots 3$.

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1A | SS -> MS | PAGING REQUEST TYPE 1 | k=1 1 st Mobile Identity contains P-TMSI of the MS, 2 nd Mobile Identity not present. Sent on PCH. |
| 1B | SS -> MS | PAGING REQUEST TYPE 2 | k=2 1 st Mobile Identity contains P-TMSI of the MS, the other two Mobile Identities not addressing the MS. Sent on PCH. |
| 1C | SS -> MS | PAGING REQUEST TYPE 3 | k=3 1 st Mobile Identity contains P-TMSI of the MS, the remaining Mobile Identities not addressing the MS. Sent on PCH. |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment Cause = "one phase access", received on RACH. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 2. Uplink assignment, sent on AGCH. |
| 5 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH containing USF assigned to the MS. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK (not L3 Message) | LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 4. |
| 7 | SS -> MS | PACKET UPLINK ACK/NACK | acknowledge the received RLC data block, Final Ack Indicator = '1', a valid RRBP. Sent on PACCH. |
| 8 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | acknowledge the RLC control message. Received on PACCH. |

41.1.5.1.2 RR / Paging / on CCCH for GPRS service / normal paging with IMSI successful

41.1.5.1.2.1 Conformance requirements

1. If the MS was paged by the network with the IMSI (for GPRS service), the MS shall delete any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number stored. The MS shall then perform a GPRS attach or combined GPRS attach procedure.

References

3GPPTS 04.08 / 3GPP TS 24.008, subclause 4.7.9.1.2.

41.1.5.1.2.2 Test purpose

To verify that the MS is able to respond to PAGING REQUEST TYPE 1 when the MS is addressed with its IMSI with *Packet Page Indication* set to packet paging procedure, and that the MS then performs a GPRS attach or combined GPRS attach procedure.

41.1.5.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH absent, Max-Retrans = 2, BS_AG_BLK_RES = 2, BS_PA_MFRMS = 9.

Mobile Station:

The MS is in GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated, SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. for a R99 or later MS the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- MS operation mode A Yes/No (TSPC_operation_mode_A)
- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The MS is paged on PCH with IMSI for packet paging procedure. After receiving the CHANNEL REQUEST from the MS a TBF is assigned. The MS sends an LLC PDU containing TLLI in the RLC/MAC header and ATTACH REQUEST, implicitly indicating a paging response. The SS verifies the completeness of ATTACH REQUEST and acknowledges the received RLC data blocks with a valid RRBP and Final Ack indicator = '1'.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | 1 st Mobile Identity contains IMSI of the MS, second Mobile Identity not present. Packet page indication indicates packet paging procedure. Sent on PCH. |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment Cause = = "one phase packet access". Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | For uplink TBF, one phase access. |
| 4 | MS -> SS | UPLINK RLC DATA BLOCK (ATTACH REQUEST) | LLC PDU containing a TLLI and the first part of ATTACH REQUEST, the implicit paging response to step 1. Received on the uplink PDTCH assigned in step 3. |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Contention resolution, acknowledge the received RLC data blocks, No USF assigned. Sent on PACCH. |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | Repeat step 6 & 7 until the CV = 0 to receive the complete ATTACH REQUEST message |
| 8 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data blocks. Final Ack Indicator = 1 containing valid RRBP sent on PACCH |
| 9 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | acknowledge the RLC control messages. Received on PACCH. |

Specific Message Contents

Contents for SYSTEM INFORMATION:

41.1.5.1.3 RR / Paging / on CCCH for GPRS service / normal paging with P-TMSI ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on CCCH which is shared by all MS in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of CCCH and will, therefore, cause an unacceptable degradation of the both GSM GPRS and circuit-switched services to other users of the mobile stations.

41.1.5.1.3.1 Conformance requirements

In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the TMSI (GPRS TMSI) or its IMSI. A PAGING REQUEST message may include more than one mobile station identification.

References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.3.2.1.1 and 3.5.1.1.

41.1.5.1.3.2 Test purpose

To verify that the MS ignores a PAGING REQUEST TYPE 1, 2 messages where both P-TMSI and IMSI do not address the MS although the paging message is sent on the CCCH to which the CCCH_GROUP belongs.

41.1.5.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH absent, Max-Retrans = 2, BS_AG_BLK_RES = 2, BS_PA_MFRMS = 7, .

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated and SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. for a R99 or later MS the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- MS operation mode A Yes/No (TSPC_operation_mode_A)
- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The test is repeated twice. Each time a different paging message not addressing the MS is sent on the PCH belonging to the MS. It is checked that the no access attempt is made by the MS for 5 s.

The MS is then paged for packet paging. The MS attempts a random access for GPRS Attach and is allowed to complete the procedure.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test steps 1 - 2 is repeated for k = 1 .. 2.

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1A | SS -> MS | PAGING REQUEST TYPE 1 | k=1, The two packet page indications are set to packet paging procedure. 1st Mobile Identity contains P-TMSI, 2nd Mobile Identity contains IMSI, both Identities do not address the MS. Sent on PCH belonging to the MS. |
| 1B | SS -> MS | PAGING REQUEST TYPE 2 | k=2, Packet page indication 3 is set to packet paging procedure. 1st Mobile Identity contains P-TMSI, 2nd Mobile Identity contains P-TMSI, 3rd Identity contains IMSI, all identities not addressing the MS. Sent on PCH belonging to the MS. |
| 2 | SS | | Check that no CHANNEL REQUEST is sent from the MS for 5s. |
| 3 | SS -> MS | PAGING REQUEST TYPE 1 | 1 st Mobile Identity contains IMSI of the MS, second Mobile Identity not present. Packet page indication indicates packet paging procedure. Sent on PCH belonging to the MS. |
| 4 | MS -> SS | CHANNEL REQUEST | Establishment Cause "one phase packet access". Received on RACH. |
| 5 | SS<->MS | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach. |

Specific Message Contents

PAGING REQUEST TYPE 1 message:

41.1.5.2 RR / Paging / on CCCH for GPRS service / extended paging

41.1.5.2.1 RR / Paging / on CCCH for GPRS service / extended paging with P-TMSI successful

41.1.5.2.1.1 Conformance requirements

The paging and immediate assignment type messages contain a page mode information element. This information element controls possible additional requirements on mobile stations belonging to the paging subgroup corresponding to the paging subchannel the message was sent on. This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

b) extended paging: the mobile station is required in addition to receive and analyse the next but one message on the PCH.

References

3GPP TS 04.18/44.018, subclauses 3.3.2.1.1, 3.5.2.1.2, 9.1.18, 9.1.19 and 9.1.20.

41.1.5.2.1.2 Test purpose

1. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 1 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
2. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 2 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
3. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 3 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
4. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT on the paging sub-channel corresponding to the MS identity.
5. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT EXTENDED on the paging sub-channel corresponding to the MS identity.
6. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT REJECT on the paging sub-channel corresponding to the MS identity.

41.1.5.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH absent, Max-Retrans = 2, CCCH_CONF = 1 basic physical channel used for CCCH with non-combined SDCCH, BS_AG_BLKs_RES = 3, BS_PA_MFRMS = 8.

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated and SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. for a R99 or later MS the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- MS operation mode A Yes/No (TSPC_operation_mode_A)
- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The test is repeated 6 times. Each time a different downlink message is sent on PCH or AGCH for setting the page mode to extended paging. The MS is paged on the next but one page block for the packet paging procedure. The MS starts a random accesses which are rejected by the SS.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test sequence is repeated for $k = 1 \dots 6$.

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1A | SS -> MS | PAGING REQUEST TYPE 1 | k=1, All mobile Identities do not address the MS. Page mode is set to "extended paging". Packet page indication indicates packet paging procedure. Sent on PCH. |
| 1B | SS -> MS | PAGING REQUEST TYPE 2 | k=2, All mobile Identities do not address the MS. Page mode is set to "extended paging". Packet page indication indicates packet paging procedure. Sent on PCH. |
| 1C | SS -> MS | PAGING REQUEST TYPE 3 | k=3, All mobile Identities do not address the MS. Page mode is set to "extended paging". Channel Needed IE's are coded with 00. Sent on PCH. |
| 1D | SS -> MS | IMMEDIATE ASSIGNMENT | k=4, Page mode is set to "extended paging". Request Reference does not address any request references sent by the MS in previous test steps. Sent on paging channel (PCH). |
| 1E | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Page mode is set to "extended paging". Request Reference does not address any request references sent by the MS in previous test steps. Sent on paging channel (PCH). |
| 1F | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | k=6, Page mode is set to "extended paging". Request Reference does not address any request references sent by the MS in previous test steps. Sent on paging channel (PCH). |
| 2 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Identity contains P-TMSI of the MS, 2nd Mobile Identity not present. Page mode is set to "normal paging". Packet page indication indicates packet paging procedure. Sent on the next but one subblock on the same CCCH as previous paging message. |
| 3 | MS -> SS | CHANNEL REQUEST | Establishment Cause = "One phase access". Received on RACH. |
| 4 | MS -> SS | CHANNEL REQUEST | Establishment Cause "One phase access". Received on RACH. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Request Reference = pertaining to the message received in step 4. Page mode is set to "normal paging". Sent on AGCH. |

41.1.5.3 RR / Paging / on CCCH for GPRS service / paging reorganisation

41.1.5.3.1 Conformance requirements

The paging and immediate assignment type messages contain a page mode information element. This information element controls possible additional requirements on mobile stations belonging to the paging subgroup corresponding to the paging subchannel the message was sent on. This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

c) paging reorganization: The mobile station shall receive all messages on the CCCH regardless of the BS-AG-BLKS-RES setting. It is required to receive all BCCH messages. When the mobile station receives the next message to its (possibly new) paging subgroup the subsequent action is defined in the page mode information element in that message.

References

3GPP TS 04.18/44.018, subclause 3.3.2.1.1, 3.5.2.1.2.

3GPP TS 04.60/44.060, subclause 7.1.2.1

41.1.5.3.2 Test purpose

1. To verify that the MS, after reception of a message with page mode set to "paging reorganisation", answers to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. To test that the MS correctly determines its new paging sub-channel when the number of reserved blocks, BS_AG_BLKS_RES, and the number of 51-multiframes between transmissions of paging messages for mobile stations of the same paging group BS_PA_MFRMS are changed.
3. To test that the MS correctly determines its new paging sub-channel when the number of basic physical channels for CCCH is changed.

41.1.5.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH absent, Max-Retrans = 2, CCCH_CONF = 0 (1 basic physical channel used for CCCH with non-combined SDCCH), BS_AG_BLKS_RES = 3, BS_PA_MFRMS = 6. SPGC_CCCH_SUP = 0 (SPLIT_PG_CYCLE is not supported on CCCH in the cell).

Mobile Station:

The MS is GPRS attached with a TMSI (only for MS operation mode A or MS operation mode B) and a P-TMSI allocated and SPLIT PG CYCLE negotiated. The mobile station is in packet idle mode and has left the Transfer non-DRX mode period, i.e. for a R99 or later MS the system simulator shall wait for a period equivalent to the value of the NON_DRX_TIMER parameter before sending the first paging message to the MS.

Specific PICS Statements

- MS operation mode A Yes/No (TSPC_operation_mode_A)
- MS operation mode B Yes/No (TSPC_operation_mode_B)

PIXIT Statements

-

Test Procedure

The page mode is set to paging reorganisation. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 1 which is sent before the MS's original paging sub-channel re-occurs, but later than the next paging block of that CCCH. The MS starts the random access. The access attempt is rejected.

The SS changes the CCCH configuration with BS_AG_BLK_RES=2 and BS_PA_MFRMS=5 and waits two SI13 repeat periods, and then sets the page mode to Normal Paging. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 2 sent on the new paging sub-channel. The MS starts the random access. The access attempt is rejected via IMMEDIATE ASSIGNMENT REJECT'. PAGING REQUEST TYPE 1 with paging fill frame and page mode set to "paging reorganisation" is sent.

Two additional CCCHs are activated by the SS. The same test procedure as above is repeated.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Page mode set to "paging reorganisation" |
| 2 | SS -> MS | PAGING REQUEST TYPE 1 | Sent before the MS's original paging sub-channel re-occurs, but later than the next paging block of that CCCH. Page mode set to "normal paging", for packet paging procedure. |
| 3 | MS -> SS | CHANNEL REQUEST | Establishment Cause = "one phase access", received on RACH. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Request Reference = pertaining to the message received in step 3. Sent on AGCH. |
| 5 | SS | PAGING REQUEST TYPE 1 | Sent on the MS's paging sub-channel. Paging fill frame and page mode set to "paging reorganisation". All L3 messages sent on any paging sub-channel are paging fill frame specify Paging Reorganisation. |
| 6 | SS | | Set BS_AG_BLK_RES=2 and BS_PA_MFRMS=5 in SI's. The value of the BCCH_CHANGE_MARK in the SI13 is altered to indicate the changes. SI_CHANGE_FIELD = 3. |
| 7 | SS | | Wait two SI13 repeat periods. All L3 messages sent on any paging sub-channel are paging fill frame specify Normal Paging. Wait for the time required for BS_PA_MFRMS Multi-Frames. |
| 8 | SS -> MS | PAGING REQUEST TYPE 2 | 1 st Mobile Identity contains P-TMSI of the MS. 2 nd Mobile Identity contains P-TMSI, 3 rd Identity contains IMSI, the last two identities not addressing the MS. Packet page indication indicates packet paging procedure. Page mode = "same as before", sent on the new PCH belonging to the MS. |
| 9 | MS -> SS | CHANNEL REQUEST | Establishment Cause = "one phase access". Received on RACH. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Request Reference = pertaining to the message received in step 9. |
| 11 | SS | PAGING REQUEST TYPE 1 | Sent on the MS's paging sub-channel. Paging fill frame and page mode set to "paging reorganisation". All L3 messages sent on any paging sub-channel are paging fill frame specify Paging Reorganisation. |
| 12 | SS | | Reconfigure the SS channels so that additional two CCCH's are set on slot 2 and slot 4, Set CCCH_CONF = 4 in SI's. The value of the BCCH_CHANGE_MARK in the SI13 is altered to indicate the changes. SI_CHANGE_FIELD = 3. |
| 13 | SS | | Wait two SI13 repeat periods. All L3 messages sent on any paging sub-channel are paging fill frame specify Normal Paging. Wait for the time required for BS_PA_MFRMS Multi-Frames. |
| 14 | SS -> MS | PAGING REQUEST TYPE 2 | 1 st Mobile Identity contains P-TMSI of the MS. 2 nd Mobile Identity contains P-TMSI, 3 rd Identity contains IMSI, the last two identities not addressing the MS. Packet page indication indicates packet paging procedure. Page mode = "same as before", sent on the new PCH belonging to the MS. |
| 15 | MS -> SS | CHANNEL REQUEST | Establishment Cause = "one phase access". Received on RACH. |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Request Reference = pertaining to the message received in step 15. Sent on AGCH. |

41.1.6 Void

41.2 RR procedures on CCCH related to temporary block flow establishment

This clause presents tests for "RR procedures on CCCH related to temporary block flow establishment" which are specified in 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.5.

Default conditions

The SS default conditions simulate one cell with default settings as defined in the GPRS general defaults section, except:

- SI 13 Rest Octets contains no PCCCH description (PCCCH is not supported by the network).

The MS default initial condition is GPRS attached. Unless otherwise stated, no PDP context is required.

Default message contents and signaling macros are also defined in the GPRS general defaults section, except for those messages and macros specified at the end of this clause.

41.2.1 Permission to access the network

41.2.1.1 Permission to access the network / priority classes

41.2.1.1.1 Conformance requirements

Access to the network is allowed:

- if packet access is allowed in the cell for the priority class associated with the packet transfer, as indicated by the PRIORITY_ACCESS_THR parameter broadcast in SI 13 message.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.1.

41.2.1.1.2 Test purpose

To verify that the MS accesses the network only if packet access is allowed in the cell for the priority class associated with the packet transfer.

41.2.1.1.3 Method of test

Initial conditions

System Simulator:

Network Mode of Operation is set to NMO II.

Mobile Station:

For PRIORITY_ACCESS_THR >2 MS is GPRS attached, a PDP context has been established (with priority level as specified below).

For PRIORITY_ACCESS_THR <=2 MS is Idle Updated.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

Specific test parameters:

PRIORITY_ACCESS_THR is chosen from {0, 1, 2, 3, 4, 5, 6, 7}.

priority level is chosen from {1, 2, 3, 4}.

Expected sequence

For PRIORITY_ACCESS_THR >2.

| Step | Direction | Message | Comments |
|------|-----------|---------|--------------------------------------|
| 1 | | | The MS is triggered to transfer data |
| 2 | SS | | See verification |

Verification:

The SS verifies for 10 s that MS access (or not) to the network according to the PRIORITY_ACCESS_THR values below.

- 0 1 1 packet access is allowed for priority level 1;
- 1 0 0 packet access is allowed for priority level 1 to 2;
- 1 0 1 packet access is allowed for priority level 1 to 3;
- 1 1 0 packet access is allowed for priority level 1 to 4;
- 1 1 1 spare, shall be interpreted as(packet access allowed).

For PRIORITY_ACCESS_THR <=2.

| Step | Direction | Message | Comments |
|------|-----------|---------|---|
| 1 | | | The MS is triggered to do Attach procedure |
| 2 | SS | | The SS verifies for 10 s that MS does not try to access to the network. |

41.2.2 Initiation of the packet access procedure

41.2.2.1 Initiation of the packet access procedure / establishment causes

41.2.2.1.1 Conformance requirements

The CHANNEL REQUEST messages are sent on RACH and contain the parameters:

- an establishment cause which indicates packet access, and as applicable, a request for one phase packet access or single block packet access;
- a random reference which is drawn randomly from a uniform probability distribution for every new transmission.

If the requested RLC mode is *unacknowledged mode*, the mobile station shall request a single block packet access and attempt a two phase packet access.

If the purpose of the packet access procedure is to send a Page Response, Cell Update, for a GPRS Mobility Management or a GPRS Session Management procedure the mobile station shall request a one phase packet access.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2

Justification

41.2.2.1.2 Test purpose

To verify that the CHANNEL REQUEST message sent by the MS contains the correct establishment cause when initiating a packet access procedure.

41.2.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate a GPRS attach procedure. The SS verifies that the MS attempts a one phase packet access.

APDP context for RLC unacknowledged is established and the MS is triggered to transfer RLC data blocks. The SS verifies that the MS correctly sets the Establishment Cause in the CHANNEL REQUEST message.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | MS | | MS is switched on and triggered to initiate a GPRS attach procedure. |
| 2 | MS -> SS | CHANNEL REQUEST | SS verifies that Establishment Cause is 'one phase'. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | SS <-> MS | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach. |
| 5 | MS<->SS | | A PDP context is established for RLC unacknowledged data transfer. |
| 6 | MS | | MS is triggered to transfer data. |
| 7 | MS -> SS | CHANNEL REQUEST | SS verifies that Establishment Cause is 'single block access'. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

41.2.2.2 Random references for single block packet access

41.2.2.2.1 Conformance requirements

The random reference in the CHANNEL REQUEST messages shall be randomly drawn from a uniform probability distribution for every new transmission.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2.

41.2.2.2.2 Test purpose

To verify that the MS produces different Random References when accessing the network for single block access.

41.2.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX_RETRANS is set to 4 retransmissions.

Mobile Station:

MS is GPRS attached, a PDP context in RLC unacknowledged mode has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data, it shall attempt a single block packet access (3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2). The SS does not answer to the access bursts but stores N (= 80) Random References and verifies that the MS uses all possible values (0 ... 7) in its Random Reference.

Justification

The length of the Random Reference is 3 bits for single block packet access (3GPP TS 04.08 / 3GPP TS 44.018 / table 9.9). This test verifies that the MS uses all values (0 ... 7) in its Random Reference.

The probability that in a sequence of N samples one of the possible value does not appear is $8^{-(7/8)^{*}N}$ for large N.

NOTE: The number of samples N has been computed such that the probability of refusing a correct MS is less than 0,02 %.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|---------------------|-----------|-----------------|--|
| 1 | MS | | MS is triggered to transfer data. |
| 2 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 3 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 4 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 5 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 6 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 7 | SS | | SS waits 5.5 seconds (Maximum value of T3146 is 5 seconds) Note: Test Case executes Step 8A or 8B depending on MS behaviour. If any CHANNEL REQUEST is received during the wait time, SS continues with Step 8A else SS continues with Step 8B |
| 8A (Conditional) | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References and repeats the Steps 3 to 7. |
| 8B (Conditional) | SS | | Repeat Steps 1 to 7 |
| 9 | MS<->SS | | Steps 1 to 8 are repeated until 80 CHANNEL REQUEST messages have been received |
| 10 | SS | | SS verifies that all Request Reference values (0 to 7) come out in the stored samples. |

41.2.2.3 Random references for one phase packet access

41.2.2.3.1 Conformance requirements

The random reference in the CHANNEL REQUEST messages shall be randomly drawn from a uniform probability distribution for every new transmission.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2.

41.2.2.3.2 Test purpose

To verify that the MS produces different Random References when accessing the network for one phase access.

41.2.2.3.3 Method of test

Initial conditions

System Simulator: default settings except:

- Parameter MAX_RETRANS is set to 4 retransmissions.
- T3302 = 1 minute, T3212 sent in SI3 is set to 6 minutes.

Mobile Station:

Note: MS may be brought into the required condition by causing it to be triggered to perform GPRS attach and the SS responding with ATTACH REJECT in which T3302 is set to 1 minute and the cause set to "MSC temporarily not reachable". MS treats this as a temporary failure and enters the test sequence by restarting the attach procedure.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS shall attempt a one phase packet access (3GPP TS 04.08 / 3GPP TS TS 44.018, subclause 3.5.2.1.2). The SS does not answer to the access bursts but stores N (= 80) Random References and verifies that the MS uses all possible values (0 ... 3) in its Random Reference and does not use value '111' as a value of the 3 least significant bits for channel request octet (see 3GPP TS 04.08 / 3GPP TS 44.018 / table 9.9).

Justification

Possible values for Random Reference for one phase packet access are 0 to 3 (value '111' is not allowed). This test verifies that the MS uses all values (0 ... 3) in its Random Reference.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| | MS | | MS re-starts the Attach Procedure. |
| 1 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 2 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 3 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 4 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| 5 | MS -> SS | CHANNEL REQUEST | SS stores the value of Request References |
| | | | Step 6 is optional and depends on the mobile implementation. |
| 6 | | {Location Update Procedure} | Macro for Location Updating. |
| 7 | MS<->SS | | Steps 1 to 6 are repeated N/5 = 16 times |
| 8 | SS | | SS verifies that all Random Reference values (Random Reference field is filled with "x") in the range 0 to 3 come out in the stored samples and that value '111' is not used as a value of the 3 least significant bits for channel request octet. |

The Channel Request message is coded as follows (reference 3GPP TS 04.08 / 3GPP TS 44.018 table 9.1.8.1):

| | |
|----------------------------------|---|
| 011110xx 01111x0x 01111xx0 | One phase packet access with request for single timeslot uplink transmission; one PDCH is needed. |
|----------------------------------|---|

41.2.2.4 Initiation of the packet access procedure / timer T3146

41.2.2.4.1 Conformance requirements

Having sent the maximum number of CHANNEL REQUEST messages, the mobile station starts timer T3146. At expiry of timer T3146, the packet access procedure is aborted and a packet access failure is indicated to upper layers.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2.

41.2.2.4.2 Test purpose

To verify that the MS waits T3146 seconds before aborting the packet access procedure.

41.2.2.4.3 Method of test

Initial conditions

System Simulator: Default settings except:

System Information parameter MAX_RETRANS is set to 2 retransmissions.

CCCH non-combined with SDCCH.

System Information parameter TX_INTEGER in RACH Control Parameters is set to 3.

Mobile Station:

MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure, the SS waits until the MS sends all M+1 CHANNEL REQUEST messages, where M is the parameter Max Retrans broadcast on BCCH. The SS waits until T3146 seconds elapse and sends an IMMEDIATE ASSIGNMENT which shall be ignored by the MS since the access procedure should be aborted.

The MS shall retry the access procedure (according to 3GPP TS 04.60 subclause 7.1.2.3). Again, the SS waits until the MS sends all M+1 CHANNEL REQUEST messages, and then sends an IMMEDIATE ASSIGNMENT before T3146 seconds elapse. In this case the MS shall correctly send the LLC PDU on the assigned PDCH.

Note:

Timer T3146 (3GPP TS 04.08 / 3GPP TS 44.018, clause 11) depends on parameter TX_INTEGER broadcast on BCCH.

The minimum value of the timer is $2 \cdot S + TX_INTEGER$ slots, where S is given in 3GPP TS 04.08 / 3GPP TS 44.018, table 3.1.

The maximum value of this timer is 5 s (subclause 11.1.1 in 3GPP TS 04.08).

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | MS -> SS | CHANNEL REQUEST | The MS turned on and triggered to initiate the GPRS attach procedure. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | SS | | SS waits 5.5 seconds (Maximum value of T3146 is 5 seconds) |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, one phase access. |
| 6 | SS | | MS shall ignore the message, SS verifies that MS does not send any RLC data or control blocks. |
| 7 | MS -> SS | CHANNEL REQUEST | MS attempts a second time to access the network. |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | SS | | SS waits $T3146 - 0.1 \cdot T3146$ (using minimum value of T3146, which is $2 \cdot S + TX_INTEGER$ slots) |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, one phase access. |
| 12 | SS <-> MS | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach. |

The complete test is repeated for:

- TX_INTEGER set to 20; and for

- TX_INTEGER set to 32.

41.2.2.5 Initiation of the packet access procedure / Request Reference

41.2.2.5.1 Conformance requirements

On receipt of an IMMEDIATE ASSIGNMENT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile stops sending CHANNEL REQUEST messages and switches to the assigned PDCH.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.1.

41.2.2.5.2 Test purpose

1. To verify that the MS continues sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT containing an incorrect Request Reference.
2. To verify that the MS stops sending CHANNEL REQUEST messages and switches to the assigned PDCH when receiving an IMMEDIATE ASSIGNMENT containing a Request Reference IE corresponding to one of its last 3 CHANNEL REQUEST messages.

41.2.2.5.3 Method of test

Initial conditions

System Simulator:

- 1 cell, CCCH combined with SDCCH, Parameter MAX_RETRANS is set to 7 retransmissions.

Mobile Station:

- The MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure. After 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT including an incorrect Request Reference. The SS verifies that the MS continues sending CHANNEL REQUEST messages.

After the 5th CHANNEL REQUEST message the SS sends an IMMEDIATE ASSIGNMENT including a correct Request Reference. The SS verifies that the MS stops sending CHANNEL REQUEST messages, switches to the assigned PDCH and completes the attach procedure.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 0 | MS | | The MS is turned on and triggered to initiate the GPRS attach procedure. |
| 1 | MS -> SS | CHANNEL REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, one phase access, dynamic allocation and including a Request Reference different from those included in previous CHANNEL REQUEST messages. |
| 5 | MS -> SS | CHANNEL REQUEST | MS continues sending CHANNEL REQUEST messages. |
| 6 | MS -> SS | CHANNEL REQUEST | |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | with Request Reference corresponding to step 3. MS shall stop sending further access bursts. |
| 8 | MS -> SS | RLC data block (GMM ATTACH REQUEST) | (see message contents in default section) |
| 9 | MS<->SS | Completion of macro {GPRS attach procedure} | SS allows MS to complete the attach procedure. |

41.2.3 Packet immediate assignment / One phase packet access

41.2.3.1 Two-message assignment / Successful case

41.2.3.1.1 Conformance requirements

If the mobile station receives an IMMEDIATE ASSIGNMENT message and the Dedicated mode or TBF information element indicates that this is the first message in a two-message assignment, the mobile station shall continue to listen to the full CCCH. The network may send a second IMMEDIATE ASSIGNMENT message within two multiframe periods following the first IMMEDIATE ASSIGNMENT, specifying the packet channel description and, if required, a mobile allocation for the assignment.

On receipt of an IMMEDIATE ASSIGNMENT message or, in case of a two-message assignment, a matching pair of IMMEDIATE ASSIGNMENT messages corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops T3146 (if running), stops sending CHANNEL REQUEST messages, and switches to the assigned PDCH.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.1.

41.2.3.1.2 Test purpose

To verify that the MS correctly decodes a two-message assignment and switches to the assigned PDCH.

41.2.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of CHANNEL REQUEST the SS sends a two-message IMMEDIATE ASSIGNMENT which actually describe a default IMMEDIATE ASSIGNMENT message, except that it is split in two parts: basically, the first part contains the IA Rest Octets, and the second part the Packet Channel Description IE.

The SS verifies that the MS correctly switches to the assigned PDCH and completes GPRS attach.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | MS | | MS is turned on and triggered to initiate the GPRS attach procedure. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | first message of two-message assignment |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | second message (see specific message contents), sent within two multiframes after step 3. |
| 5 | MS<->SS | Completion of macro {GPRS attach procedure} | SS allows MS to complete the GPRS attach procedure. |

Specific message contents:

IMMEDIATE ASSIGNMENT (first message)

| Information Element | Value |
|-----------------------------|--|
| as default except: | |
| Dedicated mode or TBF: | |
| - TMA | 1 (is first message of a two-message assignment) |
| - Downlink | 0 |
| - T/D | 1 (assign a TBF) |
| Packet Channel Description: | all bits are set to '0' |
| Request Reference: | as default |
| Timing Advance: | as default |
| Starting Time: | not present |
| IA Rest Octets: | as default |

IMMEDIATE ASSIGNMENT (second message)

| Information Element | Value |
|-----------------------------|-------------------------------|
| as default except: | |
| Dedicated mode or TBF: | |
| - TMA | 0 |
| - Downlink | 0 |
| - T/D | 1 (assign a TBF) |
| Packet Channel Description: | as default |
| Request Reference: | as default |
| Timing Advance: | as default |
| Starting Time: | not present |
| IA Rest Octets: | Second Part Packet Assignment |

41.2.3.2 Two-message assignment / Failure cases

41.2.3.2.1 Conformance requirements

If the indirect encoding is used, the IMMEDIATE ASSIGNMENT message may contain a CHANGE_MARK_1 field. If that is present, the mobile station shall verify the validity of the SI13_CHANGE_MARK associated with the GPRS mobile allocation to which the message refers, see 3GPP TS 04.60. If the CHANGE_MARK_1 field and the SI13_CHANGE_MARK do not match, the message does not satisfactorily define a PDCH.

The two IMMEDIATE ASSIGNMENT messages in a two-message assignment shall have the same contents of the Request Reference information elements.

If the mobile station does not receive the second IMMEDIATE ASSIGNMENT messages in a two-message assignment within two multiframe periods following the first message, the mobile station shall discard the first IMMEDIATE ASSIGNMENT message received.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.1.

41.2.3.2.2 Test purpose

To verify that the MS does not respond to a two-message assignment if:

- CHANGE_MARK_1 does not match SI13 CHANGE_MARK.
- The second IMMEDIATE ASSIGNMENT message is not received within two multiframes after the first -message.
- Request References in both messages do not have same contents.

41.2.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, CHANGE_MARK in SI13 is set to 1, TX-INTEGER = 7.

Mobile Station:

MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of CHANNEL REQUEST the SS sends a two-message IMMEDIATE assignment:

- first attempt: CHANGE_MARK does not match SI13 CHANGE_MARK. MS shall re-initiate packet access (see 3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.7.3.1.5, GPRS attach procedure / Abnormal cases).
- second attempt: the second IMMEDIATE ASSIGNMENT message is not received within two multiframes after the first message. MS shall discard the first IMMEDIATE ASSIGNMENT message received.
- third attempt: Request References in both messages do not have same contents. MS shall re-initiate packet access.
- fourth attempt: the second IMMEDIATE ASSIGNMENT message is received in the last access grant block before the second multiframes after the first message. In this case the MS shall successfully switch to the assigned PDCH and complete the GPRS attach procedure.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | MS | | The MS is triggered to initiate the GPRS attach procedure. |
| 2 | MS -> SS | CHANNEL REQUEST | first message of two-message assignment with contents as specified below (see specific message contents). |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 5 | MS -> SS | CHANNEL REQUEST | MS shall re-initiate packet access first message of two-message assignment (see specific message contents) second message (see specific message contents) sent after two multiframe after the first message. |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 8 | MS -> SS | CHANNEL REQUEST | MS shall discard the IMMEDIATE ASSIGNMENT message and continue with Packet Access procedure. first message of two-message assignment (see specific message contents) including a Request Reference corresponding to step 8. second message (see specific message contents) except: Request Reference is different from that in step 8. |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 11 | MS -> SS | CHANNEL REQUEST | MS shall re-initiate packet access first message of two-message assignment (see specific message contents) second message (see specific message contents) sent in the last access grant block before the second multiframe after the first message elapses. SS allows MS to complete the GPRS attach procedure. |
| 12 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 13 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 14 | MS<->SS | Completion of macro {GPRS attach procedure} | |

Specific message contents:

IMMEDIATE ASSIGNMENT (first message)

| Information Element | Value |
|-----------------------------|--|
| as default except: | |
| Dedicated mode or TBF: | |
| - TMA | 1 (is first message of a two-message assignment) |
| - Downlink | 0 |
| - T/D | 1 (assign a TBF) |
| Packet Channel Description: | all bits are set to '0' |
| Request Reference: | as default |
| Timing Advance: | as default |
| Starting Time: | not present |
| IA Rest Octets: | as default |

IMMEDIATE ASSIGNMENT (second message)

| Information Element | Value |
|-----------------------------|-------------------------------|
| as default except: | |
| Dedicated mode or TBF: | |
| - TMA | 0 |
| - Downlink | 0 |
| - T/D | 1 (assign a TBF) |
| Packet Channel Description: | as default |
| Request Reference: | as default |
| Timing Advance: | as default |
| Starting Time: | not present |
| IA Rest Octets: | Second Part Packet Assignment |

41.2.3.3 Packet uplink assignment / Polling bit set

41.2.3.3.1 Conformance requirement

If the Polling bit is set to 1, MS shall send a PACKET CONTROL ACKNOWLEDGEMENT message (see 04.60) on the assigned PDCH, in the uplink block specified by the TBF Starting Time. In this case the TBF Starting Time is used both to indicate when the assigned PDCH becomes valid and to specify the uplink block.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

41.2.3.3.2 Test purpose

To verify that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the correct uplink block if the Polling bit is set in packet uplink assignment construction.

41.2.3.3.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

Specific PICS Statements

- MS operation mode B Yes/No (TSPC_operation_mode_B)
- Automatic GPRS attach procedure at switch on or power on Yes/No (TSPC_AddInfo_on_auto_GPRS_AP)

PIXIT Statements

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and with the Polling bit set. The MS shall send a PACKET CONTROL ACKNOWLEDGMENT on the assigned uplink block and then complete the GPRS attach procedure.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | MS | | The MS is powered up or switched on. |
| 2 | | {Location Update Procedure} | This step is for class B non auto attach mobiles only. Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 3 | MS | | MS is triggered to initiate GPRS attach. |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, one phase access and Polling bit set, and arbitrarily chosen TBF starting time in the future. |
| 6 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | sent on the block indicated by TBF starting time in step 3. |
| 7 | SS->MS | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach. |

41.2.3.4 One phase packet access / Contention resolution / Successful case

41.2.3.4.1 Conformance requirements

After receiving an IMMEDIATE ASSIGNMENT message in which one phase packet access for an uplink transfer is granted, the mobile station shall start timer T3164 and proceed with the contention resolution at one phase access defined in 3GPP TS 04.60.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

41.2.3.4.2 Test purpose

To verify that the MS includes the correct TLLI (Temporary Logical Link Identifier) in the first RLC data blocks until contention resolution is completed.

41.2.3.4.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the RLC data blocks which are sent preceding the reception of PACKET UPLINK ACK/NACK.

Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 0 | MS | | The MS is triggered to transfer 200 octets of data. |
| 1 | MS -> SS | CHANNEL REQUEST | |
| 1A | | | If the MS requests two phase access the Test Case is terminated |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | For uplink TBF, one phase access |
| 3 | MS -> SS | 3 RLC data blocks | SS verifies correct TLLI in RLC headers. |
| 4 | SS -> MS | PACKET UPLINK ACK/NACK | Including correct TLLI |
| 5 | MS<->SS | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer. |

41.2.3.5 One phase packet access / Contention resolution / TLLI mismatch

41.2.3.5.1 Conformance requirement

If the TLLI in the PACKET UPLINK ACK/NACK message differs from that sent by the MS in the RLC block headers, the MS shall immediately stop transmitting on this TBF and re-initiate the packet access procedure unless it has already been repeated 4 times.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

41.2.3.5.2 Test purpose

To verify that the MS immediately stops transmitting if it receives a PACKET UPLINK ACK/NACK with incorrect TLLI.

41.2.3.5.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including an incorrect TLLI. The SS shall verify that the MS 'immediately' stops transmitting (see note below) and retries packet access procedure.

NOTE: The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 0 | MS | | The MS is triggered to transfer 200 octets of data. |
| 1 | MS -> SS | CHANNEL REQUEST | |
| 1A | | | If the MS requests two phase access the Test Case is terminated |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | For uplink TBF, one phase packet access granted, dynamic allocation. |
| 3 | MS -> SS | 3 RLC data blocks | SS verifies correct TLLI in RLC headers. |
| 4 | SS -> MS | PACKET UPLINK ACK/NACK | Including incorrect TLLI |
| 5 | SS | | The SS verifies that the MS transmits at most further n (=6) data blocks after step 4 (see Note) before re-initiating packet access. |
| 6 | MS -> SS | CHANNEL REQUEST | MS re-initiates packet access procedure. |
| 6A | | | If the MS requests two phase access the Test Case is terminated |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | For uplink TBF, one phase packet access granted, dynamic allocation. |
| 8 | MS<->SS | Completion of macro {Uplink data transfer} | SS allows MS to complete uplink data transfer. |

41.2.3.6 One phase packet access / Contention resolution / Counter N3104

41.2.3.6.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value.

Reference

3GPP TS 04.60 subclause 7.1.2.3

41.2.3.6.2 Test purpose

To verify that the MS correctly sets and considers counter N3104.

NOTE: Counter N3104 is incremented by 1 with each new RLC/MAC block the mobile station sends until the first PACKET UPLINK ACK/NACK message is received.

Its maximum value is $N3104_MAX = 3 * (BS_CV_MAX + 3) * \text{number of uplink timeslots assigned}$, where BS_CV_MAX is broadcast in SI 13 Rest Octets.

41.2.3.6.3 Method of test

Initial conditions

System Simulator: Default settings except:

1 cell, CCCH combined with SDCCH, BS_CV_MAX value in System Information Type 13 arbitrarily chosen in the range 3 to 6.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer 440 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks. The SS acknowledges the RLC block transfer with a correct PACKET UPLINK ACK/NACK sent after N3104_MAX data blocks. The SS verifies that the MS stops transmitting and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK exactly after N3104_MAX - 1 data blocks. The SS verifies that this time the MS does not abort the access procedure and successfully completes uplink transfer.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | MS -> SS | CHANNEL REQUEST | MS is triggered to transfer 440 data octets. |
| 1A | | | If the MS requests two phase access the Test Case is terminated |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | For uplink TBF, indicating one phase packet access. |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | With MS USF |
| 4 | MS -> SS | RLC data block | |
| 5 | | | Step 3 and 4 are repeated until N3104_MAX data blocks are received. |
| 6 | MS -> SS | CHANNEL REQUEST | SS verifies that MS does not send further RLC data blocks and MS re-initiates packet access procedure. |
| 6A | | | If the MS requests two phase access the Test Case is terminated |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | For uplink TBF, indicating one phase packet access granted. |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | With MS USF |
| 9 | MS -> SS | RLC data block | |
| 10 | | | Step 13 and 14 are repeated until N3104_MAX - 1 data blocks are received. |
| 11 | SS -> MS | PACKET UPLINK ACK/NACK | |
| 12 | MS<->SS | Completion of macro {Uplink data transfer} | SS allows MS to complete uplink data transfer. |

41.2.3.7 One phase packet access / Contention resolution / Timer T3166

41.2.3.7.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value, or on expiry of timer T3166.

Reference

3GPP TS 04.60 subclause 7.1.2.3.

41.2.3.7.2 Test purpose

To verify that the MS correctly considers timer T3166.

41.2.3.7.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX value in System Information Type 13 is set to 6.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer 440 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and dynamic allocation. The MS shall start transferring RLC data blocks. The SS reduces the block transfer rate by controlling the USF flag. In this way, the SS forces T3166 (with value 5 s) to expire before counter N3104 reaches N3104_MAX (with value 28 blocks for current settings). The SS verifies that the MS stops transmitting and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK before T3166 seconds. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|-----------|---------------------|--|--|
| 1 1A | MS -> SS | CHANNEL REQUEST | MS is triggered to transfer 440 data octets. If the MS requests two phase access the Test Case is terminated |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | Indicating one phase packet access granted, dynamic allocation. CS1 shall be used. |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF addressing the MS |
| 4 | MS -> SS | RLC data block | |
| 5 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 7 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 9 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 11 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 12 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 13 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 14 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 15 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF not addressing the MS |
| 16 | MS<->SS | | Steps 3 to 15 are repeated at most 22 times or until MS does not send further RLC data blocks at step 4. Note: steps 3 to 15 transfer one block every 52 frames, or 240 ms. 22 repetitions require about 5.5 s. (Timer T3166 shall expire) |
| 17 17A | MS -> SS | CHANNEL REQUEST | MS re-initiates packet access procedure. If the MS requests two phase access the Test Case is terminated |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT | Indicating one phase packet access granted, dynamic allocation. |
| 19 | MS<->SS | | Steps 3 to 15 are repeated 17 times. Note: 17 repetitions require about 4.3 s. (Timer T3166 should not expire) |
| 20 21 | SS -> MS MS<->SS | PACKET UPLINK ACK/NACK Completion of macro {Uplink data transfer} | SS allows MS to complete uplink data transfer. |

41.2.3.8 One phase packet access / Contention resolution / 4 access repetition attempts

41.2.3.8.1 Conformance requirement

If contention resolution for packet access fails, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times.

Reference

3GPP TS 04.60 subclause 7.1.2.3.

41.2.3.8.2 Test purpose

To verify that the MS attempts the packet access procedure 4 or 5 times.

41.2.3.8.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

- GPRS Release (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

The MS is triggered to transfer 200 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including a TLLI not corresponding to the MS. The SS shall verify that the MS stops transmitting blocks and attempts packet access a total of four or five times.

Note:

The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------------------------|--|------------------------|--|
| 1 | MS | | The MS is triggered to transfer 200 octets of data. |
| 2 2A | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | If the MS requests two phase access the Test Case is terminated indicating one phase packet access granted, dynamic allocation. |
| 4 | MS -> SS | 3 RLC data blocks | |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | including incorrect TLLI |
| 6 | MS -> SS | | MS aborts packet access procedure, and is allowed to transmit at most n RLC data blocks (see Note above). |
| 7 | MS<->SS | | repetition 1: MS shall reinitiate a packet access procedure, steps 2 to 6 are repeated. |
| 8 | MS<->SS | | repetition 2: MS reinitiates a packet access procedure, steps 2 to 6 are repeated. |
| 9 | MS<->SS | | repetition 3: MS reinitiates a packet access procedure, steps 2 to 6 are repeated. |
| A10 (optional step) | MS<->SS | | If PICS 'Release of GPRS supported' for MS is Release 97, 98, 99 or 4, this step is optional. If PICS 'Release of GPRS supported' for MS is Release 5 or later, this step is not allowed. repetition 4: MS reinitiates a packet access procedure, steps 2 to 6 are repeated. |
| NOTE: | After step A10 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure. | | |

41.2.3.9 One phase packet access / TBF starting time

41.2.3.9.1 Conformance requirement

In case the packet uplink assignment construction contains a TBF starting time and the mobile station receives the IMMEDIATE ASSIGNMENT message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time before accessing the channel. If the mobile station receives the message after the TBF starting time has expired, it shall ignore the TBF starting time and may immediately access the channel.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

41.2.3.9.2 Test purpose

To verify that the MS correctly considers the TBF Starting Time included in the IMMEDIATE ASSIGNMENT message.

41.2.3.9.3 Method of test

Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a TBF starting time. The MS shall start transferring RLC data blocks after the TBF starting time.

The test is repeated with a TBF starting time in the past. In this case the MS may ‘immediately’ (see note below) send RLC data blocks .

Note:

The MS shall start transmitting RLC blocks within n blocks after the block containing the IMMEDIATE ASSIGNMENT message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------------------------|-----------|--|---|
| 0 | MS | | The MS is triggered to transfer 200 octets of data. |
| 1 1A | MS -> SS | CHANNEL REQUEST | If the MS requests two phase access the Test Case is terminated |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | indicating one phase packet access granted, dynamic allocation, and an arbitrarily chosen TBF Starting Time (indicating a future frame number). |
| 3 | SS | | SS continually sends PACKET DOWNLINK DUMMY CONTROL BLOCK containing USF assigned to the MS. SS verifies that MS does not transmit for frame numbers below TBF Starting Time. |
| 4 | MS -> SS | 3 RLC data blocks | SS will verify that first RLC block arrives on first allowed block after TBF Starting Time. |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Including correct TLLI. |
| 6 | MS -> SS | RLC data blocks | |
| 7 | SS<->MS | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer. |
| 8 | MS | | The MS is triggered again to transfer 200 octets of data. |
| 9 9A | MS -> SS | CHANNEL REQUEST | If the MS requests two phase access the Test Case is terminated |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Indicating one phase packet access granted, dynamic allocation and an arbitrarily chosen TBF Starting Time with value less than current frame number. |
| A11 (Optional step) | MS -> SS | 3 RLC data blocks | SS continually sends PACKET DOWNLINK DUMMY CONTROL BLOCK containing USF assigned to the MS. SS verifies that MS starts sending RLC data blocks. The SS shall not check the number of blocks before the MS starts to send RLC blocks. |
| A12 (Optional step) | SS -> MS | PACKET UPLINK ACK/NACK | Including correct TLLI. |
| A13 (Optional step) | MS -> SS | RLC data blocks | Go to step 14 |
| B11 (Optional step) | MS -> SS | CHANNEL REQUEST | |
| B12 (Optional step) | | | If the MS requests two phase access the Test Case is terminated |
| B13 (Optional step) | SS -> MS | IMMEDIATE ASSIGNMENT | Go to step 14 |
| C11 (Optional step) | | | Verify that the MS does not send anything. Go to step 15 |
| 14 | SS<->MS | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer. |
| 15 | | | |

41.2.3.10 One phase packet access / Timing Advance Index present

41.2.3.10.1 Conformance requirement

If the timing advance index (TAI) is included in the packet uplink assignment construction, the mobile station shall use the continuous update timing advance mechanism, see 3GPP TS 05.10, using PTCCH in the same timeslot as the assigned PDCH.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

3GPP TS 03.64 subclause 6.5.7.2.

41.2.3.10.2 Test purpose

To verify that the MS uses the continuous update timing advance mechanism and sends access bursts in the PTCCH slots as determined by the Timing Advance Index (TAI) sent in the IMMEDIATE ASSIGNMENT.

41.2.3.10.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered for uplink data transfer. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a Timing Advance Index. During TBF transfer, the SS shall verify the access bursts sent by the MS in the PTCCH.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|---------|-----------|--|---|
| 0 | MS | | The MS is triggered to transfer 440 octets of data. |
| 1 1A | MS -> SS | CHANNEL REQUEST | If the MS requests two phase access the Test Case is terminated |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | For one phase packet access, dynamic allocation and including Timing Advance Index TAI=0. |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigning the USF assigned in step 2. Sent on PDTCH, 3 block after the message sent in step 2 |
| 4 | MS -> SS | RLC data block | |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Including correct TLLI. |
| 6 | | | Wait for 3 blocks. |
| 7 | MS<->SS | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer. During the data transfer, USF is assigned to MS once in 250ms |

Verification

During TBF transfer (steps 3 to 7) the SS monitors access bursts on PTCCH which are located on slots with numbers FN, such that $(FN \bmod (8*52)) = 12$ for TAI = 0 (3GPP TS 03.64 subclause 6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be '11111111 111'.

The test is repeated once more with an arbitrarily chosen TAI in the range 1 to 15. SS shall verify that the access bursts are sent in the correct PTCCH slots as specified in 3GPP TS 05.02 table 6.

41.2.3.11 One phase packet access / Timing Advance Index not present

41.2.3.11.1 Conformance requirement

If a timing advance index (TAI) field is not included, the continuous update timing advance mechanism shall not be used.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

41.2.3.11.2 Test purpose

To verify that the MS does not send any access bursts on PTCCH (i.e. it does not use the continuous update timing advance mechanism) if TAI is not present in the IMMEDIATE ASSIGNMENT message.

41.2.3.11.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message not including a Timing Advance Index. During TBF transfer, the SS shall verify that the MS does not send any access bursts in idle frames.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | MS | | The MS is triggered to transfer 440 octets of data. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 2A | | | If the MS requests two phase access the Test Case is terminated |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | not including Timing Advance Index |
| 4 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigning the USF assigned in step 3. Sent on PDTCH, 3 block after the message sent in step 3 |
| 5 | MS -> SS | RLC data block | |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | Including correct TLLI. |
| 7 | | | Wait for 3 blocks. |
| 8 | SS<->MS | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer. During the data transfer, USF is assigned to MS once in 250ms |

Verification

The SS verifies that the MS does not transmit in idle frames during data block transfer (steps 4 to 8). Idle frame numbers are 12, 25, 38 and 51 in the 52-multiframe structure.

41.2.4 Packet immediate assignment / Single block packet access

41.2.4.1 Single block packet access / Packet Resource Request

41.2.4.1.1 Conformance requirement

The network shall use the TBF starting time to indicate the first frame number belonging to the single block period granted for packet access. The mobile station may use that block period to send a PACKET RESOURCE REQUEST message to initiate the two phase access defined in 3GPP TS 04.60, or to send a PACKET MEASUREMENT REPORT message, see 3GPP TS 04.60.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.3.

41.2.4.1.2 Test purpose

To verify that the MS sends PACKET RESOURCE REQUEST in the assigned block as indicated by the TBF starting time when it is triggered for uplink transfer.

41.2.4.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS assigns packet uplink resources for single block in an IMMEDIATE ASSIGNMENT message including a TBF starting time. The SS verifies that the MS sends a PACKET RESOURCE REQUEST at the first allowed block as indicated by the TBF starting frame.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 0 | MS | | |
| 1 | MS -> SS | CHANNEL REQUEST | The MS is triggered to transfer 200 octets of data. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 3 | MS -> SS | PACKET RESOURCE REQUEST | For uplink TBF, single block assignment for an arbitrarily chosen TBF Starting Time in the future. SS verifies that first block is on first allowed block starting at frame number given by TBF Starting Time. |
| 4 | SS -> MS | PACKET ACCESS REJECT | with default contents. |

41.2.4.2 Single block packet access / Packet Measurement Report

41.2.4.2.1 Conformance requirement

1. The network shall use the TBF starting time to indicate the first frame number belonging to the single block period granted for packet access. The mobile station may use that block period to send a PACKET RESOURCE REQUEST message to initiate the two phase access defined in 3GPP TS 04.60, or to send a PACKET MEASUREMENT REPORT message, see 3GPP TS 04.60.
2. In packet idle mode, the reporting period is NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING_PERIOD_I is greater than DRX period, else, the reporting period is DRX period.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.3.

3GPP TS 45.008 (ex 05.08) subclause 10.1.4.1.

41.2.4.2.2 Test purpose

To verify that the MS sends PACKET MEASUREMENT REPORT in the assigned uplink block when performing a measurement report procedure.

Further on, this tests verifies that the MS correctly considers reporting parameter NC_REPORTING_PERIOD_I.

41.2.4.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, in Ready state and in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

-

Test procedure

The SS requests the MS via a PACKET MEASUREMENT ORDER to periodically send measurement reports. When the MS attempts a measurement report procedure, the SS assigns a single block for uplink TBF with an arbitrarily

chosen TBF starting time (not yet elapsed). The SS verifies that the MS sends PACKET MEASUREMENT REPORT in the assigned block.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment on PCH corresponding to MS. |
| 2 | SS -> MS | PACKET MEASUREMENT ORDER | Including parameters: NETWORK_CONTROL_ORDER = '01' NC_REPORTING_PERIOD_I = '011' (3.84 s.) |
| 3 | MS -> SS | CHANNEL REQUEST | with establishment cause 'single block access'. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds. |
| 5 | MS -> SS | PACKET MEASUREMENT REPORT | Shall be sent in the assigned block. |
| 6 | MS -> SS | CHANNEL REQUEST | SS verifies that the time interval between steps 3 and 6 corresponds to the time +/- 10% which is calculated from the NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING_PERIOD_I is greater than DRX period, else, the reporting period is DRX period. (3GPP TS 04.08 § 10.1.4.1) |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future. |
| 8 | MS -> SS | PACKET MEASUREMENT REPORT | Shall be sent in the assigned block. |

41.2.5 Packet immediate assignment / Packet access rejection

41.2.5.1 Packet access rejection / wait indication

41.2.5.1.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops sending CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.4.

41.2.5.1.2 Test purpose

To verify that the MS stops sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT containing a Request Reference IE corresponding to one of its last 3 CHANNEL REQUEST messages.

Further on, the SS verifies that the MS makes a new attempt for uplink transfer only after T3142 seconds ("wait indication" timer) after last IMMEDIATE ASSIGNMENT REJECT elapse.

41.2.5.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX_RETRANS is set to 7 retransmissions.

Mobile Station: MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending CHANNEL REQUEST messages and does not attempt a new packet access until T3142 seconds elapse.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 0 | MS | | MS is triggered to initiate GPRS attach procedure |
| 1 | MS -> SS | CHANNEL REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | including Request Reference corresponding to the CHANNEL REQUEST in step 1, and waiting time indication with value T3142=50s. |
| 5 | SS | | SS verifies that MS does not send any further access bursts (see note below). |
| 6 | MS -> SS | CHANNEL REQUEST | SS verifies that the access burst does not arrive before $T3142 - 0.1 * T3142 (=45s)$ after last IMMEDIATE ASSIGNMENT REJECT message. |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, one phase access |
| 8 | MS->SS | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach. |

The test is repeated with an arbitrarily chosen value of T3142 in the range 2 to 60 s.

NOTE: The number of frames between successive access bursts considering the default Sys Info parameters used in the test is larger than 58 frames (see 3GPP TS 04.08 / 3GPP TS 44.018, table 3.1). This value is large enough to allow the MS to respond to the IMMEDIATE ASSIGNMENT REJECT message by stopping sending the next access bursts.

41.2.5.2 Packet access rejection / assignment before T3142 expires

41.2.5.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops sending CHANNEL REQUEST messages, starts timer T3142 with the

indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.4.

41.2.5.2.2 Test purpose

To verify that the MS stops sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT and, if an IMMEDIATE ASSIGNMENT containing a correct Request Reference arrives before $T = \min \{T3142, T3146\}$ seconds elapse, then the MS shall accept this assignment (see below for a note on T3146).

41.2.5.2.3 Method of test

Initial conditions

System Simulator: Default settings except:

Parameter MAX_RETRANS is set to 7 retransmissions.

Parameter TX_INTEGER is set to 32.

CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

-

Test procedure

The MS is triggered to initiate GPRS attach. After reception of 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending CHANNEL REQUEST messages.

Before $T = \min \{T3142, T3146\}$ seconds elapse, the SS sends an IMMEDIATE ASSIGNMENT with correct Request Reference. The MS shall switch to the assigned PDCH and transfer the data.

NOTE: T3146 is started when sending the last CHANNEL REQUEST or when receiving the IMMEDIATE ASSIGNMENT REJECT. At its expiry, the packet access is aborted.

The value of T3146 is given by $T+2*S$ (3GPP TS 04.08 / 3GPP TS 24.008, subclause 11.1.1), where T is TX_INTEGER and S is given in 3GPP TS 04.08 / 3GPP TS 44.018, table 3.1. The value of T3146 is 2,15 s. for the current settings.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 0 | MS | | MS is triggered to initiate GPRS attach. |
| 1 | MS -> SS | CHANNEL REQUEST | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | including Request Reference corresponding to the CHANNEL REQUEST in step 2, and waiting time indication with value T3142 = 2 s. |
| 5 | | | The SS verifies that the MS stops sending CHANNEL REQUEST messages. |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | sent after 1.5s. (of the last IMMEDIATE ASSIGNMENT REJECT) and including Request Reference corresponding to step 1. |
| 7 | SS<->MS | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach. |

41.2.6 Packet downlink assignment procedure using CCCH

41.2.6.1 Initiation of packet downlink assignment procedure / MS listens to correct CCCH block

41.2.6.1.1 Conformance requirement

The network initiates the packet downlink assignment procedure by sending an IMMEDIATE ASSIGNMENT message in unacknowledged mode on the CCCH timeslot corresponding to CCCH group the mobile station belongs to.

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it starts timer T3190.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

41.2.6.1.2 Test purpose

To verify that the MS responds to an IMMEDIATE ASSIGNMENT for downlink TBF sent on PCH blocks corresponding to the MS's paging group.

41.2.6.1.3 Method of test

Initial conditions

System Simulator: Default settings except:

Parameters CCCH_CONF, BS_AG_BLK_RES, and BS_PA_MFRMS are arbitrarily chosen.

Mobile Station:

MS is GPRS attached, DRX have been negotiated, MS is in Ready state.

PDP context 2 has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS sends an IMMEDIATE ASSIGNMENT for downlink transfer on a PCH block corresponding to its paging group (see 3GPP TS 05.02 subclause 6.5.2) which depends on Sys Info parameters and the MS's IMSI. The MS shall switch to the assigned PDCH and exercise downlink transfer.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment with correct TLLI. |
| 2 | MS<->SS | Completion of macro {Downlink data transfer} | SS completes downlink transfer of 200 octets of data. |

41.2.6.2 Initiation of packet downlink assignment procedure / timer T3190

41.2.6.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it then starts timer T3190.

If the mobile station does not receive a RLC/MAC block on the assigned PDCHs before timer T3190 expires, then a TBF establishment failure has occurred.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

41.2.6.2.2 Test purpose

To verify that the MS returns to packet idle updated if RLC/MAC blocks are sent after T3190 s, and that the MS correctly receives RLC/MAC blocks if they are sent before T3190 s.

41.2.6.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS assigns a PDCH for downlink transfer but does not send any RLC/MAC blocks until T3190 s have elapsed. The MS shall return to packet idle updated and ignore the RLC/MAC blocks.

To verify that the MS returned to packet idle updated, the SS again assigns a PDCH and sends RLC/MAC blocks before T3190 s elapse. The SS shall successfully transfer all RLC data blocks.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | for downlink TBF on a PCH block corresponding to the MS, including a packet downlink assignment. SS waits T3190 + 10% (=5.5s) after the last IMMEDIATE ASSIGNMENT. SS sends data SS verifies for 10s. that the MS does not respond. |
| 2 | SS | | |
| 3 | SS -> MS | RLC data blocks | |
| 4 | SS | | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns again a PDCH. SS waits T3190 – 10% (=4.5s) after the last IMMEDIATE ASSIGNMENT SS starts sending 200 octets of data. indicating correct reception of data blocks. SS completes downlink transfer. |
| 6 | SS | | |
| 7 | SS -> MS | RLC data blocks | |
| 8 | MS -> SS | PACKET DOWNLINK ACK/NACK | |
| 9 | MS<->SS | Completion of macro {Downlink data transfer} | |

41.2.6.3 Initiation of packet downlink assignment procedure / TBF starting time

41.2.6.3.1 Conformance requirement

The IMMEDIATE ASSIGNMENT message may indicate a TBF starting time. If the mobile station receives the message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time, start timer T3190 and switch to the assigned PDCH. If the mobile station receives the message after the TBF starting time has expired, it shall ignore the indicated TBF starting time, immediately start timer T3190 and switch to the assigned PDCH.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

41.2.6.3.2 Test purpose

To verify that the MS correctly considers the TBF starting time during downlink assignment.

41.2.6.3.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS assigns a PDCH via an IMMEDIATE ASSIGNMENT including a TBF starting time. The SS does not send RLC data blocks after TBF starting time + T3190 elapses. The MS shall return to packet idle updated and ignore the RLC data blocks.

The SS assigns again a PDCH, and this time the SS sends RLC data blocks before TBF starting time + T3190 expires. The MS shall successfully receive the RLC data blocks.

Finally, the SS assigns the third time a PDCH, but including a TBF starting time which expired. The SS immediately sends RLC data blocks which shall be acknowledged by the MS.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | including a packet downlink assignment with a TBF Starting Time corresponding to 10s after the current frame number. |
| 2 | SS | | SS waits $1.1 * (TBF \text{ Starting Time} + T3190)$ (=16.5 s) after the last IMMEDIATE ASSIGNMENT. |
| 3 | SS -> MS | RLC data block | including Polling bit set and valid RRBP field. |
| 4 | SS | | SS verifies for that the MS does not respond in the assigned block in step 3. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns again a PDCH with TBF Starting Time corresponding to 10s after the current frame number. |
| 6 | SS | | SS waits $0.9 * (TBF \text{ Starting Time} + T3190)$ (= 13.5 s) after the last IMMEDIATE ASSIGNMENT. |
| 7 | SS -> MS | RLC data block | including Polling bit set and valid RRBP field. |
| 8 | MS -> SS | PACKET DOWNLINK ACK/NACK | sent in the assigned block at step 7 indicating correct reception of downlink RLC block. |
| 9 | MS<->SS | Completion of macro {Downlink data transfer} | SS completes data transfer. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | SS assigns again a PDCH with TBF Starting Time which already elapsed. |
| 11 | SS -> MS | RLC data block | sent in the third block after the block containing the message in step 10 (see note below), including Polling bit set and valid RRBP field. |
| 12 | MS -> SS | PACKET DOWNLINK ACK/NACK | indicating correct reception of RLC block. |
| 13 | MS<->SS | Completion of macro {Downlink data transfer} | SS completes data transfer. |

NOTE: The requirements to uplink and downlink assignment reaction times are stated in 3GPP TS 05.10 subclause 6.11: An MS shall be ready to transmit and receive using a new assignment no later than the next occurrence of block $B((x+3) \bmod 12)$ where block $B(x)$ is the last radio block containing the uplink assignment.

41.2.6.4 Initiation of packet downlink assignment procedure / incorrect TFI

41.2.6.4.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned Temporary Flow Identifier (TFI).

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

41.2.6.4.2 Test purpose

To verify that the MS correctly considers the TFI in the RLC/MAC blocks.

41.2.6.4.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS assigns a PDCH and starts transmitting RLC/MAC blocks with incorrect TFI. The MS shall ignore these RLC/MAC blocks and, after T3190 expires, return to packet idle mode.

To prove that the MS returns to idle mode, the SS assigns again a PDCH, and this time the SS sends RLC/MAC blocks with correct TFI. The MS shall successfully receive the data packets.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | for downlink TBF |
| 2 | SS -> MS | RLC data block | SS sends RLC blocks with incorrect TFI (i.e. not corresponding to the last IMMEDIATE ASSIGNMENT), including Polling bit set and valid RRBP field. |
| 3 | SS | | SS verifies that the MS does not respond in the assigned block. |
| 4 | SS | | SS waits value of T3190 + 10% (=5.5s). |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | for downlink TBF |
| 6 | SS -> MS | RLC data block | with correct TFI, including Polling bit set and valid RRBP field. |
| 7 | MS -> SS | PACKET DOWNLINK ACK/NACK | indicating correct reception of RLC block. |
| 8 | MS<->SS | Completion of macro {Downlink data transfer} | SS completes downlink transfer. |

41.2.7 Single block packet downlink assignment

41.2.7.1 Single block packet downlink assignment / TBF Starting Time

41.2.7.1.1 Conformance requirement

The sending of an RLC/MAC control message to a mobile station in packet idle mode may be initiated by the RR entity on network side using the packet downlink assignment procedure. The procedure is used to assign a single downlink block on a PDCH for the transfer of the RLC/MAC control message.

The packet downlink construction in the IMMEDIATE ASSIGNMENT message shall contain only:

- the TLLI; and
- the TBF starting time.

If the mobile station receives the IMMEDIATE ASSIGNMENT message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time. The network shall use the TBF starting time to indicate the first frame number belonging to the single block period assigned to the mobile station. The mobile station shall switch to the assigned PDCH and attempt to decode an RLC/MAC control message in the assigned downlink block.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.2.

41.2.7.1.2 Test purpose

To verify that the MS correctly decodes the RLC control block sent by the network on the assigned downlink block given by TBF starting time in the IMMEDIATE ASSIGNMENT message.

41.2.7.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH. The parameter CONTROL_ACK_TYPE in SI13 indicates four access bursts.

Mobile Station:

MS is GPRS attached, in Ready state and in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS assigns a single block for downlink via an IMMEDIATE ASSIGNMENT message on CCCH including a TBF starting time . The SS sends a PACKET MEASUREMENT ORDER message addressing the MS with Polling Bit set and a valid RRBP field.

The MS shall respond with a PACKET CONTROL ACKNOWLEDGMENT message on the assigned TBF block. This verifies that the MS correctly received the RLC control block sent in the assigned single block TBF.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment, including a TBF starting time arbitrarily chosen in the range 0.5 to 50 s. after the current frame number. |
| 2 | SS -> MS | PACKET MEASUREMENT ORDER | sent on the block indicated by TBF starting time in step 1, including Polling bit set and valid RRBP field and addressing the MS. |
| 3 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | sent on the block indicated by the RRBP field in step 2. 4 access bursts, received on PACCH |

41.2.7.2 Single block packet downlink assignment / MS returns to packet idle mode

41.2.7.2.1 Conformance requirement

1. Unless otherwise indicated by the RLC/MAC control message, the mobile station remains in packet idle mode. If the mobile station remains in packet idle mode, it shall continue to monitor downlink CCCH once the block period indicated by the TBF starting time has passed.

2. In packet idle mode, the reporting period is NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING PERIOD_I is greater than DRX period, else, the reporting period is DRX period.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.2.

3GPP TS 45.008 (ex 05.08) subclause 10.1.4.1.

41.2.7.2.2 Test purpose

To verify that the MS remains in packet idle mode and monitors downlink CCCH once the block period indicated by the TBF starting time has passed.

41.2.7.2.3 Method of test

Initial conditions

System Simulator: Default settings except:

NETWORK_CONTROL_ORDER in SI 13 Rest Octets set to '00' (no measurement reporting).

CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached in Packet Idle mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS assigns a single block for downlink via an IMMEDIATE ASSIGNMENT message on CCCH including a TBF starting time . The SS sends a PACKET MEASUREMENT ORDER message requesting the MS to periodically send measurement reports.

The SS shall wait until the MS attempts two periodic measurement report procedures, in order to make sure that the MS correctly decoded the PACKET MEASUREMENT ORDER on the assigned single block for downlink.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment, including a TBF starting time arbitrarily chosen on the assigned single block. NETWORK_CONTROL_ORDER = '01' NC_REPORTING_PERIOD_I = '100' (7,68 s.) |
| 2 | SS -> MS | PACKET MEASUREMENT ORDER | |
| 3 | MS -> SS | CHANNEL REQUEST | for uplink TBF, single block assignment |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 5 | MS -> SS | PACKET MEASUREMENT REPORT | |
| 6 | MS -> SS | CHANNEL REQUEST | The SS verifies reporting period: the time interval between CHANNEL REQUESTS messages in steps 3 and 6 corresponds to the time +/- 10% which is calculated from the NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING_PERIOD_I is greater than DRX period, else, the reporting period is DRX period. (3GPP TS 04.08 § 10.1.4.1) |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment |
| 8 | MS -> SS | PACKET MEASUREMENT REPORT | |

41.2.8 Macros and default message contents

41.2.8.1 Macros

In order to simplify the process of writing and coding test cases, macros are referenced in the expected signaling tables. These macros provide all additional signaling needed to complete the particular test but are not relevant to its purpose.

41.2.8.1.1 GPRS attach procedure

The following table describes a signaling sequence performing the GPRS attach procedure. Note that there are different possible sequences implementing the GPRS attach procedure.

The macros {Completion of GPRS attach} in the test cases refer to the table below starting at the step required for the particular sequence.

{GPRS attach procedure}

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| 0 | | | MS is triggered to initiate the GPRS attach procedure. |
| 1 | MS -> SS | CHANNEL REQUEST | Establishment Cause is 'one phase packet access'. For uplink TBF, single phase access, dynamic allocation. Transporting: ATTACH REQUEST Indicating correct reception of uplink blocks, including RRBp field set. Sent on PACCH |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 3 | MS -> SS | RLC data blocks | |
| 4 | SS -> MS | PACKET UPLINK ACK/NACK | |
| 5 | MS -> SS | PACKET CONTROL ACKNOWLEDGMENT | |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF, sent 1 s. after setp 5 on AGCH. Transporting: ATTACH ACCEPT. Last block containing a valid RRBp field and FBI set. |
| 7 | SS -> MS | RLC data blocks | |
| 8A | MS -> SS | PACKET DOWNLINK ACK/NACK | Including Channel Request Description. Sent on PACH. Transporting: ATTACH COMPLETE Including valid RRBp field |
| 9A | SS -> MS | PACKET UPLINK ASSIGNMENT | |
| 10A | MS -> SS | RLC data blocks | |
| 11A | SS -> MS | PACKET UPLINK ACK/NACK | |
| 12A | MS -> SS | PACKET CONTROL ACKNOWLEDGMENT | |
| 8B | MS -> SS | PACKET DOWNLINK ACK/NACK | Not including Channel Request Description. |
| 9B | MS->SS | CHANNEL REQUEST | For uplink TBF, single phase access, dynamic allocation. Transporting: ATTACH COMPLETE Indicating correct reception of uplink blocks, including RRBp field set. |
| 10B | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 11B | MS -> SS | RLC data blocks | |
| 12B | SS -> MS | PACKET UPLINK ACK/NACK | |
| 13B | MS -> SS | PACKET CONTROL ACKNOWLEDGMENT | |

41.2.8.1.2 Uplink data transfer

The following table describes a sequence performing uplink data transfer in acknowledged mode.

{Uplink data transfer, acknowledged mode}

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 0 | | | A PDP context (in acknowledged RLC mode) has been established. The MS is triggered to send data. |
| 1 | MS -> SS | CHANNEL REQUEST | |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block access. |
| 3 | MS -> SS | PACKET RESOURCE REQUEST | |
| 4 | SS -> MS | PACKET UPLINK ASSIGNMENT | for dynamic allocation |
| 5 | | | Steps 6 to 8 are executed 0 to n times as needed. |
| 6 | MS -> SS | RLC data block | |
| 7 | | | Step 6 is repeated at most 14 times (resulting in at most 15 uplink data blocks) |
| 8 | SS -> MS | PACKET UPLINK ACK/NACK | indicating correct reception of uplink data blocks |
| 9 | | | Countdown procedure: Step 10 is repeated as needed. |
| 10 | MS -> SS | RLC data block | The MS shall correctly set the CV value in the RLC header, the last one being 0. |
| 11 | SS -> MS | PACKET UPLINK ACK/NACK | indicating correct reception of uplink blocks, and valid RRBP field and Final Ack Indicator set. |
| 12 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | |

41.2.8.1.3 Downlink data transfer

The following table describes a sequence performing downlink data transfer in acknowledged mode.

{Downlink data transfer, acknowledged mode}

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|---|
| 0 | | | A PDP context (in acknowledged RLC mode) has been established. |
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | for downlink TBF, sent on CCCH on the correct CCCH block the MS belongs to. |
| 2 | | | Steps 3 to 6 are executed 0 to n times as needed. |
| 3 | SS -> MS | RLC data block | |
| 4 | | | Step 3 is repeated at most 14 times with polling bit set. |
| 5 | SS -> MS | RLC data block | |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | indicating correct reception of downlink data blocks. |
| 7 | SS -> MS | RLC data block | |
| 8 | | | Step 7 is repeated as needed. |
| 9 | SS -> MS | RLC data block | Last data block with FBI bit set and a valid RRBP field. |
| 10 | MS -> SS | PACKET DOWNLINK ACK/NACK | indicating correct reception of downlink data blocks. |

41.3 MAC/RLC Release

To bring the MS into active state U10, macro 40.4.3.22 shall be used.

The maximum duration of each test is per default 5 minutes.

41.3.1 TBF Release / Uplink / Normal / MS initiated

41.3.1.1 TBF Release / Uplink / Normal / MS initiated / Acknowledged mode

41.3.1.1.1 Conformance requirements

1. The mobile station initiates release of the uplink TBF by beginning the countdown process. When the mobile station has sent the RLC data block with CV = 0 and there are no elements in the V(B) array set to the value Nacked, it shall start timer T3182 and stop timer T3180, if running. The mobile station shall continue to send RLC data blocks on each assigned uplink data block, according to the algorithm defined in 3GPP TS 04.60, subclause 9.1.3.2.

2. Upon reception of a PACKET UPLINK ACK/NACK message the mobile station shall stop timer T3182.

3. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the mobile station shall enter packet idle mode.
4. If the PACKET UPLINK ACK/NACK message requests retransmission of RLC data blocks, the mobile station shall if necessary wait for allocation of uplink resources and then retransmit the RLC data blocks requested, restarting timer T3180 after each block is transmitted. The mobile station shall then start timer T3182 and wait for a PACKET UPLINK ACK/NACK message as above.
5. Upon transition from the packet transfer mode to the packet idle mode, a mobile station shall enter the Transfer non-DRX mode period.
6. Upon a receipt of a commanding message or indication from the network requiring an action by the mobile station, if the reaction time for such action is not specified elsewhere, the mobile station shall begin to perform the required action no later than the next occurrence of block $B((x+6) \bmod 12)$, where block $B(x)$ is the radio block containing the commanding message or indication from the network.

3GPP TS 05.10, subclause 6.11.4.

41.3.1.1.2 Test purpose

To verify that in RLC acknowledged mode:

1. the MS initiates release of an uplink TBF by beginning countdown process. After $CV = 0$ and no elements in the $V(B)$ array set to the value "Nacked" the MS continues to send RLC data blocks on each assigned uplink data block in the way defined in 3GPP TS 04.60, subclause 9.1.3 and waits for PACKET UPLINK ACK/NACK.
2. the MS retransmits the requested RLC data blocks if the PACKET UPLINK ACK/NACK message requests to do so. The MS then waits for another PACKET UPLINK ACK/NACK message.
3. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK with the Final Ack Indicator bit set to '1'. If there is no ongoing downlink TBF the mobile station shall enter packet idle mode.

41.3.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, $BS_CV_MAX = 10$.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context2 activated.

Specific PICS Statements

- GPRS Multislotclass (TSPC_Type_GPRS_Multislot_ClassX where $X = 1..45$)

PIXIT Statements

-

Test Procedure

The test has three parts.

1. The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode with $USF_GRANULARITY = 1$ block is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'. The SS assigns a downlink TBF, transfers a number of downlink data blocks and polls the MS. The MS responses the polling.

2. The MS is assigned a TBF of dynamic allocation in acknowledged mode with USF_GRANULARITY = 4 blocks. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.

3. The MS is triggered to transfer user data. A TBF of dynamic allocation on two timeslots in acknowledged mode with USF_GRANULARITY = 4 block is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------------|-----------|---|---|
| 1 | | {Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access} | n = 440 octets, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: CS-1, TLLI_BLOCK_CHANNEL_CODING: '0'B, CS-1. RLC acknowledged mode (PDP context2), without starting time |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 4 | | | Repeat step 2 and 3 until the countdown value CV=4. |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge all received data blocks, USF assigned to the MS. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that CV=3. |
| 7 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | Check that CV=2. |
| 8a | | | Repeat steps 7 and 8 two more times and check that first CV =1 block is received and then CV = 0 is received. |
| 9 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. |
| 10 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the data block is a retransmission of the data block transmitted in step 6, CV=3. |
| 11 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. |
| 12 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the data block is a retransmission of the data block transmitted in step 8. |
| 12a | | | Repeat steps 11 and 12 two more times and check that first CV =1 block is retransmitted and then CV = 0 is retransmitted. |
| 12b | SS | | SS waits BS_CV_MAX periods. |
| 13 | SS -> MS | PACKET UPLINK ACK/NACK | Negatively acknowledge the data block with CV = 0. |
| 13a | | | Wait for 5 block periods. |
| 13b | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Containing USF assigned to MS. |
| A14 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit block with CV=3 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case go to step B14 |
| B14 (optional step) | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. |
| 14 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the data block is a retransmission of the data block with CV = 0. |
| 15 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing a valid RRBP=26. Acknowledge the last two data blocks. |
| 16 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the radio block specified by RRBP |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode. |
| 18 | SS -> MS | DOWNLINK RLC DATA BLOCKs | 10 downlink data blocks, the data block with FBI = '1' and a valid RRBP |
| 19 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the block specified by RRBP in step 18. Check that the Final Ack indicator = '1'. |

| Step | Direction | Message | Comments |
|------------------------|-----------|---|--|
| 20 | | {Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access} | n = 440 octets, USF_GRANULARITY = 4 blocks, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: CS-1, TLLI_BLOCK_CHANNEL_CODING: '0'B, CS-1. RLC acknowledged mode (PDP context2), without starting time |
| 21 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 22 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 23 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 24 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 25 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 26 | | | Regard the steps 21 - 25 as a step block. Repeat the step block until the countdown value CV = 0 in one of data blocks received. |
| 26a | SS | | SS waits BS_CV_MAX periods. |
| 27 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge all received data blocks except for the data blocks which have CV=2, CV=1, or CV=0. Set SSN value in Ack/Nack description equal to the BSN' of the received data block with CV = 2. |
| 27a | SS | | Wait for 5 block periods |
| 27b | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| A28 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit block with CV=15 if it has already been scheduled before the end of the reaction time |
| 28 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the countdown value CV = 2. |
| 29 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the countdown value CV = 1. |
| 30 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the countdown value CV = 0. |
| A31 Conditional | MS -> SS | UPLINK RLC DATA BLOCK | This step should be done if step A28 was not executed Check that the countdown value CV = 2. |
| 31 | | | Wait for BS_CV_MAX block period |
| 32 | SS -> MS | PACKET UPLINK ACK/NACK | Negatively acknowledge the data blocks of CV=2, and CV=0. Acknowledge the data block of CV=1 |
| 32a | SS | | Wait for 5 block periods |
| 32b | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| A33 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit block with CV=2 if it has already been scheduled before the end of the reaction time, and if step A31 was NOT executed. MS may retransmit block with CV=1 if it has already been scheduled before the end of the reaction time, and if step A31 WAS executed. |
| 33 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the countdown value CV = 2. |
| 34 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the countdown value CV = 0. |
| 35 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the countdown value CV = 2. |
| 36 Conditional | MS -> SS | UPLINK RLC DATA BLOCK | This step should be done if step A33 was not executed Check that the countdown value CV = 0. |
| 37 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing valid RRB. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received. |
| 38 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRB on PACCH of the assigned PDCH. |
| 39 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode. |
| 40 | SS -> MS | DOWNLINK RLC DATA BLOCKS | 10 downlink data blocks, the data block with FBI = '1' and a valid RRB |
| 41 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the block specified by RRB in step 40. Check that the Final Ack indicator = '1'. |
| | | | The following steps are not applicable to the MS in GPRS multislot class 1, 2, 3, 4, 8, 30, 35 and 40. |

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 42 | | {Uplink dynamic allocation two phase access} | n = 1200 octets, without starting time, USF_GRANULARITY = 4 blocks, RLC_DATA_BLOCKS_GRANTED = open-end, CHANNEL_CODING_COMMAND: cs4 RLC acknowledged mode (PDP context2), Two slots, USF ₀ on TN ₀ and USF ₁ on TN ₁ , are assigned. |
| 43 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF ₀ on PDTCH ₀ addressing the MS. |
| 44 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF ₁ on PDTCH ₁ addressing the MS, sent on the same TDMA frame as step 43. |
| 45 | MS -> SS | UPLINK RLC DATA BLOCKS | Received on the assigned PDTCH ₀ and PDTCH ₁ . Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 46 | MS -> SS | UPLINK RLC DATA BLOCKS | Received on the assigned PDTCH ₀ and PDTCH ₁ . |
| 47 | MS -> SS | UPLINK RLC DATA BLOCKS | Received on the assigned PDTCH ₀ and PDTCH ₁ . |
| 48 | MS -> SS | UPLINK RLC DATA BLOCKS | Received on the assigned PDTCH ₀ and PDTCH ₁ . |
| 49 | | | Regard the steps 43 - 48 as a step block. Repeat the step block until the countdown value CV = 0 in one of data blocks received. Check the CV decrement from BS_CV_MAX (10) to 0. |
| 50 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing a valid RRBP. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received. |
| 51 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH. |

41.3.1.2 TBF Release / Uplink / Normal / MS initiated / Unacknowledged mode

41.3.1.2.1 Conformance requirements

The mobile station initiates release of the uplink TBF by beginning the countdown process. It indicates the end of the TBF by setting the CV value to 0 and starts timer T3182.

Upon reception of a PACKET UPLINK ACK/NACK message the mobile station shall stop timer T3182. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the mobile station shall enter packet idle mode.

If timer T3182 expires the mobile station shall release the TBF as if a PACKET UPLINK ACK/NACK message was received.

References

3GPP TS 04.60, subclause 9.3.3.3.

41.3.1.2.2 Test purpose

To verify that in RLC unacknowledged mode:

1. the MS initiates release of an uplink TBF by beginning the countdown process and indicates the end of the TBF by setting the CV value to 0.
2. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1' after CV=0. If there is no ongoing downlink TBF the mobile station enters packet idle mode.
3. the MS releases the TBF as if a PACKET UPLINK ACK/NACK message was received when timer T3182 expires.

41.3.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 12.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context3 activated.

Specific PICS Statements

- GPRS Multislotclass (TSPC_Type_GPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test Procedure

The test procedure has three parts:

1. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1' and polls the MS. The MS sends PACKET CONTROL ACKNOWLEDGEMENT in response of polling. After 6 blocks the SS assigns a downlink TBF in unacknowledged mode, sends a number downlink data blocks and polls the MS with a valid RRBP. The MS responses the polling.
2. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. After CV = 0 the SS waits for 5.5 s (T3182 expires). Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF.
3. The MS is triggered to transfer data. A TBF of dynamic allocation on two timeslots in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF. The last block may be transmitted twice (once in each slot) or the MS may transmit a PACKET UPLINK DUMMY CONTROL message.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | n = 440 octets in RLC unacknowledged mode. (PDP context3) |
| 2 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | TLLI_BLOCK_CHANNEL_CODING = '0'B, cs-1, CHANNEL_CODING_COMMAND = cs-1. USF assigned to MS |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on assigned PDCH |
| 4 | | | Repeat step 2 and 3 until the countdown value CV=0. |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing a valid RRBP=13, no retransmission needed. |
| 6 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH. |
| 7 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS |
| 8 | SS | | Check that no data block is transmitted by the MS in the next radio block. |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, unacknowledged mode. Steps 10 – 12 verify whether the MS has entered idle mode. |
| 10 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 11 | | | Repeat step 10 ten times. In the last data block set FBI = '1' with a valid RRBP. |
| 12 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 11. |
| 13 | | {Uplink dynamic allocation two phase access} | n = 600 octets in RLC unacknowledged mode. (PDP context3) |
| | | | TLLI_BLOCK_CHANNEL_CODING = '1'B, cs1, CHANNEL_CODING_COMMAND = cs1. |
| 14 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS |
| 15 | MS -> SS | UPLINK RLC DATA BLOCK | Received on assigned PDCH. |
| 16 | | | Repeat steps 14 and 15 until the countdown value CV=0. |
| 16a | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS to delay start of T3180 by 500ms (SS should ignore any received Rlc data block). This step is repeated until a PACKET UPLINK DUMMY CONTROL BLOCK is received from the MS, but not more than 4 times. |
| 17 | SS | | Wait 5.5 seconds (starting after the last RLC data block) to allow T3182 expiring |
| 18 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS |
| 19 | SS | | Check that from no data block is transmitted by the MS. The following steps are not applicable to the MS in GPRS multislot class 1, 2, 3, 4, 8, 30, 35 and 40. |

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 20 | SS -> MS | {Uplink dynamic allocation two phase access} | n = 2000 octets in RLC unacknowledged mode. (PDP context3) Uplink dynamic allocation CHANNEL_CODING_COMMAND = cs4 Two timeslots are assigned |
| 21 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | Sent on PDTCH0 and PDTCH1 |
| 22 | MS->SS | UPLINK RLC DATA BLOCKS | Received on the assigned PDTCH ₀ and PDTCH ₁ . |
| 23 | MS -> SS | | Repeat steps 21 and 22 Check the CV decrement from BS_CV_MAX (=12) to 0 in the received data blocks. Last block (CV=0) may be transmitted twice, once in PDTCH ₀ and once in PDTCH ₁ or the MS may transmit a PACKET UPLINK DUMMY CONTROL BLOCK after the last RLC DATA BLOCK |
| 23a | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS to delay start of T3180 by 500ms (SS should ignore any received Rlc data block). This step is repeated until a PACKET UPLINK DUMMY CONTROL BLOCK is received from the MS, but not more than 4 times. |
| 24 | SS | | Wait 5.5 seconds (starting after the last RLC data block) for T3182 expiry |
| 25 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | Sent on PDTCH0 and PDTCH1 |
| 26 | SS | | Verify that no data block is transmitted by the MS |

41.3.1.3 TBF Release / Uplink / Normal / MS initiated / Channel coding change during countdown

41.3.1.3.1 Conformance requirements

If the mobile station receives a change in the Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure, the mobile station shall act upon the new Channel Coding Command. The mobile station shall then recalculate the CV values for any untransmitted RLC data blocks using the new RLC data block size.

References

3GPP TS 04.60, subclause 9.3.1.

41.3.1.3.2 Test purpose

It is verified that the MS acts upon the new Channel Coding Command and recalculates the CV values for any untransmitted RLC data blocks using the new RLC data block size when the MS receives a change of Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure.

41.3.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS is triggered to transfer data. A TBF of dynamic allocation with channel coding CS-4 in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring.
2. Once CV=7 (BS_CV_MAX) the SS acknowledges the all received RLC data blocks and changes the channel coding to CS-1. In the next received RLC data block CV=15. The countdown values are checked during the RLC data transferring.
3. When CV=7 is reached the SS acknowledges the all received RLC data blocks and changes the channel coding to CS-2. The SS checks the next received RLC data block containing CV=5. The countdown values are checked during the RLC data transferring until CV=0. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.

Expected Sequence

| Step | Direction | Message | Comments |
|------------------------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | n = 1800 octets, USF GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end, CHANNEL_CODING_COMMAND: CS-4, RLC unacknowledged mode (PDP context3), without starting time |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 3 | SS -> MS | UPLINK RLC DATA BLOCK | |
| 4 | | | Repeat step 2 and 3 until the countdown value CV=7 (BS_CV_MAX). |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge all the received data blocks. CHANNEL_CODING_COMMAND = CS-1. No USF assigned to the MS. |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS on 3 blocks from the last radio block containing the Packet Uplink Ack/Nack in step 5. |
| A6 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH, CV=6. Repeat step 6. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the countdown value CV = 15. |
| 8 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH assigned in step 2, containing USF assigned to the MS. |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 10 | | | Repeat step 8 and 9 until the countdown value CV=7 (BS_CV_MAX). |
| 11 | SS -> MS | PACKET UPLINK ACK/NACK | CHANNEL_CODING_COMMAND = CS-2. No USF assigned to the MS. |
| 12 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS on 3 blocks from the last radio block containing the uplink assignment. |
| A12 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH, CV=6. Repeat step 12. |
| 13 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check the countdown value CV. In case the MS has sent an UPLINK RLC DATA BLOCK in step A12, CV = 3, otherwise CV = 4 |
| 14 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. |
| 15 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 16 | | | Repeat step 14 and 15 until the countdown value CV=0. |
| 17 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing valid RRBP, acknowledge all the received data blocks. |
| 18 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH. |

41.3.1.4 TBF release / Uplink / Normal / MS initiated / Whilst in DTM

41.3.1.4.1 Conformance requirements

If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1' and the mobile station does not initiate the establishment of a new uplink TBF according to one of the procedures described above, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If the mobile station is operating in half duplex mode and received a downlink assignment during the countdown or while timer T3182 was running, it shall then act on the downlink assignment. If there is no ongoing downlink TBF, the mobile station in packet transfer mode shall return to packet idle mode; the mobile station in dual transfer mode shall return to dedicated mode.

3GPP TS 04.60/44.060, sub-clause 9.3.2.4

41.3.1.4.2 Test purpose

To verify that the MS, whilst in DTM, can successfully remove an uplink TBF and return to dedicated mode.

41.3.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS attached with a P-TMSI allocated and the PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. On receiving the PACKET ASSIGNMENT message, the MS starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH. At the completion of the 1000 octet transmission the MS releases the TBF. The MS releases the uplink TBF by starting the countdown process. When the MS has sent the RLC data block with CV=0, it continues to send RLC data blocks until the MS receives a PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1'.

Upon completion of the uplink TBF release, the SS verifies that the MS has correctly returned to dedicated mode.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for $k = 1, 2$.

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H. |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | PACKET ASSIGNMENT | Includes information on the Radio resources provided to the MS. See specific message contents. |
| 5 | MS<->SS | { Uplink data transfer } | Macro |
| 6 | MS<->SS | { Completion of uplink RLC data block transfer } | Macro |
| 7 | SS->MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH previously assigned, containing USF assigned to the MS. |
| 8 | SS | | Check that no data block is transmitted by the MS in the radio block next to the radio block in step 7. The SS also verifies that the TCH is also unaffected. |

41.3.2 TBF Release / Uplink / Normal / Network initiated

41.3.2.1 TBF Release / Uplink / Normal / Network initiated / Acknowledged mode

41.3.2.1.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" the mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.2.3.

References

3GPP TS 04.60, subclause 8.1.1.4.

41.3.2.1.2 Test purpose

To verify that when the MS, in an uplink TBF of the RLC acknowledged mode, receives a PACKET TBF RELEASE message with cause value "Normal release":

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink acknowledged mode release procedure.

41.3.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS is triggered to transfer 2000 octets user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator, M and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | | {Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access} | n = 2000 octets (Note: more than one LLC PDU is needed for the test.) USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end, CHANNEL_CODING_COMMAND: CS-1, TLLI_BLOCK_CHANNEL_CODING: '1'B, CS-1. RLC acknowledged mode (PDP context2), without starting time |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 4 | | | Repeat step 2 and 3 three times |
| 5 | SS -> MS | PACKET TBF RELEASE | Sent on the PACCH of the PDCH assigned, USF not assigned to the MS, Global TFI is same as the assigned one in step 1, Uplink_Release = yes, Cause value = "Normal release". |
| 5a | SS | | SS waits 3 blocks. |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | USF assigned to the MS, on PACCH of the assigned PDCH in step 1. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 8 | | | Repeat step 6 and 7 until the countdown value CV=0 in step 7. Use of the Length indicator, M bit and E bit of the received data headers to determine that only the 1 st LLC PDU is transmitted. |
| 9 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indicator = '1' containing valid RRBP. Acknowledge all data blocks. |
| 10 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH. |
| 11 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH assigned in step 1, containing USF assigned to the MS. |
| 12 | SS | | Check that no data block is transmitted by the MS in the next radio block to step 11. |

41.3.2.2 TBF Release / Uplink / Normal / Network initiated / Unacknowledged mode

41.3.2.2.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" a mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.3.3.

References

3GPP TS 04.60, subclauses 8.1.1.4 and 9.3.3.3.

41.3.2.2.2 Test purpose

To verify that when the MS receives a PACKET TBF RELEASE message with cause value "Normal release" during an unacknowledged mode uplink TBF:

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink unacknowledged mode release procedure.

41.3.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 15.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS is triggered to transfer 2000 octets user data. A TBF of dynamic allocation in unacknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator, M and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

Expected Sequence

| Step | Direction | Message | Comments |

41.3.3 TBF Release / Uplink / Network initiated / Abnormal release

41.3.3.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. If the cause value is "Abnormal release" the mobile station shall immediately stop transmitting and follow the abnormal release with random access procedure.

References

3GPP TS 04.60, subclause 8.1.1.4.

41.3.3.2 Test purpose

To verify that the MS immediately stops transmitting and follows the abnormal release with random access procedure when it receives a PACKET TBF RELEASE message on the PACCH with cause value "Abnormal release".

41.3.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 9.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Abnormal release". The MS reinitiates a random access for one or two phase access request.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | {Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access} | n = 1200 octets in RLC acknowledged mode. (PDP context2) TLLI_BLOCK_CHANNEL_CODING = '0'B, cs-1, CHANNEL_CODING_COMMAND = cs-1. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF Assigned to MS |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 4 | | | Repeat step 2 and 3 five times. |
| 5 | SS -> MS | PACKET TBF RELEASE | Sent on the PACCH of the PDCH assigned, Global TFI is same as the assigned one in step 1, Uplink_Release = yes, Cause value = "Abnormal release". |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS, on PACCH of the assigned PDCH in step 1. Sent on the next block of that of message sent in step 5. This step is repeated for 5 times. Repetation should be on the consecutive blocks as that of the first. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | MS is allowed to send max. 5 blocks. Received on the assigned PDTCH. |
| 8 | MS -> SS | CHANNEL REQUEST | Check that the MS does not send more than five blocks. Received on RACH. |

41.3.4 TBF Release / Downlink / Normal / Network initiated

41.3.4.1 TBF Release / Downlink / Normal / Network initiated / Acknowledged mode

41.3.4.1.1 Conformance requirements

If the mobile station receives an RLC data block with the FBI bit set the value '1' and with a valid RRBP field, the mobile station shall transmit a PACKET DOWNLINK ACK/NACK message in the specified uplink block. The mobile station shall continue to monitor all assigned PDCHs.

Whenever the mobile station receives an RLC data block with a valid RRBP and the mobile station has received all RLC data blocks of the TBF, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', stop timer T3190 and start or restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the assignment. Otherwise, and if there is no ongoing uplink TBF, enter packet idle mode.

References

3GPP TS 04.60, subclause 9.3.2.5.

41.3.4.1.2 Test purpose

To verify that in a downlink TBF of acknowledged mode:

1. The MS sends PACKET DOWNLINK ACK/NACK in the specified uplink block and continues monitoring all assigned PDCHs when it receives an RLC data block with a valid RRBP field and the Final Block Indicator (FBI) = '1'.

2. Whenever the MS receives an RLC data block with a valid RRBP and has received all RLC data blocks of the TBF, it sends PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1'.
3. If the MS receives more than one RLC data block with the FBI set to '1', it accepts the data from only the first one of these blocks.
4. While timer T3192 is running, if the MS receives, after sending PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1', PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.
5. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires if there is no ongoing uplink TBF.

41.3.4.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 15, T3192 = 1,5 s.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on itsPCH. The SS transmits 10 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the highest BSN which is ten higher than the BSN of the last RLC data block. The SS sets FBI bit and polls the MS with a valid RRBP in the header of the RLC data block. The MS acknowledges the received data blocks and request a retransmission for the missing 9 data blocks in SSN and RBB fields.
2. The SS sends another 5 RLC data blocks and polls the MS with a valid RRBP. The MS acknowledges the received data blocks and request the retransmission of the missing 4 RLC data blocks. The SS transmits the last 4 RLC data blocks and polls the MS with RRBP=N+26. While the MS is waiting for transmission of the final Acknowledgement the SS transmits a RLC data block which sets FBI bit and has the same BSN value as the highest one in the test procedure 1. The MS ignores the downlink data and acknowledges the entire TBF with FINAL_ACK_INDICATION set. The SS transmits another data block with FBI set and polls the MS. The MS acknowledges the entire TBF with FINAL_ACK_INDICATION set. The SS waits 3 s.
3. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on itsPCH. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBP. The MS acknowledges the entire TBF with FINAL_ACK_INDICATION set.
4. The SS sends another PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBP. The MS acknowledges the entire TBF with FINAL_ACK_INDICATION set.

Expected Sequence

| Step | Direction | Message | Comments |
|--|--|--|--|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode. |
| 2 3 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on downlink PDTCH assigned. Repeat step 2 nine times, each time BSN is incremented by 1 |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with valid RRBP, FBI bit is set. BSN is incremented by 10. The MS has missed 9 consecutive RLC data blocks. BSN of this data block = (BSN of the last data block in step 3 + 10) mod 128 |
| 5 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the block specified by RRBP in step 4. Check that the Final Ack indicator = '0' and the SSN and RBB values for the 9 missing data blocks . |
| 6 7 | SS -> MS | DOWNLINK RLC DATA BLOCK | BSN of the data block = (BSN of the last data block in step 3 + 1) mod 128 Repeat step 6 three times, each time BSN is incremented by 1 on the basis of the last BSN in step 6 |
| 8 9 | SS -> MS MS -> SS | DOWNLINK RLC DATA BLOCK PACKET DOWNLINK ACK/NACK | A valid RRBP, BSN is incremented by 1. Received on the block specified by RRBP in step 8. Check that the Final Ack indicator = '0' and SSN and RBB values for the 4 missing data blocks. |
| 10 11 12 | SS -> MS SS -> MS | DOWNLINK RLC DATA BLOCK DOWNLINK RLC DATA BLOCK | BSN is incremented by 1 Repeat step 10 twice RRBP.= N+26, BSN is incremented by 1 |
| 13 14 15 | SS -> MS MS -> SS MS -> SS | DOWNLINK RLC DATA BLOCK PACKET DOWNLINK ACK/NACK PACKET DOWNLINK ACK/NACK | FBI bit is set, BSN is same as in step 4, RRBP.= N+26, sent on next radio block from step 12. Received on the block specified by RRBP in step 12. Check that the Final Ack indicator = '1'. Received on the block specified by RRBP in step 13. Check that the Final Ack indicator = '1'. |
| 16 17 18 | SS SS -> MS SS | DOWNLINK RLC DATA BLOCK | Wait 2s for expiry of T3192. FBI bit is set, a valid RRBP. Sent on downlink PDTCH assigned in step 1. Check that the MS does not respond on RRBP in step 17, the MS is now in packet idle mode. |
| 19 20 21 22 23 24 25 26 27 28 29 | SS -> MS SS -> MS SS -> MS MS -> SS SS SS -> MS SS -> MS SS -> MS MS -> SS | IMMEDIATE ASSIGNMENT DOWNLINK RLC DATA BLOCK DOWNLINK RLC DATA BLOCK PACKET DOWNLINK ACK/NACK SS PACKET DOWNLINK ASSIGNMENT DOWNLINK RLC DATA BLOCK DOWNLINK RLC DATA BLOCK PACKET DOWNLINK ACK/NACK | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, acknowledged mode. Repeat step 20 ten times One data block with FBI = '1' and valid RRBP. Received on the block specified by RRBP in step 22. Check that the Final Ack indicator = '1'. Wait for 80% of expiry of T3192 (1.2s) Downlink Assignment, acknowledged mode. A different slot assigned. Control Ack Bit = 1. Sent on PACCH. Repeat step 26 ten times One data block with FBI = '1' and valid RRBP. Received on the block specified by RRBP in step 28. Check that the Final Ack indicator = '1'. |

Specific Message Contents

PACKET DOWNLINK ACK/NACK message in step 15:

| | |
|---|---|
| Ack/Nack Description - FINAL_ACK_INDICATION - STARTING_SEQUENCE_NUMBER - RECEIVED_BLOCK_BITMAP | 1 (final ack) V(R) Acknowledges all data blocks transmitted by the MS |
|---|---|

PACKET DOWNLINK ASSIGNMET message in step 25:

| | |
|---|---|
| CONTROL_ACK TIMESLOT_ALLOCATION | 1 Single slot arbitrarily chosen but different from the value in step 19 |
| {L H<DOWNLINK_TFI_ASSIGNMENT>} - DOWNLINK_TFI_ASSIGNMENT | H (assign downlink TFI) Arbitrarily chosen but different from the value in step 19 |

41.3.4.2 TBF Release / Downlink / Normal / Network initiated / Unacknowledged mode

41.3.4.2.1 Conformance requirements

The network initiates release of a downlink TBF by sending an RLC data block with the Final Block Indicator (FBI) set to the value '1' and with a valid RRBP field. The RLC data block sent must have the highest BSN' (see 3GPP TS 04.60 subclause 9.3.1) of the downlink TBF. The network shall start timer T3191. The network may retransmit the last block with FBI set to the value '1' and with a valid RRBP field. For each retransmission the timer T3191 is restarted. For each RLC data block with the FBI bit set to '1' and with a valid RRBP field, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message in the uplink block specified by the RRBP field. The mobile station shall continue to read the assigned downlink PDCHs until the block period pointed to by the RRBP. If the mobile station receives more than one RLC data block with the FBI bit set to '1' and with valid RRBP fields that point the same uplink block period, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message only once. The mobile station shall then stop timer T3190, start timer T3192 and continue to monitor all assigned downlink PDCHs. If the mobile station then receives a subsequent RLC data block with a valid RRBP and the FBI bit set to '1', the mobile station shall retransmit the PACKET CONTROL ACKNOWLEDGEMENT message and restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the PACKET CONTROL ACKNOWLEDGEMENT message, receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs.

References

3GPP TS 04.60, subclauses 9.3.3.5 and 9.3.1.

41.3.4.2.2 Test purpose

To verify that in a downlink TBF of unacknowledged mode:

1. The MS transmits PACKET CONTROL ACKNOWLEDGEMENT in the uplink block specified by the RRBP field whenever it receives an RLC data block with a valid RRBP field and the Final Block Indicator (FBI) set to the value '1'.
2. After sending PACKET CONTROL ACKNOWLEDGEMENT the MS continues to monitor all assigned downlink PDCHs.
3. While timer T3192 is running, if the MS receives, after sending PACKET CONTROL ACKNOWLEDGEMENT, a PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.

4. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires.

41.3.4.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 15, T3192 = 1,5 s.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on itsPCH. The SS transmits 11 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the BSN which is ten higher than the BSN of the last RLC data block. The SS polls the MS with a valid RRBP in the header of the RLC data block. The MS acknowledges the received data blocks.
2. The SS sends another RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.
3. The SS resends the last RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT. The SS waits 1.2s and resends theRLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT. The SS waits till T3192 expires. The SS sends a RLC data block with FBI set and a valid RRBP and checks that the MS does not transmit any data block on RRBP block.
4. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on itsPCH. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBP. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT.
5. The SS sends another PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBP. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, unacknowledged mode. |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on downlink PDTCH assigned. |
| 3 | | | Repeat step 2 ten times, each time BSN is incremented by 1 |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with valid RRBP, BSN is incremented by 10. The MS has missed 9 consecutive RLC data blocks. BSN of this data block = (BSN of the last data block in step 3 + 10) mod 128 |
| 5 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the block specified by RRBP in step 4. Check that the Final Ack indicator = '0' |
| 6 | SS -> MS | DOWNLINK RLC DATA BLOCK | A valid RRBP, BSN is incremented by 1, FBI bit is set. |
| 7 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 6. |
| 8 | | | Repeat step 6 and 7 once Keeping BSN same. |
| 9 | SS | | Wait 1.2 seconds (T3192 not expired). |
| 10 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with FBI = '1' and valid RRBP. BSN is same as the BSN of the data block sent in step 6. |
| 11 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 10. |
| 12 | SS | | Wait for expiry of T3192 |
| 13 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with FBI = '1' and valid RRBP. Sent on downlink PDTCH assigned in step 1. BSN is same as the BSN of the data block sent in step 6 |
| 14 | SS | | Check that the MS does not transmit any control block on the RRBP block. |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment, unacknowledged mode. |
| 16 | SS -> MS | DOWNLINK RLC DATA BLOCK | Repeat step 16 ten times |
| 17 | | | |
| 18 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with FBI = '1' and valid RRBP. |
| 19 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | |
| 20 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Wait 1.2 seconds (T3192 not expired). Downlink Assignment, unacknowledged mode. A different timeslot assigned. Control Ack Bit = 1. Sent on PACCH. |
| 21 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent 5 blocks from last block containing PACKET DOWNLINK ASSIGNMENT |
| 22 | | | Repeat step 21 ten times |
| 23 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with FBI = '1' and valid RRBP. |
| 24 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 23. |

PACKET DOWNLINK ASSIGNMENT message in step 20:

| | |
|--------------------------------|--|
| RLC_MODE | Unacknowledged mode |
| CONTROL_ACK | 1 |
| {L H<DOWNLINK_TFI_ASSIGNMENT>} | H (assign downlink TFI) |
| - DOWNLINK_TFI_ASSIGNMENT | Arbitrarily chosen but different from the value in step 15 |
| TIMESLOT_ALLOCATION | Single slot arbitrarily chosen but different from the values already assigned. |

41.3.4.3 TBF release / Downlink / Normal / Network initiated / Whilst in DTM

41.3.4.3.1 Conformance requirements

When timer T3192 expires the mobile station shall release the downlink TBF. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the uplink assignment. If there is no ongoing uplink TBF, the mobile station in packet transfer mode shall return to packet idle mode; the mobile station in dual transfer mode shall return to dedicated mode.

References

3GPP TS 04.60/44.060, sub-clauses 9.3.2.6

41.3.4.3.2 Test purpose

To verify that the network can successfully remove a downlink TBF, to a MS in DTM, returning the MS to dedicated mode.

41.3.4.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS attached with a P-TMSI allocated and the PDP context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

Whilst in an active call on timeslot N, the MS receives a PACKET ASSIGNMENT message on the main DCCH, instructing the MS to switch to the designated timeslot. The SS waits a specified time and then starts to transmit to the newly allocated resources. After approximately 500 octets of data has been sent, the SS waits for the time period of T3192, before testing that the MS has dropped out of dual transfer mode by sending a DOWNLINK RLC DATA block with S/P=1 and verify that the MS does not respond.

Upon completion of the downlink TBF release, the SS verifies that the MS has correctly returned to dedicated mode.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N of cell A. When: k=1, Channel Type = TCH/F; k=2, Channel Type = TCH/H. |
| 2 | SS->MS | PACKET ASSIGNMENT | See specific message contents. |
| 3 | SS<->MS | { Downlink data transfer } | Macro – transmitting approximately 500 octets of data. |
| 4 | MS->SS | PACKET DL ACK/NACK | FAI = 1 |
| 5 | SS | | Wait for time period of T3192 + 10%. |
| 6 | SS->MS | RLC DOWNLINK DATA | S/P bit = 1 |
| 7 | SS | | Verifies that no PACKET DOWNLINK ACK/NACK message is received from MS and that the MS returns correctly to dedicated mode. |

41.3.5 PDCH Release

41.3.5.1 Void

41.3.5.2 PDCH Release / With TIMESLOTS_AVAILABLE

41.3.5.2.1 Conformance requirements

When a mobile station receives a PACKET PDCH RELEASE message containing a TIMESLOTS_AVAILABLE field, it shall immediately stop transmitting and receiving on all assigned PDCHs, which are indicated as not present in the TIMESLOTS_AVAILABLE field, remove those PDCHs from its list of assigned PDCHs.

If all of the mobile station's assigned PDCHs are removed from its list of assigned PDCH, and, if an uplink TBF was in progress, the mobile station shall perform an abnormal release with random access. If no uplink TBF was in progress, the mobile station shall perform an abnormal release with return to CCCH or PCCCH.

References

3GPP TS 04.60, subclause 8.2.

41.3.5.2.2 Test purpose

To verify that when the MS receives a PACKET PDCH RELEASE message with a TIMESLOTS_AVAILABLE field indicating that one or more timeslots is no longer available for packet data service:

1. it immediately stops transmitting and receiving on all assigned PDCHs which are not presented in the TIMESLOTS_AVAILABLE field.
2. it performs an abnormal release with random access when all of the MS's assigned PDCHs are removed, and an uplink TBF was in progress.
3. it performs an abnormal release with return to CCCH when all of the MS's assigned PDCHs are removed, and no uplink TBF was in progress.

41.3.5.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS_CV_MAX = 15.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

Specific PICS Statements

- Multislotclass (TSPC_Type_GPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

Test Procedure

1. The MS is triggered to transfer user data. A TBF on one slot of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating no timeslot available. It is checked that the MS initiates a random access request. A TBF is assigned to the MS to allow it to complete the uplink data transferring.
2. The MS is triggered to transfer user data. A TBF on two consecutive slots of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating that only a timeslot is available. The MS uses the available timeslot to complete the uplink data transferring.
3. The MS receives an IMMEDIATE ASSIGNMENT message containing packet downlink assignment on its PCH. A downlink TBF with a timeslot is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.
4. A downlink TBF with two timeslots is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating only a timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling and continues receiving the downlink data on the available timeslot. The SS sends another PACKET PDCH RELEASE with TIMESLOTS_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | | {Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access} | n = 1000 octets in RLC acknowledged mode. (Test PDP context2) CHANNEL_CODING_COMMAND = cs4. |
| 2 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received data block on the assigned PDTCH. |
| 4 | SS | | Repeat steps 2 and 3 six times |
| 5 | SS -> MS | PACKET PDCH RELEASE | Sent on the PACCH of the PDCH assigned in step 1. With TIMESLOTS_AVAILABLE indicating no timeslot available, RRBP = N + 26. |
| 6 | SS | | SS checks that no PACKET CONTROL ACKNOWLEDGEMENT is received. |
| 7 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS |
| 8 | SS | | Verify that no data block is received. |
| 9 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to order the MS making two phase access procedure. Sent on AGCH. |
| 11 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 10. |
| 12 | SS -> MS | PACKET UPLINK ASSIGNMENT | Open-ended uplink dynamic allocation with one time slot, USF_GRANULARITY = single block, CHANNEL_CODING_COMMAND = cs4, |
| 13 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH of the same PDCH assigned in step 10. Sent on the PACCH of the PDCH assigned in step 12, containing USF assigned to the MS. |
| 14 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 15 | | {Completion of uplink RLC data block transfer} | |
| 16 | | {Uplink dynamic allocation one phase access with contention resolution} or {Uplink dynamic allocation two phase access} | The MS of the GPRS multislot class 1, 2, 3, 4, 8, 30, 35 and 40 skips the steps 16 to 38. n = 1100 octets in RLC acknowledged mode. (Test PDP context2), CHANNEL_CODING_COMMAND = cs2 Two timeslots are assigned |
| 17 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | USFs assigned to MS. Sent on PDTCH ₆ and PDTCH ₇ . |
| 18 | MS -> SS | UPLINK RLC DATA BLOCKS | Received on the assigned PDTCH ₆ and PDTCH ₇ . |
| 19 | | | Repeat step 17 and 18 three times |
| 20 | SS -> MS | PACKET PDCH RELEASE | Sent on the PACCH of the PDCH ₆ assigned in step 16 RRBP=N+26 . With TIMESLOTS_AVAILABLE indicating no timeslot available. |
| 21 | SS | | SS checks that no PACKET CONTROL ACKNOWLEDGEMENT is received. |
| 22 | SS-MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | USFs assigned to MS. Sent on PDTCH ₆ and PDTCH ₇ . |
| 23 | SS | | Verify that MS stop sending on both PDTCH ₆ and PDTCH ₇ |
| 24 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 25 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to order the MS making two phase access procedure. Sent on AGCH. |
| 26 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 25. |
| 27 | SS -> MS | PACKET UPLINK ASSIGNMENT | Uplink dynamic allocation CHANNEL_CODING_COMMAND = cs4 Two timeslots |
| 28 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | USFs assigned to MS. Sent on PDTCH ₀ and PDTCH ₁ . |

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|---|
| 29 | MS -> SS | UPLINK RLC DATA BLOCKS | data blocks received on the assigned PDTCH ₁ and PDTCH ₀ . |
| 30 | SS | | Repeat steps 28 and 29 three times |
| 31 | SS -> MS | PACKET PDCH RELEASE | Sent on the PACCH of the PDCH ₁ assigned in step 27. With TIMESLOTS_AVAILABLE indicating only the timeslot corresponding to PDCH ₀ available. |
| 32 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent after 6 radio blocks from step 31 on PDCH ₁ , USFs assigned to MS |
| 33 | SS | | Verify that no data block was received |
| 34 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PDCH ₀ , USFs assigned to MS |
| 35 | MS -> SS | UPLINK RLC DATA BLOCK | data block received on PDCH ₀ |
| 36 | SS | | Repeat steps 34 and 35 until the countdown value CV=0, |
| 37 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge all data blocks. The SS sets Final Ack Indicator = '1' containing a valid RRBp. |
| 38 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBp on PDCH ₀ |
| 39 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment with one timeslot assigned, acknowledged mode. |
| 40 | SS -> MS | DOWNLINK RLC DATA BLOCK | A valid RRBp |
| 41 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the block specified by RRBp in step 40. |
| 42 | SS -> MS | DOWNLINK RLC DATA BLOCK | Repeat the step three times. |
| 43 | SS -> MS | PACKET PDCH RELEASE | Sent on the next radio block from step 42 with TIMESLOTS_AVAILABLE indicating no timeslot available. |
| 44 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on the next radio block from step 43 on PDTCH released, a valid RRBp = N + 21 or 22. |
| 45 | SS | | Check that no PACKET DOWNLINK ACK/NACK received on the block specified in step 44. |
| 46A | SS -> MS | IMMEDIATE ASSIGNMENT | The steps from 46 onwards are applicable to all GPRS multislot classes except the GPRS multislot class1. Sent on a PCH block corresponding to the MS's paging group with TBF starting time. |
| 46B | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Timeslot1 and Timeslot0 assigned, acknowledged mode. Sent on the PACCH assigned in step 46A. |
| 47 | SS -> MS | DOWNLINK RLC DATA BLOCK | Repeat the step five times. The RLC data blocks are received on PDTCH ₁ and PDTCH ₀ . |
| 48 | MS -> SS | PACKET DOWNLINK ACK/NACK | The last data block on PDTCH ₁ containing a valid RRBp. Received on the block specified by RRBp on PDTCH ₁ |
| 49 | SS -> MS | PACKET PDCH RELEASE | Check whether all data blocks in step 47 are acknowledged. With TIMESLOTS_AVAILABLE indicating only timeslot ₀ available. Sent on the PACCH of PDCH ₁ . |
| 50 | SS -> MS | DOWNLINK RLC DATA BLOCK | Repeat the step five times. The RLC data blocks are received on PDTCH ₀ . |
| 51 | MS -> SS | PACKET DOWNLINK ACK/NACK | The last data block on PDTCH ₀ containing a valid RRBp. On the block specified by RRBp on PDTCH ₀ . |
| 52 | SS -> MS | DOWNLINK RLC DATA BLOCK | Check whether all data blocks sent in step 50 are acknowledged. One data block with a valid RRBp = N + 26 on PDTCH ₁ . |
| 53 | SS | | Check that no PACKET DOWNLINK ACK/NACK received on the block specified. |
| 54 | SS -> MS | DOWNLINK RLC DATA BLOCK | Repeat the step five times on PDTCH ₀ . |
| 55 | SS -> MS | PACKET PDCH RELEASE | With TIMESLOTS_AVAILABLE indicating no timeslot available sent on the next block from step 54. |
| 56 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on the next radio block of step 55 on PDTCH ₀ , a valid RRBp = N + 21 or 22. |
| 57 | SS | | Check that no PACKET DOWNLINK ACK/NACK is received on the block specified in step 56. |

41.3.6 TBF Release / Extended Uplink

41.3.6.1 TBF Release / Extended Uplink / Recalculation of CV before CV = 0

41.3.6.1.1 Conformance requirements

In an uplink TBF operating in extended uplink TBF mode, the CV shall indicate the current number of RLC data blocks that has not been transmitted in the uplink TBF. The mobile station shall update the TBC value and recalculate the CV for any untransmitted RLC data block in the following cases:

- The RLC entity of the mobile station receives new data from upper layers for transmission in the uplink TBF.

References

3GPP TS 44.060, subclause 9.3.1.3

41.3.6.1.1.2 Test purpose

To verify that MS recalculates the CV when a new PDU is received from upper layers before MS has sent an RLC data block with CV=0.

41.3.6.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 14

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer user data. A TBF using dynamic allocation in acknowledged mode is assigned. The SS assigns an USF to MS until MS has sent CV = 14. Then MS is triggered to send more data. SS acknowledges all received data. A new USF is assigned to MS every 4th second. The CV is checked in the data block. If the CV becomes '0' before having been recalculated, the test has failed. Otherwise the uplink TBF is continued and completed.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | n = 500 octets, USF_GRANULARITY = 1 block, CHANNEL_CODING_COMMAND: CS-2, RLC acknowledged mode (PDP context2) USF assigned to the MS. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 4 | | | Repeat step 2 and 3 until CV=14 (BS_CV_MAX). |
| 5 | MS | | Trigger MS to send 400 octets of data. |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge all received data. USF assigned to the MS. |
| 7 | MS -> SS | RLC DATA BLOCK | Check CV |
| 8 | SS | | Wait 4s |
| 9 | | | Repeat step 6 to 8 until CV (as received in step 7) > 14 (successful) or CV = 0 (failed) |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 11 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 12 | | | Repeat step 10 and 11 until CV=0. |
| 13 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indication = 1 containing valid RRB. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received. |
| 14 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRB on PACCH of the assigned PDCH. |

Specific Message Contents

41.3.6.2 TBF Release / Extended Uplink / Recalculation of CV after CV = 0

41.3.6.2.1 Conformance requirements

[3GPP TS 44.060, 9.1.3.1]

In the extended uplink TBF mode, if $V(S) = V(A)$ and there is no RLC data block with $BSN = V(S)$ available, the mobile station shall stop sending RLC data blocks. The mobile station shall continue sending RLC data blocks when a RLC data block with $BSN = V(S)$ is available.

[3GPP TS 44.060, 9.3.1.3]

In an uplink TBF operating in extended uplink TBF mode, the CV shall indicate the current number of RLC data blocks that has not been transmitted in the uplink TBF. The mobile station shall update the TBC value and recalculate the CV for any untransmitted RLC data block in the following cases:

- The RLC entity of the mobile station receives new data from upper layers for transmission in the uplink TBF.

[3GPP TS 44.060, 9.3.1b.2]

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

References

3GPP TS 44.060, subclause 9.1.3.1, 9.3.1.3, 9.3.1b.2

41.3.6.2.2 Test purpose

- 1 To verify that MS sends an RLC/MAC control block after fully acknowledgement of transmitted RLC data.
- 2 To verify that MS continues to send RLC data blocks on the current TBF when MS receives new data from upper layers when all RLC data have been fully acknowledged.
- 3 To verify that MS recalculates the CV when a new LLC PDU is received from upper layers after MS has sent a RLC data block with CV=0.

41.3.6.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 15

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode is assigned. SS assigns an USF to MS until MS has sent CV = 0. SS acknowledges all received data with Final Ack Indicator bit set to '0'. SS continues to assigns USF to MS. MS shall send a PACKET UPLINK DUMMY CONTROL BLOCK every time. Then MS is triggered to send more data. After one second a new USF is assigned to MS. MS shall send a data block with a recalculated CV. Then the uplink TBF is continued and completed.

Expected Sequence

| Step | Direction | Message | Comments |
|-----------------------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 500 octets, USF_GRANULARITY = 1 block, CHANNEL_CODING_COMMAND: CS-2, RLC acknowledged mode (PDP context2) USF assigned to the MS. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 4 | | | Repeat step 2 and 3 until CV=0 |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indication = 0. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received. |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| A6 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit the block with BSN=0 once if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case go to step B6. |
| B6 (optional step) | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 7 | MS -> SS | PACKET UPLINK DUMMY CONTROL BLOCK | |
| 8 | | | Repeat step 6 and 7 five times. |
| 9 | MS | | Trigger the MS to send 400 octets of data. SS should take care of allocating USF's to the MS in order to prevent the MS from releasing the TBF. If SS receives PACKET UPLINK DUMMY CONTROL BLOCKs, these shall be discarded. If SS receives an UPLINK RLC DATA BLOCK, then verify that the MS has recalculated the CV. |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 11 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 12 | | | Repeat step 10 and 11 until CV=0 |
| 13 | SS -> MS | PACKET UPLINK ACK/NACK | Final Ack Indication = 1 containing valid RRBp. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received. |
| 14 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBp on PACCH of the assigned PDCH. |

41.3.6.3 TBF Release / Extended Uplink / CS change order while CV=0

41.3.6.3.1 Conformance requirements

[3GPP TS 44.060, 9.1.3.1b2]

During a period when the network does not receive any RLC data blocks from the mobile station, the network may periodically send a PACKET UPLINK ACK/NACK message to the mobile station.

[3GPP TS 44.060, 9.1.12]

In the uplink direction the channel coding scheme shall be the commanded channel coding scheme.

[3GPP TS 44.060, 11.2.28]

The Channel Coding Indicator field indicates the channel coding scheme that the mobile station shall use when transmitting on the uplink.

41.3.6.4 TBF Release / Extended Uplink / TBF reconfigure by PACKET TIMESLOT RECONFIGURE

41.3.6.4.1 Conformance requirements

The mobile station shall attempt to decode every downlink RLC/MAC block on all assigned PDCHs. Whenever the mobile station receives an RLC/MAC block containing an RLC/MAC control block, the mobile station shall attempt to

interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message.

The network may at any time during the uplink TBF initiate a change of resources by sending on the downlink PACCH monitored by the MS, an unsolicited PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message to the mobile station. During the reallocation TFI is allowed to be changed.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in sub-clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in sub-clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send for this TBF, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in sub-clause 8.1.1 for different kinds of RLC/MAC blocks apply.

Test Procedure

The MS is triggered to transfer user data. A TBF using dynamic allocation in acknowledged mode is assigned. The SS assigns an USF to MS. SS receives data blocks till CV=0 and acknowledges all the blocks with an UPLINK ACK/NACK setting FAI=0. Then SS checks that if a USF is matched to the MS it sends a UPLINK DUMMY CONTROL BLOCK. SS sends a PACKET TIMESLOT RECONFIGURE, reassigning the timeslot given for Uplink and initiating a downlink TBF. SS checks that the MS is sending a UPLINK DUMMY CONTROL BLOCK on the new channels whenever the USF is matched. SS releases the downlink TBF. SS initiates a data transfer of 200 octets. SS checks that the MS is using the newly assigned channels for doing the data transfer. SS allows the MS to complete the data transfer and releases the TBF.

Expected Sequence

| Step | Direction | Message | Comments |
|-----------------------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 500 octets, USF_GRANULARITY = 1 block, CHANNEL_CODING_COMMAND: CS-2, RLC acknowledged mode (PDP context2) USF assigned to the MS. |

41.3.6.6 Extended Uplink TBF / Cell Change while in Extended Uplink/ No Packet Neighbouring Cell Data

41.3.6.6.1 Conformance requirements

If CCN is enabled (see sub-clause 5.5.1.1a), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or in PACKET CELL CHANGE ORDER messages. If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not perform the cell change. At receipt of the first PACKET NEIGHBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210. If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE CONTINUE message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE CONTINUE message is received, the mobile station shall stop timer T3208, leave CCN mode and continue the cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (sub-clause 8.4) and in sub-clause 8.8.1.

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

41.3.6.6.2 Test purpose

To verify that an MS which is in Extended Uplink TBF, NACC active, changes to the proposed cell while in extending (sending uplink dummy control blocks).

41.3.6.6.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm, NW_EXT_UTBF = 1.

Cell A: RLA_C = -50 dBm, is active.

Cell B: RLA_C = -60 dBm, is active.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. When MS reaches CV=0, it starts sending PACKET UPLINK DUMMY CONTROL BLOCKS. During the uplink the signal strength of Cell A is lowered to -80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send PACKET UPLINK DUMMY CONTROL BLOCKS. While MS is sending PACKET UPLINK DUMMY CONTROL BLOCKS, the SS then sends PACKET CELL CHANGE CONTINUE and the MS change to Cell B. The MS request resources for an uplink in the new cell and complete the uplink transfer in the new cell.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|--------------------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 500 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present. |

41.3.6.7 Extended Uplink TBF / Cell Change failure while in Extended Uplink/ No Packet Neighbouring Cell Data

41.3.6.7.1 Conformance requirements

If CCN is enabled (see sub-clause 5.5.1.1a), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or in PACKET CELL CHANGE ORDER messages. If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not perform the cell change. At receipt of the first PACKET NEIGHBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210. If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE CONTINUE message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE CONTINUE message is received, the mobile station shall stop timer T3208, leave CCN mode and continue the cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (sub-clause 8.4) and in sub-clause 8.8.1.

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

41.3.6.7.2 Test purpose

To verify that an MS, which is in Extended Uplink TBF, NACC active, shall revert to the previous TBF, if selected cell disappears from the coverage and MS should still stay in Extended Uplink TBF

41.3.6.7.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm, NW_EXT_UTBF = 1.

Cell A: RLA_C = -50 dBm, is active.

Cell B: RLA_C = -60 dBm, is active.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established. Ready timer is deactivated

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. When MS reaches CV=0, it starts sending PACKET UPLINK DUMMY CONTROL BLOCKS. During the uplink the signal strength of Cell A is lowered to -80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send PACKET UPLINK DUMMY CONTROL BLOCKS. While MS is sending PACKET UPLINK DUMMY CONTROL BLOCKS, the SS then sends PACKET CELL CHANGE CONTINUE and the MS change to Cell B. MS tries to access Cell B. SS deactivates Cell B, The MS request resources for an uplink in the old cell.

Maximum duration of the test

41.3.6.8 Extended Uplink TBF / Cell Change while in Extended Uplink/ With Packet Neighbouring Cell Data

41.3.6.8.1 Conformance requirements

If CCN is enabled (see sub-clause 5.5.1.1a), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or in PACKET CELL CHANGE ORDER messages. If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not perform the cell change. At receipt of the first PACKET NEIGHBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210. If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE CONTINUE message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE CONTINUE message is received, the mobile station shall stop timer T3208, leave CCN mode and continue the cell reselection in NC0/NC1 mode. The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in sub-clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (sub-clause 8.4) and in sub-clause 8.8.1.

In extended uplink TBF mode, the uplink TBF may be maintained during temporary inactive periods, where the mobile station has no RLC information to send.

During the temporary inactive periods, the mobile station may stop sending RLC data block, as defined in clause 9.1.3. The network shall continue allocating the mobile station uplink radio blocks during the inactivity period, using the procedures defined in clause 8.1.1 for each medium access mode. Uplink radio blocks shall be allocated as required allowing the mobile station to continue the transfer of RLC data blocks, when a new RLC data block becomes available.

When the mobile station is allocated an uplink radio block and there is no RLC data block ready to send, the mobile station shall send an RLC/MAC control block in each uplink radio block allocated by the network. The priority defined in clause 8.1.1 for different kinds of RLC/MAC blocks apply.

41.3.6.8.2 Test purpose

To verify that: MS takes into consideration the change of parameter NW_EXT_UTBF in SI13 (sent in PACKET NEIGHBOUR CELL DATA) and operate in Extended Uplink TBF in the new cell.

41.3.6.8.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm,.

Cell A: RLA_C = -50 dBm, is active and NW_EXT_UTBF = 0.

Cell B: Supports PACKET SI STATUS. No System Information is broadcast on the BCCH, except SI3. This is only made to make it possible to verify that the MS uses the information in Packet Neighbour Cell Data. RLA_C = -60 dBm, is active and NW_EXT_UTBF = 1.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. SS sends one or more PACKET NEIGHBOUR CELL DATA to the MS (with NW_EXT_UTBF in SI13 set to 1). The SS then sends PACKET CELL CHANGE CONTINUE and the MS change to Cell B. The MS requests resources for an uplink and asks for the SI2 and SI2bis messages by sending PACKET_SI_STATUS. In the new cell the MS completes the uplink transfer while operating in extended uplink TBF.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 1200 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present. |

41.3.6.9 TBF Release / Extended Uplink / Change of RLC mode / Normal release

41.3.6.9.1 Conformance requirements

During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU does not have the same RLC mode as the current uplink TBF but has a higher radio priority, the mobile station shall complete the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in acknowledged mode.

If the TBF is operated in extended uplink TBF mode (see sub-clause 9.3.1b), the mobile station shall use the procedure in sub-clause 8.1.1.6 for changing RLC mode.

The mobile station shall send a PACKET RESOURCE REQUEST message on PACCH indicating the new RLC mode and start timer T3168.

If timer T3168 expires, the mobile station shall retransmit the PACKET RESOURCE REQUEST message and restart timer T3168.

On receipt of a PACKET RESOURCE REQUEST message, indicating a change of RLC mode, the network shall release the uplink TBF at a point determined by the network, using the procedure defined in sub-clause 9.5.

On receipt of PACKET UPLINK ACK/NACK with Final Ack Indicator set to '1' the mobile station shall stop timer T3168 and after sending the PACKET CONTROL ACK perform the change of RLC mode by establishing a new TBF.

References

3GPP TS 44.060, subclauses 8.1.1.6, 8.1.1.1.2, and 9.5.

41.3.6.9.1.2 Test purpose

To verify that during extended uplink TBF the MS re-establishes the TBF and changes the RLC mode.

41.3.6.9.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 14, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 1 and context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. SS assigns USFs allowing the MS to transmit data blocks. The MS is triggered to transfer 220 octets user data with a different RLC mode and higher radio priority.

The mobile station shall complete the transmission of the current LLC PDU; SS will verify the complete reception of the LLC PDU.

SS acknowledges the LLC PDU with a Packet Uplink Ack/Nack with TBF Est field is set to '1' and Final Ack Indicator bit set to '1'.

The mobile station shall use the same procedures as are used for TBF establishment using two phase starting from the point where the mobile station transmits the PACKET RESOURCE REQUEST message

In case the MS ignores the TBF Est field in the PACKET UPLINK ACK/NACK , the mobile station shall transmit a PACKET CONTROL ACKNOWLEDGEMENT message, release the TBF and shall establish a new TBF using two phase access.

SS assigns a PDCH to the MS. SS assigns USFs allowing the MS to transmit data blocks until the countdown value CV=0.

SS sends a Packet Uplink Ack/Nack with TBF Est field set to '0' and Final Ack Indicator bit set to '1' and the MS is polled. The MS answers with a Packet Control Acknowledgement and the TBF is released.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------------|-----------|--|--|
| 1 | MS | {Uplink dynamic allocation two phase access} | In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end, TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, RADIO_PRIORITY = 4 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI, and BSN is correct. |
| 4 | | | Repeat step 2 and 3 three times |
| 5 | MS | | To trigger the MS to transfer 220 octets: in test PDP context1, unacknowledged RLC mode and Radio Priority = 1 |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK Or | Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI, and BSN is correct. Send PACKET UPLINK ACK/NACK to acknowledge all received datablocks when CV=0 and PACKET RESOURCE REQUEST is not yet received. (Note: MS may retransmit the block with BSN=0 once if it has already been scheduled while PACKET UPLINK ACK/NACK is being processed and the new LLC PDU is not ready for the transmission) |
| | | PACKET RESOURCE REQUEST Or | Received on PACCH of the assigned PDCH indicating the change of RLC mode. Check for radio priority level = 1 and RLC mode Unacknowledged RLC mode. |
| | | PACKET UPLINK DUMMY CONTROL BLOCK | The MS is in extended TBF mode. |
| 8 | | | Repeat step 6 and 7 until CV = 0 and a PACKET RESOURCE REQUEST is received. |
| 9 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH assigned, acknowledging all blocks so far. FINAL_ACK_INDICATION = '1', TBF Est = 1, Valid RRBP. |
| 10 | SS | | Verify that only one complete LLC PDU has been received. |
| 11 (optional) | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH. If not received continue with step 14. |
| 12 (conditional) | MS -> SS | CHANNEL REQUEST | CHANNEL REQUEST with establishment cause = 'Single block packet access' or one phase packet access. |
| 13 (conditional) | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on the AGCH |
| 14 | MS -> SS | PACKET RESOURCE REQUEST | Received on PACCH of the assigned PDCH Check for radio priority level = 1 and RLC mode Unacknowledged RLC mode. Received on the block specified by the single block assignment of step 13 or by the RRBP of step 9. |
| 15 | SS -> MS | PACKET UPLINK ASSIGNMENT | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the assigned PDCH. |
| 16 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of the assigned PDCH. |
| 17 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the PDTCH assigned. |

| | | | |
|----|----------|--------------------------------|--|
| 18 | | | Repeat step 16 and 17 until countdown value CV=0. |
| 19 | SS -> MS | PACKET UPLINK ACK/NACK | FINAL_ACK_INDICATION = '1', TBF Est = 0, a valid RRBP, acknowledge all received data, sent on PACCH. |
| 20 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH. |

41.3.6.10 TBF Release / Extended Uplink / Change of RLC mode / Abnormal release

41.3.6.10.1 Conformance requirements

During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU does not have the same RLC mode as the current uplink TBF but has a higher radio priority, the mobile station shall complete the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in acknowledged mode. immediately request a resource reallocation for uplink according to the new Radio Priority of the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and starting timer T3168.

If the TBF is operated in extended uplink TBF mode (see sub-clause 9.3.1b), the mobile station shall use the procedure in sub-clause 8.1.1.6 for changing RLC mode.

Then the mobile station shall complete the transmission of the current LLC PDU. If the TBF is operated in extended uplink TBF mode, the mobile station shall release the uplink TBF and re-establish a new uplink TBF in order to change the RLC mode

The mobile station shall send a PACKET RESOURCE REQUEST message on PACCH indicating the new RLC mode and start timer T3168.

If timer T3168 expires, the mobile station shall retransmit the PACKET RESOURCE REQUEST message and restart timer T3168.

If timer T3168 expires and the PACKET RESOURCE REQUEST message has already been transmitted four times, the mobile station shall perform an abnormal release with access retry (see sub-clause 8.7.2).

On receipt of a PACKET RESOURCE REQUEST message, indicating a change of RLC mode, the network shall release the uplink TBF at a point determined by the network, using the procedure defined in sub-clause 9.5.

On receipt of PACKET UPLINK ACK/NACK with Final Ack Indicator set to '1' the mobile station shall stop timer T3168 and after sending the PACKET CONTROL ACK perform the change of RLC mode by establishing a new TBF.

41.3.6.10.1.2 Test purpose

To verify that during extended uplink TBF the MS perform an abnormal release with access retry after timer T3168 expired and PACKET RESOURCE REQUEST message has been transmitted four times.

41.3.6.10.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, BS_CV_MAX = 14, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 1 and context 2 established.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. SS assigns USFs allowing the MS to transmit data blocks until the MS completes the countdown procedure. As soon as the MS is in extended UL TBF mode, the MS is triggered to transfer 220 octets user data with different RLC mode.

The mobile station shall immediately request a resource reallocation for uplink indicating the changed RLC mode applied to the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and start timer T3168.

SS keeps assigning USFs, the MS will send Packet Uplink Dummy Control Blocks till T3168 expire. The MS will send a PACKET RESOURCE REQUEST message again on the PACCH and restart timer T3168.

The SS keeps assigning USFs till the MS has transmitted the Packet Resource Request four times.

The MS shall perform an abnormal release with access retry.

The SS will assign new resources to the MS to complete the new TBF.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------------|-----------|--|--|
| 1 | SS | {Uplink dynamic allocation two phase access} | In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end, TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, RADIO_PRIORITY = 4 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct. |
| 4 | | | Repeat step 2 and 3 till CV = 0 |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH assigned, the USF not assigned to the MS, acknowledging all blocks. FINAL_ACK_INDICATION = '0', TBF Est = 1 |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS, sent after 6 blocks from step 5 |
| A6 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit the block with BSN=0 once if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case go to step B6. |
| B6 (optional step) | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 7 | MS -> SS | PACKET UPLINK DUMMY CONTROL BLOCK | MS is in extended UL TBF mode. |
| 8 | MS | | To trigger the MS to transfer 220 octets: in test PDP context1, unacknowledged RLC mode and Radio Priority = 1 |
| 9 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| A10 (optional step) | MS -> SS | PACKET UPLINK DUMMY CONTROL BLOCK | MS may transmit while processing the uplink data trigger PACKET UPLINK DUMMY CONTROL BLOCK. In this case repeat step 9 until a PACKET RESOURCE REQUEST is received. |
| 10 | MS -> SS | PACKET RESOURCE REQUEST | MS starts T3168. Received on the PACCH of the assigned PDCH, Indicating the change of RLC mode: Check that radio priority level = 1 and Unacknowledged RLC mode. |
| 11 | SS -> MS | PACKET UPLINK ACK/NACK | To prevent T3184 from expiring, sent on the PACCH of the PDCH assigned, the USF not assigned to the MS, acknowledging all Blocks. FINAL_ACK_INDICATION = '0', TBF Est = 0 |
| 12 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 13 | MS -> SS | PACKET UPLINK DUMMY CONTROL BLOCK | MS is in extended UL TBF mode |
| | | Or PACKET RESOURCE REQUEST | |
| 14 | | | Repeat step 12 and 13 until a PACKET RESOURCE REQUEST has been received. Check that the PACKET RESOURCE REQUEST is received within T3168 +/- 10% from the previous PACKET RESOURCE REQUEST. |
| 15 | | | Repeat Step 11 to Step 14 until the PACKET RESOURCE REQUEST has been received a total of 4 times. |
| | | | MS shall perform an abnormal release with access retry |
| 16 | MS -> SS | CHANNEL REQUEST | CHANNEL REQUEST with establishment cause = 'Single block packet access' or one phase packet |

| | | | |
|----|----------|-------------------------------------|--|
| | | | access. |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on the AGCH |
| 18 | MS -> SS | PACKET RESOURCE REQUEST | Received on the single block assigned in step 17. Check that radio priority level = 1, peak throughput class = 5, unacknowledged RLC mode. |
| 19 | SS -> MS | PACKET UPLINK ASSIGNMENT | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. |
| 20 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 19. |
| 21 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the PDTCH assigned. |
| 22 | | | Repeat step 20 and 21 until countdown value CV=0. |
| 23 | SS -> MS | PACKET UPLINK ACK/NACK | FINAL_ACK_INDICATION = '1', a valid RRB, acknowledge all received data, sent on PACCH. |
| 24 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRB on PACCH of the assigned PDCH. |

41.3.7 Void

41.4 Void

41.5 Dual transfer mode

To bring the MS into active state U10, macro 40.4.3.22 shall be used.

41.5.1 PS establishment whilst in dedicated mode

41.5.1.1 Uplink TBF establishment

41.5.1.1.1 Uplink TBF establishment with no reallocation of CS resources

41.5.1.1.1.1 Uplink TBF establishment with no reallocation of CS resources / Successful case / Uplink resources assigned

41.5.1.1.1.1.1 Conformance requirements

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007.

On receipt of a DTM REQUEST message the network may allocate an uplink packet resource. The packet uplink resource is assigned to the mobile station in one of the DTM assignment messages:

- DTM ASSIGNMENT COMMAND or
- PACKET ASSIGNMENT.

The PACKET ASSIGNMENT message is only used when the packet resource is a PDCH and no reallocation of the RR connection is needed.

On receipt of:

- DTM ASSIGNMENT COMMAND message or
- PACKET ASSIGNMENT message,

the mobile station shall stop T3148.

- when the network sends a PACKET ASSIGNMENT message, the packet request procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

When the packet request procedure is completed, the mobile station has entered the dual transfer mode.

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1

41.5.1.1.1.2 Test purpose

To verify that the MS:

- decodes correctly the Cell's System information, understanding that DTM access is allowed;
- requests an uplink TBF when it has something to send;
- acts upon the PACKET ASSIGNMENT message and then transmitting on the PDCH allocated.

41.5.1.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in packet idle mode with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. On receipt of the PACKET ASSIGNMENT message, the MS starts to send RLC DATA BLOCKS to the SS on the assigned PDCH.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|--|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H. |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | PACKET ASSIGNMENT | SS sends this message such that it is received before Timer T3148 expiry. Includes information on the Radio resources provided to the MS. See specific message contents. |
| 5 | MS<->SS | { Uplink data transfer } | Macro - Completion of the 1000 Octets of Data. |

Specific Message Contents

PACKET ASSIGNMENT (Step 4):

k=1;

41.5.1.1.1.2 Uplink TBF establishment with no reallocation of CS resources / Successful case / Downlink resources assigned

41.5.1.1.1.2.1 Conformance requirements

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007.

On receipt of a DTM REQUEST message the network may allocate an uplink packet resource. The packet uplink resource is assigned to the mobile station in one of the DTM assignment messages:

- DTM ASSIGNMENT COMMAND or
- PACKET ASSIGNMENT.

The PACKET ASSIGNMENT message is only used when the packet resource is a PDCH and no reallocation of the RR connection is needed.

On receipt of:

- DTM ASSIGNMENT COMMAND message or
- PACKET ASSIGNMENT message,

the mobile station shall stop T3148.

If the received DTM ASSIGNMENT COMMAND or PACKET ASSIGNMENT message includes uplink packet resources, the mobile station shall proceed with the packet access. If the received message includes downlink packet resources and no uplink packet resources, the mobile station shall abort the packet access procedure and proceed with the procedure specified in clause 3.4.22.3, and then attempt an establishment of uplink TBF, using the applicable procedure specified in 3GPP TS 04.60.

- when the network sends a PACKET ASSIGNMENT message, the packet request procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

When the packet request procedure is completed, the mobile station has entered the dual transfer mode.

If the received PACKET ASSIGNMENT message includes downlink packet resources and no uplink packet resources, the mobile station shall abort the packet access procedure and proceed with the downlink TBF establishment, and then attempt an establishment of uplink TBF.

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS assigns the MS downlink PS resources using the PACKET ASSIGNMENT message. The MS, upon receipt of the assignment message, aborts the packet access procedure and proceeds with the downlink assignment. When possible the MS requests the uplink TBF establishment. The SS upon receipt of the resource request allocates the MS uplink resources using the PACKET UPLINK ASSIGNMENT message. The MS then starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

The MS is in the active state (U10) of a call on cell A.

The MS is in packet idle mode with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC acknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, the SS returns a DTM REJECT message, simulating the inability to allocate the requested packet resource. The DTM REJECT message includes a wait indication (T3142) specifying that the MS is to wait 5 seconds before being allowed to re-request resources. The MS is again prompted to initiate an uplink TBF before the wait indication has expired, it is then tested that the MS does not try to access the network until the Wait Indication has expired. After the Wait Indication has expired, the MS initiates the packet access procedure and sends a DTM REQUEST message.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

2 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |
|------|-----------|-------------|---|
| 1 | SS | | MS in state U10, utilising Timeslot N for CS connection (Timeslot chosen arbitrarily). When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H. |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | DTM REJECT | SS sends this message such that it is received before Timer T3148 expiry. The message contains the "Wait Indication" which is set to 10 seconds. |
| 5 | SS | | Waits 2 seconds |
| 6 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.If triggering of data involves manual operation, this is to be finished within 5 seconds. |
| 7 | SS | | Monitors the MS, checking that the MS does not try and establish an uplink TBF until at least 10 seconds after the DTM REJECT message was passed to the MS. |
| 8 | MS->SS | DTM REQUEST | Check that this message is sent after the Wait Indication has expired. |

41.5.1.1.1.4 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / Inter System to UTRAN Handover Command

41.5.1.1.1.4.1 Conformance requirements

Only valid for a UTRAN capable MS. In dedicated mode or dual transfer mode, a change to UTRAN channel(s) can be requested by the network RR sublayer. This change is performed through the handover to UTRAN procedure.

If the mobile station receives an INTER SYSTEM TO UTRAN HANDOVER COMMAND message during the packet access procedure, the mobile station shall abort the packet access procedure, stop timer T3148 and proceed with the handover to UTRAN procedure as specified in clause 3.4.4a.

References

3GPP TS 04.18/44.018 sub-clauses 3.4.4a & 3.4.22.1.1.3.2

41.5.1.1.1.4.2 Test purpose

Verifying that the MS aborts the Packet Access procedure and proceed with the handover to UTRAN, upon reception of an INTER SYSTEM TO UTRAN HANDOVER COMMAND message.

41.5.1.1.1.4.3 Method of test

Initial Conditions

System Simulator:

2 cells - Cell 1 is GSM with DTM supported, Cell 2 is UTRAN. The present document sub-clause 26.6.5.1 shall be referenced for the default parameters of cell 1. 3GPP TS 34.108, sub-clause 6.1 shall be referenced for default parameters of Cell 2.

Mobile Station:

The MS is in the active state (U10) of a call.
The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS starts the GSM cell and UTRAN cell with cell selection conditions in favour of GSM cell, the MS selects the GSM cell for camping on. The SS brings the MS into the call active state (CC state U10). The MS is then triggered to initiate packet uplink data transfer in RLC acknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS configures the dedicated channel corresponding to the pre-configuration in UTRAN cell, then sends INTERSYSTEM TO UTRAN HANDOVER COMMAND message indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of the UTRAN cell. The SS checks whether the handover is performed by confirming the MS transmits a HANDOVER TO UTRAN COMPLETE message to the SS, on the DCCH of the UTRAN cell. To check that CS call is still active, SS Releases the CS call. To check that PDP context is active, SS sends MODIFY PDP CONTEXT REQUEST in UMTS cell. The MS may or may not accept the QoS and replies to the SS accordingly.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | SS | | MS in state U10, utilising Timeslot N for CS connection (Timeslot chosen arbitrarily) |
| 2 | ← | MEASUREMENT INFORMATION | |
| 3 | → | MEASUREMENT REPORT | Including Measurement Results on the UTRAN cell |
| 4 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |

41.5.1.1.1.5 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / Assignment Command

41.5.1.1.1.5.1 Conformance requirements

If the mobile station receives an ASSIGNMENT COMMAND or HANDOVER COMMAND message during the packet access procedure, the mobile station shall abort the packet access procedure, stop timer T3148 and proceed with the channel assignment procedure as specified in clause 3.4.3 or the handover procedure as specified in clause 3.4.4. The mobile station shall then attempt an establishment of uplink TBF, using the procedure specified in clause 3.4.22.

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.3.2

41.5.1.1.1.5.2 Test purpose

To verify that the MS aborts the packet access procedure when the MS receives an ASSIGNMENT COMMAND message before the expiry of T3148, completing the channel assignment procedure before re-attempting the establishment of the uplink TBF.

41.5.1.1.1.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC unacknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS reallocates the MS's CS resources using the ASSIGNMENT COMMAND. Once the MS changes to the newly allocated timeslot the MS re-requests PS resources with a DTM REQUEST message. Once the PS resources are allocated, the MS enters DTM.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|--|
| 1 | MS | | MS in state U10, utilising Timeslot N for CS connection (Timeslot chosen arbitrarily) |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | ASSIGNMENT COMMAND | This message is sent such that it is received before timer T3148 expires. CS resources changed to (N + 4) MOD 8. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H. |
| 5 | MS->SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. |
| 6 | MS->SS | DTM REQUEST | |
| 7 | SS->MS | PACKET ASSIGNMENT | Includes information on the Radio resources provided to the MS. See specific message contents. |
| 8 | MS<->SS | { Uplink data transfer } | Macro - Completion of the 1000 octets of Data. |

41.5.1.1.1.6 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / Handover Command

41.5.1.1.1.6.1 Conformance requirements

If the mobile station receives an ASSIGNMENT COMMAND or HANDOVER COMMAND message during the packet access procedure, the mobile station shall abort the packet access procedure, stop timer T3148 and proceed with the channel assignment procedure as specified in clause 3.4.3 or the handover procedure as specified in clause 3.4.4. The mobile station shall then attempt an establishment of uplink TBF, using the procedure specified in clause 3.4.22.

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.3.2

41.5.1.1.1.6.2 Test purpose

To verify that the MS aborts the packet access procedure when the MS receives a HANDOVER COMMAND message before the expiry of T3148, completing the handover procedure before re-attempting the establishment of the uplink TBF.

41.5.1.1.1.6.3 Method of test

Initial Conditions

System Simulator:

2 Cells, A and B, with same LAI/RAI and both supporting DTM.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in packet idle mode with a P-TMSI allocated and PDP context 2 activated

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC acknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS returns a HANDOVER COMMAND to the MS. The HANDOVER COMMAND instructs the switching of the MS to the newly assigned channel and the establishment of lower layer connections. Once the CS connection is established, the MS returns an HANDOVER COMPLETE message on the new main signalling link. The MS may perform Cell Update by sending the GPRS INFORMATION message containing an empty LLC PDU followed by DTM REQUEST to initiate packet uplink data transfer. If the Cell Update is not performed using GPRS INFORMATION, the MS again sends a DTM REQUEST message to initiate packet uplink data transfer, the SS allocates the MS PS resources and the MS enters DTM.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |
|-----------------------|-----------|--------------------------|---|
| 1 | SS | | MS in state U10, utilising Timeslot N for CS connection (Timeslot chosen arbitrarily) When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H. Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 2 | MS | | |
| 3 | MS->SS | DTM REQUEST | The message is sent such that it is received before the timer T3148 expires. See specific message contents. 41.5.1.1.1.7 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / Channel Release

41.5.1.1.1.7.1 Conformance requirements

If the MS receives a CHANNEL RELEASE message during the packet access procedure, the MS shall abort the packet access procedure, stop timer T3148 and proceed with the RR connection release procedure. The MS shall then attempt an establishment of the uplink TBF.

References

3GPP TS 04.18/44.018 sub-clauses 3.4.13 & 3.4.22.1.1.3.2

41.5.1.1.1.7.2 Test purpose

To verify that the MS aborts the packet access procedure when the MS receives a CHANNEL RELEASE message before the expiry of T3148, completing the release before re-attempting the establishment of the uplink TBF.

41.5.1.1.1.7.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC acknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS orders the MS to release the CS connection. The MS releases lower layer resources and then requests uplink packet transfer using normal dynamic allocation two phase access.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | MS | | MS in state U10, utilising Timeslot N for CS connection (Timeslot chosen arbitrarily by test house) |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | CHANNEL RELEASE | This message is sent such that it is received before expiry of timer T3148. |

| 6 | MS<->SS | { Uplink data transfer } | Macro - Completion of the 1000 octets of Data. |

41.5.1.1.2 Uplink TBF establishment with reallocation of CS resources

41.5.1.1.2.1 Uplink TBF establishment with reallocation of CS resources / Successful case

41.5.1.1.2.1.1 Conformance requirements

Upon receipt of the DTM ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channel and initiates the establishment of lower layer connection (this includes the activation of the channel, their connection and the establishment of the main signalling link).

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.3.1

41.5.1.1.2.1.2 Test purpose

To verify that the MS allows reallocation of its CS resources during the request for PS resources. The resources can either be reallocated to a new timeslot within the same frequency or a new frequency.

41.5.1.1.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

41.5.1.1.2.2 Uplink TBF establishment with reallocation of CS resources / Abnormal case / Assignment Failure

41.5.1.1.2.2.1 Conformance requirements

If the network commands the mobile station to reallocate the RR connection and the establishment of the main DCCH fails, all the allocated packet resources are released; the mobile station shall revert to the old channel, trigger the establishment of the main DCCH and send a DTM ASSIGNMENT FAILURE message on the main DCCH with cause value "lower layer failure".

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.5

41.5.1.1.2.2.2 Test purpose

To verify that, if the MS cannot complete the reallocation, then the MS shall revert back to the old resources and re-establish a connection.

41.5.1.1.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS reallocates the MS's CS resources to a different frequency band and assigns the new PS resources. The SS accomplishes the resource assignment by passing a DTM ASSIGNMENT COMMAND message to the MS. Once the MS has received the assignment message, it moves to the new allocation, attempts to reconnect the CS resources, but the SS is not receptive to the establishment of the main signalling bearer in the new cell. The MS reverts back to the old CS resources and sends a DTM ASSIGNMENT FAILURE message on the old main DCCH, with cause value set to "lower layer failure". The MS re-initiates the packet access procedure and sends a DTM REQUEST message.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |

41.5.1.1.2.3 Uplink TBF establishment with reallocation of CS resources / Abnormal case / Multislot class violation

41.5.1.1.2.3.1 Void

41.5.1.1.2.3.2 Void

41.5.1.1.2.3.3 Void

41.5.1.1.2.3.4 Uplink TBF establishment with reallocation of CS resources / Abnormal case / Multislot class violation / Singleslot allocation

41.5.1.1.2.3.4.1 Conformance requirements

If a failure occurs on the mobile station side before the packet request procedure is completed, all the allocated packet resources are released, the mobile station remains on the current channel and upper layers are notified (packet resource establishment failure). d) If a DTM ASSIGNMENT COMMAND or PACKET ASSIGNMENT message assigns resources not compliant with the multislot capabilities of the mobile station.

If the mobile station received a DTM ASSIGNMENT COMMAND message before the packet resource establishment failure was detected, the mobile station shall return a DTM ASSIGNMENT FAILURE message with one of the following corresponding cause values:

For Release 6 and later:

d) In case of abnormal case d) above, "protocol error unspecified";

otherwise:

d) In case of abnormal case d) above, "channel mode unacceptable";

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.5

41.5.1.1.2.3.4.2 Test purpose

If the MS is allocated resources that do not fulfil the MS multislot class indicated in the Classmark (Classmark 3 and MS Radio Access Capabilities), then the MS shall send an ASSIGNMENT FAILURE message to the network indicating this discrepancy. If the MS is allocated resources outside those indicated in the Classmark with an PACKET ASSIGNMENT message the MS shall ignore the message and continue in dedicated mode.

41.5.1.1.2.3.4.3 Method of test

Initial Conditions

System Simulator:

1 cell with DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call, packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS commands the MS to reallocate its CS resources and also assigns PS resources to the MS. The resources provided to the MS by the SS fall outside of the MS multislot classmark. The MS transmits the DTM ASSIGNMENT FAILURE message, with cause value set to "protocol error unspecified" in case of release 6 and later or "channel mode unacceptable" / "protocol error unspecified" otherwise, indicating the discrepancy. The SS then reassigns the CS resources of the MS into a full rate channel and then waits for the MS to again request an uplink TBF. Upon reception of the DTM REQUEST message the SS allocates the MS resources using a PACKET ASSIGNMENT message. The SS verifies that the MS ignores this incorrect allocation and maintains the CS connection.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------|--|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N. |

41.5.1.1.3 Uplink TBF establishment required whilst DTM is not supported in cell

41.5.1.1.3.1 Conformance requirements

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007.

Access to the network is allowed:

- if dual transfer mode is supported in the cell.

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1

41.5.1.1.3.2 Test purpose

To verify that the MS:

- understands the SI6 Rest Octets information element, containing the DTM support field, which indicates network support of DTM;
- does not attempt to establish an uplink TBF whilst in DM and in a cell that indicates that DTM is unsupported.

41.5.1.1.3.3 Method of test

Initial Conditions

System Simulator:

- 1 cell with DTM not supported

Mobile Station:

- The MS is in the active state (U10) of a call.
- The MS is in packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate uplink packet transfer, whilst the MS has an active call and DTM is not supported in the cell. The MS does not request packet resources from the network until the CS call is complete.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------|--|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N. |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 3 | SS | | Check that the MS is not sending a DTM REQUEST. |
| 4 | SS | | The SS verifies that the MS has maintained the CS connection |

41.5.1.2 Downlink TBF establishment

41.5.1.2.1 Whilst in Ready State

41.5.1.2.1.1 Downlink TBF establishment in Ready State / Successful case

41.5.1.2.1.1.1 Conformance requirements

This procedure is only applicable to a mobile station in dedicated mode and with no TBF allocated. If the mobile station already has an ongoing TBF, the establishment of the downlink packet resource is performed on the PACCH; see 3GPP TS 04.60.

The establishment of a downlink packet resource is initiated by the RR entity on the network side using the packet downlink assignment procedure in dedicated mode. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007. The request from upper layers specifies a QoS profile, an *RLC mode*, *DRX parameters* and an *MS classmark* associated with the packet transfer.

The network initiates the packet downlink assignment procedure in dedicated mode by sending a DTM assignment message (i.e. DTM ASSIGNMENT COMMAND or a PACKET ASSIGNMENT) in acknowledged mode on the main DCCH.

The completion of the packet downlink assignment procedure while in dedicated mode depends on the actual assignment message used by the network:

- when the network sends a PACKET ASSIGNMENT message, the packet downlink assignment procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.3

41.5.1.2.1.1.2 Test purpose

To test that while in dedicated mode and in ready state, the MS can decode and act upon the allocation of downlink packet resources and enter dual transfer mode.

41.5.1.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in the GMM READY state, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

Whilst in an active call on timeslot N, the MS receives a PACKET ASSIGNMENT message on the main DCCH, instructing the MS to switch to the designated timeslot. The SS waits a specified time and then starts to transmit to the newly allocated resources. The test procedure is complete when the MS successfully acknowledges the downlink RLC data blocks.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N of cell A. When: K=1, Channel Type = TCH/F K=2, Channel Type = TCH/H |
| 2 | SS->MS | PACKET ASSIGNMENT | See specific message contents. |
| 3 | SS | | SS Waits T3190 – 50% (2.5s) |
| 4 | SS<->MS | { Downlink data transfer } | Macro – Transmitting 10kB of Data |

Specific Message Contents

PACKET ASSIGNMENT (Step 2):

k=1;

| | |
|--|-----------------------------------|
| As default message contents except: RR Packet Uplink Assignment IE RR Packet Downlink Assignment IE - TIMESLOT_ALLOCATION | Not included (N ± 1) MOD 8 |
|--|-----------------------------------|

k=2;

|--|-----------------------|

41.5.1.2.1.2 Downlink TBF establishment in Ready State / Abnormal cases / No cell allocation available

41.5.1.2.1.2.1 Conformance requirements

If a failure occurs on the mobile station side before the packet downlink assignment procedure is completed (packet establishment failure), all the allocated packet resources are released and the mobile station remains on the current channel.

In the following cases a packet resource establishment failure has occurred:

e) If the mobile station has no current CA and if it needs a CA to analyse the DTM ASSIGNMENT COMMAND message.

If the mobile station received a DTM ASSIGNMENT COMMAND message before the packet resource establishment failure was detected, the mobile station shall return a DTM ASSIGNMENT FAILURE message with one of the following corresponding cause values:

e) In case of abnormal case e) above, "no cell allocation available";

References

3GPP TS 04.18/44.018 sub-clause 3.4.22.3.3

41.5.1.2.1.2.2 Test purpose

To verify that when the MS is unable analyse a DTM ASSIGNMENT COMMAND message, it returns a DTM ASSIGNMENT FAILURE message with the cause value set to "no cell allocation available".

41.5.1.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell no SYSTEM INFORMATION TYPE 1 message (some other SI message is sent with TC=0),, with GPRS and DTM support.

Mobile Station:

The MS is in the active state (U10) of a call and is also in GMM-READY state.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS attempts to assign a PDCH for downlink transfer, with reallocating the MS's current TCH, but the MS has no current cell allocation (taken from BCCH) and is therefore unable to decode the allocation received in the DTM ASSIGNMENT COMMAND message.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------|---|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N of cell A. |
| 2 | SS->MS | DTM ASSIGNMENT COMMAND | Sent on main DCCH in acknowledged mode. |
| 3 | MS->SS | DTM ASSIGNMENT FAILURE | Cause = "no cell allocation available" |

41.5.1.2.2 Whilst in Standby State / Packet Notification

41.5.1.2.2.1 Conformance requirements

3GPP TS 04.18/44.018 sub-clause 3.4.22.2:

Upon receipt of the PACKET NOTIFICATION message, the RR sublayer of the MS indicates the receipt of a packet paging request to the GMM sublayer.

3GPP TS 23.060 sub-clause 8.1.4:

4) Upon receipt of a GPRS Paging Request message, the MS shall respond with either any single valid LLC frame (e.g., a Receive Ready or Information frame) that implicitly is interpreted as a page response message by the SGSN. The MS shall not use the LLC NULL frame as a page response. When responding, the MS changes MM state to READY. The Packet Channel Request precedes the response and Packet Immediate Assignment procedures as described in GSM 03.64.

3GPP TS 23.060 sub-clause 8.1.4

3GPP TS 04.64/44.064 sub-clause 6.4.1.7

41.5.1.2.2.2 Test purpose

To test that an MS in an active call and also in GMM Standby state, can respond to a PACKET NOTIFICATION message sent on the main DCCH, with a Cell Update.

41.5.1.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The DTM MS in GMM Standby state, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, in an active call using timeslot N, upon receipt of a PACKET NOTIFICATION message on the main DCCH returns a blank LLC frame to the SS as Cell Update, drawing the MS into Ready state.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------|---|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N of cell A. |
| 2 | SS->MS | PACKET NOTIFICATION | Sent on main DCCH in acknowledged mode. |
| 3 | MS->SS | GPRS INFORMATION | The MS responds with an empty LLC PDU to indicate Cell Update. |

41.5.2 CS establishment whilst in packet transfer mode

41.5.2.1 MT CS establishment whilst in packet transfer mode with a downlink TBF established

41.5.2.1.1 Conformance requirements

Paging initiation using PACCH applies when sending a paging request message to a mobile station that is GPRS attached, when the mobile station is in packet transfer mode and the network is able to co-ordinate the paging request with the radio resources allocated for the mobile station on a PDCH. This kind of paging co-ordination shall be provided in network mode of operation I (see 3G TS 23.060). This kind of paging co-ordination may be provided also in network mode of operation II or III. This kind of paging co-ordination shall be provided if the network supports DTM.

When the mobile station responds to a paging request for RR connection establishment, it shall follow the paging response procedures as specified in 3GPP TS 04.18. For that purpose, a mobile station in packet transfer mode or a mobile station that has initiated a packet access procedure may abort any ongoing TBF or the packet access procedure in the following two cases:

- The mobile station requires that the BSS co-ordinates the allocation of radio resources for an RR connection and a simultaneous TBF (GPRS class A mode of operation by means of DTM).

References

3GPP TS 04.60/44.060, sub-clauses 6.1.3, 6.1.4.

41.5.2.1.2 Test purpose

To verify that the MS reacts to CS paging on the PACCH, whilst in packet transfer mode, by releasing the downlink TBF and then establishing an RR connection. It is then tested that once the RR connection is established the MS accepts the re-establishment of the downlink TBF.

41.5.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 cell, DTM supported.

Mobile Station:

- The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.
- The MS is in the GMM READY state.

Specific PICS Statements

- GPRS Release (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Test Procedure

The MS is brought into packet transfer mode before being paged on the PACCH. Upon receipt of the PACKET PAGING REQUEST message, the MS returns to packet idle mode and initiate the establishment of CS connection. Once the MS has established the CS connection, the SS requests the re-establishment of the PS resources with a PACKET ASSIGNMENT message.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| 20 | MS | | The appropriate bearer channel is through connected in both directions. |
| 21 | SS | | Maintain CS connection call for 30 seconds and check that no DTM Request is received |
| 22 | SS->MS | CHANNEL RELEASE | With a valid RR cause value and including the GPRS Resumption IE |
| 23 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 24 | | {Uplink dynamic allocation one phase access or two phase access } | |
| 25 | MS<->SS | { Uplink data transfer } | Macro |

41.5.3 PS establishment whilst in dual transfer mode

41.5.3.1 Uplink TBF establishment with a downlink TBF established

41.5.3.1.1 Uplink TBF establishment with a downlink TBF established and no PS downlink reallocation

41.5.3.1.1.1 Conformance requirements

The mobile station may request establishment of one or more uplink TBFs when there are one or more ongoing downlink TBFs by including a Channel Request Description or the Extended Channel Request Description information element in the (EGPRS) PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer an upper layer PDU.

When multiple TBF procedures are not supported, the mobile station initiates the packet access procedure by sending the Channel Request Description information element in the (EGPRS) PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of an (Extended) Channel Request Description information element in the (EGPRS)PACKET DOWNLINK ACK/NACK message, the network may assign radio resources to the mobile station on one or more PDCHs by transmitting an uplink assignment message (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE message) on the PACCH, or may reject one or more of the requests by sending a PACKET ACCESS

REJECT message on the PACCH. If the PACKET TIMESLOT RECONFIGURE message is sent, then the message shall contain the UPLINK_TFI_ASSIGNMENT field.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall stop timer T3168 and switch to the assigned PDCHs.

References

3GPP TS 04.60/44.060 sub-clause 8.1.2.5

On receipt of the PACKET RESOURCE REQUEST the network shall respond by sending a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE or a PACKET ACCESS REJECT message to the mobile station on the downlink PACCH.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall stop timer T3168 and switch to the assigned PDCHs.

3GPP TS 04.60/44.060 sub-clause 8.1.1.1.2

41.5.3.1.1.2 Test purpose

To verify that the MS can be assigned uplink PS resources, when no reallocation of the existing CS and downlink PS resources is required.

41.5.3.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the state "idle, updated, GMM-registered, GPRS attached" with a TMSI, P-TMSI allocated and PDP context 1 has been established. The MS is also in the active state (U10) of a call on the cell.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

Whilst in an active call on timeslot N, the MS receives a PACKET ASSIGNMENT message on the main DCCH, instructing the MS to switch to a designated timeslot and receive data. The SS then starts to transmit to the newly allocated resources. Before the SS completes transmission of the 1000 octets of data, the MS is triggered to initiate an uplink packet transfer. The SS then sends another RLC Downlink Data block to the MS with the S/P bit set to 1. The MS responds by sending a PACKET DOWNLINK ACK/NACK message to the SS including the Channel Request Description IE. The SS allocates uplink resources to the MS with the PACKET UPLINK ASSIGNMENT message. The test procedure is complete when the SS successfully verifies both uplink and downlink transmission are working in parallel.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for $k = 1, 2$.

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N of cell A. When: k=1, Channel Type = TCH/F; k=2, Channel Type = TCH/H. See specific message contents. |
| 2 | SS->MS | PACKET ASSIGNMENT | |
| 3 | SS<->MS | { Downlink data transfer } | Macro – Transmission of 10k octets of data |
| 4 | MS | | Before the completion of the downlink transmission, the MS is triggered to initiate an uplink packet transfer containing 1000 octets. |
| 5 | SS<->MS | { Downlink data transfer } | RLC Downlink Data - S/P Bit = 1 Continue the { Downlink data transfer } until the MS include the Channel Request Description IE in the PACKET DOWNLINK ACK/NACK. |
| 6 | SS->MS | PACKET UPLINK ASSIGNMENT | When: k=1, Timeslot=T; and k=2, Timeslot=N. |
| 7 | SS | | Verify both uplink and downlink data transmission is functioning correctly. |

41.5.3.1.2 Uplink TBF establishment with a downlink TBF established and PS downlink reallocation

41.5.3.1.2.1 Conformance requirements

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message, the network may assign radio resources to the mobile station on one or more PDCHs by transmitting a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message on the PACCH, or may reject the request by sending a PACKET ACCESS REJECT message on the PACCH.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall stop timer T3168 and switch to the assigned PDCHs.

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer of 1000 octets of data in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS an uplink TBF. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. On receiving the PACKET ASSIGNMENT message, the MS starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH. Once the MS has sent correctly approximately 500 octets, the SS transmits a PACKET DOWNLINK ASSIGNMENT message allocating the MS downlink packet resources. The test procedure is complete when the SS successfully verifies both uplink and downlink transmission are working in parallel.

MS supporting DTM shall complete testing for k=1 and MSs indicating support of single slot DTM shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

41.5.4 Enhanced DTM CS Establishment

41.5.4.1 MT Call Establishment - No Reallocation of PS Resources

41.5.4.1.1 Conformance Requirements

The network initiates the RR connection establishment procedure by sending a PACKET CS COMMAND message to the mobile station on PACCH, encapsulating one of the following RR messages:

- DTM ASSIGNMENT COMMAND message (see sub-clause 8.9.2.1);

The network may allocate both a dedicated channel and radio resources on one or more PDCHs to be used by the mobile station and shall in this case send a DTM ASSIGNMENT COMMAND encapsulated in a PACKET CS COMMAND message. Having sent the DTM ASSIGNMENT COMMAND message, the network starts timer T3107, specified in 3GPP TS 44.018. The allocated dedicated channel shall be of TCH type. The network may also reallocate radio resources (PDCH(s)) in the DTM ASSIGNMENT COMMAND message. If both the RR Packet Uplink Assignment and the RR Packet Downlink Assignment information elements are omitted in the DTM ASSIGNMENT COMMAND the network implicitly indicates that the current radio resources shall be maintained. The mobile station shall act on the DTM ASSIGNMENT COMMAND message as specified in GPP TS 44.018. On receiving an encapsulated DTM ASSIGNMENT COMMAND message, the mobile station shall establish the main signalling link using the procedure described in 3GPP TS 44.018.

References

3GPP TS 44.060, sub-clauses 8.9.1.2, 8.9.2.1

41.5.4.1.2 Test Purpose

To verify that the MS reacts to CS establishment initiated by the NW whilst in packet transfer mode, by establishing an RR connection on the allocated circuit switched resources.

To verify that the MS continues to maintain an ongoing downlink TBF throughout the enhanced DTM CS establishment procedure.

41.5.4.1.3 Method of Test

Initial Conditions

41.5.4.3 MT Call Establishment - Allocation of CS Resources Only - Downlink TBF

41.5.4.3.1 Conformance Requirements

The network initiates the RR connection establishment procedure by sending a PACKET CS COMMAND message to the mobile station on PACCH, encapsulating one of the following RR messages:

- IMMEDIATE ASSIGNMENT message (see sub-clause 8.9.2.2).

The network may allocate only a dedicated channel to the mobile station and shall in this case send an IMMEDIATE ASSIGNMENT encapsulated in a PACKET CS COMMAND message. Having sent the IMMEDIATE ASSIGNMENT message, the network starts timer T3101, specified in 3GPP TS 44.018.

If a mobile station receives an encapsulated IMMEDIATE ASSIGNMENT message which either does not specify a starting time or specifies a starting time which has already elapsed, the mobile station shall immediately:

- perform an abnormal release without retry (see sub-clause 8.7.1), if no uplink TBF is in progress

The mobile station shall abort all TBFs on PDCH(s) in progress and report an RLC/MAC failure to upper layers.

Upon mobile originated or mobile terminated RR connection establishment, on receipt of IMMEDIATE ASSIGNMENT message while in packet transfer mode, the mobile station shall enter dedicated mode.

References

41.5.4.4 MO Call Establishment - No Reallocation of PS Resources

41.5.4.4.1 Conformance Requirements

The mobile station shall initiate the RR connection establishment by sending PACKET CS REQUEST messages on the PACCH.

Upon receipt of a PACKET CS REQUEST message, the network shall answer to the mobile station by encapsulating one of the following RR messages in the PACKET CS COMMAND message, and sending the PACKET CS COMMAND message on PACCH:

- DTM ASSIGNMENT COMMAND message (see sub-clause 8.9.2.1);

The network may allocate both a dedicated channel and radio resources on one or more PDCHs to be used by the mobile station and shall in this case send a DTM ASSIGNMENT COMMAND encapsulated in a PACKET CS COMMAND message. The allocated dedicated channel shall be of TCH type. If both the RR Packet Uplink Assignment and the RR Packet Downlink Assignment information elements are omitted in the DTM ASSIGNMENT COMMAND the network implicitly indicates that the current radio resources shall be maintained.

References

41.5.4.4.2 Test Purpose

To verify that following the sending of the PACKET CS REQUEST on PACCH whilst in packet transfer mode, the MS establishes an RR connection on the allocated circuit switched resources.

To verify that the MS continues to maintain an ongoing uplink TBF throughout the enhanced DTM CS establishment procedure.

41.5.4.4.3 Method of Test

Initial Conditions

System Simulator:

- 1 cell, Enhanced DTM supported.

Mobile Station:

- The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.
- The MS is in the GMM READY state.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is brought into packet transfer mode for uplink TBF. The user is made to initiate the establishment of a mobile originated circuit switched call. The MS sends the PACKET CS REQUEST message on PACCH. The NW responds by sending an encapsulated DTM ASSIGNMENT COMMAND on the PACCH. The encapsulated DTM ASSIGNMENT COMMAND contains neither the RR Packet Uplink Assignment IE nor the RR Packet Downlink Assignment IE. Upon receipt of the PACKET CS COMMAND, the MS initiates the establishment of the CS connection. It is checked that the MS maintains the uplink TBF throughout the enhanced DTM CS establishment procedure.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | { Uplink dynamic allocation two phase access } | Macro. An uplink TBF is established on timeslot N. n = 1000 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: arbitrarily chosen CHANNEL_CODING_COMMAND: cs-1 |
| 2 | SS<->MS | { Uplink data } | Macro. |
| 3 | | | The user is made to trigger the establishment of a mobile originated speech call. |

41.5.4.5 MO Call Establishment - Reallocation of PS Resources

41.5.4.5.1 Conformance Requirements

The mobile station shall initiate the RR connection establishment by sending PACKET CS REQUEST messages on the PACCH.

Upon receipt of a PACKET CS REQUEST message, the network shall answer to the mobile station by encapsulating one of the following RR messages in the PACKET CS COMMAND message, and sending the PACKET CS COMMAND message on PACCH:

- DTM ASSIGNMENT COMMAND message (see sub-clause 8.9.2.1);

The network may allocate both a dedicated channel and radio resources on one or more PDCHs to be used by the mobile station and shall in this case send a DTM ASSIGNMENT COMMAND encapsulated in a PACKET CS COMMAND message. The allocated dedicated channel shall be of TCH type. The network may also reallocate radio resources (PDCH(s)) in the DTM ASSIGNMENT COMMAND message.

41.5.4.6 MO Call Establishment - Allocation of CS Resources Only - Downlink TBF

41.5.4.6.1 Conformance Requirements

The mobile station shall initiate the RR connection establishment by sending PACKET CS REQUEST messages on the PACCH.

Upon receipt of a PACKET CS REQUEST message, the network shall answer to the mobile station by encapsulating one of the following RR messages in the PACKET CS COMMAND message, and sending the PACKET CS COMMAND message on PACCH:

- IMMEDIATE ASSIGNMENT message (see sub-clause 8.9.2.2);

The network may allocate only a dedicated channel to the mobile station and shall in this case send an IMMEDIATE ASSIGNMENT encapsulated in a PACKET CS COMMAND message.

If a mobile station receives an encapsulated IMMEDIATE ASSIGNMENT message which either does not specify a starting time or specifies a starting time which has already elapsed, the mobile station shall immediately:

- perform an abnormal release without retry (see sub-clause 8.7.1), if no uplink TBF is in progress,

The mobile station shall abort all TBFs on PDCH(s) in progress and report an RLC/MAC failure to upper layers.

Upon mobile originated or mobile terminated RR connection establishment, on receipt of IMMEDIATE ASSIGNMENT message while in packet transfer mode, the mobile station shall enter dedicated mode.

41.5.4.7 MO Call Establishment – IMMEDIATE ASSIGNMENT REJECT

41.5.4.7.1 Conformance Requirements

The mobile station shall initiate the RR connection establishment by sending PACKET CS REQUEST messages on the PACCH.

Upon receipt of a PACKET CS REQUEST message, the network shall answer to the mobile station by encapsulating one of the following RR messages in the PACKET CS COMMAND message, and sending the PACKET CS COMMAND message on PACCH:

- IMMEDIATE ASSIGNMENT REJECT message (see sub-clause 8.9.2.3).

If no dedicated channel is available for assignment, the network may send to the mobile station an IMMEDIATE ASSIGNMENT REJECT message encapsulated in a PACKET CS COMMAND message.

On receipt of the encapsulated IMMEDIATE ASSIGNMENT REJECT message the mobile station shall stop sending PACKET CS REQUEST messages, starts timer T3122 with the indicated value ("wait indication" information element, specified in 3GPP TS 44.018) and continue in packet transfer mode.

The behaviour of the mobile station while timer T3122 is running is specified in 3GPP TS 44.018.

The mobile station is not allowed to make a new attempt to establish a non emergency RR connection in the same cell until T3122 expires. Provided that an IMMEDIATE ASSIGNMENT REJECT message has not been received for an emergency RR connection attempt, the mobile station may attempt to enter the dedicated mode for an emergency call in the same cell before T3122 has expired.

3GPP TS 44.018, sub clauses 3.3.1.1.3.2

41.5.4.7.2 Test Purpose

To verify that when the MS receives an IMMEDIATE ASSIGNMENT REJECT encapsulated in a PACKET CS COMMAND following an attempt to originate a non-emergency call, it does not attempt to originate a further non-emergency call whilst T3122 is running.

To verify that the MS does attempt to originate an emergency call whilst T3122 is running following the receipt of an encapsulated IMMEDIATE ASSIGNMENT REJECT message in response to non-emergency call establishment.

To verify that MS continues with any ongoing TBFs after receiving an IMMEDIATE ASSIGNMENT REJECT with Wait Indication.

41.5.4.7.3 Method of Test

Initial Condition

System simulator

41.5.4.8 MO Call Establishment - Dedicated Channel Establishment Failure

41.5.4.8.1 Conformance Requirements

The network may allocate both a dedicated channel and radio resources on one or more PDCHs to be used by the mobile station and shall in this case send a DTM ASSIGNMENT COMMAND encapsulated in a PACKET CS COMMAND message. Having sent the DTM ASSIGNMENT COMMAND message, the network starts timer T3107, specified in 3GPP TS 44.018. The allocated dedicated channel shall be of TCH type

- If the mobile fails to establish the main signalling link, it shall perform an abnormal release with RR connection establishment retry (see sub-clause 8.7.4).

mobile station shall abort all TBFs in progress and report an RLC/MAC failure to upper layers. The mobile station in packet transfer mode shall return to the CCCH configuration, enter packet idle mode and initiate the establishment of the RR connection as specified in 3GPP TS 44.018.

References

3GPP TS 44.060, sub-clauses 8.7.4,8.9.2.1,8.9.4.1

41.5.4.8.2 Test Purpose

To verify that MS aborts all TBF in progress when it fails to establish the main signalling link after receiving the PACKET CS COMMAND.

To verify that during procedure of establishment of the main DCCH link MS is using the new PS resources re-allocated in PACKET CS COMMAND.

To verify MS initiate establishment of circuit switch connection in CCCH configuration.

41.5.4.8.3 Method of Test

Initial Conditions

System Simulator:

- 1 cell, Enhanced DTM supported.

Mobile Station:

- The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.
- The MS is in the GMM READY state.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is brought into packet transfer mode for uplink and downlink .The user is made to initiate the establishment of mobile originated call.The MS sends PACKET CS REQUEST message on PACCH.The network responds by sending an encapsulated DTM ASIGNMENT COMMAND which reallocates the PS resources.Upon receipt of PACKET CS COMMAND,the MS initiates establishment of CS connection,meanwhile the uplink and downlink data transfer continues on the new allocated PS resources.There is no response on the main DCCH from the newtork.The MS establish CS call using CCCH procedure.It is checked that MS neither uses the old PS resources nor the new PS resources.

Maximum Duration of Test

10 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|-----------------------|-----------|---|--|
| 1 | | { Uplink dynamic allocation two phase access } | n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: arbitrarily chosen CHANNEL_CODING_COMMAND: cs-1 An uplink TBF is established on timeslot N. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF addressing the MS, sent on 3 blocks from the last radio block containing the uplink assignment in step 1. |
| 3 | MS->SS | UPLINK RLC DATA BLOCK | |

41.5.5 Enhanced DTM CS Release

41.5.5.1 SI Aquisition - No Reallocation of PS Resources

41.5.5.1.1 Conformance Requirements

If the mobile station and the network support enhanced DTM CS release procedure, the network may delay the release of the RR connection until the mobile station has received the needed system information, in order to maintain the radio resources on the PDCH(s) after the release of the RR connection.

The network initiates enhanced DTM CS release procedure by sending the PACKET CS RELEASE INDICATION message as specified in 3GPP TS 44.060.

On receipt of PACKET CS RELEASE INDICATION message with the ENHANCED_DTM_CS_RELEASE_INDICATION parameter set to indicate that the RR connection is released, the mobile station shall send the PACKET SI STATUS (respectively PACKET PSI STATUS if the PBCCH is present) message on PACCH to indicate which system information messages were stored while in the dual transfer mode by the mobile station. The following system information (respectively packet system information) messages are required to maintain radio resources and enter packet transfer mode after the release of the RR connection:

- PSI1, PSI2 and PSI14 in the *Received PSI Message List*; or respectively
- SI13, SI3 and SI1, if present, in the *Received SI Message List*.

The PSI (respectively SI) messages listed above shall be indicated as the first PSI (respectively SI) messages indicated in the PACKET PSI STATUS (respectively PACKET SI STATUS) messages. If other PSI (respectively SI) messages are indicated in the PACKET PSI STATUS (respectively PACKET SI STATUS) message, the priority order defined in Table 5.5.1.4.3.1 shall apply.

The mobile station is allowed to send the PACKET SI STATUS (respectively PACKET PSI STATUS) message twice and the second sending occurrence of this message shall take place at the first suitable opportunity at least one second after the first transmission of that message. Whenever the mobile station has received all required system information (respectively packet system information) messages, it shall send the PACKET SI STATUS (respectively PACKET PSI STATUS) message at the first suitable opportunity, even if it has already sent the PACKET SI STATUS (respectively PACKET PSI STATUS) twice.

When the network receives the PACKET SI STATUS (respectively PACKET PSI STATUS) message indicating that all required system information (respectively packet system information) messages have been received by the mobile station it shall stop timer T3197, start timer T3109 (see 3GPP TS 44.018) and send the CHANNEL RELEASE message on the main DCCH indicating that the mobile station is allowed to continue in packet transfer mode after the release of the RR connection (see 3GPP TS 44.018).

41.5.5.1.2 Test Purpose

To verify that the MS performs the acquisition of system information in response to the PACKET CS RELEASE INDICATION message from the NW with the ENHANCED_DTM_CS_RELEASE_INDICATION indicating that the RR connection is released.

To verify that during the acquisition of system information procedure performed as part of the Enhanced DTM CS Release procedure, the MS sends the PACKET SI STATUS message no more than twice when acquiring the system information and then once more only when all the required system information has been acquired.

To verify that the MS continues to maintain an ongoing uplink TBF throughout the Enhanced DTM CS Release procedure and once the Enhanced DTM CS Release procedure has been completed.

41.5.5.1.3 Method of Test

Initial Conditions

System Simulator:

- 2 cells A and B with the same MCC/MNC/LAC/RAC, Enhanced DTM supported.

Mobile Station:

- The MS is in the active state (U10) of a call on Cell A on timeslot N.
- The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resource using a PACKET ASSIGNMENT message. Following handover to Cell B, the active speech call is disconnected. The SS sends the PACKET CS RELEASE INDICATION message on PACCH to the MS indicating that the RR connection is going to end. The PACKET CS RELEASE INDICATION indicates that when the RR connection is released the MS maintains its downlink and/or uplink TBF(s). The MS responds with the PACKET SI STATUS message on PACCH which indicates the non receipt of the SI1 and SI3 messages. In response the SS sends the PACKET SERVING CELL SI message on PACCH encapsulating the SI1 message. The MS again sends the PACKET SI STATUS message on PACCH which indicates reception of the SI1 message but not the SI3 message. In response the SS sends the PACKET SERVING CELL SI message on PACCH encapsulating the SI13 message. It is checked that the two PACKET SI STATUS messages from the MS are sent at least 1s apart. Finally the SS sends the PACKET SERVING CELL SI message on PACCH encapsulating the SI3 message. The MS responds with the PACKET SI STATUS message indicating receipt of the SI1 and SI3 messages. The SS sends the CHANNEL RELEASE message on the main DCCH indicating in the Enhanced DTM Release Indication IE that the MS may continue in packet transfer mode. It is checked that the MS continues operating the uplink TBF by sending RLC data blocks on the PS resources.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|--------------------|-----------|-------------------------------------|---|
| 1 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 2 | MS->SS | DTM REQUEST | Sent on main DCCH. |
| 3 | SS->MS | PACKET ASSIGNMENT | Sent on main DCCH. See specific message contents. |
| 4 | SS<->MS | { Uplink data } | Macro. |
| 5 | SS->MS | HANDOVER COMMAND | Sent on main DCCH. See specific message contents. The following messages are sent and received on Cell B. |
| 6 | MS->SS | HANDOVER ACCESS | Repeated on every burst of the uplink main DCCH (and optionally on the SACCH) until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND. |
| 7 | SS->MS | PHYSICAL INFORMATION | Sent on main DCCH. |
| 8 | MS->SS | HANDOVER COMPLETE | Sent on main DCCH. |
| 9 | SS->MS | DTM INFORMATION | Sent on main DCCH. |
| 10 | MS->SS | GPRS INFORMATION | Sent on main DCCH. Contains an empty LLC PDU for Cell Update. |
| (optional step) | | | |
| 11 | MS->SS | DTM REQUEST | Sent on main DCCH. |
| 12 | SS->MS | PACKET ASSIGNMENT | Sent on main DCCH. See specific message contents. |
| 13 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH. USF assigned to the MS. |
| 14 | MS->SS | UPLINK RLC DATA BLOCK | Sent on PDTCH. May contain an empty LLC PDU for cell update provided Step 10 was not performed. Note : The empty LLC PDU may be followed by one or more lower priority LLC PDUs in the same RLC Data Block. Steps 15 and 16 are performed if an empty LLC PDU was received in Step 14. |
| 15 | MS->SS | PACKET RESOURCE REQUEST | Sent on PACCH. |
| (conditional step) | | | |
| 16 | SS->MS | PACKET UPLINK ASSIGNMENT | Sent on PACCH. See specific message contents. |
| 17 | | | It is checked that the MS continues to transmit uplink data during Steps 18 to 29 below. |
| 18 | SS->MS | DISCONNECT | Sent on main DCCH. The active speech call is disconnected. |
| 19 | MS->SS | RELEASE | Sent on main DCCH. |
| 20 | SS->MS | RELEASE COMPLETE | Sent on main DCCH. |
| 21 | SS->MS | PACKET CS RELEASE INDICATION | Sent on PACCH. See specific message contents. |
| 22 | MS->SS | PACKET SI STATUS | Sent on PACCH. Indicates non receipt of SI13, SI3 and SI1. |
| 23 | SS->MS | PACKET SERVING CELL SI | Sent on PACCH. Contains the SI1 message from Cell B. |
| 24 | MS->SS | PACKET SI STATUS | Sent on PACCH. Received at least 1s after Step 22. Indicates reception of SI1. Indicates non receipt of SI13 and SI3. |
| 25 | SS->MS | PACKET SERVING CELL SI | Sent on PACCH. Contains the SI13 message from Cell B. |

| | | | |
|----|---------|--------------------------|--|
| 26 | SS | | The SS checks for 2s after Step 24 that the MS does not repeat the PACKET SI STATUS message. |
| 27 | SS->MS | PACKET SERVING CELL SI | Sent on PACCH. Contains the SI3 message from Cell B. |
| 28 | MS->SS | PACKET SI STATUS | Sent on PACCH. Indicates reception of SI13, SI3 and SI1. |
| 29 | SS->MS | CHANNEL RELEASE | Sent on main DCCH. |
| 30 | SS<->MS | { Uplink data transfer } | See specific message contents. Macro. |

|---|--|
| As default message contents, except: - GLOBAL TFI - ENHANCED PACKET CS RELEASE INDICATION | The TFI of the current uplink TBF. 1 (RR connection released) The subsequent message encoding indicates that when the RR connection is released the MS maintains it's downlink and/or uplink TBF(s). |

CHANNEL RELEASE (Step 29):

| Information Element | Value/remark |
|---|--|
| As default message contents, except: Enhanced DTM CS Release Indication IE | 1 (MS allowed to continue in packet transfer mode) |

41.5.5.2 Reallocation of PS Resources for Uplink and Downlink TBFs

41.5.5.2.1 Conformance Requirements

The network may at any time during uplink packet transfer initiate a change of resources by sending on the downlink PACCH monitored by the MS, an unsolicited uplink assignment message (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT

RECONFIGURE or PACKET CS RELEASE INDICATION message) to the mobile station. During the reallocation, TFI is allowed to be changed.

References

3GPP TS 44.060, sub-clauses 8.1.1.1.2

41.5.5.2.2 Test Purpose

To verify that the MS continues to maintain an ongoing uplink TBF and downlink TBF throughout the Enhanced DTM CS Release procedure.

To verify that the MS correctly implements the reallocation of the PS resources, including a change of TFI, for an ongoing uplink TBF upon completion of the Enhanced DTM CS Release procedure.

To verify that the MS correctly implements the reallocation of the PS resources, including a change of TFI, for an ongoing downlink TBF upon completion of the Enhanced DTM CS Release procedure.

41.5.5.2.3 Method of Test

Initial Conditions

System Simulator:

- 1 cell, Enhanced DTM supported.

Mobile Station:

- The MS is in the active state (U10) of a call on timeslot N.
- The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC unacknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, the SS assigns the MS packet switched resources using a PACKET ASSIGNMENT message. Before the MS has completed transmission of the uplink data, the SS orders a handover to Cell B. Following handover to Cell B the non-combined routing area update procedure is performed on the main DCCH. The MS resumes transmission of the uplink data. The active speech call is disconnected. The SS sends the PACKET CS RELEASE INDICATION message on PACCH to the MS indicating that the RR connection is going to end. The PACKET CS RELEASE INDICATION indicates that when the RR connection is released the MS may maintain its uplink TBF. The packet switched resources are not re-allocated. The MS responds with the PACKET SI STATUS message on PACCH. The SS sends the MS any requested SI messages encapsulated within PACKET SERVING CELL SI messages on PACCH. The MS responds with the PACKET SI STATUS message indicating receipt of the required SI messages. The SS sends the CHANNEL RELEASE message on the main DCCH indicating in the Enhanced DTM Release Indication IE that the MS may continue in packet transfer mode. It is checked

that the MS continues operating the uplink TBF by sending RLC data blocks on the PS resources. The MS requests circuit switched resources by sending the PACKET CS REQUEST on PACCH. The SS responds with the PACKET CS COMMAND on PACCH which encapsulates a DTM ASSIGNMENT COMMAND. The location update procedure is completed on the assigned circuit switched resources. Prior to sending the CHANNEL RELEASE message on the main DCCH, the SS sends the PACKET CS RELEASE INDICATION message on PACCH to the MS indicating that the RR connection is going to end. The PACKET CS RELEASE INDICATION indicates that when the RR connection is released the MS may maintain its uplink TBF. The packet switched resources are not re-allocated. The MS responds with the PACKET SI STATUS message on PACCH. The SS sends the MS any requested SI messages encapsulated within PACKET SERVING CELL SI messages on PACCH. The MS responds with the PACKET SI STATUS message indicating receipt of the required SI messages. The SS then sends the CHANNEL RELEASE message on the main DCCH indicating in the Enhanced DTM Release Indication IE that the MS may continue in packet transfer mode. It is checked that the MS continues operating the uplink TBF by sending RLC data blocks on the PS resources.

Maximum Duration of Test

5 minutes

41.5.5.4 Change of LA in NW Mode I

41.5.5.4.1 Conformance Requirements

If the MS and the network in mode I support enhanced DTM CS release procedure and the location area of the MS has changed while in dual transfer mode, the MS shall send an indication to the network that in this case the enhanced DTM CS release procedure shall not be used. This indication is sent in the PACKET SI STATUS or PACKET PSI STATUS message. After the receipt of the indication the network shall release the RR connection and PS resources. Upon receipt of a CHANNEL RELEASE message the MS shall initiate the Combined RA/LA Update procedure.

References

3GPP TS 43.055, sub-clauses 6.4.4.1

41.5.5.4.2 Test Purpose

To verify that in response to the NW initiating the Enhanced CS Release procedure the MS requests that the procedure shall not be used following a change of location area whilst the MS was in dedicated mode in a network using network mode I.

To verify that following the release of packet and circuit switched resources the MS performs the Combined Routing Area Update procedure following a change of location area whilst the MS was in dedicated mode in a network using network mode I.

41.5.5.4.3 Method of Test

Initial Conditions

System Simulator:

- 2 cells, A and B operating in NW Mode I with different LAC, both supporting Enhanced DTM.

Mobile Station:

- The MS is in the active state (U10) of a call on Cell A on timeslot N.
- The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC unacknowledged mode and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, the SS assigns the MS packet switched resources using a PACKET ASSIGNMENT message. Before the MS has completed transmission of the uplink data, the SS orders a handover to Cell B. Following handover to Cell B the non-combined routing area update procedure is performed on the main DCCH. The MS resumes transmission of the uplink data. The active speech call is disconnected. The SS sends the PACKET CS RELEASE INDICATION message on PACCH to the MS indicating that the RR connection is going to end. The PACKET CS RELEASE INDICATION indicates that when the RR connection is

released, the MS may maintain the uplink TBF. The packet switched resources are not re-allocated. The MS responds with the PACKET SI STATUS message on PACCH in which it requests the release of both packet and circuit switched resources. The SS responds with the CHANNEL RELEASE message which indicates that the MS may not continue in packet transfer mode. It is checked that the MS no longer transmits data on the previously assigned packet switched resources. The MS requests packet switched resources in order to perform the Combined Routing Area update procedure. Following completion of the Combined Routing Area Update procedure the MS requests packet switched resources in order to continue with the transfer of user data.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets. |
| 2 | MS->SS | DTM REQUEST | Sent on main DCCH. |
| 3 | SS->MS | PACKET ASSIGNMENT | Sent on main DCCH. See specific message contents. |
| 4 | SS<->MS | { Uplink data } | Macro. |
| 5 | SS->MS | HANDOVER COMMAND | Sent on main DCCH. See specific message contents. The following messages are sent and received on Cell B. |
| 6 | MS->SS | HANDOVER ACCESS | Repeated on every burst of the uplink main DCCH (and optionally on the SACCH) until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND. |
| 7 | SS->MS | PHYSICAL INFORMATION | Sent on main DCCH. |
| 8 | MS->SS | HANDOVER COMPLETE | Sent on main DCCH. |
| 9 | SS->MS | DTM INFORMATION | Sent on main DCCH. |
| 10 | MS->SS | GPRS INFORMATION | Sent on main DCCH. Contains a ROUTING AREA UPDATE REQUEST message. |
| 11 | SS->MS | GPRS INFORMATION | Sent on main DCCH. Contains a ROUTING AREA UPDATE ACCEPT message. Does not allocate MS a new P-TMSI. |
| 12 | MS->SS | DTM REQUEST | Sent on main DCCH. |
| 13 | SS->MS | PACKET ASSIGNMENT | Sent on main DCCH. See specific message contents. |
| 14 | SS<->MS | { Uplink data } | Macro. |
| 15 | | | It is checked that the MS continues to transmit uplink data during Steps 16 to 20 below. |
| 16 | SS->MS | DISCONNECT | Sent on main DCCH. The active speech call is disconnected. |
| 17 | MS->SS | RELEASE | Sent on main DCCH. |
| 18 | SS->MS | RELEASE COMPLETE | Sent on main DCCH. |
| 19 | SS->MS | PACKET CS RELEASE INDICATION | Sent on PACCH. See specific message contents. |
| 20 | MS->SS | PACKET SI STATUS | Sent on PACCH. PS_REL_REQ = 1 The MS requests release of both packet and circuit switched resources. |
| 21 | SS->MS | CHANNEL RELEASE | Sent on main DCCH. See specific message contents. |
| 22 | SS | | It is checked that the MS no longer transmits data on the packet switched resources assigned at Step 13. |
| 23 | MS -> SS | CHANNEL REQUEST | Sent on RACH. Access Type = MM Procedure |
| 24 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. Allocates uplink TBF on single timeslot. |
| 25 | SS<->MS | { Uplink data block transfer } | Macro. The received RLC data blocks contain :- ROUTING AREA UPDATE REQUEST Update type = 'Combined RA/LA updating' |
| 26 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on PCH. Allocates downlink TBF on single timeslot. |
| 27 | SS<->MS | { Downlink data transfer } | Macro. The transmitted RLC data blocks contain :- ROUTING AREA UPDATE ACCEPT Update result = 'Combined RA/LA updated' |
| 28 | MS -> SS | CHANNEL REQUEST | Does not assign a new P-TMSI. Sent on RACH Access Type = Two Phase Access Request |
| 29 | SS -> MS | IMMEDIATEASSIGNMENT | Sent on AGCH. Single block assignment, to order the MS to follow the two phase access procedure. |

| | | | |
|----|----------|--------------------------|---|
| 30 | MS -> SS | PACKET RESOURCE REQUEST | Sent on PACCH. |
| 31 | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent on PACCH. uplink dynamic allocation, no starting time |
| 32 | SS<->MS | { Uplink data transfer } | Macro - Completion of the 1kB of Data. |

Specific Message Contents

PACKET ASSIGNMENT (Step 3 and Step 13):

| | |
|--|-------------------------------|
| As default message contents except: RR Packet Uplink Assignment IE - TIMESLOT_ALLOCATION RR Packet Downlink Assignment IE | (N + 1) MOD 8 Not included |
|--|-------------------------------|

HANDOVER COMMAND (Step 5):

| Information Element | Value/remark |
|---|---|
| As default message contents, except: Channel Description - Timeslot Number - Channel Type Cell Description Synchronization Indication - Report Observed Time Difference - Synchronization Indication - Normal Cell Indication | N (chosen arbitrarily) TCH/F Default values from Cell B Shall not be included. "Non synchronized". Ignore out of range timing advance. |

PACKET CS RELEASE INDICATION (Step 19):

| Information Element | Value/remark |
|---|---|
| As default message contents, except: - GLOBAL TFI - ENHANCED PACKET CS RELEASE INDICATION | The TFI of the current uplink TBF. 1 (RR connection released) The subsequent message encoding indicates that when the RR connection is released the MS maintains it's uplink TBF. |

CHANNEL RELEASE (Step 21):

| Information Element | Value/remark |
|---|--|
| As default message contents, except: Enhanced DTM CS Release Indication IE | 0 (MS not allowed to continue in packet transfer mode) |

41.6 Intra SGSN PS Handover

41.6.1 Intra SGSN PS Handover / Synchronized cell case

41.6.1.1 Intra SGSN PS Handover / Synchronized cell case / successful

41.6.1.1.1 Conformance requirements

The following synchronisation mechanisms are used for PS handover:

- Non-synchronised.
- Synchronised.
- Pre-Synchronised.

The synchronised and pre-synchronised cases are shown in figures 23 and 25 and have different mechanisms for the provision of the timing advance that are described in 3GPP TS 45.010 [26].

NOTE: The pseudo-synchronised case is not supported by the PS handover feature.

If the timing advance with the new cell calculated by the mobile station is not out of range, i.e. smaller than or equal to the maximum timing advance that can be coded as specified in 3GPP TS 44.004, or if the new cell does accept out of range timing advance as indicated in the PS HANDOVER COMMAND message, the mobile station acts on the message.

After having switched to the assigned channels, if the Handover Reference information is included within the PS HANDOVER COMMAND message the mobile station shall send four times the PS HANDOVER ACCESS message.

The mobile station activates the channels in sending and receiving mode. The MS may activate the channels in downlink while sending access bursts.

41.6.1.1.2 Test purposes

To verify that while in uplink acknowledged mode operation the MS performs successfully synchronized PS Handover from A/Gb to A/Gb.

41.6.1.1.3 Method of test

Initial Conditions

System Simulator:

2 cells A and B, GPRS supported, NC 2 mode, PCCCH not present.

The RF level of cell A is -50 dBm and cell B - 60 dBm.

Mobile Station:

The MS is GPRS attached on cell A, a P-TMSI allocated and test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer 2000 octets in the RLC acknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer about 30 RLC blocks.

The SS provides the MS a minimum set of System Info Types in order to perform a A/Gb to A/Gb synchronized PS Handover by sending them in PACKET NEIGHBOUR CELL DATA message.

The SS sends PS HANDOVER COMMAND to assign a PDCH on cell B. The MS moves to cell B and resumes the uplink data transfer. The MS completes the uplink data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | {Uplink dynamic allocation two phase access} | The following messages received on cell A. n = 2000 octets in RLC acknowledged mode (Test PDP context2), without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1 USF assigned to the MS |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET MEASUREMENT REPORT | Received on the assigned PDTCH. In case of Uplink data block check that the coding and the TFI are correct. |
| 4 | | | Repeat step 2 and 3 in total of 30 times. |
| 5 | SS -> MS | PACKET NEIGHBOUR CELL DATA | Sent on the PACCH of the assigned PDCH. Containing : System Info Type 1, System Info Type 3 and System Info Type 13. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET MEASUREMENT REPORT | USF assigned to the MS. Received on the assigned PDTCH. |
| 7 | SS -> MS | PS HANDOVER COMMAND | Sent on the PACCH of the assigned PDCH . USF not assigned to the MS. |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The following messages are received on cell B. 120 ms (T_GSM_delay) after step 7. USF assigned to the MS. |
| 9 | MS -> SS | PACKET UPLINK DUMMY CONTROL BLOCK or UPLINK RLC DATA BLOCK or PACKET MEASUREMENT REPORT | Received on the assigned PDTCH. Repeat steps 8 and 9 for maximum of 100 ms or until UPLINK RLC DATA BLOCK is received. (Data block may contain empty LLC PDU for Cell Update. In that case the SS shall accept Packet Resource Request from MS and respond with Packet Uplink Assignment.) |
| 10 | | {Completion of uplink RLC data block transfer} | NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment as required), in order to ensure that the radio resources are used efficiently. |

41.6.1.2 Intra SGSN PS Handover / Synchronized cell case / Abnormal Case / T3218 expiry

41.6.1.2.1 Conformance requirements

In case of initial access failure in the target cell, including the case where the MS fails to acquire time alignment information (for the unsynchronised network case), the MS is allowed to revert to the old cell. As is defined currently in 3GPP TS 44.060 [7], the MS shall return to the old cell and send a **Packet Cell Change Failure** message with the appropriate cause.

If the MS was in packet transfer mode (or MAC-shared state) before the attempted handover it will, when going back to the old cell, send a **Packet Cell Change Failure** message and resume TBFs which were ongoing in the old cell.

A mobile station operating in *A/Gb mode* shall consider the PS handover to *A/Gb mode* to have failed for the following reasons:

- Timer T3218 expires while in the new cell.

A mobile station operating in *A/Gb mode* when a PS handover to *A/Gb mode* fails shall proceed as follows:

- If timer T3218 expired it shall return to the cell on which the PS HANDOVER COMMAND message was received.

- Send a PACKET CELL CHANGE FAILURE message with the cause code set to "No response on target cell" if timer T3218 or T3216 expired, otherwise "PS Handover failure-others". The message shall be sent on PACCH .
- The transmission of a PACKET CELL CHANGE FAILURE message terminates the PS handover procedure in the mobile station and after the transmission of this message the mobile station is therefore allowed to request the establishment of additional uplink TBFs.
- After terminating the PS handover procedure the mobile station shall resume all uplink and downlink TBFs that were ongoing in the old cell prior to receiving the PS HANDOVER COMMAND message. Timers T3180 (uplink TBFs) and T3190 (downlink TBFs) corresponding to these TBFs shall be re-started.
- For each TBF that is resumed the corresponding RLC state machine shall reflect its state when the last RLC data block was transmitted for that TBF in the old cell (uplink TBFs) and the last RLC data block was received for that TBF in the old cell (downlink TBFs).

| 5 | SS -> MS | PACKET NEIGHBOUR CELL DATA | All instances are sent on the PACCH of the assigned PDCH. Containing : System Info Type 1, System Info Type 3 and System Info Type 13 of cell B. USF assigned to the MS. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET MEASUREMENT REPORT | Received on the assigned PDTCH. |
| 7 | SS -> MS | PS HANDOVER COMMAND | Sent on the PACCH of the assigned PDCH. USF not assigned to the MS. |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The following messages are sent on cell B. Sent on PACCH assigned in step 7. USF not addressing the MS. |
| 9 | SS | | Check that no data block is transmitted by the MS in the next radio block. Steps 8 and 9 are repeated for 1s (T3218). The following messages are sent 200 ms after step 9 on cell A. |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF allocated in PACKET UPLINK ASSIGNMENT from step 1 assigned to the MS. |
| 11 | MS -> SS | PACKET CELL CHANGE FAILURE | Cause:"No response on target cell" |
| 12 | | {Completion of uplink RLC data block transfer} | |

41.6.1.3 Intra SGSN PS Handover / Synchronized cell case / Abnormal Case / Minimum set of SI not available

41.6.1.3.1 Conformance requirements

In case of initial access failure in the target cell, including the case where the MS fails to acquire time alignment information (for the unsynchronised network case), the MS is allowed to revert to the old cell. As is defined currently in 3GPP TS 44.060 [7], the MS shall return to the old cell and send a **Packet Cell Change Failure** message with the appropriate cause.

If the MS was in packet transfer mode (or MAC-shared state) before the attempted handover it will, when going back to the old cell, send a **Packet Cell Change Failure** message and resume TBFs which were ongoing in the old cell.

A mobile station operating in *A/Gb mode* shall consider the PS handover to *A/Gb mode* to have failed for the following reasons:

- If it has not stored a valid minimum set of the following of PSI or SI messages (provided via PACKET NEIGHBOUR CELL DATA messages, see sub-clause 8.8.1) required for mobile station to operate in the new cell: PSII, a consistent set of PSI2 messages and PSI14 (if PBCCH allocated in the new cell) or SI3, SI1 (if present in the new cell) and SI13 messages (if PBCCH not allocated in the new cell).

A mobile station operating in *A/Gb mode* when a PS handover to *A/Gb mode* fails shall proceed as follows:

- Send a PACKET CELL CHANGE FAILURE message with the cause code set to "No response on target cell" if timer T3218 or T3216 expired, otherwise "PS Handover failure-others". The message shall be sent on PACCH .PACCH.
- The transmission of a PACKET CELL CHANGE FAILURE message terminates the PS handover procedure in the mobile station and after the transmission of this message the mobile station is therefore allowed to request the establishment of additional uplink TBFs.

References

3GPP TS 43.129, subclasses 5.7.2.1

3GPP TS 44.060, subclasses 8.10.5.1

41.6.1.3.2 Test purposes

To verify that the MS, when PS handover failed due to a valid minimum set of SI messages for the new cell not stored, returns to the cell on which PS HANDOVER COMMAND message was received, sends a PACKET CELL CHANGE FAILURE message with cause "PS Handover failure-others" and resumes the TBFs that were ongoing in the old cell.

41.6.1.3.3 Method of test

Initial Conditions

System Simulator:

2 cells A and B, GPRS supported, NC 2 mode, PCCCH not present.

The RF level of cell A is -50 dBm and cell B - 60 dBm.

Mobile Station:

The MS is GPRS attached on cell A, a P-TMSI allocated and test PDP context2 activated.

| 12 | | {Completion of uplink RLC data block transfer} | |

41.6.2 Intra SGSN PS Handover / Pre-synchronized cell case

41.6.2.1 Intra SGSN PS Handover / Pre-synchronized cell case / successful / RLC reset

41.6.2.1.1 Conformance requirements

The following synchronisation mechanisms are used for PS handover:

- Non-synchronised.
- Synchronised.
- Pre-Synchronised.

The synchronised and pre-synchronised cases are shown in figures 23 and 25 and have different mechanisms for the provision of the timing advance that are described in 3GPP TS 45.010 [26].

NOTE: The pseudo-synchronised case is not supported by the PS handover feature.

In the case of pre-synchronised handover the MS may receive the timing advance information to use in uplink in the target cell in the **PS Handover Command** message (if no timing advance information is included, the mobile station uses a default timing advance in the target cell). In a pre-synchronised or synchronised handover, the **Packet Physical information** message is not sent in the target cell.

If the timing advance with the new cell calculated by the mobile station is not out of range, i.e. smaller than or equal to the maximum timing advance that can be coded as specified in 3GPP TS 44.004, or if the new cell does accept out of range timing advance as indicated in the PS HANDOVER COMMAND message, the mobile station acts on the message.

After having switched to the assigned channels, if the Handover Reference information is included within the PS HANDOVER COMMAND message the mobile station shall send four times the PS HANDOVER ACCESS message.

The mobile station activates the channels in sending and receiving mode. The MS may activate the channels in downlink while sending access bursts.

If the PS HANDOVER COMMAND indicates RLC reset for a TBF allocated in the new cell corresponding to a PFC receiving a PS handover, the target BSS shall initialize a new RLC entity to support that TBF. Otherwise, the TBF allocated in the new cell shall be supported using the same RLC entity used to support the TBF in the old cell corresponding to the same PFC (i.e. the RLC state machine is maintained across PS handover).

Test Procedure

The MS is triggered to initiate packet uplink transfer 2000 octets in the RLC acknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer about 30 RLC blocks.

The SS provides the MS a set of System Info messages in order to perform a A/Gb to A/Gb pre-synchronized PS Handover by sending them in PACKET NEIGHBOUR CELL DATA message.

The SS sends PS HANDOVER COMMAND to assign a hopping PDCH on cell B. The MS moves to cell B sends PS HANDOVER ACCESS and resends the unacknowledged RLC data blocks. The MS completes the uplink data transfer.

The procedure is performed for execution counter M=1 and 2 using different methods for assigning the hopping frequencies.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | {Uplink dynamic allocation two phase access} | The following messages received on cell A. n = 2000 octets in RLC acknowledged mode (Test PDP context2), without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET MEASUREMENT REPORT | Received on the assigned PDTCH. Check that the coding BSN and the TFI are correct. |
| 4 | | | Repeat step 2 and 3 in total of 30 times. |
| 5 | SS -> MS | PACKET NEIGHBOUR CELL DATA | All instances are sent on the PACCH of the assigned PDCH. Containing : System Info Type 1, System Info Type 3 and System Info Type 13 of cell B (see Specific Message Contents). USF assigned to the MS. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET MEASUREMENT REPORT | Received on the assigned PDTCH. Check that the coding BSN and the TFI are correct. |
| 7 | SS -> MS | PS HANDOVER COMMAND | Sent on the PACCH of the assigned PDCH . USF not assigned to the MS. |
| | | | The following messages are received on cell B. |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | 120 ms (T_GSM_delay) after step 7. USF assigned to the MS. |
| 9 | MS -> SS | PS HANDOVER ACCESS | As 4 access bursts. Check that handover reference is correct. |
| 10 | MS -> SS | PACKET UPLINK DUMMY CONTROL BLOCK or UPLINK RLC DATA BLOCK or PACKET MEASUREMENT REPORT | Repeat steps 10 and 11 for maximum of 100 ms or until UPLINK RLC DATA BLOCK is received. Received on the assigned PDTCH. (Data block may contain empty LLC PDU for Cell Update. In that case the SS shall accept Packet Resource Request from MS and respond with Packet Uplink Assignment.) NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment as required), in order to ensure that the radio resources are used efficiently. |
| 11 | | {Completion of uplink RLC data block transfer} | |

41.6.3 Intra SGSN PS Handover / Non synchronized cell case

41.6.3.1 Intra SGSN PS Handover / Non synchronized cell case / PS Handover Access (8-bit / 11-bit format) / successful

41.6.3.1.1 Conformance requirements

The following synchronisation mechanisms are used for PS handover:

- Non-synchronised.
- Synchronised.
- Pre-Synchronised.

The non-synchronised cases are shown in figures 22 and 24 and are characterised by the requirement for the MS to obtain a valid uplink timing advance before it can transmit normal bursts. The MS shall notify its presence in the target cell through the transmission of access bursts to the BSS, and the BSS shall respond with a valid timing advance which in turn enables the MS to send normal bursts in uplink.

After having switched to the assigned channels, the mobile station shall send four times the PS HANDOVER ACCESS message. The mobile station shall start timer T3216 at the start point of the timeslot in which the PS HANDOVER ACCESS message is sent the first time on the PACCH.

If the network requests the transmission of the PS HANDOVER ACCESS message it shall be sent with highest transmission priority using either the 8-bit or 11-bit access burst format on the PACCH associated with any uplink TBF allocated in the PS HANDOVER COMMAND message for which the mobile station detects an assigned USF value. Its content consists of the handover reference field. The burst format used shall be that specified by the ACCESS_BURST_TYPE in the system information for the target cell.

The mobile station then activates the channels in receiving mode.

Upon reception of the PS HANDOVER ACCESS message containing the expected Handover Reference value, once the network has the RF characteristics that are necessary, it sends a PACKET PHYSICAL INFORMATION message to the mobile station on the PACCH.

When the mobile station receives a PACKET PHYSICAL INFORMATION message, it stops timer T3216, stops sending access bursts and activates the channels in sending and receiving mode.

The MS sends uplink LLC PDUs, e.g. a **Routing Area Update Request** message or uplink user data packets to the SGSN immediately after receiving the **Packet Physical Information** message or, in a synchronised or pre-synchronised handover, immediately if the **PS Handover Access** message is not required to be sent (see Section 6.2).

41.6.3.1.2 Test purpose

To verify that while in uplink Acknowledged mode MS performs successfully Non-Synchronised PS Handover from A/Gb to A/Gb.

To verify that MS uses correct access burst format for the PS HANDOVER ACCESS message.

41.6.3.1.3 Method of test

Initial Conditions

System Simulator:

Two cells A (RAI1, SI13 indicates 8-bit access burst format) and Cell B (RAI 1, SI13 indicates 11-bit access burst format), NC2 mode, GPRS supported, PCCCH not present.

Mobile Station:

The MS is GPRS attached on cell A, a P-TMSI allocated and test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer 2000 octets in the RLC acknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the assigned USF to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer about 30 RLC blocks.

The SS provides the MS a minimum set of System Info Types in order to perform a A/Gb to A/Gb Non-synchronized PS Handover to cell B by sending them in PACKET NEIGHBOUR CELL DATA message.

The SS sends PS HANDOVER COMMAND to assign a PDCH on cell B and containing a handover reference. The MS moves to cell B and sends PS HANDOVER ACCESS in 11-bit access burst format in Cell B. The SS sends PACKET PHYSICAL INFORMATION to the MS.

Following handover to Cell B MS continues with the data uplink data transfer in Cell B. The SS allows the MS to transfer about 30 RLC blocks.

The SS provides the MS a minimum set of System Info Types in order to perform a A/Gb to A/Gb Non-synchronized PS Handover to cell A by sending them in PACKET NEIGHBOUR CELL DATA message.

The SS sends PS HANDOVER COMMAND to assign a PDCH on cell A and containing a handover reference. The MS moves to cell A and sends PS HANDOVER ACCESS in 8-bit access burst format in Cell A. The SS sends PACKET PHYSICAL INFORMATION to the MS.

Following handover to cell A MS continues with the data uplink data transfer in Cell A.

Maximum Duration of Test

10 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|

41.6.3.2 Intra SGSN PS Handover / Non synchronized cell case / Different RA / successful

41.6.3.2.1 Conformance requirements

The following synchronisation mechanisms are used for PS handover:

- Non-synchronised.
- Synchronised.
- Pre-Synchronised.

The non-synchronised cases are shown in figures 22 and 24 and are characterised by the requirement for the MS to obtain a valid uplink timing advance before it can transmit normal bursts. The MS shall notify its presence in the target cell through the transmission of access bursts to the BSS, and the BSS shall respond with a valid timing advance which in turn enables the MS to send normal bursts in uplink.

After having switched to the assigned channels, the mobile station shall send four times the PS HANDOVER ACCESS message. The mobile station shall start timer T3216 at the start point of the timeslot in which the PS HANDOVER ACCESS message is sent the first time on the PACCH.

The mobile station then activates the channels in receiving mode.

Upon reception of the PS HANDOVER ACCESS message containing the expected Handover Reference value, once the network has the RF characteristics that are necessary, it sends a PACKET PHYSICAL INFORMATION message to the mobile station on the PACCH.

When the mobile station receives a PACKET PHYSICAL INFORMATION message, it stops timer T3216, stops sending access bursts and activates the channels in sending and receiving mode.

The MS sends uplink LLC PDUs, e.g. a **Routing Area Update Request** message or uplink user data packets to the SGSN immediately after receiving the **Packet Physical Information** message or, in a synchronised or pre-synchronised handover, immediately if the **PS Handover Access** message is not required to be sent (see Section 6.2).

41.6.3.3 Intra SGSN PS Handover / Non synchronized cell case / Abnormal Case / T3216 expiry

41.6.3.3.1 Conformance requirements

In case of initial access failure in the target cell, including the case where the MS fails to acquire time alignment information (for the unsynchronised network case), the MS is allowed to revert to the old cell. As is defined currently in 3GPP TS 44.060 [7], the MS shall return to the old cell and send a **Packet Cell Change Failure** message with the appropriate cause.

If the MS was in packet transfer mode (or MAC-shared state) before the attempted handover it will, when going back to the old cell, send a **Packet Cell Change Failure** message and resume TBFs which were ongoing in the old cell.

A mobile station operating in *A/Gb mode* shall consider the PS handover to *A/Gb mode* to have failed for the following reasons:

- Timer T3216 expires while in the new cell.

A mobile station operating in *A/Gb mode* when a PS handover to *A/Gb mode* fails shall proceed as follows:

- If timer T3216 expired it shall return to the cell on which the PS HANDOVER COMMAND message was received.
- Send a PACKET CELL CHANGE FAILURE message with the cause code set to "No response on target cell" if timer T3218 or T3216 expired, otherwise "PS Handover failure-others". The message shall be sent on PACCH .
- The transmission of a PACKET CELL CHANGE FAILURE message terminates the PS handover procedure in the mobile station and after the transmission of this message the mobile station is therefore allowed to request the establishment of additional uplink TBFs.
- After terminating the PS handover procedure the mobile station shall resume all uplink and downlink TBFs that were ongoing in the old cell prior to receiving the PS HANDOVER COMMAND message. Timers T3180 (uplink TBFs) and T3190 (downlink TBFs) corresponding to these TBFs shall be re-started.
- For each TBF that is resumed the corresponding RLC state machine shall reflect its state when the last RLC data block was transmitted for that TBF in the old cell (uplink TBFs) and the last RLC data block was received for that TBF in the old cell (downlink TBFs).

41.6.3.3.2 Test purposes

To verify that the MS upon PS handover failure due to T3216 expiry, returns to the old cell and sends a PACKET CELL CHANGE FAILURE message with cause “No response on target cell” and resumes the TBFs that were ongoing in the old cell.

41.6.3.3.3 Method of test

Initial Conditions

System Simulator:

2 cells A and B, GPRS supported, NC 2 mode, PCCCH not present.

The RF level of cell A is -50 dBm and cell B - 60 dBm.

Mobile Station:

The MS is GPRS attached on cell A, a P-TMSI allocated and test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer 2000 octets in the RLC acknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the USF assigned to the MS. The SS allows the MS to transfer about 30 RLC blocks.

The SS provides the MS a minimum set of System Info Types in order to perform a A/Gb to A/Gb non-synchronized PS Handover by sending them in PACKET NEIGHBOUR CELL DATA message.

The SS sends PS HANDOVER COMMAND to assign a PDCH on cell B.

MS will send 4 PS Handover Access messages. SS does not send Packet Physical information and waits for timer T3216(1 s) expiry.

SS then assigns USF to the MS on the old cell A. MS send PACKET CELL CHANGE FAILURE with cause value “No response on target cell” and resumes the uplink data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | The following messages received on cell A. n = 2000 octets in RLC acknowledged mode (Test PDP context2), without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1 |

42 Test of Medium Access Control (MAC) protocol

42.1 Test of Medium Access Control (MAC) Procedures

Default conditions

The SS default conditions simulate one cell with default settings as defined in the GPRS general default section.

The MS default initial condition is GPRS attached. Unless otherwise stated, no PDP context is required.

The default message contents and signalling macro not specified in the end of this subclause shall be set as in "GPRS default conditions" clause 40. Specific message contents for a test case is specified in each test case.

Conditions or message contents specified in a test case have the highest precedence. In addition, the default message contents described in the end of this subclause override those specified in "GPRS default conditions".

In case the test case not expected "short access" as access type for Packet Channel Request the amount of RLC data specified in the comments in expected sequence is not necessary to be exactly the specified amount of data. It only has to be more than the limit for short access. If the test case need a specific amount of data this is specified in the test case.

42.1.2.1.9.2 Packet Uplink Assignment / Two phase access / Contention resolution

42.1.2.1.9.2.1 Packet Uplink Assignment / Two phase access / Contention resolution / Expiry of timer T3168

42.1.2.1.9.2.1.1 Conformance requirements

The contention resolution has failed on the mobile station side when the mobile station does not receive a PACKET UPLINK ASSIGNMENT message with its TLLI before expiry of timer T3168. The mobile station shall then reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.3.3.

42.1.2.1.9.2.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure after a time equal to timer T3168 and the procedure shall be attempted a total of 4 or 5 times.

42.1.2.1.9.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH, SI13 GPRS Cell Options, T3168 = 7.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

- Release of GPRS supported (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT message including Single Block Allocation struct information to order the MS to send PACKET RESOURCE REQUEST message. The MS shall perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource. The SS wait for a time greater than timer T3168 so the MS shall reinitiate packet access procedure. This procedure shall be attempted 4 or 5 times.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|--|-----------|-------------------------|--|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Single Block Allocation struct. Sent on AGCH. |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | ACCESS_TYPE = "Two Phase Access Request". Received on the single block assigned in step 3. |
| 5 | SS | | The SS waits T3168 expiry. |
| 6 | | | The SS verifies that the MS attempts packet access procedure (steps 2-5 are repeated) in total: Four or five times if PICS 'Release of GPRS supported' is Release 97, 98, 99 or 4. Four times if PICS 'Release of GPRS supported' is Release 5 or later. |
| NOTE: After step 6 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure. | | | |

Specific message contents

None.

42.1.2.1.9.2.2 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI mismatch

The contention resolution is completed on the mobile station side when the mobile station receives a PACKET UPLINK ASSIGNMENT message with the same TLLI as the mobile station has included in the PACKET RESOURCE REQUEST message.

42.1.2.1.9.2.2.1 Conformance requirements

If the failure is due to a TLLI mismatch, or to the expiry of timers T3166 or T3168, or to the fact that the counter N3104 reached its maximum value in the contention resolution procedure, and repetition as described in subclause 7.1.3.3 has been performed, the mobile station shall remain in packet idle mode, notify higher layer (TBF establishment failure), transactions in progress shall be aborted and cell reselection continued.

Reference

3GPP TS 04.60 subclauses 7.1.4 and 7.1.3.3.

42.1.2.1.9.2.2.2 Test purpose

To verify that the MS reinitiates packet access procedure with failure due to a TLLI mismatch in the contention resolution procedure, unless it has already been attempted 4 or 5 times. In that case, TBF failure has occurred.

42.1.2.1.9.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH, GPRS cell options ACCESS_BURST_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

Specific PICS Statements

- Release of GPRS supported (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request two phase access. The MS shall then send PACKET RESOURCE REQUEST message. The SS responds with PACKET UPLINK ASSIGNMENT message with a TLLI different to that the MS has sent in PACKET RESOURCE REQUEST message. The MS shall reinitiate the packet access procedure.

This procedure shall be attempted 4 or 5 times.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|--|-----------|--------------------------|--|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Single Block Allocation struct. Sent on AGCH. |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | ACCESS_TYPE = "Two Phase Access Request". Include TLLI. Received on the single block assigned in step 3. |
| 5 | SS -> MS | PACKET UPLINK ASSIGNMENT | Include incorrect TLLI according to step 4. Sent on the PACCH of the assigned PDCH. |
| 6 | | | The SS verifies that the MS attempts packet access procedure (steps 2-5 are repeated) in total: Four or five times if PICS 'Release of GPRS supported' is Release 97, 98, 99 or 4. Four times if PICS 'Release of GPRS supported' is Release 5 or later. |
| Note: After step 6 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure. | | | |

Specific message contents

None.

42.1.2.1.9.3 Packet Uplink Assignment / Two phase access / Packet Resource Request / No respond to Packet Downlink Assignment

42.1.2.1.9.3.1 Conformance requirements

At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168. Further more, the mobile station shall not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running.

Reference

3GPP TS 04.60 subclause 7.1.3.1.

42.1.2.1.9.3.2 Test purpose

To verify that the mobile station does not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running after sending of the PACKET RESOURCE REQUEST message.

42.1.2.1.9.3.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH, T3168 indicates value 7 in GPRS Cell Options.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS shall send IMMEDIATE ASSIGNMENT message including Single Block Allocation struct information to instruct the MS to send PACKET RESOURCE REQUEST. The MS

should perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource.

While timer T3168 is running the SS send PACKET DOWNLINK ASSIGNMENT message and starts to send data on the allocated downlink before the timer expires. The MS shall not respond to the Downlink data transfer.

The SS should then send PACKET UPLINK ASSIGNMENT message before the timer T3168 expires and the MS should then begin transmitting RLC data blocks on the allocated uplink resources. The SS allows the MS to complete the sending of the data.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|---|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of an LLC PDU containing 400 octets of data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block allocation struct. Sent on AGCH. |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | Received on the single block assigned in step 3. |
| 5 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Sent on PACCH. |
| 6 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on the assigned PDTCH with poll bit set to 1. |
| | SS | | Verify no response from the MS. |
| 7 | SS -> MS | PACKET UPLINK ASSIGNMENT | Dynamic allocation struct. Sent on the PACCH of the assigned PDCH 0,9* T3168. |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigning USF to the MS. Sent at least 3 block periods from the assignment in step 7. |
| 9 | | {Uplink data transfer} | Macro. Completion of the TBF procedure. |

Specific message contents

None.

42.1.2.1.10 Packet Uplink Assignment / Abnormal cases

42.1.2.1.10.1 Packet Uplink Assignment / Abnormal cases / Incorrect PDCH assignment

42.1.2.1.10.1.1 Conformance requirements

If the mobile station has been assigned more PDCHs than it supports according to its MS multislot class, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.4.

42.1.2.1.10.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure when the mobile station has been assigned more PDCHs than it supports and after 4 or 5 attempts of the packet access procedure the mobile station shall initiate TBF failure.

42.1.2.1.10.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

Specific PICS Statements

- Release of GPRS supported (TSPC_MS_GPRS_RELEASE)
- GPRS Multislotclass (TSPC_Type_GPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test procedure

Convert the MS GPRS Multislot Class to number of uplink timeslot supported.

The MS is powered up or switched on and triggered to perform a GPRS attach. An uplink TBF is established and after PACKET RESOURCE REQUEST the SS sends PACKET UPLINK ASSIGNMENT message containing more assigned PDCHs than the MS supports according to its GPRS multislot class. The MS shall reinitiate packet access procedure; this procedure shall be attempted 4 or 5 times.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|--|-----------|-------------------------------------|--|
| 1 | MS | | The MS is powered up or switched on and triggered to perform a GPRS attach. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block allocation struct. Sent on AGCH. |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | Received on the single block assigned in step 3. |
| 5 | SS -> MS | PACKET UPLINK ASSIGNMENT | Assign one more Tx than the MS supported. Sent on PACCH. |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the third block from the message sent in step 35 Assigning USF to the MS |
| 7 | | | The SS verifies that the MS does not send UPLINK RLC DATA BLOCKS and instead attempts packet access procedure (steps 2-6 are repeated) in total: Four or five times if PICS 'Release of GPRS supported' is Release 97, 98, 99 or 4. Four times if PICS 'Release of GPRS supported' is Release 5 or later |
| NOTE: After step 7 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure. | | | |

Specific message contents

None.

42.1.2.1.10.2 Packet Uplink Assignment / Abnormal cases / Expiry of timer T3164

42.1.2.1.10.2.1 Conformance requirements

On expiry of timer T3164, the mobile station shall reinitiate the packet access procedure unless it has already been reinitiated 3 times, in which case the mobile station shall return to packet idle mode and notify higher layers.

Reference

3GPP TS 04.60 subclause 7.1.4.

42.1.2.1.10.2.2 Test purpose

To verify that the mobile station reinitiate the packet access procedure when the network have sent a PACKET UPLINK ASSIGNMENT message but the MS has not sent the first block within the time equal to the timer T3164. This packet access procedure shall be reinitiated 3 times.

42.1.2.1.10.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT message with a USF assigned to the MS. The SS shall send PACKET DOWNLINK DUMMY CONTROL BLOCK messages with USF not assigned to the MS. T3164 expires. The SS send a PACKET DOWNLINK DUMMY CONTROL BLOCK containing the assigned USF. The SS verifies that the MS does not send a RLC data block. The SS verifies that the MS reinitiate the packet access procedure within 5 seconds of T3164 expiry; this shall be repeated 3 times.

Maximum duration of the test

1 minute.

Expected sequence

| Step | Direction | Message | Comments |
|--|-----------|--------------------------------------|---|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets of data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to order the MS to follow the two phase access procedure. Sent on AGCH |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | Received on the single block assigned in step 3. |
| 5 | SS -> MS | PACKET UPLINK ASSIGNMENT | Allocate a USF for the MS. Sent on PACCH. |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCKs | Don't contain the assigned USF in step 5. Repeat step 6 for a maximum of 5.5 seconds (1.1*T3164). The MS may send a CHANNEL REQUEST at any time after 0.9*T3164, in this case go to step 9. |
| 7 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCKs | Containing the assigned USF in step 5. |
| 8 | SS | | Verify the MS does not transmit an RLC data block |
| 9 | SS | | The SS verifies that the packet access procedure (steps 2-6) is reinitiated three times. The CHANNEL REQUEST for reinitiation (in step 2) shall be sent within 5 sec of T3164 expiry (to cater for T3168 - the maximum duration of a packet access procedure). |
| NOTE: After step 9 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure. | | | |

Specific message contents

None.

42.1.2.2 Packet Downlink Assignment

42.1.2.2.1 Packet Downlink Assignment / Response to poll bit

42.1.2.2.1.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL_ACK_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message.
- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL_ACK_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE_OF_ACK parameter set to access bursts (see subclause 11.2.12).

The mobile station shall always transmit the uplink radio block on the same timeslot as the block where the RRBP was received. After receiving an RLC/MAC block containing a valid RRBP field the mobile station need not monitor the USF in the associated downlink RLC/MAC block appearing just before the uplink block it shall transmit.

Reference

3GPP TS 04.60 subclause 7.2.1.1 and 10.4.5.

42.1.2.2.1.2 Test purpose

To verify that the mobile station sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts if the network sets the poll bit in the PACKET DOWNLINK ASSIGNMENT message when CONTROL_ACK_TYPE is set to four access bursts.

42.1.2.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH. CONTROL_ACK_TYPE is set to indicate PACKET CONTROL ACKNOWLEDGEMENT format as four access bursts and the ACCESS_BURST_TYPE indicates 11 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message. The poll bit in the MAC header of the PACKET DOWNLINK ASSIGNMENT message will be set to indicate RRBP field is valid. The MS may delay the establishment of the downlink channels in order to answer the poll request on the common control channel. The SS verifies that the MS sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts on the timeslot on which it received the polling command.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS | | The SS initiate a downlink transfer of 200 octets data. |
| 2a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 2b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Poll bit in the MAC header is set to indicate a valid RRBP = 1. Sent on PACCH. |
| 3 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | As four access bursts. Received on PACCH. |
| 4 | SS | | The SS verifies that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT as four access bursts, one per TDMA frame of the uplink radio block. |

Specific message contents

None.

42.1.2.2.2 Void

42.1.2.2.3 Void

42.1.2.2.4 Packet Downlink Assignment / Response to Packet Polling

42.1.2.2.4.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL_ACK_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message.
- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL_ACK_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE_OF_ACK parameter set to access bursts (see subclause 11.2.12).

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING REQUEST message shall be sent on PACCH.

Reference

3GPP TS 04.60 subclauses 7.2.1.3 and 7.2.1.1.

42.1.2.2.4.2 Test purpose

To verify that on receipt of a PACKET POLLING REQUEST message, the mobile station responds with PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

42.1.2.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH. CONTROL_ACK_TYPE is set to not indicate acknowledgement as four access bursts and ACCESS_BURST_TYPE indicate 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS with a TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. The SS sends PACKET PDCH RELEASE message to the MS. The SS initiate a downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS without TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------------|---|
| 1 | SS | | The SS initiate a downlink transfer of 200 octets data. |
| 2a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 2b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | See specific message contents. Sent on PACCH. |
| 3 | SS -> MS | PACKET POLLING REQUEST | Sent on PACCH after TBF starting time in step 2 has elapsed. See specific message contents. |
| 4 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | The SS verifies that the MS send this message in the block period specified by the RRBP field as four access bursts. Received on PACCH. |
| 5 | SS -> MS | PACKET PDCH RELEASE | Sent on PACCH. |
| 6 | SS | | Wait 20 s. |
| 7 | SS | | The SS initiate a downlink transfer of 200 octets data. |
| 8a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 8b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | See specific message contents. Sent on PACCH. |
| 9 | SS -> MS | PACKET POLLING REQUEST | Sent on PACCH. See specific message contents. |
| 10 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | The SS verifies that the MS send this message in the block period specified by the RRBP field as four access bursts. Received on PACCH. |

42.1.2.2.6 Packet Downlink Assignment Timing Advance / TA value field not provided

42.1.2.2.6.1 Conformance requirements

For the case where a TIMING_ADVANCE_VALUE field is not provided in the assignment message, the mobile station is not allowed to send normal bursts on the uplink until it receives a valid timing advance either through the continuous timing advance procedure or in a PACKET TIMING ADVANCE/POWER CONTROL message.

Reference

3GPP TS 04.60 subclause 7.1.2.5.

42.1.2.2.6.2 Test purpose

To verify that the mobile station does not send normal bursts on the uplink until it receives a valid timing advance in a PACKET POWER CONTROL/TIMING ADVANCE message if Timing Advance Value field is not provided in the PACKET DOWNLINK ASSIGNMENT message.

42.1.2.2.6.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS, CCCH combined with SDCCH.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The SS initiates downlink data transfer by sending IMMEDIATE ASSIGNMENT on PCH. The SS sends PACKET DOWNLINK ASSIGNMENT message. The SS does not include Timing Advance in the PACKET DOWNLINK ASSIGNMENT. The SS poll MS by sending an RLC DATA BLOCK. SS verifies for 2 seconds that MS did not answer to poll and then send a PACKET POWER CONTROL/TIMING ADVANCE message with a valid timing advance information. The SS verifies that the MS does not send any normal burst on the uplink until the SS sends a valid timing advance.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|--|
| 1 | MS | | The SS initiate a downlink transfer of 200 octets data. |
| 2a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 2b | SS->MS | PACKET DOWNLINK ASSIGNMENT | Sent on PACCH. No Timing Advance Value |
| 3 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on assigned PDTCHs with a valid RRBP field. Final Block Indicator is set to 0. |
| 4 | SS | | SS verifies that the MS does not send any normal burst on the uplink. |
| 5 | SS -> MS | PACKET POWER CONTROL/TIMING ADVANCE | Include a valid Timing Advance information. Sent on PACCH. |
| 6 | SS->MS | DOWNLINK RLC DATA BLOCK | Sent on assigned PDTCHs with a valid RRBP field. Final Block Indicator is set to 0. |
| 7 | MS->SS | PACKET DOWNLINK ACK/NACK | The SS verifies that the MS indicating correct reception of downlink data blocks. Received on PACCH. |

42.3 Dynamic Allocation in Packet Transfer Mode

42.3.1 Dynamic Allocation / Uplink Transfer

42.3.1.1 Dynamic Allocation / Uplink Transfer / Normal

42.3.1.1.1 Dynamic Allocation / Uplink Transfer / Normal / Successful

42.3.1.1.1.1 Conformance requirements

1. The mobile station shall set the TFI field of each uplink RLC data block to the TFI value assigned to the mobile station in the PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message.
2. Whenever the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH in the next block period(s). The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 05.02. The number of RLC/MAC blocks to transmit is controlled by the USF_GRANULARITY parameter characterising the uplink TBF.
3. At two-phase access the mobile station does not include its TLLI in any RLC data block.

References

3GPP TS 04.60, subclauses 8.1.1, 8.1.1.1 and 7.1.3.3.

3GPP TS 05.02, subclause 6.3.2.2.1.

42.3.1.1.1.2 Test purposes

To verify that the MS:

1. depending on the parameter USF_GRANULARITY, transmits one or a sequence of four RLC/MAC data block(s) in the next block period(s) on the PDCH on which it has detected its corresponding assigned USF.
2. includes the assigned TFI in each uplink RLC data blocks.
3. does not include its TLLI in any RLC data block at two phase access.

42.3.1.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, .

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC unacknowledged mode. The SS orders the MS to have two-phase access, in PACKET UPLINK ASSIGNMENT message the USF_GRANURALITY is set to 4 blocks. The SS sends the assigned USF assigned to the MS and checks that a sequence of four RLC/MAC data blocks in the next radio block period is received, and that each data block contains the correct TFI, but without TLLI. The SS assigns the USF assigned to the MS again. The check is repeated. The procedure is going on until the MS completes the packet data transfer.

The above test procedure is repeated once for USF_GRANURALITY set to one block.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n =600 octets, without starting time, USF_GRANULARITY = 4 blocks, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS, on 3 blocks from the last radio block containing the uplink assignment. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 4 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH in the next radio block to step 3. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH in the next radio block to step 4. Check that the coding is the scheme specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH in the next radio block to step 5. Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 7 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH, the USF not addressing the MS. |
| 8 | SS | | Check that no RLC data blocks are transmitted from the MS in the next radio block to step 7. |
| 9 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. |
| 10 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 11 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH in the next radio block to step 10. Check that the TFI is correct. |
| 12 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH in the next radio block to step 11. Check that the TFI is correct. |
| 13 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH in the next radio block to step 12. Check that the TFI is correct. |
| 14 | | {Completion of uplink RLC data block transfer} | USF_GRANULARITY = 4 blocks |
| 15 | | {Uplink dynamic allocation two phase access} | Similar parameter values to step 1 Except USF_GRANULARITY = 1 blocks |
| 16 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, the USF assigned to the MS on 3 blocks from the last radio block containing the uplink assignment. |
| 17 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 18 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH, the USF not addressing the MS. |
| 19 | SS | | Check that no RLC data blocks are transmitted from the MS in the next radio block to step 18. |
| 20 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on a PDCH with any different time slot as the assigned PDCH, the USF assigned to the MS. |
| 21 | SS | | Check that no RLC data block is transmitted from the MS on the next radio block to step 20. |
| 22 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, the USF assigned to the MS. |
| 23 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 24 | | {Completion of uplink RLC data block transfer} | USF_GRANULARITY = 1 block |

42.3.1.1.2 Void

42.3.1.1.3 Dynamic Allocation / Uplink Transfer / Normal / Starting frame number encoding

42.3.1.1.3.1 Conformance requirements

1. In case of dynamic allocation, if no uplink TBF is in progress, the MS needs not monitor the USF field until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.
2. If an uplink TBF is already in progress, the MS shall continue to use the parameters of the existing TBF until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.
3. In case of single block allocation, the mobile station shall use the assigned timeslot during the RLC/MAC block whose first TDMA burst occurs in the indicated TDMA frame number.
4. If the mobile station is in packet transfer mode during the block immediately before the starting time and the lowest numbered PDCH assigned to the MS is different immediately before and after the starting time then the mobile station shall be ready to receive or transmit no later than one radio block from the starting time
5. If the Starting FN (in absolute frame number encoding) is not aligned to the start of a block period and the mobile station is in packet transfer mode during the TDMA immediately before the Starting FN, then the mobile station shall align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

References

3GPP TS 04.60, subclauses 11.2.29, 12.21 and 12.21.1.

42.3.1.1.3.2 Test purposes

To verify that the MS, in transfer mode:

1. correctly uses the starting frame number description in PACKET UPLINK ASSIGNMENT, and in all subsequent RLC/MAC control messages which are sent on the uplink TBF;
2. is ready to receive or transmit no later than one radio block from the starting time;
3. is able to align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

42.3.1.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer 440 octets in the RLC unacknowledged mode. The IMMEDIATE ASSIGNMENT message contains a starting time for the single block allocation. It is checked that the MS uses the time slot at the assigned frame number. In the two-phase access a starting time is included in PACKET UPLINK ASSIGNMENT. The assigned USF is on a radio block before the starting time. The MS does not react upon that. The assigned USF is on one block after the starting time. The MS sends a RLC data block.

The test procedure is repeated once. The starting time is encoded in relative frame number format.

Maximum Duration of Test

5 minutes.

Expected Sequence

The expected sequence is repeated once. In the 2nd execution the starting frame numbers in the specific message contents are encoded in the relative format.

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 440 octets, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-3 The IMMEDIATE ASSIGNMENT contains starting time current frame + 1001. It is checked that PACKET RESOURCE REQUEST in the macro is sent at the starting time. The PACKET UPLINK ASSIGNMENT contains starting time specified in absolute frame number encoding, current frame + 91, The timeslot TN ₇ assigned. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS, Sent on one radio block before the starting time. |
| 3 | SS | | Check that there is no RLC data block sent by the MS on the assigned PDTCH. |
| 4 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on one block after the starting time. |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding is the scheme specified by CHANNEL_CODING_COMMAND in step 1, and TFI is correct. |
| 6 | | {Completion of uplink RLC data block transfer} | |

42.3.1.1.4 Dynamic Allocation / Uplink Transfer / Normal / Starting time

42.3.1.1.4.1 Conformance requirements

- 1 If a TBF starting time information element is present and no uplink TBF is in progress, but a downlink TBF is in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs.
- 2 If an uplink TBF is already in progress, the mobile station shall continue to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. At that time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters.
- 3 While waiting for the frame number indicated by the TBF starting time if the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

4 An MS shall be ready to transmit and receive using a new assignment no later than the next occurrence of block $B((x+3) \bmod 12)$ where block $B(x)$ is the last radio block containing the assignment message. This applies also for the reception of the first USF for dynamic uplink assignment.

References

3GPP TS 04.60, subclause 8.1.1.1, 3GPP TS 45.010 subclause 6.11.1.

42.3.1.1.4.2 Test purposes

To verify that after the MS receives an uplink assignment with starting time:

1. if a downlink TBF is in progress and no uplink TBF is in progress it monitors the assigned PDCHs while waiting for the starting time. If another uplink assignment received while waiting, the mobile station acts upon that and ignores the previous uplink assignment.
2. if an uplink TBF is already in progress, it continues to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. While waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station acts upon that and ignores the previous uplink assignment. As soon as the starting time occurs the MS immediately begins to use the newly assigned uplink TBF parameters.

42.3.1.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

A downlink TBF is established and in progress. An uplink TBF is established with a starting time which does not yet elapse. The SS sends two downlink data blocks before the starting time to the MS and signals the assigned TBF addressing the MS for uplink transfer. It is checked that no uplink RLC data blocks are sent by the MS. The SS sends PACKET TIMESLOT RECONFIGURE on three radio blocks before the starting time, assigning a new starting time. Two downlink data blocks are then sent to the MS before the new starting time occurs. Each data block contains one of the assigned USFs addressing the MS. It is checked that no uplink data blocks are sent from the MS. After the new starting time elapses the SS sends a downlink data block containing the USF assigned to the MS. The MS sends an uplink data block. The MS is brought to Idle mode.

Subsequently an uplink TBF is established. The SS sends PACKET UPLINK ASSIGNMENT assigning a reconfigured PDCH with a starting time and a new USF associated. Before the starting time the SS signals the USF of the ongoing TBF addressing the MS. The SS receives an uplink data block from the MS. The SS sends UPLINK ASSIGNMENT on three radio blocks before the starting time, assigning a new reconfigured PDCH with a starting time and a different USF associated. The later assignment overwrites the earlier one.. While waiting for the frame number of the newly assigned starting time the SS signals the USF of the previous assignment on both the ongoing PDCH and on the previous assigned PDCH. The MS ignores it. The SS signals the USF of the ongoing TBF addressing the MS. An uplink data block can be received. On one radio block before the starting time the SS signals the later assigned USF assigned to the MS on the later assigned PDCH. No uplink data block is received. On one radio block after the starting time the SS signals the just expired USF. No uplink data block is received. Then the SS signals the valid USF assigned to the MS. An uplink data block is received.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | | {Downlink TBF establishment} | RLC mode: acknowledged, without starting time |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | The data block contains FBI=0 and a valid RRBp, sent on the third block after the last radio block containing the downlink assignment. |
| 3 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the specified RRBp of downlink PACCH. |
| 4 | MS | | The MS is triggered to send 440 octets of user data. |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | The data block contains FBI=0 and a valid RRBp. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the specified RRBp of downlink PACCH. Contains Channel Request Description IE. Note : If the triggering of the uplink access involves a manual operation taking more than 5s to complete, steps 5 and 6 are repeated (until the MS does include the Channel Request Description IE) at least once every 5s in order to keep the downlink transfer active. |
| 7 | SS -> MS | PACKET UPLINK ASSIGNMENT | USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen. TBF Starting Time : starting time ₁ , the current frame + 104 frames, encoded in absolute frame number. The uplink TBF is assigned on the same timeslot as the downlink TBF. |
| 8 | SS -> MS | DOWNLINK RLC DATA BLOCK | FBI=0, the assigned USF ₁ to the MS. Sent on downlink PDTCH, 12 data blocks (52 TDMA frames) before the starting time ₁ . |
| 9 | SS -> MS | DOWNLINK RLC DATA BLOCK | FBI=0, the assigned USF ₁ to the MS. Sent on downlink PDTCH, 5 blocks before the starting time ₁ , a valid RRBp = N+13. |
| 10 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the specified RRBp on downlink PACCH. |
| 11 | SS -> MS | PACKET TIMESLOT RECONFIGURE | Assigned USF ₁ addressing the MS, sent on three blocks before the starting time ₁ . Assigned a new USF ₂ on the same timeslot, with starting time ₂ , current frame + 104 frames in relative frame number encoding. |
| 12 | SS -> MS | DOWNLINK RLC DATA BLOCK | On 4 blocks from the last radio block containing the uplink assignment in step 11, with FBI=0, the assigned previous USF ₁ addressing the MS. Sent on downlink PDTCH. |

| Step | Direction | Message | Comments |
|-------------------|-----------|--|--|
| 13 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with FBI=0, the assigned USF ₂ addressing the MS. Sent on downlink PDTCH, one radio block before the starting time ₂ . |
| 14 | SS | | Check that from the step 4 onwards till the starting time ₂ , there is no RLC data block sent by the MS on the assigned uplink PDTCH. |
| 15 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with FBI=0, a valid RRBP, the assigned USF ₂ addressing the MS. Sent on downlink PDTCH, on the frame number specified in the starting time ₂ . |
| 16 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned uplink PDTCH. |
| 17 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the specified RRBP of downlink PACCH. |
| 18 | SS -> MS | DOWNLINK RLC DATA BLOCK | One data block with FBI=1 and a valid RRBP. Sent on downlink PDTCH. |
| 19 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the specified RRBP of the downlink PACCH. |
| 20 | | {Completion of uplink RLC data block transfer} | |
| 21 | | {Uplink dynamic allocation two phase access} | n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: arbitrarily chosen CHANNEL_CODING_COMMAND: cs-1 The timeslot TN ₃ assigned |
| 22 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF ₁ addressing the MS, sent on 3 blocks from the last radio block containing the uplink assignment in step 21. |
| 23 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the coding is cs1, the TFI is correct. |
| 24 | SS -> MS | PACKET UPLINK ACK/NACK | Assigned USF ₁ addressing the MS. |
| 25 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 26 | | PACKET UPLINK ASSIGNMENT | Assign an uplink TBF on the timeslot TN ₂ , containing new TFI ₂ , USF ₂ , starting time ₃ , current frame + 117 in relative encoding. Sent on PACCH assigned. |
| 27 | | PACKET UPLINK ACK/NACK | USF ₁ addressing the MS, sent on 5 radio blocks before the starting time ₃ , on PACCH assigned in step 21. |
| 28 | | UPLINK RLC DATA BLOCK | Check that the coding is cs1, the TFI is correct. |
| 29 | SS -> MS | PACKET UPLINK ASSIGNMENT | Assign a TBF on the timeslot TN ₁ , containing new TFI ₃ , USF ₃ , cs-3 coding, starting time ₄ , current frame + 325 in relative encoding. Sent on three radio blocks before the starting time ₃ , on PACCH assigned in step 21. |
| 30 | SS -> MS | PACKET UPLINK ACK/NACK | USF ₂ addressing the MS, sent on 4 blocks from the last radio block containing the uplink assignment in step 29 on the PACCH assigned in step 26. |
| 31 | SS | | Check that no data block is sent from the MS on the assigned radio block on the PDTCH assigned in step 26. |
| 32 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF ₁ addressing the MS, sent on 5 radio blocks before the starting time ₄ , on PACCH assigned in step 21. |
| 33 | MS -> SS | UPLINK RLC DATA BLOCK | Check that the coding is cs1, the TFI is correct. |
| 34 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF ₃ addressing the MS, sent on one radio block before the starting time ₄ , on PACCH assigned in step 26. |
| 35 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF ₁ addressing the MS, sent on one radio block after the starting time ₄ , on PACCH assigned in step 21. |
| 36 | SS | | Check that no data blocks are sent from the MS on the radio blocks assigned in steps 34 and 35, or any intermediate radio blocks, on any of the three PDTCHs assigned |
| 37 | SS -> MS | PACKET UPLINK ACK/NACK | Containing USF ₃ . Sent on PACCH of PDCH assigned in step 29. |
| 38 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the PDTCH assigned in step 29. Use coding cs-1. |
| (optional step) | | | If step 38 is performed, then step 39 must be performed. |
| 39(optional step) | SS -> MS | PACKET UPLINK ACK/NACK | Only performed if step 38 is performed Containing USF ₃ . Sent on PACCH of PDCH assigned in step 29. |
| 40 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the PDTCH assigned in step 29. Check that the coding cs-3 and TFI ₃ are correct. |
| 41 | | {Completion of uplink RLC data block transfer} | |

42.3.1.1.5 Void

42.3.1.1.6 Dynamic Allocation / Uplink Transfer / Normal / T3180 expiry

42.3.1.1.6.1 Conformance requirements

When the mobile station transmits an RLC/MAC block to the network, it shall start timer T3180. When the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall reset timer T3180. If timer T3180 expires, the mobile station shall perform the abnormal release with random access procedure.

References

3GPP TS 04.60, subclause 8.1.1.1.

42.3.1.1.6.2 Test purposes

To verify that

1. Timer T3180 will not expire as long as an USF for the MS under test is detected in the downlink blocks within the defined time period of the timer. (It is implicitly verified).
2. Timer T3180 expires if no USF for the MS under test is detected during a time period longer than T3180.
3. The MS performs an abnormal release with random access procedure after T3180 expires.

42.3.1.1.6.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS for 4.5s. Before T3180 times out the SS signals the USF assigned to the MS. The MS sends a data block. Then the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS until receiving CHANNEL REQUEST from the MS for establishment of a new TBF.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | CHANNEL_CODING_COMMAND: arbitrarily chosen. The USF assigned to the MS sent on 3 blocks from the last radio block containing the uplink assignment. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the TFI is correct. |
| 4 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH assigned in step 2, the USF assigned to the MS. |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the TFI is correct. |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH, containing a different TFI and USF from the assigned ones to the MS. |
| 7 | SS | | Repeat step 6 every 5 radio blocks for 4.5 s. (T3180 * 90%) the SS signals different USFs on the assigned PDCH, but none of them addressing the MS. |
| 8 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH of the PDCH assigned in step 2, the USF assigned to the MS. |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the TFI is correct. |
| 10 | SS | | Repeat step 6 every 5 radio blocks until step 11 occurs. The maximum period for the repetition is of 8s. None of the signalled USFs addresses the MS on the assigned PDCH. |
| 11 | MS -> SS | CHANNEL REQUEST | Received on RACH within 7.5 seconds |
| 12 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to order the MS making two-phase access procedure. Sent on AGCH. |
| 13 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 12. |
| 14 | SS -> MS | PACKET UPLINK ASSIGNMENT | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block, Sent on PACCH of the same PDCH assigned in step 12. |
| 15 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 14. |
| 16 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding scheme is that specified in step 14 by CHANNEL_CODING_COMMAND and the TFI is correct. |
| 17 | | {Completion of uplink RLC data block transfer} | |

Specific Message Contents

PACKET UPLINK ASSIGNMENT message in step 14:

42.3.1.1.7 Dynamic Allocation / Uplink Transfer / Normal / PACCH operation

42.3.1.1.7.1 Conformance requirements

1. The mobile station shall attempt to decode every downlink RLC/MAC block on all assigned PDCHs. Whenever the mobile station receives an RLC/MAC block containing an RLC/MAC control block, the mobile station shall attempt to interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message. The mobile station shall not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.
2. PACKET POLLING REQUEST is sent on the PCCCH or PACCH by the network to the mobile station to solicit a PACKET CONTROL ACKNOWLEDGEMENT message from the mobile station.
3. In downlink RLC/MAC control blocks, the TFI identifies the Temporary Block Flow (TBF) to which the RLC/MAC control message contained in the downlink RLC/MAC control block relates. If present, this field indicates the mobile station to which the control message is addressed, and all other mobile stations shall ignore the control message. If this field is present and the contents of the control message also contain a TFI addressing the mobile station, the mobile station shall ignore the TFI in the control message contents.

References

3GPP TS 04.60, subclauses 8.1.1.1.1, 11.2.12 and 10.4.10.

42.3.1.1.7.2 Test purposes

To verify that:

1. The MS attempts to decode every downlink RLC/MAC block on all assigned PDCHs whenever the MS receives an RLC/MAC block containing an RLC/MAC control block, the MS attempts to interpret the message contained therein, such as Payload type and TFI in the optional fields. If the message addresses the MS, it acts upon the message.
2. When receiving PACKET POLLING REQUEST on PACCH the MS responds with four PACKET CONTROL ACKNOWLEDGEMENT messages of access burst format and does not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.

42.3.1.1.7.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

A TBF is established. It is polled with PACKET POLLING REQUEST containing a global TFI not addressing the MS. The assigned USF addresses the MS. The MS transmits a data block. The SS polls the MS with PACKET POLLING REQUEST containing any global TFI not addressing the MS. The message has optional octets where TFI does address the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats. The SS polls again the MS with PACKET POLLING REQUEST containing the global TFI addressing the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen. |
| 2 | SS -> MS | PACKET POLLING REQUEST | the USF assigned to the MS, the TFI in the message not addressing the MS, no optional octets in RLC/MAC header, a valid RRBP |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Check the TFI is correct as assigned in step 1. |
| 4 | SS -> MS | PACKET POLLING REQUEST | NOT the USF assigned to the MS, the global TFI in the message contents NOT addressing the MS, Payload type indicates the RLC/MAC header containing optional octets where TFI DOES address the MS, RBSN='0'. TYPE_OF_ACK = '0', a valid RRBP=N+13 |
| 5 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | 4 access bursts. Received on PACCH, CTRL_ACK = '10'. |
| 6 | SS -> MS | PACKET POLLING REQUEST | Not the USF assigned to the MS. The global TFI in the message contents addressing the MS. Payload type indicates the RLC/MAC header containing optional octets where TFI not addressing the MS. a valid RRBP |
| 7 | SS | | Check the MS ignores the polling . |
| 8 | SS -> MS | PACKET POLLING REQUEST | Not the USF assigned to the MS. the Global TFI addresses the MS, RLC/MAC header containing no optional octets. TYPE_OF_ACK = '0', a valid RRBP |
| 9 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | 4 access bursts, received on PACCH. |
| 10 | | {Completion of uplink RLC data block transfer} | |

42.3.1.1.8 Dynamic Allocation / Uplink Transfer / Normal / Two uplink timeslots

42.3.1.1.8.1 Conformance requirements

Mobile station belonging to multislot class 3, 5, 6, 7 and 9 to 29 shall support at least two transmit timeslots per TDMA frame (refer to 3GPP TS 05.02, clause B.1).

References

3GPP TS 05.02, clause B.1.

42.3.1.1.8.2 Test purposes

To verify that an MS belonging to GPRS multislot class 5, 6, 7 and 9 to 29 supports an uplink TBF using two timeslots per TDMA frame.

42.3.1.1.8.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure, in PACKET UPLINK ASSIGNMENT two timeslots are assigned. On the same TDMA frame the SS signals to the MS the assigned USFs addressing the MS on the two assigned PDTCHs. It is checked that the two RLC/MAC data blocks in the next radio block period are received on the respective PDTCH channels and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USFs addressing the MS. The check is repeated. The same procedure is going on until the MS completes the packet data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily. Two timeslots, USF ₀ on TN ₀ and USF ₁ on TN ₁ , are assigned. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF ₀ on PDTCH ₀ addressing the MS on 3 blocks from the last radio block containing the uplink assignment. |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF ₁ on PDTCH ₁ addressing the MS, sent on the same TDMA frame as step 2. |
| 4 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH ₀ . Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH ₁ on the same TDMA frame as step 4. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | Assigned USF ₀ on PDTCH ₀ addressing the MS. |
| 7 | SS -> MS | PACKET UPLINK ACK/NACK | Assigned USF ₁ on PDTCH ₁ addressing the MS, sent on the same TDMA frame as step 6. |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH ₀ . Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH ₁ , on the same TDMA frame as step 8. Check that the coding as specified in CHANNEL_CODING_COMMAND, the TFI is correct and the block does not contain TLLI. |
| 10 | | {Completion of uplink RLC data block transfer} | |

42.3.1.1.9 Void

42.3.1.1.10 Dynamic Allocation / Uplink Transfer / Normal / USF assigned with MCS-1 to MCS-4

42.3.1.1.10.1 Conformance requirements

In 44.060 it is stated: "If dynamic or extended dynamic allocation is used, a mobile station in GPRS TBF mode shall be able to detect the USF that assigns the uplink to that mobile station. The network shall use GMSK modulation, i.e. either CS-1 to CS-4 or MCS-1 to MCS-4, in those blocks."

In 45.003 it is stated: "For the coding schemes CS-2 to CS-4 and MCS-1 to MCS-4, the first three bits (USF-bits) of the data block are encoded such that the first twelve coded bits are representing the same bit pattern, irrespective of the coding scheme, depending only on the USF-bits. For these coding schemes, the USF-bits can therefore always be decoded from these twelve bits in the same way."

According to these two requirements, a MS in GPRS TBF mode shall detect an assigned USF value on an assigned PDCH when the network sends the USF in a EGPRS RLC/MAC block coded with MCS-1 to MCS-4.

42.3.1.1.10.2 Test purposes

To verify that a MS in GPRS TBF mode in uplink detects the assigned USFs when the network assigns these USFs with data blocks coded with MCS-1 to MCS-4.

42.3.1.1.10.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate a packet uplink data transfer in RLC acknowledged mode on one PDCH. The SS orders the MS to have a two-phase access, in PACKET UPLINK ASSIGNMENT message with the USF_GRANURALITY set to 1 block.

The SS sends on the assigned PDCH an EGPRS data block coded with MCS-1 containing the USF value assigned to the MS on the corresponding PDCH. The SS checks that the MS sends in response on the assigned PDCH the expected data block.

The test is repeated by the SS using EGPRS data blocks coded successively with MCS-2, MCS-3 and MCS-4 to assign the USF to the MS.

Then the data transfer is completed.

Maximum Duration of Test

1 minute.

| 11 | | {Completion of uplink RLC data block transfer} | USF_GRANULARITY = 1 block; 1 slot assigned in uplink. |

42.3.1.2 Dynamic Allocation / Uplink Transfer / Abnormal

42.3.1.2.1 Void

42.3.1.2.2 Void

42.3.1.2.3 Void

42.3.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment (concurrent)

42.3.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal

42.3.2.1.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Successful

42.3.2.1.1.1 Conformance requirements

During uplink transfer, the network may initiate a downlink TBF by sending a PACKET DOWNLINK ASSIGNMENT message, or a PACKET TIMESLOT RECONFIGURE, to the mobile station on the PACCH. If a PACKET TIMESLOT RECONFIGURE message is sent, then the message shall contain the DOWNLINK_TFI_ASSIGNMENT field. On receipt of an assignment message, and after the TBF starting time, if present, the mobile station shall switch to the

assigned PDCHs. The operation of the downlink TBF follows the procedures in 3GPP TS 04.60, subclause 8.1.2 with the following additions:

1. If a timer or counter expiry causes the uplink TBF to be aborted in the mobile station, the mobile station shall also abort the downlink TBF and perform an abnormal release with random access.
2. If uplink and downlink TBFs are already established, then the network may send a PACKET TIMESLOT RECONFIGURE message without DOWNLINK_TFI_ASSIGNMENT. The mobile station shall interpret this as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs and the downlink TFI is not changed.

References

3GPP TS 04.60, subclauses 8.1.1.1.3 and 8.1.2.

42.3.2.1.1.2 Test purposes

To verify that during uplink transfer:

1. The MS switches to the assigned PDCHs when the network initiates a downlink TBF by sending PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE to the MS on PACCH.
2. When the MS receives PACKET TIMESLOT RECONFIGURE without DOWNLINK_TFI_ASSIGNMENT in the case of uplink and downlink TBFs established already, the MS interprets this message as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs.
3. The MS also aborts the downlink TBF and performs an abnormal release with random access if a timer or a counter expiry causes the uplink TBF to be aborted in the MS.

42.3.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting,.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS assigns a downlink TBF on the same timeslot as the uplink TBF. The SS sends a downlink data block with polling for acknowledgement and the assigned USF assigned to the MS for the MS, and indicates FBI=1 for the final data block. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame. The SS waits 2s for the MS releasing the downlink PDCH. The SS sends PACKET TIMESLOT RECONFIGURE assigning a new downlink PDCH. A downlink data block is sent, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the last received downlink data block on the correct frame.

The SS sends PACKET TIMESLOT RECONFIGURE without DOWNLINK_TFI_ASSIGNMENT replacing the existing uplink and downlink PDCH with another pair of concurrent PDCH. A downlink data block is sent on the replaced PDCH and the MS is polled for acknowledgement. The MS shall not react upon it. Another downlink data block is sent on the assigned PDCH, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame.

The SS sends downlink data blocks with USF not addressing the MS until receives CHANNEL REQUEST.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The assigned USF assigned to the MS on 3 blocks from the last radio block containing the uplink assignment. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 4 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Sent on the PACCH, assigning a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged, single timeslot, TFI ₂ , no starting time. |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | Containing RRBp= N+13 and USF assigned to the MS. FBI = '1'. Sent on the downlink PDTCH on 3 blocks from the last radio block containing the downlink assignment. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH assigned in step 1. |
| 7 | MS -> SS | PACKET CONTROL ACK | Received on the frame number = N+13, N is the frame number of the first burst of the data block in step 5. |
| 8 | SS -> MS | PACKET UPLINK ACK/NACK | Containing USF assigned to the MS |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH assigned in step 1. |
| 10 | SS | | Wait 2 s for T3192 timeout. |
| 11 | SS -> MS | PACKET TIMESLOT RECONFIGURE | Sent on the PACCH of the PDCH assigned in step 1. Assign a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged, single slot, TFI ₂ , no starting time. |
| 12 | SS -> MS | DOWNLINK RLC DATA BLOCK | Containing RRBp= N+21 or +22 and USF assigned to the MS. FBI = '0'. Sent on the downlink PDTCH assigned on 3 blocks from the last radio block containing the downlink assignment in step 11. |
| 13 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH assigned in step 1. |
| 14 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the block of frame number = N+21 or +22, N is the frame number of the first burst of the data block in step 12. |
| 15 | SS -> MS | PACKET TIMESLOT RECONFIGURE | Without DOWNLINK_TFI_ASSIGNMENT, Assign new uplink and downlink time slots, no starting time, sent on the PACCH of the PDCH assigned in step 11. |
| 16 | SS -> MS | DOWNLINK RLC DATA BLOCK | Containing USF assigned to the MS. Sent on the downlink PDTCH assigned in step 11 on 3 blocks from the last radio block containing the assignment in step 15. |
| 17 | SS | | Check that neither data blocks, nor control blocks are sent by the MS within the next seven radio blocks. |
| 18 | SS -> MS | DOWNLINK RLC DATA BLOCK | Containing a valid RRBp= N+26 and USF assigned to the MS. Sent on the downlink PDTCH assigned in step 15. |
| 19 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH assigned in step 15. |
| 20 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the block of frame number = N+26, N is the frame number of the first burst of the data block in step 18, on the PACCH of the downlink PDCH. |
| 21 | SS -> MS | DOWNLINK RLC DATA BLOCK | USF not addressing the MS. |
| 22 | SS -> MS | | Repeat step 21 until receives CHANNEL REQUEST in step 23. |
| 23 | MS -> SS | CHANNEL REQUEST | Received on RACH within 7.5 seconds from step 20. |
| 24 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, |
| 25 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 24. |
| 26 | SS -> MS | PACKET UPLINK ASSIGNMENT | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = 4 blocks, Sent on PACCH of the same PDCH assigned in step 24. |
| 27 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of PDCH assigned on 3 blocks from the last radio block containing the uplink assignment in step 26. |
| 28 | MS -> SS | UPLINK RLC DATA BLOCK | Received 4 consecutive data blocks |
| 29 | | {Completion of uplink RLC data block transfer} | |

42.3.2.1.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Multislot capabilities

42.3.2.1.2.1 Conformance requirements

1. Mobile station belonging to multislot class 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24 shall support as many uplink and downlink timeslots as indicated in 3GPP TS 05.02 clause B.1.
2. If transmission of the PACKET CONTROL ACKNOWLEDGEMENT would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class, transmission of the highest numbered PDCH(s) shall be omitted.

References

3GPP TS 05.02, clause B.1.

3GPP TS 04.60, subclause 8.6.

42.3.2.1.2.2 Test purposes

To verify that the GPRS multislot MS supports as many uplink and downlink TBFs per TDMA frame as indicated. Especially, it is verified that the Type 1 MS in a GPRS multislot class declared has the capability of supporting:

1. T_{ib} , the minimum number of slots allowed between the end of the previous transmit or receive TS and the next transmit TS when measurement is to be performed for type 1 MS;
2. T_{ra} , the minimum number of slots allowed between the previous transmit or receive TS and the next receive TS when measurement is to be performed for type 1 MS;
3. the maximum number of Rx and Tx supported;

4. the sum of slots supported.

It is also verified that the MS of a GPRS multislot class transmits PACKET CONTROL ACKNOWLEDGEMENT when polled, and omits the transmission of the highest numbered PDCH(s) if the transmission would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class.

42.3.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

- TSPC_Type_GPRS_Multislot_ClassX (where X = 1..45)

PIXIT Statements

-

Test Procedure

The following GPRS multislot configurations are tested in the test case:

- Class 2 and 3 support two downlink timeslots and one uplink timeslot, $T_{tb}=2$, $T_{ra}=3$;
- Class 4 and 6 support three downlink timeslots and one uplink timeslot, $T_{tb}=1$, $T_{ra}=3$;
- Class 5 and 9 supports two downlink timeslots and two uplink timeslots, $T_{tb}=1$, $T_{ra}=3$;
- Class 8 and 10 support four downlink timeslots and one uplink timeslot, $T_{tb}=1$, $T_{ra}=2$;
- Class 19 and 24 support five downlink timeslots and one uplink timeslot, $T_{tb}=1$, $T_{ra}=2$.

In the multislot configurations all assigned channels are frequency hopped except for the class 19 and 24 test where non-hopping channels are assigned for PDCHs. The class 3, 6, 9 and 10 are tested in a reduced uplink configuration.

According to the multislot configurations an uplink TBF with one or two timeslots assigned is established and in progress. The SS establishes a concurrent downlink TBF with multiple timeslots assigned.

On the 1st radio block the SS sends downlink data in the maximum capability allowed under the configuration, signals to the MS the assigned USFs addressing the MS and polls the MS. On the 2nd radio block the MS sends RLC data in response of the addressing the MS USFs. On the 6th radio block the SS sends downlink data in the maximum capability allowed under the configuration and signals to the MS the assigned USFs addressing the MS. On the 7th radio block the MS responses PACKET DOWNLINK ACK/NACK and sends RLC data in response of one of the USFs addressing the MS if the configuration is allowed.

The basic test procedure is repeated until CV=1. The SS sends the last RLC data block with FBI=1 and polls the MS for acknowledgement. The SS sends PACKET UPLINK ACK/NACK setting FINAL_ACK_INDICATION=1. The MS sends two separate PACKET CONTROL ACKNOWLEDGEMENT messages to release the uplink and downlink TBFs.

Maximum Duration of Test

5 minutes.

Expected Sequence for GPRS multislots class 2 and class 3 (2 downlink timeslots + 1 uplink timeslot)

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1 CHANNEL_CODING_COMMAND: cs1 An uplink timeslot is assigned (see specific message contents). |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 1. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH. |
| 4 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Sent on PACCH of the uplink PDCH. Assigning a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged mode, TFI _d (different from the uplink one), no starting time, assigning TN ₁ and TN ₂ . |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₁ of the downlink PDTCH, RRBP invalid. |
| 6 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₂ of the downlink PDTCH, a valid RRBP = N + 26, the assigned USF assigned to the MS, on the same radio block as step 5. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH, on the next radio block from step 6. |
| 8 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₁ of the downlink PDTCH, RRBP invalid, on five radio blocks after step 6. |
| 9 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₂ of the downlink PDTCH, the assigned USF assigned to the MS and RRBP invalid, on the same radio block as in step 8. Note: The next uplink radio will not be used for the uplink data. It is reserved for a control block answering the polling in step 6. |
| 10 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the RRBP block on TN ₂ specified in step 6. |
| 11 | | | Repeat step 5 to 10, until CV=0 in step 7. |
| 12 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₂ with FBI = 1 and a valid RRBP=N+26. |
| 13 | SS -> MS | PACKET UPLINK ACK/NACK | FINAL_ACK_INDICATION = 1. Sent on TN ₂ PACCH of the uplink PDCH. With a valid RRBP=N+13 |
| 14 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | CTRL_ACK = 11. The MS releases the uplink TBF. |
| 15 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 12. CTRL_ACK = 11. The MS releases the downlink TBF. |

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | n = 330 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1 CHANNEL_CODING_COMMAND: cs1 An uplink timeslot is assigned (see specific message contents). |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 1. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH. |
| 4 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Sent on PACCH of the uplink PDCH. Assigning a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged mode, TFI _d (different from the uplink one), no starting time, assigning the timeslots TN ₁ , TN ₂ and TN ₃ . |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₁ of the downlink PDTCH, RRBP invalid. |
| 6 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₂ of the downlink PDTCH, the assigned USF assigned to the MS and a valid RRBP = N +26, on the same radio block as step 5. |
| 7 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₃ of the downlink PDTCH, RRBP invalid, on the same radio block as step 5. |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the uplink PDTCH, on the next radio block from step 5. |
| 9 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₁ of the downlink PDTCH, RRBP invalid, on five radio blocks after step 6. |
| 10 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₂ of the downlink PDTCH, the assigned USF assigned to the MS and an invalid RRBP, on the same radio block as step 9. Note: The next uplink radio block will not be used for the uplink data. It is reserved for a control block answering the polling in step 6. |
| 11 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₃ of the downlink PDTCH, RRBP invalid, on the same radio block as step 9. |
| 12 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the RRBP block on TN ₂ specified in step 6. |
| 13 | | | Repeat step 5 to 12, until CV=0 in step 8. |
| 14 | SS -> MS | DOWNLINK RLC DATA BLOCK | Sent on TN ₂ with FBI = 1 and a valid RRBP=N+26. |
| 15 | SS -> MS | PACKET UPLINK ACK/NACK | FINAL_ACK_INDICATION = 1. Sent on PACCH of the uplink PDCH. With a valid RRBP=N+13 |
| 16 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | CTRL_ACK = 11. The MS releases the uplink TBF. |
| 17 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 14. CTRL_ACK = 11. The MS releases the downlink TBF. |

42.3.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal

42.3.2.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / with random access

42.3.2.2.1.1 Conformance requirements

1. If a failure occurs on the mobile station side before the new TBF has been successfully established, the newly reserved resources are released.
2. If the information in the PACKET TIMESLOT RECONFIGURE does not properly specify an uplink and downlink PDCH or violates the mobile station's multislot capabilities, the mobile station shall perform an abnormal release with random access.
3. If uplink and downlink TBFs are not already established and the PACKET TIMESLOT RECONFIGURE message does not include a DOWNLINK_TFI_ASSIGNMENT field, then the mobile station shall perform an abnormal release with random access.
4. If a failure in the PACKET TIMESLOT RECONFIGURE is due to any other reason, the mobile station shall abort the procedure and perform an abnormal release with random access.
5. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.
6. To perform an abnormal release with random access, the mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF.

References

3GPP TS 04.60, subclauses 8.1.1.1.3.1, 8.1.1.1.2.1 and 8.7.2.

42.3.2.2.1.2 Test purposes

To verify that the MS, in downlink TBF establishment during uplink transfer, performs an abnormal release with random access, when the information in the PACKET TIMESLOT RECONFIGURE:

1. does not properly specify an uplink and downlink PDCH;
2. violates the mobile station's GPRS multislot capabilities;
3. does not include a DOWNLINK_TFI_ASSIGNMENT field;
4. has a failure due to any other reason other than the reasons listed above.

42.3.2.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

- TSPC_Type_GPRS_Multislot_ClassX (where X = 1..45)

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The SS sends PACKET TIMESLOT RECONFIGURE for establishment a downlink TBF. A failure occurs at the mobile station side before the new downlink TBF has been successfully established. The MS starts a random access for uplink establishment. The SS assigns a new uplink PDCH to the MS. The SS signals the USF of the preceding uplink TBF addressing the MS on the preceding PDCH which shall have been released by the MS. It is checked that no RLC data block is received on the next three radio blocks. The SS signals the assigned USF assigned to the MS on the uplink PDCH assigned. The MS sends a RLC data block.

The test procedure is repeated 4 times. The message contents of PACKET TIMESLOT RECONFIGURE are varied as defined below.

1st execution, improper PDCH: hopping frequencies not all in one band.

2nd execution, violating the GPRS multislot capabilities.

3rd execution, no DOWNLINK_TFI_ASSIGNMENT.

4th execution, CONTROL_ACK = '1' (shall be set to '0' as the SS has not yet sent the final downlink RLC data block).

Maximum Duration of Test

10 minutes.

Expected Sequence

The sequence is repeated 4 times. The 2nd execution is not applicable for the MS GPRS multislot class 18 and 29.

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end CHANNEL_CODING_COMMAND: arbitrarily chosen. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The assigned USF assigned to the MS |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding and the TFI are correct. |
| 4 | SS -> MS | PACKET TIMESLOT RECONFIGURE | See specific message contents. |
| 5 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to force the MS making the two-phase access procedure. Sent on AGCH. |
| 7 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 6. |
| 8 | SS -> MS | PACKET UPLINK ASSIGNMENT | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block, the assigned slot and USF different from TN ₂ (as in the default) |
| 9 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS in step 1, sent on TN ₂ , on PACCH in step 1. |
| 10 | SS | | Check that no RLC data block is received on the next three radio blocks from step 9. |
| 11 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS sent on the PACCH assigned in step 8. |
| 12 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the correct radio block of the assigned PDTCH. |
| 13 | | {Completion of uplink RLC data block transfer} | |

42.3.2.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / Continuation of normal operation

42.3.2.2.2.1 Conformance requirements

1. If a failure occurs on the mobile station side before the new TBF has been successfully established, the newly reserved resources are released.
2. If a failure in the PACKET DOWNLINK ASSIGNMENT is due to any reason, the mobile station shall abort the procedure and continue the normal operation of the uplink TBF.

References

3GPP TS 04.60, subclauses 8.1.1.1.3.1 and 8.7.

42.3.2.2.2.2 Test purposes

To verify that the MS aborts the downlink TBF establishment and continues the normal operation of the uplink TBF when the PACKET DOWNLINK ASSIGNMENT fails due to any reason in downlink TBF establishment during uplink transfer.

42.3.2.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The SS sends PACKET DOWNLINK ASSIGNMENT assigning a downlink TBF while a fault occurs in the downlink assignment message.

The SS sends a downlink RLC data block on the downlink PDCH assigned and polls the MS for acknowledgement. It is checked that no PACKET DOWNLINK ACK/NACK is received. The SS signals the assigned USF assigned to the MS on the uplink PDCH assigned. The MS sends a RLC data block.

Maximum Duration of Test

5 minutes.

Expected Sequence

| {0 1<DOWNLINK_TFI_ASSIGNMENT>} | L (no downlink TFI assignment) |

42.3.3 Dynamic Allocation / Resource reallocation

42.3.3.1 Dynamic Allocation / Resource reallocation / Successful

During an uplink packet transfer, upper layer may request to transfer another LLC PDU with a different Radio Priority, a different peak throughput class or a different RLC mode than the current one, the MS may require the allocation of new uplink resources.

42.3.3.1.1 Dynamic Allocation / Resource reallocation / Successful / Higher throughput class or higher radio priority

42.3.3.1.1.1 Conformance requirements

1. During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the mobile station has not started the countdown procedure and the new LLC PDU has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class, the mobile station shall immediately request a resource reallocation for uplink according to the new Radio Priority and peak throughput class of the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and starting timer T3168.
2. Then the mobile station shall complete the transmission of the current LLC PDU.
3. After the transmission of the PACKET RESOURCE REQUEST message with the reason for changing the priority or peak throughput class of an assigned uplink TBF the mobile station shall continue to use the currently assigned uplink TBF assuming that the requested priority or peak throughput class is already assigned to that TBF.

References

3GPP TS 04.60 subclause 8.1.1.1.2.

42.3.3.1.1.2 Test purposes

It is verified that:

1. Having an uplink TBF in progress without starting the countdown procedure, the MS will immediately send PACKET RESOURCE REQUEST if upper layer requests to transfer another LLC PDU which has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class.
2. After the request of the resource reallocation for uplink the MS completes the transmission of the current LLC PDU independent of whether or not a new resource is allocated.
3. After the transmission of the PACKET RESOURCE REQUEST the MS continues to use the currently assigned uplink TBF.

42.3.3.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, T3168 timeout value=7 (4s), BS_CV_MAX = 1, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated:

- Test PDP context3 and context6 activated;

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher throughput in the same RLC mode and the same radio priority.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks. It is verified that the MS completes the transmission of the current LLC PDU and

then starts transmitting a new LLC PDU with the higher throughput. A new PDCH is assigned to MS to complete the RLC data block transferring.

The test procedure is executed twice. In the 2nd execution, after the MS requests a resource reallocation for transferring the data block with a higher throughput a new PDCH is assigned. It is verified that the MS switches on the new PDCH, completes the transmission of the current LLC PDU and then starts transmitting a new LLC PDU with the higher throughput.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test sequence is executed twice for $k = 1$ and 2.

When $k=1$ testing that the MS continues to use the currently assigned uplink TBF, while $k=2$ testing that the MS to use newly assigned the resource to complete transmission of the current PDU before starting transmission the PDU with a higher radio priority or a higher throughput.

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | n = 440 octets in test PDP context3, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5 (16k octets/s), RADIO_PRIORITY = 4, RLC_MODE = unacknowledged mode. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS. |

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer 220 octets user data with a higher throughput or a higher radio priority, but in a different RLC mode.

SS assigns the USFs allowing the MS transmit more data blocks until the MS complete the countdown procedure. It is verified that the MS has transmitted only one LLC PDU.

Random accesses are received from the MS for channel request. SS assigns a PDCH to it. SS assigns USFs addressing to the MS allowing more data blocks are transmitted by the MS until the countdown value CV=0.

The MS requests more resources through random accesses of channel requests for the remaining LLC PDU in the initial test PDP context. SS starts a two-phase dynamic allocation. It is checked that the values of

PEAK_THROUGHPUT_CLASS, RADIO_PRIORITY and RLC_MODE requested by the MS in the PACKET RESOURCE REQUEST are in consistence with the initial test PDP context2.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | MS | {Uplink dynamic allocation two phase access} | In PDP context2, n = 880 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 4 | MS | | Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct. To trigger the MS to transfer 220 octets in test PDP context1, unacknowledged RLC mode and a higher radio priority. |
| 5 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, the USF assigned to the MS. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. Check that the coding and the TFI are correct. |
| 7 | SS | | Repeat step 5 and 6 until countdown value CV=0. Observe the Length indicator, M bit and E bit of the received data headers. |
| 8 | SS -> MS | PACKET UPLINK ACK/NACK | Check that transmitted is only the 1 st LLC PDU, Note: the 1 st LLC PDU is in PDP context2, the 2 nd LLC PDU is waiting for transferring. |
| 9 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | FINAL_ACK_INDICATION = '1'. Acknowledge all received data, containing valid RRBp, sent on PACCH. Received on the block specified by RRBp on PACCH of the assigned PDCH. |
| 10 | MS -> SS | CHANNEL REQUEST | Received on RACH for TBF establishment for transferring of the LLC PDU in PDP context1. |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to force the MS making two-phase access procedure. Sent on AGCH. |
| 12 | MS -> SS | PACKET RESOURCE REQUEST | Received on the single block assigned in step 11. Check that radio priority level = 1, peak throughput class = 5, unacknowledged RLC mode. |
| 13 | SS -> MS | PACKET UPLINK ASSIGNMENT | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the same PDCH assigned in step 11. |
| 14 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 13. |
| 15 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the PDTCH assigned. |
| 16 | | | Repeat step 14 and 15 until countdown value CV=0. Check the amount of data is consistent with what was indicated by the MS in step 4. |

42.3.3.2 Dynamic Allocation / Resource reallocation / Abnormal

42.3.3.2.1 Dynamic Allocation / Resource reallocation / Abnormal / T3168 expiry

42.3.3.2.1.1 Conformance requirements

On expiry of timer T3168 the mobile station shall retransmit the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times in which case the mobile station shall return to packet idle mode and indicate a packet access failure to upper layer.

References

3GPP TS 04.60, subclause 8.1.1.1.2.

42.3.3.2.1.2 Test purposes

To verify that during uplink resource reallocation on expiry of timer T3168:

1. The MS retransmits the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times;
2. The MS returns to idle mode after PACKET RESOURCE REQUEST has been transmitted four times.

42.3.3.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, CONTROL_ACK_TYPE = 0, T3168 timeout value=0 (0.5s), BS_CV_MAX = 1, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7, Max Retrans = 11 (Max 7 retransmissions).

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated:

- Test PDP context2 and context5 activated;

-

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks, but does not answers to the requested resources. The MS repeatedly sends PACKET RESOURCE REQUEST three times after T3168 expires each time.

SS waits 0,55 s after receiving the 4th PACKET RESOURCE REQUEST and then sends PAGING REQUEST TYPE 1 in the next paging block for the. The MS answers with CHANNEL REQUEST.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | MS | {Uplink dynamic allocation two phase access} | In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode. |

42.3.3.2.2 Dynamic Allocation / Resource reallocation / Abnormal / Invalid assignment

42.3.3.2.2.1 Conformance requirements

1. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message and detects an invalid Frequency Parameters information element in the message, the mobile station shall perform an abnormal release with system information (see sub-clause 8.7.3), performing a partial acquisition of system information messages containing frequency information.
2. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.
3. If the mobile station receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency that is in a frequency band not supported by the mobile station then the mobile station shall perform an abnormal release with random access.

References

3GPP TS 04.60, subclause 8.1.1.2.1.

42.3.3.2.2.2 Test purposes

To verify that during uplink resource reallocation:

1. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band.
2. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency in the frequency band not supported.
3. The MS performs an abnormal release with system information if it receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message containing an Invalid Frequency Parameters information element.

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode. The MS sends PACKET RESOURCE REQUEST. SS sends PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE containing an invalid assignment ($k=1\dots 5$, see step 6 in expected sequences).

It is checked that the MS starts random accesses.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test sequence is executed in total five times, $k = 1 \dots 5$. The 5th execution is applicable to the single band MS, but not to the multi-band one.

| Step | Direction | Message | Comments |
|----------|-----------|--|---|
| 1 | MS | {Uplink dynamic allocation two phase access} | In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDCH. |
| 4 | MS | | Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct. To trigger the MS to transfer 440 octets with the peak throughput class 5 (16k octets/s) and the radio priority 1 in acknowledge RLC mode of the PDP context5. |
| 5-1 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on the PACCH, the USF assigned to the MS. |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET RESOURCE REQUEST | Received on the PACCH of the PDCH assigned. |
| 6-1 | | | Repeat steps 5-1 and 5 until reception of PACKET RESOURCE REQUEST (ensure that countdown procedure did not start before that MS requests additional resources) |
| 6 k=1 | SS -> MS | PACKET UPLINK ASSIGNMENT | Assign a frequency hopping PDCH, but not all frequencies are in one frequency band. |
| 6 k=2 | SS -> MS | PACKET TIMESLOT RECONFIGURE | Assign a frequency hopping PDCH, but not all frequencies are in one frequency band. |
| 6 k=3 | SS -> MS | PACKET UPLINK ASSIGNMENT | Assign a frequency hopping PDCH, the MA_NUMBER and MA_CHANGE_MARK_1 mismatch the values of MA_NUMBER and MA_CHANGE_MARK stored in the MS. |
| 6 k=4 | SS -> MS | PACKET TIMESLOT RECONFIGURE | Assign a frequency hopping PDCH, the MA_NUMBER and MA_CHANGE_MARK_1 mismatch the values of MA_NUMBER and MA_CHANGE_MARK stored in the MS. |
| 6 k=5 | SS -> MS | PACKET UPLINK ASSIGNMENT | Assigned ARFCN on PDCH is not in the frequency band supported by the MS. |
| 7 | MS -> SS | CHANNEL REQUEST | Received on RACH. |

42.3.3.3 Dynamic Allocation / Resource reallocation / Reject

42.3.3.3.1 Conformance requirements

1. On receipt of a PACKET ACCESS REJECT message, the mobile station shall stop timer T3168 if running and indicate a packet access failure to upper layers. If no downlink TBF exists, the mobile station shall return to packet idle mode.
2. If the PACKET ACCESS REJECT message contains a WAIT_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall start timer T3172 and if the mobile station has additional RLC data blocks to transmit, it shall initiate a new TBF establishment procedure on the RACH or PRACH, but the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, it may, however, attempt packet access in an other cell after successful cell reselection. A mobile station in GPRS MS class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the time T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

References

3GPP TS 04.60, subclause 8.1.1.1.2.

42.3.3.3.2 Test purposes

To verify that during the uplink resource reallocation:

1. The MS returns to packet idle mode when it receives PACKET ACCESS REJECT without WAIT_INDICATION.
2. On receipt of a PACKET ACCESS REJECT with a WAIT_INDICATION the MS waits until T3172 expires. The MS, if having another RLC data blocks to transmit, initiates a new TBF establishment procedure on the RACH.

42.3.3.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, BS_CV_MAX = 1, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated:

- Test PDP context2 and context5 activated;

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. SS sends PACKET ACCESS REJECT without containing WAIT_INDICATION. The MS may attempt a new random access because of the user data from the upper layer.

The test procedure is repeated once. The difference between the two executions is that in the 2nd execution, PACKET ACCESS REJECT contains WAIT_INDICATION. The MS may start the random access after T3172 expires.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test sequence is executed twice for $k = 1 \dots 2$.

| Step | Direction | Message | Comments |
|-------------------|-----------|--|---|
| 1 | MS | {Uplink dynamic allocation two phase access} | In PDP context2, n = 220 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: cs1, CHANNEL_CODING_COMMAND: cs1, PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 4 | MS | | Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct. To trigger the MS to transfer 440 octets with the peak throughput class 5 (16k octets/s) and the radio priority 1 in acknowledge RLC mode of the PDP context5. |
| 5 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS. |
| 5-1 | MS -> SS | UPLINK RLC DATA BLOCK or PACKET RESOURCE REQUEST | Received on the PACCH of the PDCH assigned |
| 5-2 | | | Repeat steps 5 and 5-1 until reception of PACKET RESOURCE REQUEST (ensure that countdown procedure did not start before that MS requests additional resources) |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH, the USF assigned to the MS. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 8 | SS -> MS | PACKET ACCESS REJECT | Check that the coding as specified by CHANNEL_CODING_COMMAND, the TFI is correct. Sent on the PACCH of the PDCH, including the same address reference received from step 5-1 addressing the MS. |
| 9(option al step) | MS -> SS | CHANNEL REQUEST | For k = 1 without WAIT_INDICATION For k = 2 with WAIT_INDICATION. Optionally received on RACH, depending on the MS implementation. For k=2, check that the random access is received not before 4,5s from step 8 |

Specific Message Contents

PACKET ACCESS REJECT message in step 8 for $k=1$:

| | |
|--------------|-------------------------------------|
| MESSAGE_TYPE | 1 00001 |
| PAGE_MODE | Normal Paging |
| Reject | |
| - | 0 (TLLI) |
| - TLLI | the same value as the TLLI received |
| - | 0 (no WAIT_INDICATION) |
| - | 0 |

PACKET ACCESS REJECT message in step 8 for k=2:

| | |
|------------------------|-------------------------------------|
| MESSAGE_TYPE | 1 00001 |
| PAGE_MODE | Normal Paging |
| Reject | |
| - | 0 (TLLI) |
| - TLLI | The same value as the TLLI received |
| - | 1 (WAIT_INDICATION present) |
| - WAIT_INDICATION | 5 s |
| - WAIT_INDICATION_SIZE | 0 (units of seconds) |
| - | 0 (end of reject IE) |

PACKET RESOURCE REQUEST message in step 5:

| Information Element | value/ remark |
|-----------------------------|----------------------|
| Channel Request Description | |
| - PEAK_THROUGHPUT_CLASS | 5 |
| - RADIO_PRIORITY | 1 |
| - RLC_MODE | Acknowledged mode |
| - LLC_PDU_TYPE | 1 (not SACK or ACK) |
| - RLC_OCTET_COUNT | Any allowed value |

42.3.3.4 Dynamic Allocation / Resource reallocation / Successful / Lower Coding Scheme Command

42.3.3.4.1 Void

42.3.3.4.2 Conformance requirements

1. On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall stop timer T3168 and switch to the assigned PDCHs (3GPP TS 04.60 sub-clause 8.1.1.1).
2. The transmitter shall transmit the oldest RLC data block whose corresponding element in V(B) indexed relative to V(A) has the value NACKED. As each RLC data block is transmitted the corresponding element in V(B) is set to the value PENDING_ACK, (3GPP TS 04.60 sub-clause 9.1.3.2).
3. If all RLC data blocks whose corresponding element in V(B) has the value PENDING_ACK have been transmitted once, the process shall be repeated beginning with the oldest RLC data block (3GPP TS 04.60 subclause 9.1.3.2).
4. In GPRS TBF mode, once an RLC data block has been transmitted over the physical link, should it be necessary to re-transmit the RLC data block, it shall be re-transmitted using the same channel coding scheme, BSN, and CV as it had in the previous transmission (3GPP TS 04.60 sub-clause 9.1.11)

References

3GPP TS 04.60, sub-clauses 8.1.1.1, 9.1.3.2, 9.1.11.

42.3.3.4.3 Test purposes

Verify that an MS switches to the newly assigned PDCH, retransmits unacknowledged RLC data blocks with the previous CS, transmits no more than one RLC data block with the previous CS and then applies the new CS command only to the new RLC data blocks.

42.3.3.4.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, has a PDP context 2 activated. One LLC frame of 225 octets (which fits in 3 CS-4 blocks and 3 CS-1 blocks, or 2 CS-4 blocks and 6 CS-1 blocks) are to be sent by the MS.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

- 1) The MS receives a IMMEDIATE ASSIGNMENT message on its assigned PCH, containing a CS command set to CS4.
- 2) The SS transmits a USF assigned to the MS.
- 3) The MS responds by sending an uplink RLC data block.
- 4) the TLLI is sent in a Packet Uplink Ack/Nack in order to solve the contention.
- 5) The MS detects that the contention is solved.
- 6) The SS transmits another PACKET UPLINK ASSIGNMENT message on PACCH, containing new resources and a CS command set to CS1.
- 7) The MS transmits uplink RLC data blocks on the newly assigned resources: unacknowledged RLC data blocks or pending RLC data blocks are retransmitted using the previous CS; no more than one new RLC data block shall then be sent with the previous CS, and subsequent new RLC data blocks are transmitted using the new CS.
- 8) All blocks are acknowledged by the SS and the TBF is released.

Maximum Duration of Test

3 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------|-----------|--------------------------------------|--|
| 1 | | | MS is in the state "idle, GMM-registered" with a P-TMSI allocated, has a PDP context activated |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Triggers the MS to switch to PDCH0. (no starting time); CS4 is commanded. |
| 4 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | 3 blocks after the previous message, one USF addressing the MS is sent on PACCH according to allocation from step 3. |
| 5 | MS -> SS | RLC DATA BLOCK | |
| 6 | SS -> MS | Packet Uplink Ack/Nack | The SS transmits the MS TLLI in order to solve the contention and indicates that the 1 st RLC data block has been received. |
| 7 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | 3 blocks after the previous message, one USF addressing the MS is sent on PACCH according to allocation from step 3. |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | |
| 7a (optional) | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | If the data block contains the TLLI perform optional steps 7a and 8a, otherwise continue with step 9. 3 blocks after the previous message, one USF addressing the MS is sent on PACCH according to allocation from step 3. |
| 8a (optional) | MS -> SS | UPLINK RLC DATA BLOCK | |
| 9 | SS -> MS | PACKET UPLINK ACK/NACK | MS sends the 2 nd RLC data block sent on PDCH0 using CS4. The SS indicates that the 2 nd RLC data block has not been received. |
| 10 | SS -> MS | PACKET UPLINK ASSIGNMENT | Triggers the MS to switch to PDCH1. (no starting time) CS1 is commanded. |
| 11 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | 3 blocks after the previous message, a USF is addressed to MS according to allocation from step 9. |
| 12 | MS -> SS | RLC DATA BLOCK | |
| 13 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | MS sends a RLC data block on PDCH1. The SS continues transmitting USF according to allocation from step 9. |
| 14 | MS -> SS | RLC DATA BLOCK | |
| 15 | | | Verify that no more than one new RLC data block shall then be sent with the previous CS: at the latest the 4 th RLC data block of the TBF is sent with CS1. The SS verifies that CS4 is used for the 2 nd RLC data block, and that CS1 is used at the latest for the 4 th RLC data block and the subsequent blocks. The 3 rd RLC data block may be sent using the previous CS or the new one. Repeat steps 12 and 13 until all the RLC data blocks have been sent, i.e. 6 times |
| 16 | SS -> MS | Packet Uplink Ack/Nack | The SS indicates that every data blocks have been received. |
| 17 | | {Completion of uplink data transfer} | Macro |

Specific Message Contents

IMMEDIATE ASSIGNMENT message in step 3:

| | |
|---------------------------|--|
| TIMESLOT_ALLOCATION | <one timeslot assigned – PDCH0> |
| CHANNEL_CODING_COMMAND | 11 (CS-4) |
| TLLI_BLOCK_CHANNEL_CODING | 1 (the mobile station shall use the value commanded in the CHANNEL_CODING_COMMAND or EGPRS_CHANNEL_CODING_COMMAND field) |
| TBF STARTING TIME | <IE not present> |

PACKET UPLINK ASSIGNMENT message in step 9:

| | |
|--|--|
| TIMESLOT_ALLOCATION CHANNEL_CODING_COMMAND TLLI_BLOCK_CHANNEL_CODING | <one timeslot assigned – PDCH1> 00 (CS-1) 1 (the mobile station shall use the value commanded in the CHANNEL_CODING_COMMAND or EGPRS_CHANNEL_CODING_COMMAND field) |
| TBF STARTING TIME | <IE not present> |

42.3.4 Default message contents

Default message contents and macros as defined in the GPRS defaults section 40 are used for subclause 42.3.

42.4 Measurement reports and Cell change order procedures

This subclause presents tests for "Measurement Reports and Cell Change Order Procedures" which are specified in 3GPP TS 04.60/3GPP TS 44.060 subclauses 5.6 and 8.4.

In the testcases which have uplink data transfer while in NC2, the USF needs to be assigned very frequently so that the measurement reports will be received by the SS within the 10% tolerance.

Default conditions

Default message contents and signalling macros are defined in the GPRS general defaults section, except for those messages and macros specified at the end of this subclause.

42.4.1 Measurement reports

42.4.1.1 Network Control measurement reporting / Uplink / Normal case

42.4.1.1.1 Conformance requirement

The behaviour of the mobile station is controlled by the NETWORK_CONTROL_ORDER parameter in a PACKET MEASUREMENT ORDER message. The reporting periods are indicated in the NC_REPORTING_PERIOD_T field of the PACKET MEASUREMENT ORDER message. The mobile station shall apply to the timer T3158 the NC_REPORTING_PERIOD_T when in packet transfer mode.

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A mobile station in mode NC1 may receive a new indicated reporting period or change packet mode while timer T3158 is active. If the new indicated reporting period is less than the time to expiry of timer T3158, the mobile station shall immediately restart timer T3158 with the new indicated reporting period. Otherwise, the timer T3158 shall continue to run.

42.4.1.1.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

Reference

3GPP TS 04.60, subclauses 5.6.1 and 8.3.

42.4.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. MS sends continuously data blocks and PACKET MEASUREMENT REPORT messages according to the indicated reporting period. A PACKET MEASUREMENT ORDER message is sent again with new reporting period. MS sends data blocks and PACKET MEASUREMENT REPORT messages according to the new reporting period.

Maximum duration of the test

-

42.4.1.2 Network Control measurement reporting / Idle mode / New cell reselection

42.4.1.2.1 Conformance requirement

The procedure for measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the expired timer T3158, perform the measurements and initiate the packet access.

The procedure for measurement report sending is initiated by the mobile station either on PCCCH (sub-clause 7.3.1) or, if a packet control channel not exists, on CCCH (sub-clause 7.3.2).

If the mobile station initiates the establishment of an RR connection, the timer T3158 shall be stopped and no measurement reports shall be sent. When the RR connection is released and if the mobile station has not changed cell, the measurement reporting procedure shall be restarted.

If a cell change has occurred during the RR connection, the measurements shall be cancelled until new NC orders have been received (see sub-clause 5.6).

42.4.1.2.2 Test Purpose

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the MS shall immediately restart timer T3158 with the indicated reporting period for the new cell.

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is shorter than the indicated reporting period for the new cell, the timer T3158 shall continue to run.

42.4.1.2.3 Method of test

Initial conditions

System Simulator:

3 cells (cell A, cell B, cell C), activated at power-on, GPRS supported.

READY Timer is Set to 4 minutes.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

the Ready Timer is running.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in idle mode.

Test procedure

SS sends PACKET MEASUREMENT ORDER message to MS. SS sends PACKET CELL CHANGE ORDER message to MS with new reporting period before the old reporting period has expired. MS initiates a packet access and sends the PACKET MEASUREMENT REPORT to SS. Another measurement report is sent before new PACKET CELL CHANGE ORDER message with new reporting period is sent to MS. Two more measurement reports are sent using correct reporting periods.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|---|
| 1 | SS->MS | IMMEDIATE ASSIGNMENT | SS establishes a single block down link |
| 2 | SS->MS | PACKET MEASUREMENT ORDER | -Sent on PACCH. -Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD_I of cell A See specific message contents |
| 3 | MS ->SS | CHANNEL REQUEST | 'Single block packet access' |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. |
| 5 | MS ->SS | PACKET MEASUREMENT REPORT | Sent on the allocated PDCH. The SS verifies that measurement results for cells B and C are included. |
| 6 | SS->MS | IMMEDIATE ASSIGNMENT | SS establishes a single block downlink |
| 7 | SS->MS | PACKET CELL CHANGE ORDER | -Sent on PACCH. - Commands the MS to cell B. -Contains NETWORK_CONTROL_ORDER, NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I of cell B with new reporting period, which is shorter than remaining time of the old reporting period. See specific message contents |
| 8 | MS ->SS | CHANNEL REQUEST | To the new cell. 'One phase packet access' Note: The SS should take into account that the MS can start timer 3158 with the new timer values for NC_REPORTING_PERIOD either after step 7 or step 8. |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH containing USF assigned to the MS. |
| 11 | MS ->SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating Cell Update |
| 12 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data block, Final Ack Indicator = '1', a valid RRB. Sent on PACCH. |
| 13 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Acknowledge the RLC control message. Received on PACCH. |
| 14 | MS ->SS | CHANNEL REQUEST | To the new cell. 'Single block packet access ' |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT | SS verifies that CHANNEL REQUEST arrives at the end of correct reporting period. Sent on AGCH. |
| 16 | MS ->SS | PACKET MEASUREMENT REPORT | Sent on the allocated PDCH. The SS verifies that measurement results for cells A and C are included. |
| 17 | MS ->SS | CHANNEL REQUEST | 'Single block packet access ' |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT | SS verifies that CHANNEL REQUEST arrives at the end of correct reporting period. Sent on AGCH. |
| 19 | MS ->SS | PACKET MEASUREMENT REPORT | Sent on the allocated PDCH. |
| 20 | SS->MS | IMMEDIATE ASSIGNMENT | SS establishes a single block down link |
| 21 | SS->MS | PACKET CELL CHANGE ORDER | -Sent on PACCH. - Commands to MS to cell C. -Contains NETWORK_CONTROL_ORDER, NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I of cell C with new reporting period, which is longer than remaining time of the old reporting period. See specific message contents |
| 22 | MS ->SS | CHANNEL REQUEST | To the new cell. 'One phase packet access ' |
| 23 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. |
| 24 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH containing USF assigned to the MS. |
| 25 | MS ->SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating Cell Update |
| 26 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data block, Final Ack Indicator = '1', a valid RRB. Sent on PACCH. |

| | | | |
|----|----------|--------------------------------|--|
| 27 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Acknowledge the RLC control message. Received on PACCH. |
| 28 | MS ->SS | CHANNEL REQUEST | 'Single block packet access ' CHANNEL REQUEST arrives at the end of correct reporting period. |
| 29 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. |
| 30 | MS ->SS | PACKET MEASUREMENT REPORT | Sent on the allocated PDCH. The SS verifies that measurement results for cells A and B are included. |
| 31 | MS ->SS | CHANNEL REQUEST | 'Single block packet access ' SS verifies that CHANNEL REQUEST arrives at the end of correct reporting period. |
| 32 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. |
| 33 | MS ->SS | PACKET MEASUREMENT REPORT | Sent on the allocated PDCH. The SS verifies that measurement results for cells A and B are included. |

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |
|---------------------------|-----------------|
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 111 (61.44s) |
| NC_FREQUENCY_LIST | 0 (not present) |

PACKET CELL CHANGE ORDER in step 7:

| | |
|---------------------------|-------------------------|
| IMMEDIATE_REL | 1 |
| ARFCN, BSIC | as specified for cell B |
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 110 (30.72s) |
| NC_REPORTING_PERIOD_T | 110 (30.72s) |
| NC_FREQUENCY_LIST | 0 (not present) |

PACKET CELL CHANGE ORDER in step 21:

| | |
|---------------------------|-------------------------|
| IMMEDIATE_REL | 1 |
| ARFCN, BSIC | as specified for cell C |
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 111 (61.44s) |
| NC_REPORTING_PERIOD_T | 111 (61.44s) |
| NC_FREQUENCY_LIST | 0 (not present) |

42.4.1.3 Network Control measurement reporting / Downlink transfer / Normal case

42.4.1.3.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

Following a downlink TBF establishment, the PACKET MEASUREMENT REPORT message shall not be sent on the uplink PACCH associated with this TBF until two PACKET DOWNLINK ACK/NACK messages has been sent to the network.

The mobile station shall transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message at most every second time it is polled.

42.4.1.3.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

To verify that the MS sends at least two PACKET DOWNLINK ACK/NACK messages before transmitting a PACKET MEASUREMENT REPORT message upon entering transfer state.

Reference

3GPP TS 04.60, subclauses 8.1.2.2, 8.3 and 5.6.1.

42.4.1.3.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into downlink packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK. When reporting period has expired and at least two PACKET DOWNLINK ACK/NACK messages has been sent, MS sends a PACKET MEASUREMENT REPORT message. SS sends data blocks continuously and MS sends PACKET MEASUREMENT REPORT messages when reporting period has expired and at least one PACKET DOWNLINK ACK/NACK messages have been sent after the last PACKET MEASUREMENT REPORT message.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS->MS | IMMEDIATE ASSIGNMENT | Sent on the PCH, assigning a downlink TBF. |
| 2 | SS->MS | PACKET MEASUREMENT ORDER | -Sent on PACCH. -Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD_T See specific message contents |
| 3 | SS | | Wait for 0.5 seconds. |
| 4 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 5 | MS -> SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 6 | SS->MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 7 | MS -> SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 8 | SS->MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 9 | MS->SS | PACKET MEASUREMENT REPORT | - Sent on PACCH. - Contains the "NC measurement report struct" on PACCH |
| 10 | SS | | Wait for 0.5 seconds. |
| 11 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 12 | MS -> SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 13 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 14 | MS->SS | PACKET MEASUREMENT REPORT | - Sent on PACCH. - Contains the "NC measurement report struct" on PACCH |
| 15 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 16 | MS -> SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 17 | SS->MS | PACKET MEASUREMENT ORDER | - Sent on PACCH. -Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD_T with new reporting period. See specific message contents |
| 18 | SS | | Wait for 0.5 seconds. |
| 19 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 20 | MS -> SS | PACKET MEASUREMENT REPORT | Sent on PACCH. - Contains the "NC measurement report struct" on PACCH |
| 21 | SS | | Wait for 0.5 seconds. |
| 22 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 23 | MS->SS | PACKET DOWNLINK ACK/NACK | - Sent on PACCH. |
| 24 | SS | | Wait for 1.0 s. |
| 25 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 26 | MS -> SS | PACKET MEASUREMENT REPORT | Sent on PACCH. - Contains the "NC measurement report struct" on PACCH |
| 27 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 28 | MS -> SS | PACKET DOWNLINK ACK/NACK | - Sent on PACCH. |

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |
|---|--------------------------|
| NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T | 01 (NC1) 000 (0,48 s) |
|---|--------------------------|

PACKET MEASUREMENT ORDER in step 17:

| | |
|---|--------------------------|
| NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T | 01 (NC1) 001 (0,96 s) |
|---|--------------------------|

42.4.1.4 Network Control measurement reporting / Uplink transfer / Continuation in Idle mode.

42.4.1.4.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

Reference

3GPP TS 04.60, subclauses 8.1.2.2, 8.3 and 5.6.1.

3GPP TS 05.08, subclause 10.1.4

42.4.1.4.2 Test Purpose

To verify that if the NC parameters are changed while in packet transfer mode, the MS continues to use the changed parameters after returning to packet idle mode.

42.4.1.4.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is GPRS attached with a P-TMSI allocated.

PDP context 2 established.

Specific PICS Statements

- MS GPRS Release (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

MS is brought into uplink packet transfer mode. SS commands MS to NC2 with PACKET MEASUREMENT ORDER. SS checks that the MS is sending the PACKET MEASUREMENT REPORT at the expiry of the reporting period. SS allows the MS to complete the data transfer. SS checks that after entering packet idle mode MS continues being in NC2 mode by receiving the PACKET MEASUREMENT REPORT.

The test is repeated twice for k=1, and k=2.

K=1:

READY TIMER is set to 2 min, NC_REPORTING_PERIOD_I set to 61.44 sec and NC_REPORTING_PERIOD_T set to 1.92 sec.

K=2:

READY TIMER is set to 30 sec, NC_REPORTING_PERIOD_I set to 7.68 sec and NC_REPORTING_PERIOD_T set to 1.92 sec.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | SS->MS | { Uplink dynamic allocation one phase access with contention resolution } or {Uplink dynamic allocation two phase access} | Macro parameters: 500 : the number of RLC data block to be transferred, USF_GRANULARITY : 1 RLC_DATA_BLOCKS_GRANTED : absent (open-end) CHANNEL_CODING_COMMAND : CS-1 TLLI_BLOCK_CHANNEL_CODING : CS-1 -Sent on PACCH. |
| 2 | SS->MS | PACKET MEASUREMENT ORDER | - For K = 1 and K =2 NETWORK_CONTROL_ORDER, NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I are Specified. See specific message Contents |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS in step 1. |
| 4a | MS -> SS | RLC data block | Received on PDTCH assigned in step 1. |
| 4b | MS -> SS | PACKET MEASUREMENT REPORT | |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on PACCH. Acknowledging the received block. |
| 6 | | | Repeat steps 3-5 until the MS completes the data transfer of all the octets triggered in step 1. The last PACKET UPLINK ACK/NACK is sent with valid RRBP and FAI = 1. SS verifies that the time interval between two consecutive PACKET MEASUREMENT REPORTS is as per REPORTING_PERIOD_T of PMO sent in Step 2. |
| 7 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on PACCH. |
| 8 | MS ->SS | CHANNEL REQUEST | 'Single block packet access' For Rel4 and earlier MS: SS verifies that either Rel5 requirements are fulfilled OR: CHANNEL REQUEST arrives : - After NC_REPORTING_PERIOD_T from last execution of step 4b for first CHANNEL REQUEST. Note: When the MS enters Idle mode, the Channel Request may be delayed by one Paging block of the MS. - After NC_REPORTING_PERIOD_I from last CHANNEL REQUESTs (step 8) for following CHANNEL REQUEST(s). For Rel5 and later MS: SS verifies that CHANNEL REQUEST arrives : - After NC_REPORTING_PERIOD_I from step 7 After NC_REPORTING_PERIOD_I from last CHANNEL REQUEST (step 8) for following CHANNEL REQUEST(s). |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. |
| 10 | MS ->SS | PACKET MEASUREMENT REPORT | Received on the allocated PDCH. |
| 11 | SS | | Steps 8-10 will be repeated till the READY TIMER expires. Check for NC_REPORTING_PERIOD_I that the MS stops sending Packet Measurement Reports |

Note: in step 4x, the MS shall perform **either** the 'a' branch **or** the 'b' branch.

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

For K = 1:

| | |
|--|---|
| NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I NC_REPORTING_PERIOD_T | 10 (NC2) 111 (61.44 s) 010 (1.92 s) |
|--|---|

For K = 2:

| | |
|--|--|
| NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I NC_REPORTING_PERIOD_T | 10 (NC2) 100 (7.68 s) 010 (1.92 s) |
|--|--|

42.4.1.5 Network Control measurement reporting / Idle mode / DSC failure/ reselection.

42.4.1.5.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER, NC_REPORTING_PERIOD(s) and optionally REPORT_TYPE, MULTIBAND_REPORTING, SERVING_BAND_REPORTING, XXX_MULTIRAT_REPORTING, XXX_REPORTING_OFFSET, XXX_REPORTING_THRESHOLD (XXX indicates frequency band or radio access technologies), FDD_REPORTING_THRESHOLD_2, REP_PRIORITY, REPORTING_RATE, INVALID_BSIC_REPORTING, SCALE_ORD, FDD_REP_QUANT, Qsearch_P, 3G_SEARCH_PRIO), E-UTRAN_REP_QUANT, E-UTRAN_FDD_REPORTING_THRESHOLD, E-UTRAN_FDD_REPORTING_THRESHOLD_2, E-UTRAN_TDD_REPORTING_THRESHOLD, E-UTRAN_TDD_REPORTING_THRESHOLD_2, E-UTRAN_FDD_MEASUREMENT_REPORT_OFFSET and E-UTRAN_TDD_MEASUREMENT_REPORT_OFFSET, Qsearch_P_E-UTRAN) is broadcast on BCCH and, excepting E-UTRAN parameters, on PBCCH if it exists.

The MS shall send measurement reports to the network as defined in subclause 10.1.4.1.

The MS shall only perform autonomous cell re-selection when the reselection is triggered by a downlink signalling failure as defined in subclause 6.5 or a random access failure as defined in 3GPP TS 44.018 and 3GPP TS 44.060 or if the cell is barred or the C1 criterion falls below zero. The MS shall only determine whether the cell is barred once camped on the cell.

Reference

3GPP TS 044.060, subclauses 8.1.2.2, 8.3 and 5.6.1.

3GPP TS 045.008, subclause 10.1.4

42.4.1.5.2 Test Purpose

To verify that while in NC2, MS performs autonomous cell reselection when the reselection is triggered by the downlink signalling failure.

42.4.1.5.3 Method of test

Initial conditions

System Simulator:

2 cell, GPRS supported.

| Parameter | Carrier1 | Carrier2 |
|-----------------------|-----------------|-----------------|
| RF Signal Level (dBm) | -60 | -70 |
| NETWORK_CONTROL_ORDER | NC2 | NC2 |
| NC_REPORTING_PERIOD_I | 110 (30.72 sec) | 110 (30.72 sec) |

Mobile Station:

MS is GPRS attached on cell A (Carrier 1) with a P-TMSI allocated. Ready timer is set to 2 min.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

MS is in packet idle mode in cell A (Carrier 1). MS sends a CHANNEL REQUEST for the measurement report. SS assigns resources for it. MS sends a PACKET MEASUREMENT REPORT. SS receives one more PACKET MEASUREMENT REPORT by repeating the above steps. SS starts sending the corrupted blocks on the MS PCH channel in such a way that $DSC < 0$. SS checks that the MS does reselection to cell B.

Maximum duration of the test

5 min.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS->SS | CHANNEL REQUEST | ACCESS TYPE = 'Single block packet access'. Received on RACH. |
| 2 | SS->MS | IMMEDIATE ASSIGNMENT | Received on cell A |
| 3 | MS ->SS | PACKET MEASUREMENT REPORT | Sent on AGCH, assigning a single block. |
| 4 | | | Received on the allocated PDCH. |
| 5 | SS | | Steps 1-3 are repeated once. |
| 6 | SS | | SS Verifies that the measurement results for cells A, B are included in the PACKET MEASUREMENT REPORT. |
| 7 | MS -> SS | CHANNEL REQUEST | SS starts sending the corrupted data on successive paging blocks of the MS until $DSC < 0$. Then it reverts to sending of the normal data. |
| | | | Received on cell B. |
| | | | 'One phase packet access' |

Specific message contents

None.

42.4.2 Cell change order procedures

42.4.2.1 Cell change order procedure / Uplink transfer

42.4.2.1.1 Cell change order procedure / Uplink transfer / Normal case

42.4.2.1.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

42.4.2.1.1.2 Test Purpose

To verify the when NC2 is commanded, the MS sends PACKET MEASUREMENT REPORT messages, in which both the serving and non-serving cells are reported.

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

Reference

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

42.4.2.1.1.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A and cell B), activated at power-on, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. SS commands MS to NC2 with PACKET MEASUREMENT ORDER. SS waits for a PACKET MEASUREMENT REPORT to contain measurement results for both cell A and cell B. SS sends a PACKET CELL CHANGE ORDER message. SS checks that there is no traffic on the old cell. MS switches to the new cell and re-establishes the uplink TBF.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | | { Uplink dynamic allocation one phase access with contention resolution } or {Uplink dynamic allocation two phase access} | Macro parameters: 400 : the number of RLC data block to be transferred, USF_GRANULARITY : 1 RLC_DATA_BLOCKS_GRANTED : absent (open-end) CHANNEL_CODING_COMMAND : CS-1 TLLI_BLOCK_CHANNEL_CODING : CS-1 |

42.4.2.1.2 Void

42.4.2.1.3 Cell change order procedure / Uplink transfer / Failure cases / REJECT from the new cell

42.4.2.1.3.1 Conformance requirement

42.4.2.1.3.1.1 Conformance requirement for Rel-5 and earlier

If a PACKET ACCESS REJECT message is received from the new cell, the mobile station shall start timer T3176, return to the old cell and send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF.

Reference

3GPP TS 04.60/44.060, subclause 8.4.1.

42.4.2.1.3.1.2 Conformance requirement for Rel-6 and later

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- Access is denied in the new cell (i.e., the mobile station receives an IMMEDIATE ASSIGNMENT REJECT, a PACKET ASSIGNMENT REJECT or, in a UTRAN cell, an RRC CONNECTION REJECT message). *Cause*: “Immediate Assign Reject or Packet Access Reject on target cell”.

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type “single block without TBF establishment” (PCCCH) / “single block packet access” (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

Reference

3GPP TS 44.060, subclause 8.4.2.

42.4.2.1.3.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network from the old cell, if a PACKET ACCESS REJECT message is received from the new cell.

42.4.2.1.3.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends the CHANNEL REQUEST. SS sends IMMEDIATE ASSIGNMENT REJECT message. MS returns to the old cell and sends PACKET CELL CHANGE FAILURE message to the network.

Maximum duration of the test

|------|-----------|---|---|
| 1 | | {Uplink dynamic allocation two phase access} | Macro parameters: USF_GRANULARITY : 1 RLC_DATA_BLOCKS_GRANTED : absent (open-end) CHANNEL_CODING_COMMAND : CS-1 LLI_BLOCK_CHANNEL_CODING : CS-1 |
| 2 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH, 3 block periods after contention resolution in step 1 has been completed. - Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD . See specific message contents |
| 3 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 4a | MS -> SS | RLC data blocks | MS sends data |
| 4b | MS -> SS | PACKET MEASUREMENT REPORT | |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on PACCH. |
| 6 | SS | | Repeat steps 3-5 until measurement results for cell B are included in the PACKET MEASUREMENT REPORT message. |
| 7 | SS -> MS | PACKET CELL CHANGE ORDER | Sent on the PACCH. Contains -BSIC + BCCH frequency -The network control order See specific message contents |
| 8 | MS -> SS | CHANNEL REQUEST | To the new cell. 'One Phase Access Request' or 'Two Phase Access Request' |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Received from the new cell |
| 10 | MS -> SS | CHANNEL REQUEST | Received on RACH To the old cell. Sent within 15 seconds from the IMMEDIATE ASSIGNMENT REJECT in step 9. |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. Single block assignment. |
| 12 | MS -> SS | PACKET CELL CHANGE FAILURE or PACKET RESOURCE REQUEST | Error cause in PACKET CELL CHANGE FAILURE : "Packet Access Reject on target cell" See specific message content. Branch 'b' will be performed when PACKET RESOURCE REQUEST is received. |
| 13a | MS -> SS | CHANNEL REQUEST | To the old cell. |
| 14a | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on the AGCH. Single block assignment |
| 15a | MS -> SS | PACKET RESSOURCE REQUEST | Sent on the assigned block. |
| 16a | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent on PACCH. Dynamic allocation |
| 13b | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent on PACCH. Dynamic allocation. |
| 14b | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 15b | MS -> SS | PACKET CELL CHANGE FAILURE | Error cause:" Packet Access Reject on target cell " See specific message content |
| 17 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |

| | | | |
|-------|----------|---------------------------|---|
| | | | <p>If the first received RLC Data Block in current TBF contains an empty LLC PDU, the SS shall accept Packet Resource Request from MS and respond with Packet Uplink Assignment. The USF shall be assigned once more to the MS.</p> <p>NOTE: The empty LLC PDU may be accompanied by another low priority RLC data block (with Packet Resource Request and Packet Uplink Assignment as required), in order to ensure that the radio resources are used efficiently. MS sends data</p> |
| 18a | MS -> SS | RLC data blocks | |
| 18b | MS -> SS | PACKET MEASUREMENT REPORT | |
| 19 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on PACCH if step 18a was executed. |
| Note: | | | In steps 4x, steps 12x-16x and 18x the MS shall perform either the 'a' branch or the 'b' branch. |

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |
|---------------------------|-----------------------|
| Global TFI | TFI of the uplink TBF |
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 111 (61.44 sec) |
| NC_REPORTING_PERIOD_T | 010 (1.92 sec) |
| NC_FREQUENCY_LIST | 0 (not present) |

PACKET CELL CHANGE ORDER in step 7:

| | |
|---------------------------|-----------------------|
| Global TFI | TFI of the uplink TBF |
| IMMEDIATE_REL | 1 |
| ARFCN, BSIC | specified for cell B |
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 111 (61.44 sec) |
| NC_REPORTING_PERIOD_T | 100 (7.68 sec) |
| NC_FREQUENCY_LIST | 0 (not present) |

PACKET CELL CHANGE FAILURE in step 12/15b:

| | |
|---|------|
| Packet Cell Change Failure message content: | |
| CAUSE | 0010 |

42.4.2.1.4 Cell change order procedure / Uplink transfer / Failure cases / Contention resolution failure

42.4.2.1.4.1 Conformance requirement

42.4.2.1.4.1.1 Conformance requirement for Rel-5 and earlier

If the contention resolution procedure fails on the new cell, then the mobile station shall start timer T3176 and return to the old cell. The mobile station shall send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF.

References

3GPP TS 04.60/44.060, subclause 8.4.1

42.4.2.1.4.1.2 Conformance requirement for Rel-6 and later

The mobile station shall regard the network controlled cell reselection procedure as successfully completed when it has performed access and successfully completed contention resolution in the new cell.

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- The mobile station is unable to synchronise to the new cell (see 3GPP TS 45.008) or the timer T3174 expires before a successful completion of the network controlled cell reselection procedure. *Cause:* 'No response on target cell'.

If the mobile station determines that the network controlled cell reselection procedure has failed, the mobile station shall stop timer T3174 (if it is still running) and start timer T3176. The mobile station shall return to the old cell, where it may trigger a cell update or other GMM specific procedure. In case the mobile station synchronised and attempted to access the new cell before returning to the old cell, the mobile station shall trigger a cell update or other GMM specific procedure, as appropriate according to the GMM requirements (see 3GPP TS 24.008).

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type 'single block without TBF establishment' (PCCCH) / 'single block packet access' (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

References

3GPP TS 44.060, subclauses 8.4.1 and 8.4.2

42.4.2.1.4.2 Test Purpose

To verify that the mobile station initiates a random access to the old cell, if the contention resolution procedure fails on the new cell.

42.4.2.1.4.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on , GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached. Ready timer is set to 44 seconds

PDP context established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends the CHANNEL REQUEST to the new cell. Contention resolution procedure fails in the new cell. While timer T3174 is running the MS may re-initiate the packet access procedure on the new cell. MS initiates a random access to the old cell and sends PACKET CELL CHANGE FAILURE message to the network.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | MS is brought into uplink packet transfer mode and contention resolution is completed. Macro parameters: USF_GRANULARITY : 1 RLC_DATA_BLOCKS_GRANTED : absent (open-end) CHANNEL_CODING_COMMAND : CS-1 TLLI_BLOCK_CHANNEL_CODING : CS-1 |
| 2 | SS -> MS | PACKET MEASUREMENT ORDER | Sent on PACCH, 3 block periods after contention resolution in step 1 has been completed. - Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD . See specific message contents USF assigned to the MS |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | |
| 4a | MS -> SS | RLC data blocks | MS sends data |
| 4b | MS -> SS | PACKET MEASUREMENT REPORT | |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on PACCH. |
| 6 | SS | | Repeat steps 3-5 until measurement results for cell B are included in the PACKET MEASUREMENT REPORT message. |
| 7 | SS -> MS | PACKET CELL CHANGE ORDER | Sent on PACCH. Contains -BSIC + BCCH frequency -The network control order |
| 8 | MS -> SS | CHANNEL REQUEST | See specific message contents. Received on RACH To the new cell. 'One Phase Packet Access' or 'Single Block Packet Access' If MS request 'One Phase Access Request' branch A applies, otherwise branch B applies. |
| 9A | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on the AGCH. |
| 10A | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS. Sent at earliest 3 block periods from the IMMEDIATE ASSIGNMENT in step 9A. |
| 11A | MS -> SS | RLC data block | The data block contains the TLLI. The TLLI should be the same in each RLC data block header. |
| 12A | SS -> MS | PACKET UPLINK ACK/NACK | Or The RLC data serves as cell update. Contention resolution procedure fails in the new cell. Message has wrong TLLI. Sequence continues on step 13 |
| 9B | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on the AGCH. Single block allocation. |
| 10B | MS -> SS | PACKET RESSOURCE REQUEST | Send on the assigned block. |
| 11B | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent on the PACCH. Dynamic allocation, Message has wrong TLLI. While timer T3174 is running the MS may re-initiate the packet access procedure on the new cell using one of the access types specified in step 8. In this case steps 9A to 12A or 9B to 11B are repeated. The SS verifies that no CHANNEL REQUEST is received on cell B after expiry of timer T3174. |

| | | | |
|-----|----------|-------------------------------------|---|
| 13 | MS -> SS | CHANNEL REQUEST | To the old cell. Within 15 seconds from PACKET UPLINK ACK/NACK in step 12A or the PACKET UPLINK ASSIGNMENT in step 11B. Received on RACH 'One Phase Packet Access' or 'Single Block Packet Access' If MS requests 'Single Block Packet Access' branch A shall apply, otherwise branch B applies. |
| 14A | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. Single block assignment. |
| 15A | MS -> SS | PACKET CELL CHANGE FAILURE | Presence of error code should be checked, value should be '0001' (No response on target cell) |
| 16A | MS -> SS | CHANNEL REQUEST | To the old cell. 'One Phase Access Request' or 'Single Block Packet Access'. |
| 17A | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on the AGCH. Single block assignment. (forcing two phase access). |
| 18A | MS -> SS | PACKET RESSOURCE REQUEST | Send on the assigned block. |
| 19A | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent on the PACCH. Dynamic allocation. Sequence continues in step 20. |
| 14B | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on the AGCH. Single block assignment. |
| 15B | MS -> SS | PACKET RESSOURCE REQUEST | Send on the assigned block. |
| 16B | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent on the PACCH. Dynamic allocation, |
| 17B | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 18B | MS -> SS | PACKET CELL CHANGE FAILURE | Presence of error code should be checked, value should be '0001' (No response on target cell) |
| 20 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 21 | MS -> SS | RLC data block | MS sends data |
| 22 | SS -> MS | PACKET UPLINK ACK/NACK | Sent on PACCH. |

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |
|---------------------------|-----------------------|
| Global TFI | TFI of the uplink TBF |

42.4.2.2 Cell change order procedure / Downlink transfer

42.4.2.2.1 Cell change order procedure / Downlink transfer / Normal case

42.4.2.2.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

42.4.2.2.1.2 Test Purpose

To verify that when NC2 is commanded, the MS sends PACKET MEASUREMENT REPORT messages, in which both the serving and non-serving cells are reported.

To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.

To verify that the MS switches to the new cell.

To verify that the MS correctly performs a cell update.

To verify that the MS uses the established downlink TBF on the new cell.

Reference

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

42.4.2.2.1.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Transfer mode.

Test procedure

MS is brought into downlink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message. MS switches to the new cell and SS establishes a new downlink TBF.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS->MS | IMMEDIATE ASSIGNMENT | SS establish a Downlink TBF. |
| 2 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH, 3 block periods from the IMMEDIATE ASSIGNMENT in step 1. - Contains NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD. See specific message contents |
| 3 | SS->MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 4a | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 4b | MS->SS | PACKET MEASUREMENT REPORT | Sent on PACCH. |
| 5 | SS | | Repeat steps 3-4 until measurement results for cell B are included in the PACKET MEASUREMENT REPORT message. The SS verifies that for the first 2 polls, PACKET DOWNLINK ACK/NACK messages are sent by the MS. |
| 6 | SS->MS | PACKET CELL CHANGE ORDER | Sent on the PACCH. IMMEDIATE_REL bit is set to "1" Contains -BSIC + BCCH frequency of cell B -The network control order, NC2 See specific message contents |
| 7 | MS->SS | CHANNEL REQUEST | To the new cell. |
| 8 | SS->MS | IMMEDIATE ASSIGNMENT | Received on RACH |
| 9 | MS->SS | RLC data block | Sent on AGCH. Sent on the PDCH. The RLC data also serves as cell update. |
| 10 | SS->MS | PACKET UPLINK ACK/NACK | Sent on the PACCH with valid RRBP. |
| 11 | MS->SS | PACKET CONTROL ACK | |
| 12 | SS | | The SS waits 2 sec for expiring timer T3158 which was set in PACKET MEASUREMENT ORDER message in step 2; If the MS does not send a CHANNEL REQUEST for sending a PACKET MEASUREMENT REPORT continue with step 14 |
| 13a | MS->SS | CHANNEL REQUEST | Single Block without TBF establishment |
| 13b | SS->MS | IMMEDIATE ASSIGNMENT | |
| 13c | MS->SS | PACKET MEASUREMENT REPORT | |
| 14 | SS->MS | IMMEDIATE ASSIGNMENT | Sent on AGCCH. On the new cell. Addressing the MS with TLLI. |
| 15 | SS->MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 16 | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |

Note 1: in step 4x, the MS shall perform **either** the 'a' branch **or** the 'b' branch.

Note 2: steps 13a-c are performed only when MS tries to send a PACKET MEASUREMENT REPORT after expiring of T3158 in step 12

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |
|---------------------------|-------------------------|
| Global TFI | TFI of the downlink TBF |

| NC_FREQUENCY_LIST | 0 (not present) |

42.4.2.2.2 Cell change order procedure / Downlink transfer / Failure cases / REJECT from the new cell

42.4.2.2.2.1 Conformance requirement

If a PACKET ACCESS REJECT message is received from the new cell, the mobile station shall start timer T3176, return to the old cell and send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in downlink packet transfer mode before the cell change, the mobile station shall initiate a random access to the old cell, with access type "single block without TBF establishment", and then transmit the PACKET CELL CHANGE FAILURE message on the single block.

42.4.2.2.2.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network in the old cell, if a IMMEDIATE ASSIGNMENT REJECT message is received from the new cell.

Reference

3GPP TS 04.60, subclause 8.4.1.

42.4.2.2.2.3 Method of test

Initial conditions

System Simulator:

| A9 | MS->SS | RLC data block | LLC PDU implicitly indicating Cell Update |
| A10 | SS->MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data block, Final Ack Indicator = '1', a valid RRBP. Send on PACCH. |
| B6 | MS->SS | PACKET CELL CHANGE FAILURE | Sent on PACCH. Error cause: "Frequency not implemented". See specific message content. |

Note: Branch A is performed only in case MS wants to do a Cell Update. Branch B is performed if MS does not do a Cell Update.

Specific message contents

PACKET CELL CHANGE FAILURE in step A8 and B6:

| | |
|--|----------------------------------|
| Packet Cell Change Failure message content: CAUSE | 0000 (Frequency not implemented) |
|--|----------------------------------|

42.4.2.3 Cell change order procedure / Simultaneous uplink and downlink transfer

42.4.2.3.1 Cell change order procedure / Simultaneous uplink and downlink transfer / Normal case

42.4.2.3.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

When cell reselection is controlled by the network, the mobile station in packet transfer mode shall act upon the IMMEDIATE_REL value: it may continue its operation in the old serving cell, as in mobile steered cell reselection, or it shall immediately abort its TBF if it is indicated by the IMMEDIATE_REL value.

Under no circumstances, operations in the old cell shall be continued more than 5 s after a cell reselection has been determined.

42.4.2.3.1.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

To verify that the MS shall act upon the IMMEDIATE_REL value.

3GPP TS 04.60, subclauses 5.5.1.1, 8.4 and 8.4.1.

42.4.2.3.1.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A, cell B), activated at power-on, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in simultaneous uplink and downlink packet transfer mode.

Test procedure

MS is brought into simultaneous uplink and downlink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE_REL value set to 1 to force the mobile to release all ongoing TBFs. MS switches to the new cell and simultaneous uplink and downlink TBF is re-established.

SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE_REL value set to 0. The MS continues its operation in the old serving cell.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | { Uplink dynamic allocation one phase access with contention resolution } or {Uplink dynamic allocation two phase access} | Macro parameters: 400 : the number of RLC data block to be transferred, USF_GRANULARITY : 1 RLC_DATA_BLOCKS_GRANTED : absent (open-end) CHANNEL_CODING_COMMAND : CS-1 TLLI_BLOCK_CHANNEL_CODING : CS-1 |

42.4.2.3.2 Void

42.4.2.3.3 Void

42.4.2.3.4 Packet Measurement order procedure / Downlink transfer / Normal case/ Routing Area Update/ NMO II

42.4.2.3.4.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

To initiate the normal routing area updating procedure, the MS sends the message ROUTING AREA UPDATE REQUEST to the network, starts timer T3330 and changes to state GMM-ROUTING-AREA-UPDATING-INITIATED. The message ROUTING AREA UPDATE REQUEST shall contain the P-TMSI signature when received within a previous ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message.

If the routing area updating request has been accepted by the network, a ROUTING AREA UPDATE ACCEPT message shall be sent to the MS. The network may assign a new P-TMSI and/or a new P-TMSI signature for the MS. If

a new P-TMSI and/or P-TMSI signature have been assigned to the MS, it/they shall be included in the ROUTING AREA UPDATE ACCEPT message together with the routing area identification.

References

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

42.4.2.3.4.2 Test Purpose

To test the behaviour of the MS when the network triggers a Packet Cell Change Order to a cell belonging to another routing area, whereas the network mode of operation II is active, i.e.:

- To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.
- To verify that the MS switches to the new cell.
- To verify that the MS uses the established downlink TBF on the new cell.
- To verify that the MS performs the Normal Routing Area Update procedure.

42.4.2.3.4.3 Method of test

Initial conditions

System simulator:

2 cells, GPRS supported, Carrier 1 is active, at -60dBm. Carrier 2 is on, at low level -70dBm (in order to prevent sync reading suspension due to unsuccessful synchronization attempts). PBCCH is not present on Cell A (Carrier 1), and not present on Cell B (Carrier 2). NETWORK_CONTROL_ORDER is set to NC0, and Network Mode of Operation is set to NMO 2, on both Carrier 1 and Carrier 2. Cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Transfer mode on carrier 2.

Test procedure

The MS is brought into downlink packet transfer mode on carrier 1 in Cell A. The SS sends a PACKET MEASUREMENT ORDER message, setting NETWORK_CONTROL_ORDER to NC2. The SS raises carrier 2 (Cell B) with higher RF signal strength than carrier 1. The MS shall stay camping in the cell A.

During the transfer, the SS sends a PACKET CELL CHANGE ORDER message. The MS shall reselect carrier 2, MS will send a ROUTING AREA UPDATE REQUEST message and SS establishes a new downlink TBF

The SS accepts the P-TMSI and returns ROUTING AREA UPDATE ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the P-TMSI.

NOTE: During the UL TBF, T3158 may expire and thus PACKET MEASUREMENT REPORT is sent there. The SS shall be prepared for this.

Maximum duration of the test

4 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | MS | | The MS is GPRS attached and has activated a PDP context (see PICS) on carrier 1. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment Triggers the MS to monitor the assigned PDCH. |
| 3 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH of carrier 1 PMO message contains Network Control Order set to NC2 and NC_REPORTING_PERIOD_T set to 0.48s. The SS shall accept PACKET MEASUREMENT REPORT messages during the TBF, while the MS is in NC2 mode. |
| 4 | SS->MS | 12 RLC data blocks | SS sends data, the last block contains a valid RRBP. |
| 5 | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 6 | SS->MS | 12 RLC data blocks | SS sends data, the last block contains a valid RRBP. |
| 7 | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 8 | SS->MS | 12 RLC data blocks | SS sends data, the last block contains a valid RRBP. |
| 9a | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 9b | MS->SS | PACKET MEASUREMENT REPORT | At NC_REPORTING_PERIOD_T expiry instead of PACKET DOWNLINK ACK/NACK, the MS sends the PACKET MEASUREMENT REPORT, which contains the "NC measurement report struct", on the PACCH. |
| 10 | | | Repetition of steps 8 and 9 until Measurement for Cell B are included in PACKET MEASUREMENT REPORT message. |
| 11 | SS | | Raise the carrier 2 level to -50dBm |
| 12 | | | The MS still camps on carrier 1 and remains in Packet Transfer Check that no CHANNEL REQUEST is received on cell B. |
| 13 | SS->MS | PACKET CELL CHANGE ORDER | Sent on the PACCH. Contains -BSIC + BCCH frequency Network control order = NC2 |
| 14 | MS->SS | CHANNEL REQUEST | To the new cell. |
| 15 | SS->MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. Assigning a uplink TBF. |
| 16 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' Routing area identity = RAI-1 |
| 17 | SS->MS | IMMEDIATE ASSIGNMENT | Sent on CCCH. On the new cell. Assigns a Downlink TBF. Addressing the MS with TLLI. |
| 18 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Update result = 'RA updated' Routing area identity = RAI-2 |
| 19a | MS->SS | CHANNEL REQUEST | Received on RACH. |
| 19b | SS->MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. Assigning a uplink TBF. |
| 20 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 21 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on PCH. Addressing the MS with TLLI. |
| 22 | SS->MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 23 | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |

NOTE: 9b is chosen depending at NC_REPORTING_PERIOD_T expiry, otherwise 9a is chosen.

Specific message contents

PACKET MEASUREMENT ORDER in step 3:

| PACKET MEASUREMENT ORDER message content: NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T | 0010 (NC2) 000 (0.48s) |
|---|---------------------------|

42.4.2.3.5 Packet Measurement order procedure / Downlink transfer / Normal case/ Routing Area Update/ NMO I

42.4.2.3.5.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

To initiate a combined routing area updating procedure the MS sends the message ROUTING AREA UPDATE REQUEST to the network, starts timer T3330 and changes to state GMM-ROUTING-UPDATING-INITIATED and MM LOCATION UPDATING PENDING. The value of the update type IE in the message shall indicate "combined RA/LA updating". If for the last attempt to update the registration of the location area a MM specific procedure was performed, the value of the update type IE in the ROUTING AREA UPDATE REQUEST message shall indicate "combined RA/LA updating with IMSI attach". Furthermore the MS shall include the TMSI status IE if no valid TMSI is available.

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |
|---|---------------------------|
| PACKET MEASUREMENT ORDER message content: NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_T | 0010 (NC2) 001 (0.96s) |
|---|---------------------------|

42.4.2.3.6 MT CS establishment whilst in NC2 with a downlink TBF established

42.4.2.3.6.1 Conformance requirements

The behaviour of the mobile station is controlled by the NETWORK_CONTROL_ORDER parameter in a PACKET MEASUREMENT ORDER message. The reporting periods are indicated in the NC_REPORTING_PERIOD_T field of the PACKET MEASUREMENT ORDER message. The mobile station shall apply to the timer T3158 the NC_REPORTING_PERIOD_T when in packet transfer mode.

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

Paging initiation using PACCH applies when sending a paging request message to a mobile station that is GPRS attached, when the mobile station is in packet transfer mode and the network is able to co-ordinate the paging request with the radio resources allocated for the mobile station on a PDCH. This kind of paging co-ordination shall be provided in network mode of operation I (see 3G TS 23.060). This kind of paging co-ordination may be provided also in network mode of operation II or III. This kind of paging co-ordination shall be provided if the network supports DTM.

When the mobile station responds to a paging request for RR connection establishment, it shall follow the paging response procedures as specified in 3GPP TS 04.18. For that purpose, a mobile station in packet transfer mode or a mobile station that has initiated a packet access procedure may abort any ongoing TBF or the packet access procedure in the following two cases:

- The mobile station requires that the BSS co-ordinates the allocation of radio resources for an RR connection and a simultaneous TBF (GPRS class A mode of operation by means of DTM).

3GPP TS 04.60/44.060, sub-clauses 6.1.3, 6.1.4.

3GPP TS 04.60, subclauses 5.6.1 and 8.3.

42.4.2.3.6.2 Test purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires. To verify that the MS reacts to CS paging on the PACCH, whilst the MS was in packet transfer mode and NC2, by releasing the downlink TBF and then establishing an RR connection.

42.4.2.3.6.3 Method of test

Initial Conditions

System Simulator:

2 cells, GPRS supported, NMO I activated, CTRL_ACK_TYPE=0 in SI13.

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

- GPRS Release Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Test Procedure

The MS is brought into packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. SS sends continuously data blocks and regularly polls so that PACKET MEASUREMENT REPORT messages are sent by the MS according to the indicated reporting period, before being paged on the PACCH. Upon receipt of the PACKET PAGING REQUEST message, the MS returns to packet idle mode and initiate the establishment of CS connection.

NOTE: carrier 2 is activated in order to prevent synchronisation reading suspension due to unsuccessful synchronization attempts.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS | | The MS is GPRS attached and has activated a PDP context (see PICS) on carrier 1. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | Triggers the MS to monitor the assigned PDCH with a valid RRBp. |
| 3 | MS -> SS | PACKET CONTROL ACK | Sent in the block specified by RRBp field in step 2 as four access bursts |
| 4 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH of carrier 1 PMO message contains Network Control Order set to NC2 and NC_REPORTING_PERIOD_T set to 0.48s. |
| 5 | SS->MS | 12 RLC data blocks | SS sends data, the last block contains a valid RRBp. |
| 6 | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |
| 7 | SS->MS | 12 RLC data blocks | SS sends data, the last block contains a valid RRBp. |
| 8 | MS->SS | PACKET DOWNLINK ACK/NACK | Sent on PACCH. |

42.4.2.3.7 MT CS establishment whilst in NC2 with a uplink TBF established

42.4.2.3.7.1 Conformance requirements

The behaviour of the mobile station is controlled by the NETWORK_CONTROL_ORDER parameter in a PACKET MEASUREMENT ORDER message. The reporting periods are indicated in the NC_REPORTING_PERIOD_T field of the PACKET MEASUREMENT ORDER message. The mobile station shall apply to the timer T3158 the NC_REPORTING_PERIOD_T when in packet transfer mode.

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

Paging initiation using PACCH applies when sending a paging request message to a mobile station that is GPRS attached, when the mobile station is in packet transfer mode and the network is able to co-ordinate the paging request with the radio resources allocated for the mobile station on a PDCH. This kind of paging co-ordination shall be provided in network mode of operation I (see 3G TS 23.060). This kind of paging co-ordination may be provided also in network mode of operation II or III. This kind of paging co-ordination shall be provided if the network supports DTM.

When the mobile station responds to a paging request for RR connection establishment, it shall follow the paging response procedures as specified in 3GPP TS 04.18. For that purpose, a mobile station in packet transfer mode or a mobile station that has initiated a packet access procedure may abort any ongoing TBF or the packet access procedure in the following two cases:

- The mobile station requires that the BSS co-ordinates the allocation of radio resources for an RR connection and a simultaneous TBF (GPRS class A mode of operation by means of DTM).

References

3GPP TS 04.60/44.060, sub-clauses 6.1.3, 6.1.4

3GPP TS 04.60, subclauses 5.6.1 and 8.3.

42.4.2.3.7.2 Test purpose

To verify that the MS sends packet measurement reports of the NC measurements according to the indicated reporting periods when T3158 expires. To verify that the MS reacts to CS paging on the PACCH, whilst the MS was in packet transfer mode and NC2, by releasing the uplink TBF and then establishing the RR connection.

42.4.2.3.7.3 Method of test

Initial Conditions

System Simulator:

2 cells, GPRS supported, NMO I activated.

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated and PDP context 2 activated.

NOTE: carrier 2 is activated in order to prevent synchronisation reading suspension due to unsuccessful synchronization attempts.

Specific PICS Statements

- GPRS Release Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

Foreseen final state of the MS

- MS is in RR dedicated mode.

Test Procedure

The MS is brought into packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. MS sends continuously data blocks and PACKET MEASUREMENT REPORT messages according to the indicated reporting period, before being paged on the PACCH. Upon receipt of the PACKET PAGING REQUEST message, the MS returns to packet idle mode and initiates the establishment of a CS connection.

Maximum Duration of Test

10 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | Macro parameters: n: 1000 octets USF_GRANULARITY: 1 block RLC_DATA_BLOCKS_GRANTED: absent (open-end) CHANNEL_CODING_COMMAND: CS-1 TLLI_BLOCK_CHANNEL_CODING: CS-1 TBF_STARTING_TIME: Without |
| 2 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH of carrier 1 PMO message contains Network Control Order set to NC2 and NC_REPORTING_PERIOD_T set to 1.92s. |
| 3 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |

42.4.4 Cell Change Order Procedures without PBCCH

42.4.4.1 Network Controlled Cell Reselection – Packet Measurement Order Procedure

42.4.4.1.1 Conformance requirement

A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command.

Reference:

3GPP TS 04.60 subclause 8.4.0.

3GPP TS 05.08 subclause 10.1.4.2.

42.4.4.1.2 Test purpose

To verify that when the Network initiates the Packet Measurement Order Procedure, the MS correctly interprets the Packet Measurement Order Message, changes the network control mode and acts accordingly.

42.4.4.1.3 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---------------------------|----------|----------|----------|
| RF Signal Level (dBm) | -70 | -80 | -50 |
| GPRS_RXLEV_ACCE SS_MIN | -100 | -100 | -100 |
| NETWORK_CONTROL_ORDER | NC2 | NC2 | NC2 |
| C1 | 30 | 20 | 50 |
| C2 | 30 | 20 | 50 |

System simulator:

3 cells, GPRS supported, PBCCH not present (Carrier 1 & 2 is active. Carrier 3 is off).

Mobile Station:

MS is GPRS attached on carrier 1 (with Ready timer value unit set to '111' in the ATTACH ACCEPT message, thus the MS is always in Ready state).

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS establishes single block down link TBF and then initiates the Packet Measurement Order Procedure on carrier 1 with the Packet Measurement Order (PMO) changing NC2 to NC0. The MS shall reselect to carrier 3 and initiate channel request procedure.

The SS shall accept PACKET MEASUREMENT REPORT from the MS anytime during GPRS attach procedure

Expected Sequence

| Step | Direction | Message | Comments |
|-------------------|-----------|------------------------------|--|
| 1 | SS | | Activate carrier 3 |
| 2 (optional step) | MS->SS | CHANNEL REQUEST | ACCESS TYPE ='Single block without TBF establishment.' Received on RACH carrier 1. |
| 3(optional step) | SS->MS | IMMEDIATE ASSIGNMENT | Sent on AGCH, assigning a single block carrier 1. |
| 4(optional step) | MS ->SS | PACKET MEASUREMENT REPORT | Received on the allocated PDCH. |
| 5 | SS->MS | IMMEDIATE ASSIGNMENT | SS establishes a single block down link TBF on carrier 1. |
| 6 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH of carrier 1. PMO message contains Network Control Order 0 |
| 7 | MS->SS | CHANNEL REQUEST | Verify MS sends channel request on carrier 3 within 30 s of step 6. |
| 8 | SS->MS | IMMEDIATE ASSIGNMENT REJECT. | Network sends immediate assignment reject on carrier 3. |

42.4.4.2 Network Controlled Cell Reselection/validity of reselection parameters/MS enters standby state

42.4.4.2.1 Conformance requirement

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to MS., there is a downlink signalling failure or the MS enters Standby State.

Reference:

3GPP TS 05.08 subclause 10.1.4.

42.4.4.2.2 Test purpose

To verify that the measurement reporting parameters are valid till the MS enters the standby state.

42.4.4.2.3 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 |
|---------------------------|----------|----------|
| RF Signal Level (dBm) | -80 | -70 |
| GPRS_RXLEV_ACCE SS_MIN | -100 | -100 |
| NETWORK_CONTRO L_ORDER | NC0 | NC2 |
| C1 | 20 | 30 |
| C32 | 20 | 30 |

System simulator:

2 cells (cell A, cell B), GPRS supported, PBCCH not present (Carrier 1 is active. Carrier 2 is off)

Mobile Station:

MS is off.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS establishes single block down link TBF and then initiates the Packet Measurement Order Procedure on carrier 1 with the Packet Measurement Order (PMO) changing NC0 to NC2. The SS activates carrier 2 with higher RF signal strength than carrier 1. After the Ready Timer expires in the mobile, the MS shall reselect carrier 2 as NC2 is not applicable in standby mode.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|---|
| 1 | MS | | The MS is powered up or switched on and initiates an attach. |
| 2 | MS -> SS | ATTACH REQUEST | |
| 3 | SS -> MS | ATTACH ACCEPT | Ready timer set to 60 s. Mobile identity = P-TMSI-1 P-TMSI-1 signature |
| 4 | MS->SS | ATTACH COMPLETE | Apply the new Ready Timer value. |
| 5 | SS->MS | IMMEDIATE ASSIGNMENT | SS establishes a single block downlink assignment procedure on carrier 1. |
| 6 | SS->MS | PACKET MEASUREMENT ORDER | Sent on PACCH of carrier 1 PMO message contains Network Control Order 2 |
| 7 | SS | | Activate carrier 2 |
| 8 | SS | | Wait for 30 s |
| 9 | SS->MS | PAGING REQUEST TYPE 1 | MS paged continuously on carrier 2 |
| 10 | SS | | Verify no response from MS on carrier 2 for 25 seconds. |
| 11 | SS | | Wait for 36 s |
| 12 | SS-> MS | PAGING REQUEST TYPE 1 | MS paged on carrier 2 |
| 13 | MS -> SS | CHANNEL REQUEST | Verify MS has camped on carrier 2 |

Specific message contents

PACKET MEASUREMENT ORDER in step 6:

| | |
|---------------------------|-----------------|
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 111 (61.44 sec) |
| NC_REPORTING_PERIOD_T | 010 (1.92 sec) |
| NC_FREQUENCY_LIST | 0 (not present) |

42.4.4.3 Network Control measurement reporting / Idle mode / Returning to Broadcast parameters

42.4.4.3.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

Reference

3GPP TS 04.60, subclauses 8.1.2.2, 8.3 and 5.6.1.

3GPP TS 05.08, subclause 10.1.4

42.4.4.3.2 Test Purpose

To verify that individual parameters are valid only until the MS goes to Stand-by State. MS returns to broadcast parameters once it enters the Stand-by State and uses the broadcast parameters if it again goes to ready state.

42.4.4.3.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS assigns a single block downlink TBF to MS and sends PACKET MEASUREMENT ORDER changing the NC mode from NC0 to NC2. SS then receives PACKET MEASUREMENT REPORTS until the READY TIMER expires. SS then waits for 30 sec and checks that the MS is not sending any more PACKET MEASUREMENT REPORTS. SS pages the MS to bring the MS into ready state and receives the page response by giving the uplink TBF. SS then assigns a downlink TBF and checks that the MS is not sending any PACKET MEASUREMENT REPORTS.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | SS establishes a single block downlink TBF. Sent on the blocks assigned in step 1. PMO message contains Network Control Order 2 (See the specific message content) |
| 2 | SS -> MS | PACKET MEASUREMENT ORDER | |
| 3 | MS -> SS | CHANNEL REQUEST | With establishment cause 'single block access'. After the second execution of the step: SS verifies that CHANNEL REQUEST arrives after NC_REPORTING_PERIOD_I from last measurement report. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 1seconds. |
| 5 | MS -> SS | PACKET MEASUREMENT REPORT | Received on the assigned block. |
| 6 | SS | | Steps 3-5 are repeated until the expiry of READY TIMER. |
| 7 | SS | | SS waits for 30 sec, checks that the MS is not sending any more measurement reports. |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Page info contains P-TMSI of the MS. Sent on PCH. |
| 9 | MS->SS | CHANNEL REQUEST | Establishment cause = "One phase access". Received on RACH. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Random Reference = pertaining to the message received in step 9. Dynamic allocation for RLC data blocks, Sent on AGCH. |
| 11 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 12 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 10. |
| 13 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data block, with FAI=1, Containing contention resolution TLLI. Sent on uplink PACCH. Valid RRBP. |
| 14 | MS ->SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on uplink PACCH. |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT | SS initiates a data transfer of 1000 octets. Sent on PCH. Downlink Assignment, TLLI value as received. Sent on PCH. |
| 16 | MS ->SS | Completion of macro {Downlink data transfer} | SS completes downlink transfer of 1000 octets of data. SS checks that the MS has not sent any PACKET MEASUREMENT REPORT during the TBF. |

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |

| NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I NC_REPORTING_PERIOD_T | 10 (NC2) 100 (7.68 s) 000 (0.48 s) |
|--|--|

42.4.4.4 Void

42.4.4.5 Network Control measurement reporting / Idle mode / Reselection due to RA failure

42.4.4.5.1 Conformance Requirement

Having made $M + 1$ attempts to send a PACKET CHANNEL REQUEST (respectively EGPRS PACKET CHANNEL REQUEST) message, the mobile station shall stop timer T3186 and start timer T3170. At expiry of timer T3170, the packet access procedure shall be aborted, a random access failure shall be indicated to upper layer and the mobile station shall perform autonomous cell re-selection according to 3GPP TS 43.022.

The MS shall only perform autonomous cell re-selection when the reselection is triggered by a downlink signalling failure as defined in subclause 6.5 or a random access failure as defined in 3GPP TS 44.018 and 3GPP TS 44.060.

Reference

3GPP TS 44.060, subclause 3.5.2.1.2.

3GPP TS 45.008, subclause 10.1.4

42.4.4.5.2 Test Purpose

To verify that while in NC2, MS performs autonomous cell reselection when the reselection is triggered by the random access failure.

42.4.4.5.3 Method of test

Initial conditions

System Simulator:

2 cell, GPRS supported.

42.4.5 Network Assisted Cell Change

42.4.5.1 Network Assisted Cell Change / Expiry of T3206

42.4.5.1.1 Conformance requirements

[3GPP TS 44.060, 8.1.3]

If CCN is enabled (see subclause 5.5.1.1a, 3GPP TS 44.160 subclause 5.4.1.3), the mobile station shall behave as in network control mode NC0 or NC1 up to the point when a new cell has been chosen. It shall then check the CCN_SUPPORTED parameter, if available, that was last received for that cell. This parameter can be sent on BCCH or PBCCH or individually in PACKET MEASUREMENT ORDER or PACKET CELL CHANGE ORDER messages.

If it is available and if it indicates that CCN mode shall not be entered towards that cell, then the mobile station shall perform the cell change and not enter CCN mode.

If it is available and if it indicates that CCN mode shall be entered towards that cell or if it is not available, then instead of performing the cell change, the mobile station shall start timer T3206 and enter the CCN mode. At the first possible opportunity, the MS shall then, when in CCN mode, inform the network about the proposed cell by sending a PACKET CELL CHANGE NOTIFICATION message, stop timer T3206, start timers T3208 and T3210. The PACKET CELL CHANGE NOTIFICATION message shall contain the ARFCN for the BCCH and the BSIC as identity of the proposed cell. The message shall also contain measurement reports for the proposed cell and for other neighbour cells if available. In CCN mode the mobile station shall continue the data transfer and store neighbour cell system information if received in instances of the PACKET NEIGHBOUR CELL DATA message, but not

perform the cell change. At receipt of the first PACKET NEIGHBOUR CELL DATA message or PACKET CELL CHANGE CONTINUE message or PACKET CELL CHANGE ORDER message, the mobile station shall stop the timer T3210.

The mobile station shall retransmit the PACKET CELL CHANGE NOTIFICATION message once at the first possible opportunity when the timer T3210 expires.

The mobile station shall leave CCN mode when either CCN is no longer enabled (towards all neighbour cells with the CCN_ACTIVE bit or towards the cell that had been re-selected) or when the network has responded with a PACKET CELL CHANGE CONTINUE or PACKET CELL CHANGE ORDER message or when either of the timers T3206 or T3208 have expired.

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.1.2 Test purpose

To verify that the MS leaves the CCN mode and continues cell reselection in NC0 mode when T3206 expires.

42.4.5.1.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS establishes a downlink data transfer. SS then waits 4 seconds and lower the signal strength of Cell A to - 80 dBm. The MS will enter CCN mode, and when T3206 expires it will leave CCN mode and continue cell reselection in NC0 mode. The MS change cell and perform a Cell update in the new cell.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Downlink TBF establishment} | RLC mode: acknowledged, without starting time. |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | No valid RRBP |
| 3 | SS | | SS waits 4 seconds. |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | No valid RRBP |
| 5 | | | Lower signal strength of Cell A to – 80 dBm. |
| 6 | SS | | SS waits 4 seconds. |
| 7 | SS -> MS | DOWNLINK RLC DATA BLOCK | No valid RRBP Step 6 and 7 are repeated until the MS access Cell B, but no longer than for 15 seconds. The test has failed if the MS has not accessed Cell B within 15 sec from Step 5. |
| | | | The following messages are to be sent and received in Cell B. |
| 8 | | {Uplink dynamic allocation one phase access} | USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present. |
| 9 | | {Completion of uplink RLC data block transfer} | MS performs a Cell Update. |

Specific message contents

None.

42.4.5.2 Network Assisted Cell Change / No Packet Neighbouring Cell Data and Packet Cell Change Continue

42.4.5.2.1 Conformance requirements

[3GPP TS 44.060, 8.1.1]

The mobile station shall transmit RLC/MAC blocks with the following priority:

- RLC/MAC control blocks containing a Packet Cell Change Notification message;
- Other RLC/MAC control blocks, except Packet Uplink Dummy Control Blocks;
- RLC data blocks;
- RLC/MAC control blocks containing Packet Uplink Dummy Control Blocks.

[3GPP TS 44.060, 8.1.2.2]

Whenever the mobile station receives an RLC data block addressed to itself and with a valid RRBP field in the RLC data block header (i.e., is polled), the mobile station shall transmit a PACKET DOWNLINK ACK/NACK message in the uplink radio block specified by the RRBP field whatever the BSN value of the received RLC data block, unless another RLC/MAC control message is waiting to be transmitted, in which case the other RLC/MAC control message shall be sent. Among the other RLC/MAC control blocks the PACKET CELL CHANGE NOTIFICATION message shall be sent with highest priority. However, the mobile station shall transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message at most every second time it is polled. Furthermore the mobile station shall not transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message if the PACKET DOWNLINK ACK/NACK message would contain a Final Ack Indicator or Channel Request Description IE. The mobile station shall not send a PACKET CONTROL ACKNOWLEDGEMENT message unless otherwise specified.

[44.060, 8.8.3]

After receiving a PACKET CELL CHANGE NOTIFICATION message from the mobile station the network can behave in different ways as described below.

1) The network responds with a PACKET CELL CHANGE CONTINUE message.

If a mobile station as response to a PACKET CELL CHANGE NOTIFICATION message receives a PACKET CELL CHANGE CONTINUE message without receiving any neighbour cell system information, the mobile station shall stop timer T3208, stop timer T3210 if still running, leave CCN mode and continue cell reselection in NC0/NC1 mode.

References

3GPP TS 44.060, subclause 8.1.1, 8.1.2.2 and 8.8.3

42.4.5.2.2 Test purpose

- 1) To verify that MS sends a PACKET CELL CHANGE NOTIFICATION when it enters CCN mode.
- 2) To verify that MS leaves CCN mode and continues cell reselection in NC0 mode when a PACKET CELL CHANGE CONTINUE is received when no PACKET NEIGHBOUR CELL DATA has been received.

42.4.5.2.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS establishes a downlink TBF and sends 4 RLC data blocks, the last one containing FBI = 0 and a valid RRBP. The MS sends a PACKET DOWNLINK ACK/NACK. The signal strength of Cell A is lowered to - 80 dBm. The downlink continues until MS sends PACKET CELL CHANGE NOTIFICATION. SS sends PACKET CELL CHANGE CONTINUE and verifies that the MS change to Cell B and does a Cell Update.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | | {Downlink TBF establishment} | RLC mode: acknowledged, without starting time. |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 3 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | The data block contains FBI=0 and a valid RRBP. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the specified RRBP of downlink PACCH. |
| 7 | | | Lower signal strength of Cell A to -80 dBm. |
| 8 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 9 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 10 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 11 | SS -> MS | DOWNLINK RLC DATA BLOCK | The data block contains FBI=0 and a valid RRBP. |
| 12 | MS -> SS | PACKET DOWNLINK ACK/NACK Or PACKET CELL CHANGE NOTIFICATION | |
| 13 | | | Step 8 to 12 are repeated until a PACKET CELL CHANGE NOTIFICATION is received in step 12, but no longer than 15 sec. The test has failed if no PACKET CELL CHANGE NOTIFICATION is received in Cell A within 15 sec from Step 7. |
| 14 | SS -> MS | PACKET CELL CHANGE CONTINUE | |
| | | | The following messages are to be sent and received in Cell B. |
| 15 | | {Uplink dynamic allocation one phase access} | USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present. |
| 16 | | {Completion of uplink RLC data block transfer} | MS performs a Cell Update. |

42.4.5.3 Void

42.4.5.4 Network Assisted Cell Change / Packet Neighbour Cell Data and Packet Cell Change Order

42.4.5.4.1 Conformance requirements

[3GPP TS 44.060, 5.5.1.4.3]

A mobile station supporting the Network Assisted Cell Change procedures shall implement the request for acquisition of system information (see clause 5.5.1.1a).

The PACKET PSI STATUS (respectively PACKET SI STATUS) message shall indicate the present status of PSI (respectively SI) messages stored in or requested but not received by the mobile station. The mobile station shall include as many PSI (respectively SI) message types that fit into the *Received PSI Message List* (respectively *Received SI Message List*) construction in the PACKET PSI STATUS (respectively PACKET SI STATUS) message and that meet the following criteria: The PACKET PSI STATUS (respectively PACKET SI STATUS) message is sent on PACCH when the mobile station is in packet transfer mode. The first sending of this message during the acquisition of PBCCH (respectively BCCH) information shall take place at the first suitable opportunity after the acquisition is initiated:

- The PSI (respectively SI) message type is relevant for the mobile station, based on the features the mobile station supports (e.g. non-GSM and multi-RAT capabilities); and
- In case of optional PSI (respectively SI) messages types, the PSI (respectively SI) message type shall be indicated by the network as present on PBCCH (respectively BCCH).

If the presence of an optional PSI (respectively SI) message type cannot be determined, based on the information received, the mobile station shall assume that the optional PSI (respectively SI) message type is present.

NOTE 1: On PBCCH, the presence of optional PSI messages is indicated in PSI1 and PSI2.

NOTE 2: On BCCH, SI2, SI3, SI4 and, if present, SI9 indicate the presence of optional SI messages, except SI1. The presence of SI1 can be determined by reading the BCCH Norm block at TC = 0.

The message type value for these PSI (respectively SI) messages shall be included in the *Received PSI Message List* (respectively *Received SI Message List*) in the PACKET PSI STATUS (respectively PACKET SI STATUS) message. The network may use this information to determine which PSI (respectively SI) message types the mobile station is able to receive and the present status of the PSI (respectively SI) messages stored in the mobile station.

[3GPP TS 44.060, 8.8.3]

After receiving a PACKET CELL CHANGE NOTIFICATION message from the mobile station the network can behave in different ways as described below.

- 3) The network sends first necessary system information for the cell proposed in the PACKET CELL CHANGE NOTIFICATION message, or for any other cell, in one or more instances of the PACKET NEIGHBOUR CELL DATA message and sends then a PACKET CELL CHANGE ORDER message. The mobile station shall store the received system information as specified in clause 8.8.1. When the first instance of the PACKET NEIGHBOUR CELL DATA message is received, the mobile station shall stop timer T3210 if still running. When the PACKET CELL CHANGE ORDER message is received, the mobile station shall stop timer T3208, leave CCN mode and follow the procedures as specified for the Packet Cell Change Order (clause 8.4) and in clause 8.8.1.

References

3GPP TS 44.060, subclause 5.5.1.4.3 and 8.8.3

42.4.5.4.2 Test purpose

1. To verify that the MS applies CCN when CCN is indicated in SI13 of the serving cell by sending a PACKET CELL CHANGE NOTIFICATION when deciding to make a cell reselection.
2. To verify that MS leaves CCN mode when it receives a PACKET CELL CHANGE ORDER and follows the procedures as specified in the PACKET CELL CHANGE ORDER.
3. To verify that MS uses the System Information received in PACKET NEIGHBOUR CELL DATA when accessing the new cell.
4. To verify that MS requests remaining System Information messages when having accessed the new cell by sending PACKET SI STATUS.

42.4.5.4.3 Method of test

Initial conditions

System Simulator:

3 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: The indication of Cell C is removed in SI2. RLA_C = -50 dBm

Cell B: Supports PACKET SI STATUS. No System Information is broadcast on the BCCH, except SI3. This is only made to make it possible to verify that the MS uses the information in Packet Neighbour Cell Data. RLA_C = -60 dBm

Cell C: The cell is not active at the start of the test.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledges. During the uplink the signal strength of cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send uplink data. SS sends a complete set of PACKET NEIGHBOUR CELL DATA with SI1, SI3 and SI13 of Cell B to the MS. The SS then sends a PACKET CELL CHANGE ORDER that orders the MS to change to Cell B.

The MS requests resources for an uplink in the Cell B and continues the uplink. The MS then requests the remaining SI messages by sending PACKET SI STATUS (Note: During the acquisition of BCCH information the MS may send up to three extra PACKET SI STATUS messages). SS verifies that the MS indicates that it has received the SI sent in PACKET NEIGHBOUR CELL DATA. SS sends the missing SI to the MS in PACKET SERVING CELL DATA messages during the uplink.

To ensure that the MS has received the requested SI, Cell A is deactivated and Cell C is activated with signal strength set to – 50 dBm. The signal strength of cell B is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The SS then sends PACKET CELL CHANGE ORDER and the MS changes to Cell C. The MS requests resources for an uplink in the new cell and re-establishes and completes the uplink transfer in the new cell.

42.4.5.5 Network Assisted Cell Change / Expiry of T3208 and T3210

42.4.5.5.2 Conformance requirements

[3GPP TS 44.060, 8.8.3]

After receiving a PACKET CELL CHANGE NOTIFICATION message from the mobile station the network can behave in different ways as described below.

5) No network response

When timer T3210 expires, the mobile station shall retransmit once the PACKET CELL CHANGE NOTIFICATION message at the first possible opportunity.

When timer T3208 expires, the mobile station shall leave CCN mode and continue cell reselection in NC0/NC1 mode as described in clause 5.5.1.1 and in [15].

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.5.2 Test purpose

1. To verify that the MS retransmits the PACKET CELL CHANGE NOTIFICATION when T3210 expires 300 ms after no reception of any PACKET NEIGHBOUR CELL DATA, PACKET CELL CHANGE CONTINUE, PACKET MEASUREMENT ORDER or PACKET CELL CHANGE ORDER.
2. To verify that MS leaves CCN mode when T3208 expires and continues cell reselection in NC0 mode.

42.4.5.5.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION and starts timer T3208 and T3210. The MS then continues to send uplink data. When timer T3210 expires, the MS retransmits PACKET CELL CHANGE NOTIFICATION once. When timer T3208 expires, the MS leaves CCN mode and performs cell reselection in NCO mode. The MS change to Cell B and complete the upload.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation one phase access or two-phase access} | n = 5000 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present. |

None.

42.4.5.6 Network Assisted Cell Change / Entering packet idle mode

42.4.5.6.1 Conformance requirements

[3GPP TS 44.060, 8.8.3]

The CCN mode is only valid in Packet Transfer Mode. If the mobile station is in CCN mode when entering packet idle mode, the mobile station shall stop the timers T3206 and T3208, stop timer T3210 if still running, leave CCN mode and continue the cell reselection procedure according to the NC0/NC1 procedures. If PACKET NEIGHBOUR CELL DATA messages are received on the PACCH before entering packet idle mode and the cell identity parameters are included, this information may then be used at the next cell change.

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.6.2 Test purpose

To verify that the MS continues according to the normal packet idle mode cell reselection procedures when leaving CCN mode and entering packet idle mode.

42.4.5.6.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

GPRS ready timer T3314 = infinity

T3192 = 0 ms

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS establishes a downlink TBF and sends 4 RLC data blocks, the last one containing FBI = 0 and a valid RRBP. The MS sends a PACKET DOWNLINK ACK/NACK. The signal strength of Cell A is lowered to -80 dBm. The downlink continues until MS sends PACKET CELL CHANGE NOTIFICATION. SS sends a RLC block that contains FBI = 1 and a valid RRBP. The MS sends a PACKET DOWNLINK ACK/NACK containing FINAL_ACK_INDICATION = 1. The MS leaves CCN mode and enters packet idle mode and performs cell reselection in NC0 mode. The MS performs a Cell update in the new cell.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | {Downlink TBF establishment} | RLC mode: acknowledged, without starting time. |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 3 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | The data block contains FBI=0 and a valid RRBP. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | Received on the specified RRBP of downlink PACCH. |
| 7 | | | Lower signal strength of Cell A to -80 dBm. |

42.4.5.7 Network Assisted Cell Change / CCN not supported towards target cell

42.4.5.7.1 Conformance requirements

The SI2quater message may also contain information, the CCN Support description, to be used when CCN is enabled in the serving cell, see 3GPP TS 44.060. This CCN Support description is associated with the Neighbour Cell list (see 3.4.1.2.1.3) having the same BA_IND value and 3G_BA_IND value. Each CCN_SUPPORTED bit of this field relates to indices of the Neighbour Cell list, starting with index 0. The CCN Support description may be received before the corresponding Neighbour Cell list.

Indices exceeding the value 95 or the number of cells in the Neighbour Cell List shall be ignored. If there are fewer indices than the number of cells in the Neighbour Cell List, the value 0 shall be assumed for the missing bits.

When this information is not present but CCN is enabled in the serving cell, the mobile station shall assume that CCN is enabled towards all neighbour cells.

References

3GPP TS 44.018, subclause 3.4.1.2.1.8

42.4.5.7.2 Test purpose

To verify that the MS does not apply CCN on a target cell when the CCN support description not is set for that cell.

42.4.5.7.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Cell A: CCN Active. SI3 indicates SI2quater broad cast on BCCH norm. SI2quater contains a CCN Support Description indicating that CCN not is supported towards Cell B. RLA_C = -50 dBm

Cell B: CCN Active. RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is given time to read all SI including SI2quater in idle mode.

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and it starts to send uplink data that the SS acknowledge. During the uplink the signal strength of Cell A is lowered to – 80 dBm. The MS enters CCN mode but does not send any PACKET CELL CHANGE NOTIFICATION. The MS continues to send uplink data. After w while, the MS selects cell B. The MS requests resources for an uplink in cell B and completes the uplink transfer.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation one phase access or two phase access} | n = 5000 octets. USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: same as channel coding CHANNEL_CODING_COMMAND: cs-1 No starting time present. USF assigned to the MS. |

42.4.5.8 Network Assisted Cell Change / NC mode change

42.4.5.8.1 Conformance requirements

[3GPP TS 44.060, 8.8.3 & 4)]

The network orders the mobile station into NC2 mode.

A mobile station may in response to a PACKET CELL CHANGE NOTIFICATION message sent to the network receive a PACKET MEASUREMENT ORDER message indicating NC2 mode. When the mobile station receives the NC2 order it shall leave CCN mode, stop timer T3208, stop timer T3210 if still running, and go into NC2 mode.

References

3GPP TS 44.060, subclause 8.8.3

42.4.5.8.2 Test purpose

To verify that the MS leaves the CCN mode and enters NC2 mode on receipt of Packet Measurement Order and the NC2 parameters.

42.4.5.8.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, CCN Active, RXLEV_ACCESS_MIN = -90dBm.

GPRS ready timer T3314 = infinity

Cell A: RLA_C = -50 dBm

Cell B: RLA_C = -60 dBm

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS establishes a downlink TBF and sends 4 RLC data blocks, the last one containing FBI = 0 and a valid RRBP. The MS sends a PACKET DOWNLINK ACK/NACK. The signal strength of Cell A is lowered to - 80 dBm. The downlink continues until MS sends PACKET CELL CHANGE NOTIFICATION. SS sends PACKET MEASUREMENT ORDER setting NC2 and then sends RLC data blocks, regularly polling the MS with a valid RRBP, and verifies that the MS has entered NC2 mode: the MS leaves CCN mode, starts reporting measurements and does not perform any cell reselection on its own as required in NC2.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | | {Downlink TBF establishment} | RLC mode: acknowledged, without starting time. |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | The data block contains FBI=0 and a valid RRBP. |
| 3 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | |

42.4.5.9 Network Assisted Cell Change / NC mode change / Packet Neighbour Cell Data

42.4.5.9.1 Conformance requirements

[3GPP TS 44.060, 8.8.3 & 4]

The network orders the mobile station into NC2 mode.

A mobile station may in response to a PACKET CELL CHANGE NOTIFICATION message sent to the network receive a PACKET MEASUREMENT ORDER message indicating NC2 mode. When the mobile station receives the NC2 order it shall leave CCN mode, stop timer T3208, stop timer T3210 if still running, and go into NC2 mode.

When the NC2 mode has been ordered, the network may send PACKET NEIGHBOUR CELL DATA messages on the PACCH before sending the PACKET CELL CHANGE ORDER to the mobile station.

42.4.5.9.2 References

3GPP TS 44.060, subclause 5.5.1.4.3 and 8.8.3

42.4.5.9.3 Test purpose

1. To verify that MS leaves CCN mode when it receives a PACKET MEASUREMENT ORDER activating NC2 and follows the NC2 procedures.
2. To verify that MS uses the System Information received in PACKET NEIGHBOUR CELL DATA when accessing the new cell.
3. To verify that MS requests remaining System Information messages when having accessed the new cell by sending PACKET SI STATUS.

42.4.5.9.4 Method of test

42.4.5.9.4.1 Initial conditions

System Simulator:

3 cells, GPRS supported, CCN Active in SI13, PCCCH not present.

GPRS ready timer T3314 = infinity

Cell A: The indication of Cell C is removed in SI2. RLA_C = -50 dBm

Cell B: Supports PACKET SI STATUS. No System Information is broadcast on the BCCH, except SI3. This is only made to make it possible to verify that the MS uses the information in Packet Neighbour Cell Data. RLA_C = -60 dBm. PSI13 shall be transmitted during transfer mode on cell B to prevent any TBF suspension.

Cell C: The cell is not active at the start of the test.

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

42.4.5.9.4.2 Void

42.4.5.9.4.3 Test procedure

The MS is triggered to initiate packet uplink transfer. SS assigns resources to the MS and the MS starts to send uplink data that the SS acknowledges. During the uplink transfer, the signal strength of cell A is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The MS then continues to send uplink data.

SS sends a Packet Measurement Order providing the MS with NC2 parameters. MS starts sending Packet Measurement Reports. SS then sends a complete set of PACKET NEIGHBOUR CELL DATA with SI1, SI3 and SI13 of Cell B to the MS. SS then sends a PACKET CELL CHANGE ORDER that orders the MS to change to Cell B.

The MS requests resources for an uplink transfer in Cell B and continues the uplink transfer. The MS then requests the remaining SI messages by sending PACKET SI STATUS (Note: During the acquisition of BCCH information the MS may send up to three extra PACKET SI STATUS messages). SS verifies that the MS indicates that it has received the SI sent in PACKET NEIGHBOUR CELL DATA. SS sends the missing SI to the MS in PACKET SERVING CELL DATA messages during the uplink transfer.

To ensure that the MS has received the requested SI, Cell A is deactivated and Cell C is activated with signal strength set to – 60 dBm. The signal strength of cell B is lowered to – 80 dBm. The MS enters CCN mode and sends PACKET CELL CHANGE NOTIFICATION. The SS then sends PACKET CELL CHANGE ORDER and the MS changes to Cell C. The MS requests resources for an uplink transfer in the new cell and re-establishes and completes the uplink transfer in the new cell.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|

42.4.6 Packet Enhanced Measurement Report (PEMR)

42.4.6.1 Network Control PEMR – Activation with SI Messages

42.4.6.1.1 Conformance requirement

- 1 The behaviour of the mobile station is controlled by the parameter **NETWORK_CONTROL_ORDER** broadcast in the **PSI5** message on **PBCCH**, in the **SI13** and **SI2quarter** messages on the **BCCH** and in the **PSI13** message on **PACCH**.

When in mode **NC1** or **NC2**, the mobile station shall perform the **NC** measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the **NC_REPORTING_PERIOD_I** and **NC_REPORTING_PERIOD_T** field of the **PSI5**, the **SI2quarter**, the **PACKET CELL CHANGE ORDER** or the **PACKET MEASUREMENT ORDER** message

On expiry of timer **T3158**, the mobile station shall restart timer **T3158** with the indicated reporting period, perform the measurements and send either the **PACKET MEASUREMENT REPORT** message or the **PACKET ENHANCED MEASUREMENT REPORT** to the network. The condition for sending the **PACKET ENHANCED MEASUREMENT REPORT** message instead of the **PACKET MEASUREMENT REPORT** message is based on the **REPORT_TYPE** parameter and if the **MS** has received **BSIC** information for all cells.

- 2 In packet idle mode, the reporting period is **NC_REPORTING_PERIOD_I** rounded off to the nearest smaller integer multiple of **DRX** period if **NC_REPORTING_PERIOD_I** is greater than **DRX** period, else, the reporting period is **DRX** period

Reference:

3GPP TS 04.60 / 3GPP TS 44.060 subclause 5.6.1

3GPP TS 05.08 / 3GPP TS 45.008 subclause 10.1.4.1

42.4.6.1.2 Test purpose

To verify that the MS sends PEMR following the report type and according to the indicated reporting periods covering GSM neighbour list specified in SI2quater.

42.4.6.1.3 Method of test

Initial conditions

| Transmitter | RF Signal Level (dBm) | NCC | BCC | Cell Identity |
|---------------|-----------------------|-----|-----|---------------|
| Serving, S1 | -60 | 1 | 3 | 0001H |
| Neighbour, N1 | -70 | 1 | 5 | 0002H |

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 GPRS cells configured as GPRS cells with SI2 quater giving all adjacent cell configuration and GPRS PEMR parameters. SI13 and SI2quater indicate that Network Control Order is NC2. BCCH allocation sequence number(BA_IND) = 1

Mobile Station:

MS is Idle Updated

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is idle updated

Test procedure

MS is powered on and Attach procedure is completed. The negotiated Ready Timer value in ATTACH ACCEPT indicates the ready timer function is active for 60 seconds. When the measurement reporting time becomes valid, the MS sends a CHANNEL REQUEST message indicating 'Single block packet access' on RACH. The network shall then respond with an IMMEDIATE ASSIGNMENT message granting a 'single block access' on a PDCH. The mobile station shall then send the PACKET ENHANCED MEASUREMENT REPORT message in the allocated radio block on the assigned PDCH as indicated in the Measurement Parameters struct.

Maximum duration of the test

3 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------------------|-----------|------------------------------------|--|
| 1 | | {Attach procedure} | -MS is GPRS attached with PTMSI allocated |
| 2 | MS->SS | CHANNEL REQUEST | -Ready timer is set to 60 seconds -Sent on RACH. -Cause 'Single block packet access' |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4A (optional) | MS -> SS | PACKET MEASUREMENT REPORT | Optionally sent once after Attach procedure |
| 4B | MS -> SS | PACKET ENHANCED MEASUREMENT REPORT | Sent on the allocated PDCH |
| 5 | | | Repeat steps 2, 3 and 4B until expiry of the Ready timer. The SS verifies that the interval between two subsequent PEMR messages corresponds to the reporting period +/- 10%. The reporting period is calculated from NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING_PERIOD_I is greater than DRX period, else, the reporting period is DRX period. |
| 6 | SS | | Verify that the mobile stops sending PEMR after Ready timer expiry. |

Specific Message Contents

System Information 3 Rest Octets

| | |
|---------------------|----------------------------------|
| SI2quarter_POSITION | 0 (message is sent on BCCH Norm) |
|---------------------|----------------------------------|

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network. The condition for sending the PACKET ENHANCED MEASUREMENT REPORT message instead of the PACKET MEASUREMENT REPORT message is based on the REPORT_TYPE parameter and if the MS has received BSIC information for all cells.

- 2 In packet idle mode, the reporting period is NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING PERIOD_I is greater than DRX period, else, the reporting period is DRX period

3GPP TS 05.08 / 3GPP TS 45.008 subclause 10.1.4.1

42.4.6.3.2 Test purpose

To verify that the MS sends PEMR following the report type and according to the indicated reporting period specified in Packet Measurement Order.

42.4.6.3.3 Method of test

Initial conditions

| Transmitter | RF Signal Level (dBm) | NCC | BCC | Cell Identity |
|---------------|-----------------------|-----|-----|---------------|
| Serving, S1 | -60 | 1 | 3 | 0001H |
| Neighbour, N1 | -70 | 1 | 5 | 0002H |

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 GPRS cells configured as GPRS cells with SI2 quater giving adjacent cell configuration.

Mobile Station:

MS is Idle Updated

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is idle updated

Test procedure

MS is powered on and Attach procedure is completed. The negotiated Ready Timer value in ATTACH ACCEPT indicates the ready timer function is active for 32 seconds. A Packet Measurement Order is sent to the MS changing the scale order parameter as well as measurement reporting period. When the measurement reporting time becomes valid, the MS sends a CHANNEL REQUEST message indicating 'Single block without TBF establishment' on RACH. The network shall then respond with either a IMMEDIATE ASSIGNMENT message granting a 'Single block without TBF establishment' on a PDCH. The mobile station shall then send the PACKET ENHANCED MEASUREMENT REPORT message in the allocated radio block on the assigned PDCH as indicated in the Measurement Information struct.

Maximum duration of the test

3 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|---|
| 1 | | {Attach procedure} | -MS is GPRS attached with PTMSI allocated -Ready timer is set to 32 seconds |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on PCH |
| 3 | SS->MS | PACKET MEASUREMENT ORDER | -Scale Order changed to 1 -Measurement Reporting time changed to 7.68 secs |
| 4 | MS->SS | CHANNEL REQUEST | Sent on PACCH -Cause 'Single block without TBF establishment' |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | PACKET ENHANCED MEASUREMENT REPORT | Sent on the allocated PDCH Scale = 1 |
| 7 | | | Repeat steps 4, 5 and 6 until expiry of the Ready timer. The SS verifies that the interval between two subsequent PEMR messages corresponds to the reporting period +/- 10%. The reporting period is calculated from NC_REPORTING_PERIOD_I rounded off to the nearest smaller integer multiple of DRX period if NC_REPORTING_PERIOD_I is greater than DRX period, else, the reporting period is DRX period. |
| 8 | SS | | Verify that the mobile stops sending PEMR after Ready timer expiry. |

42.4.6.4 Network Control PEMR – Uplink Data Transfer

42.4.6.4.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station .

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message

The procedure for NC measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send either the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' or the PACKET ENHANCED MEASUREMENT REPORT on PACCH.

42.4.6.4.2 Test Purpose

To verify that the MS sends PEMR during uplink packet transfer according to the indicated reporting type and reporting periods specified in SI2quater.

To verify that the MS sends PEMR during uplink packet transfer according to the indicated reporting type and reporting period specified in Packet Measurement Order.

Reference

3GPP TS 04.60, subclauses 5.6.1, 8.3 and 8.5.

42.4.6.4.3 Method of test

Initial conditions

| Transmitter | RF Signal Level (dBm) | NCC | BCC | Cell Identity |
|---------------|-----------------------|-----|-----|---------------|
| Serving, S1 | -60 | 1 | 3 | 0001H |
| Neighbour, N1 | -70 | 1 | 5 | 0002H |

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 cells configured as GPRS cells with SI2 quater giving adjacent cell configuration and GPRS PEMR parameters. Network Control Order is NC2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. MS sends data blocks until T3158 is expired and then sends PACKET ENHANCED MEASUREMENT REPORT. SS sends a PACKET MEASUREMENT ORDER message with new reporting parameters. MS sends continuously data blocks and PACKET ENHANCED MEASUREMENT REPORT messages according to the indicated reporting period in PACKET MEASUREMENT ORDER

The SS shall accept PACKET ENHANCED MEASUREMENT REPORT from the MS anytime during GPRS attach and PDP Context activation procedures.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation one phase access with contention resolution } or {Uplink dynamic allocation two phase access} | MS is brought into uplink packet transfer mode. 42.4.6.5 Network Control PEMR – Downlink Data Transfer

42.4.6.5.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message

The procedure for NC measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send either the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' or the PACKET ENHANCED MEASUREMENT REPORT on PACCH.

Following a downlink TBF establishment, the PACKET MEASUREMENT REPORT or PACKET ENHANCED MEASUREMENT REPORT message shall not be sent on the uplink PACCH associated with this TBF until two PACKET DOWNLINK ACK/NACK messages has been sent to the network.

Reference

3GPP TS 44.060, subclauses 5.6.1, 8.3 and 8.5.

42.4.6.5.2 Test Purpose

To verify that the MS sends PEMR during downlink packet transfer according to the indicated reporting type and reporting periods specified in SI2 quater.

To verify that the MS sends PEMR during downlink packet transfer according to the indicated reporting type and reporting period specified in Packet Measurement Order.

42.4.6.5.3 Method of test

Initial conditions

| Transmitter | RF Signal Level (dBm) | NCC | BCC | Cell Identity |
|---------------|-----------------------|-----|-----|---------------|
| Serving, S1 | -60 | 1 | 3 | 0001H |
| Neighbour, N1 | -70 | 1 | 5 | 0002H |

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 cells configured as GPRS cells with SI2 quater giving adjacent cell configuration and GPRS PEMR parameters. Network Control Order is NC2.

Mobile Station:

MS is in Packet Idle mode and GPRS attached, Ready timer deactivated.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

MS is brought into downlink packet transfer mode. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK. When reporting period has expired and at least two PACKET DOWNLINK ACK/NACK messages have been sent, MS sends a PACKET ENHANCED MEASUREMENT REPORT message. SS sends data blocks continuously and MS sends PACKET ENHANCED MEASUREMENT REPORT messages when reporting period has expired and at least one PACKET DOWNLINK ACK/NACK message has been sent after the last PACKET ENHANCED MEASUREMENT REPORT message.

The SS shall accept PACKET ENHANCED MEASUREMENT REPORT from the MS anytime during GPRS attach and PDP Context activation procedures.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|---|
| 1 | SS->MS | IMMEDIATE ASSIGNMENT | Downlink assignment. Sent on the PCH. |

42.4.6.6 Network Control PEMR / Packet Cell Change Order

42.4.6.6.1 Conformance requirement

For (NC) measurement reporting, the Mobile Station shall use PACKET ENHANCED MEASUREMENT REPORT messages instead of PACKET MEASUREMENT REPORT messages if that is indicated by the parameter REPORT_TYPE and if at least one BSIC is allocated to each frequency in the BA(GPRS) list.

Reference:

3GPP TS 04.60 / 3GPP TS 44.060 5.6.1

42.4.6.6.2 Test purpose

To verify that the MS sends PEMR following the report type specified in Packet Cell Change Order.

42.4.6.6.3 Method of test

Initial conditions

| Transmitter | RF Signal Level (dBm) | NCC | BCC | Cell Identity |
|---------------|-----------------------|-----|-----|---------------|
| Serving, S1 | -60 | 1 | 3 | 0001H |
| Neighbour, N1 | -70 | 1 | 5 | 0002H |

The ARFCN of the serving and neighbouring cell is selected from the default defined in section 40.

System simulator:

2 GPRS cells A and B SI2quater includes GPRS MEASUREMENT PARAMETERS description. In both cells Network Control Order is NC2 and PMR shall be used.

Mobile Station:

MS is Idle Updated and GPRS attached. Ready timer set to 1min.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is idle updated

Test procedure

MS is brought into downlink transfer mode. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK until at least one PACKET MEASUREMENT REPORT has been received.

SS sends then a PACKET CELL CHANGE ORDER message to MS ordering the MS to select Cell-B and to use NC2 and PEMR.

The MS performs a cell update.

MS is brought into downlink transfer mode. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK until at least one PACKET ENHANCED MEASUREMENT REPORT has been received.

Maximum duration of the test

3 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF, Sent on the PCH. |
| 2 | SS | | Wait for 0.5 seconds. |
| 3 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 4 | MS -> SS | PACKET DOWNLINK ACK/NACK | |
| 5 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK or PACKET MEASUREMENT REPORT | |
| 7 | | | Repeat steps 5 and 6 for max 4s until at least one PACKET MEASUREMENT REPORT has been received. |
| 8 | SS->MS | PACKET CELL CHANGE ORDER | Commanding the MS to select Cell-B: See specific message contents |
| 9 | | | The following messages are to be sent and received in Cell B. |
| 10 | MS ->SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. |
| 12 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH containing USF assigned to the MS. |
| 13 | MS ->SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating Cell Update. |
| 14 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data block(s), Final Ack Indicator = '1' , a valid RRBP. |
| 15 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | |
| 16 | SS | | Wait for 0.5 seconds. |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF, Sent on the PCH. |
| 18 | SS | | Wait for 0.5 seconds. |
| 19 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 20 | MS -> SS | PACKET DOWNLINK ACK/NACK | |
| 21 | SS -> MS | 10 RLC data blocks | SS sends data, last block is polling. |
| 22 | MS -> SS | PACKET DOWNLINK ACK/NACK or PACKET ENHANCED MEASUREMENT REPORT | |
| 23 | | | Repeat steps 21 and 22 for max 1s until at least one PACKET ENHANCED MEASUREMENT REPORT has been received. |

| | | | |
|----|----------|--------------------------|--|
| 24 | SS -> MS | RLC data block | Last data block with FBI bit set and a valid RRBp field. |
| 25 | MS -> SS | PACKET DOWNLINK ACK/NACK | Indicating correct reception of downlink data blocks. |

Specific Message Contents

PACKET CELL CHANGE ORDER in step 8

42.4.6.7 Void

42.4.7 Inter-RAT (GPRS to UTRAN) Cell Change Order

42.4.7.1 Inter-RAT Cell Change Order (Known Cell) – Uplink Data Transfer

42.4.7.1.1 Conformance requirement

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in subclause 5.5.1.1. with the additional rule that an immediate abort of operation in the old cell may be required by the network through the IMMEDIATE_REL field, except for the acknowledgement, by means of a PACKET CONTROL ACKNOWLEDGEMENT message, of a valid RRBp field possibly included in the PACKET CELL CHANGE ORDER message. The mobile station shall obey the PACKET CELL CHANGE ORDER message irrespective of whether or not the mobile station has any knowledge of the relative synchronisation of the target cell to the serving cell. A UTRAN capable mobile station shall obey the command irrespective of whether the cell is known or not known (see 3GPP TS 25.133 and 3GPP TS 25.123).

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

- The UE shall:

- 1> set the variable ESTABLISHMENT_CAUSE to "Inter-RAT cell change order";

NOTE: This value of ESTABLISHMENT_CAUSE has priority over the cause requested by upper layers.

- 1> initiate an RRC connection establishment procedure as specified in subclause 8.1.3.

For a UTRAN target cell, the mobile station regards the procedure as completed when it has received a successful response to its RRC Connection Request message, see 3GPP TS 25.331. It shall then stop timer T3174.

42.4.7.1.2 Test Purpose

To verify the when NC2 is commanded, the MS sends PACKET ENHANCED MEASUREMENT REPORT messages, in which both the serving and non-serving cells are reported.

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS switches to the commanded UTRAN cell.

42.4.7.4 Inter-RAT Cell Change Order (Known Cell) – Simultaneous uplink and downlink transfer

42.4.7.4.1 Conformance requirement

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in subclause 5.5.1.1. with the additional rule that an immediate abort of operation in the old cell may be required by the network through the IMMEDIATE_REL field, except for the acknowledgement, by means of a PACKET CONTROL ACKNOWLEDGEMENT message, of a valid RRBP field possibly included in the PACKET CELL CHANGE ORDER message. The mobile station shall obey the PACKET CELL CHANGE ORDER message irrespective of whether or not the mobile station has any knowledge of the relative synchronisation of the target cell to the serving cell. A UTRAN capable mobile station shall obey the command irrespective of whether the cell is known or not known (see 3GPP TS 25.133 and 3GPP TS 25.123).

For a multi-RAT mobile station, the PACKET CELL CHANGE ORDER message may contain information on a 3G target cell, together with the IMMEDIATE_REL parameter; in the case of UTRAN establishment of UTRAN channel(s) and subsequent measurement reporting are defined in 3GPP TS 25.331.

- The UE shall:

- 1> set the variable ESTABLISHMENT_CAUSE to "Inter-RAT cell change order";

NOTE: This value of ESTABLISHMENT_CAUSE has priority over the cause requested by upper layers.

- 1> initiate an RRC connection establishment procedure as specified in subclause 8.1.3.

For a UTRAN target cell, the mobile station regards the procedure as completed when it has received a successful response to its RRC Connection Request message, see 3GPP TS 25.331. It shall then stop timer T3174.

42.4.7.4.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS switches to the commanded UTRAN cell.

42.4.7.5 Inter-RAT (GPRS to UTRAN) Cell Change Order (Known cell) / Failure

42.4.7.5.1 Inter-RAT (GPRS to UTRAN) Cell Change Order (Known cell) / Failure / Uplink transfer / T3174 expiry

42.4.7.5.1.1 Conformance requirement

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- The PACKET CELL CHANGE ORDER message commands the mobile station to a frequency in a frequency band not supported by the mobile station. *Cause*: “frequency not implemented”.
- The PACKET CELL CHANGE ORDER message is received while a circuit switched connection is on going. *Cause*: “on-going CS connection”.
- In *A/Gb mode*, the PACKET CELL CHANGE ORDER message is received and the GMM READY timer (see 3GPP TS 24.008) is not running (i.e., mobile station in GMM STAND-BY state). *Cause*, if the GMM READY timer has a negotiated value equal to zero: “Forced to the Standby State”. *Cause*, if the GMM READY timer has a negotiated value greater than zero: “MS in GMM Standby state”.
- Access is denied in the new cell (i.e., the mobile station receives an IMMEDIATE ASSIGNMENT REJECT, a PACKET ASSIGNMENT REJECT or, in a UTRAN cell, an RRC CONNECTION REJECT message). *Cause*: “Immediate Assign Reject or Packet Access Reject on target cell”.
- The mobile station is unable to synchronise to the new cell (see 3GPP TS 45.008) or the timer T3174 expires before a successful completion of the network controlled cell reselection procedure. *Cause*: “No response on target cell”.
- Due to any other reason (e.g. unknown or unsupported target cell information). In this case the MS shall set the ARFCN and BSIC fields to the value zero and set the cause to value “frequency not implemented”.

If the mobile station determines that the network controlled cell reselection procedure has failed, the mobile station shall stop timer T3174 (if it is still running) and start timer T3176. The mobile station shall return to the old cell, where it may trigger a cell update or other GMM specific procedure. In case the mobile station synchronised and attempted to access the new cell before returning to the old cell, the mobile station shall trigger a cell update or other GMM specific procedure, as appropriate according to the GMM requirements (see 3GPP TS 24.008).

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode, dual transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type “single block without TBF establishment” (PCCCH) / “single block packet access” (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

Reference

3GPP TS 044.060, subclause 8.4.2

42.4.7.5.1.2 Test Purpose

To verify that an MS in uplink packet transfer mode when commanded by a PACKET CELL CHANGE ORDER, reports a PACKET CELL CHANGE FAILURE on the old GPRS cell due to the expiry of T3174 before receiving response to RRC CONNECTION REQUEST on target UTRAN cell.

42.4.7.5.1.3 Method of test

Initial conditions

System Simulator:

- 2 cells, Cell A, GPRS Supported without PBCCH, NC2.

- Cell B is a UTRAN cell. UTRAN cell is the better cell of the two cells. It is activated after MS is GPRS attached to Cell A. 3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell B except that T300 and N300 are to be set to the maximum values (8000 milliseconds for T300 and 7 for N300). 3GPP TS 34.123-3, subclause 8.3.2 shall be referenced for configuring channels on Cell B.
- 3G Neighbour Cell Description of Cell A refers to the UTRAN Cell B. XXX_MUTIRAT_REPORTING is set to 1. REPORT_TYPE is set to indicate the usage of Packet Enhanced Measurement Report.

Mobile Station:

- MS is in Packet Idle mode and GPRS attached on Cell A.
- PDP context 2 established

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in Packet transfer mode in the GPRS cell.

Test procedure

MS is brought into uplink packet transfer mode. MS sends PEMR with UTRAN cell information. SS sends the PACKET CELL CHANGE ORDER message giving a UTRAN cell description to the MS. MS sends RRC Connection Request on the UTRAN cell. The SS does not respond to the request and timer T3174 expires. MS returns to the old cell, sends a PACKET CELL CHANGE FAILURE message to the SS and continues data transfer on the old cell.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | SS | {Uplink dynamic allocation one phase access} | Initiate uplink transfer of 1500 octets. The TBF is active at steps 2-3 and 7-9. |
| 2a | MS -> SS | Uplink data | MS sends uplink data. |
| 2b | MS -> SS | PACKET ENHANCED MEASUREMENT REPORT | Sent on PACCH. Contains NC Measurement Report struct. |
| 3 | | | Repeat steps 2a and 2b until UTRAN cell information is sent in PEMR. |
| 4 | SS -> MS | PACKET CELL CHANGE ORDER | Sent on the PACCH. Contains Description of the UTRAN cell. See specific message contents. |
| 5 | MS -> SS | RRC CONNECTION REQUEST | To the UTRAN cell. |
| 6 | SS | | SS does not respond to the request until timer T3174 has expired. During this period MS will retransmit RRC CONNECTION REQUEST after the expiry of T300. |
| 7 | MS -> SS | CHANNEL REQUEST | After the expiry of T3174, to the old cell within 15 sec. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH, Dynamic allocation |
| 9 | MS -> SS | PACKET CELL CHANGE FAILURE | Sent when USF is allocated to the MS. Error cause: " No response on target cell " |
| 11 | | | See specific message contents (MS may perform ROUTING AREA UPDATE procedure) |

Note: MS will send Packet Enhanced Measurement Report at the expiry of T3158 during the entire test case.

| Packet Cell Change Failure message content: CAUSE | 0001(No response on target cell) |
|--|----------------------------------|

42.4.7.5.2 Inter-RAT (GPRS to UTRAN) Cell Change Order (Known cell) / Failure / Downlink transfer / REJECT from target UTRAN cell with Inter-RAT info set to GSM.

42.4.7.5.2.1 Conformance requirement

In the following cases, the mobile station shall determine that the network controlled cell reselection procedure has failed:

- The PACKET CELL CHANGE ORDER message commands the mobile station to a frequency in a frequency band not supported by the mobile station. *Cause*: “frequency not implemented”.
- The PACKET CELL CHANGE ORDER message is received while a circuit switched connection is on going. *Cause*: “on-going CS connection”.
- In *A/Gb mode*, the PACKET CELL CHANGE ORDER message is received and the GMM READY timer (see 3GPP TS 24.008) is not running (i.e., mobile station in GMM STAND-BY state). *Cause*, if the GMM READY timer has a negotiated value equal to zero: “Forced to the Standby State”. *Cause*, if the GMM READY timer has a negotiated value greater than zero: “MS in GMM Standby state”.
- Access is denied in the new cell (i.e., the mobile station receives an IMMEDIATE ASSIGNMENT REJECT, a PACKET ASSIGNMENT REJECT or, in a UTRAN cell, an RRC CONNECTION REJECT message). *Cause*: “Immediate Assign Reject or Packet Access Reject on target cell”.
- The mobile station is unable to synchronise to the new cell (see 3GPP TS 45.008) or the timer T3174 expires before a successful completion of the network controlled cell reselection procedure. *Cause*: “No response on target cell”.
- Due to any other reason (e.g. unknown or unsupported target cell information). In this case the MS shall set the ARFCN and BSIC fields to the value zero and set the cause to value “frequency not implemented”.

If the mobile station determines that the network controlled cell reselection procedure has failed, the mobile station shall stop timer T3174 (if it is still running) and start timer T3176. The mobile station shall return to the old cell, where it may trigger a cell update or other GMM specific procedure. In case the mobile station synchronised and attempted to access the new cell before returning to the old cell, the mobile station shall trigger a cell update or other GMM specific procedure, as appropriate according to the GMM requirements (see 3GPP TS 24.008).

The mobile station shall send a PACKET CELL CHANGE FAILURE message with the appropriate cause value to the network in the old cell and stop timer T3176. The PACKET CELL CHANGE FAILURE message may be sent on PACCH when the mobile station is in packet transfer mode, dual transfer mode or MAC-Shared state. Alternatively, the mobile station may initiate random access with access type "single block without TBF establishment" (PCCCH) / "single block packet access" (CCCH) and send the PACKET CELL CHANGE FAILURE message using an allocated single uplink block.

42.4.8 NC2 Procedures

42.4.8.1 NC2 and DRX

42.4.8.1.1 NC2 and DRX / NC_NON_DRX_PERIOD / Respect of NC2 non-DRX mode period

42.4.8.1.1.1 Conformance requirement

There are four cases when the mobile station shall enter a non-DRX mode period.

- 1) At the transition from the packet transfer mode to the packet idle mode, the mobile station shall enter the Transfer non-DRX mode period.
- 2) At the transition from the dual transfer mode to the dedicated mode or packet idle mode, the mobile station shall enter the Transfer non-DRX mode period.

In both cases, the duration of the Transfer non-DRX mode period is determined by value of the NON_DRX_TIMER parameter, requested in the *GPRS attach procedure*, and the value of the DRX_TIMER_MAX parameter broadcast in the cell. The mobile station may use the minimum value of these two parameters.

If the mobile station receives a new value of the DRX_TIMER_MAX parameter during the Transfer non-DRX mode period, the mobile station may wait to apply the new value until the next time the Transfer non-DRX mode period is entered.

- 3) A mobile station operating in NC2 mode shall enter the NC2 non-DRX mode period when it sends an NC measurement report. The duration of this period is defined by the NC_NON_DRX_PERIOD parameter.
- 4) When initiating the MM procedures for *GPRS attach* and *routing area update* defined in 3GPP TS 04.08, the mobile station shall enter the MM non-DRX mode period. This period ends when either of the messages GPRS ATTACH ACCEPT, GPRS ATTACH REJECT, ROUTING AREA UPDATE ACCEPT or ROUTING AREA UPDATE REJECT is received by the mobile station. This period also ends after timeout when waiting for any of these messages.

The non-DRX mode periods defined above run independent of each other and may overlap. The non-DRX mode periods have effect only in packet idle mode. In packet idle mode, the mobile station shall be in non-DRX mode during any of the non-DRX mode periods. Otherwise, the mobile station in packet idle mode may be in DRX mode.

42.4.8.1.1.2 Test Purpose

To verify that an MS in Idle mode enters and remains in the non-drx mode only for the duration of NC2 non-DRX mode period which is equal to NC_NON_DRX_PERIOD parameter, when it sends a NC measurement report

Reference

3GPP TS 44.060, sub-clause 5.5.1.5.

42.4.8.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

Test PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER message to MS. NETWORK_CONTROL_ORDER is commanded to be NC2. NC_NON_DRX_PERIOD is commanded to be 1.92 Sec.

At the end of reporting period, MS sends a PACKET MEASUREMENT REPORT to the SS. After receiving the PACKET MEASUREMENT REPORT message, SS waits for $0.8 * NC_NON_DRX_PERIOD$ and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS responds to the Paging.

SS waits for $1.1 * NC_NON_DRX_PERIOD$ and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS does not respond to the Paging.

Maximum duration of the test

5 min

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1a | SS->MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment. Triggers the MS to monitor the assigned PDCH. |

PACKET MEASUREMENT ORDER in step 1b:

| | |
|---------------------------|-----------------|
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 100 (7.68 sec) |
| NC_NON_DRX_PERIOD | 111 (1.92 sec) |
| NC_FREQUENCY_LIST | 0 (not present) |

42.4.8.1.2 NC2 and DRX / NC_NON_DRX_PERIOD / NC2 non-DRX mode period ordered in Packet Cell Change Order

42.4.8.1.2.1 Conformance requirement

A mobile station operating in NC2 mode shall enter the NC2 non-DRX mode period when it sends an NC measurement report. The duration of this period is defined by the NC_NON_DRX_PERIOD parameter.

The non-DRX mode periods have effect only in packet idle mode. In packet idle mode, the mobile station shall be in non-DRX mode during any of the non-DRX mode periods. Otherwise, the mobile station in packet idle mode may be in DRX mode.

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station. The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

A mobile station in packet idle mode shall take into account the page mode information in any message received in a radio block on PCCCH corresponding to its paging group. The mobile station shall not take into account the page mode information in a message received in any other radio block than those corresponding to its paging group. The requirements yielded by the page mode information are as follows:

- *normal paging*: no additional requirements;

[...]

- *paging reorganization*: The mobile station shall receive all messages on the PCCCH regardless of the BS_PAG_BLK_RES setting. It is required to receive all PBCCH messages. When the mobile station receives the next message to its (possibly new) paging group, subsequent action is defined by the page mode information in that message;

42.4.8.1.2.2 Test Purpose

To verify that when an MS selects a new cell as ordered using a PACKET CELL CHANGE ORDER message, the MS takes into consideration and respects the NC_NON_DRX_PERIOD parameter sent in a PACKET CELL CHANGE ORDER message in the new cell.

42.4.8.1.2.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported.

Mobile Station:

MS is GPRS attached in Cell-A and is in Packet Idle mode. Ready Timer set to 5 min.

Test PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER message to MS ordering the MS to send measurement, the MS starts sending measurements. SS continues receiving measurements until measurement results of cell B are included. SS sends then a PACKET CELL CHANGE ORDER message to MS ordering the MS to select Cell-B. NETWORK_CONTROL_ORDER is commanded to be NC2. NC_NON_DRX_PERIOD for Cell-B is commanded to be 1.2 Sec.

MS selects Cell-B.

At the end of reporting period, MS sends a PACKET MEASUREMENT REPORT to the SS on Cell-B, this is done twice. After receiving the second PACKET MEASUREMENT REPORT message, the SS waits for $0.8 * NC_NON_DRX_PERIOD$ and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS responds to the Paging.

At the end of next reporting period, MS sends a PACKET MEASUREMENT REPORT to the SS on Cell-B. After receiving the PACKET MEASUREMENT REPORT message, the SS waits for $1.1 * NC_NON_DRX_PERIOD$ and sends a PAGING REQUEST message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS does not respond to the Paging.

Maximum duration of the test

5 min

42.4.8.1.3 Void

42.4.8.1.4 NC2 and DRX / NC_NON_DRX_PERIOD / NC2 non-DRX mode period broadcast in SI2Quater

42.4.8.1.4.1 Conformance requirement

A mobile station operating in NC2 mode shall enter the NC2 non-DRX mode period when it sends an NC measurement report. The duration of this period is defined by the NC_NON_DRX_PERIOD parameter.

The non-DRX mode periods have effect only in packet idle mode. In packet idle mode, the mobile station shall be in non-DRX mode during any of the non-DRX mode periods. Otherwise, the mobile station in packet idle mode may be in DRX mode.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

If no parameters have been brought from the old cell, and until individual measurement parameters are received in the new cell, the mobile station shall use the broadcast measurement parameters from PSI5 if a PBCCH is allocated in the cell or SI2quarter if a PBCCH is not allocated in the cell or use the default parameter values.

The mobile station in idle mode is required to receive and analyse the paging messages and immediate assignment messages sent on the paging subchannel corresponding to its paging subgroup, as specified in 3GPP TS 05.02.

[...]

This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

- normal paging: no additional requirements;

[...]

- paging reorganization: The mobile station shall receive all messages on the CCCH regardless of the BS-AG-BLKS-RES setting. It is required to receive all BCCH messages. When the mobile station receives the next message to its (possibly new) paging subgroup the subsequent action is defined in the page mode information element in that message.

Reference

3GPP TS 44.060, sub-clauses 5.5.1.5, 5.6.1

3GPP TS 24.008, sub-clauses 3.3.2.1.1

42.4.8.1.4.2 Test Purpose

To verify that when an MS selects a new cell and if no parameters have been brought from the old cell, the MS uses the broadcast measurement parameter NC_NON_DRX_PERIOD from SI2quarter if PBCCH is not allocated in the new cell.

42.4.8.1.4.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported

SI2quarter transmitted (Rest Octet as described in the Specific Message Contents).

Mobile Station:

MS is GPRS attached in Cell-A and is in Packet Idle mode. Ready Timer set to 5 min.

Test PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER message to MS ordering the MS to send measurement, the MS starts sending measurements. SS continues receiving measurements until measurement results of cell B are included. SS sends then a PACKET CELL CHANGE ORDER message to MS ordering the MS to select Cell-B. NETWORK_CONTROL_ORDER is commanded to be NC2. Measurement parameters are omitted from the message.

MS selects Cell-B.

At the end of reporting period as specified in SI2quarter message broadcast in Cell-B, MS sends a PACKET MEASUREMENT REPORT to the SS on Cell-B, this is done twice. After receiving the second PACKET MEASUREMENT REPORT message, the SS waits for $0.8 * NC_NON_DRX_PERIOD$ period as specified in SI2quarter message broadcast in Cell-B and sends a PAGING REQUEST TYPE 1 message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS responds to the Paging.

At the end of next reporting period, MS sends a PACKET MEASUREMENT REPORT to the SS on Cell-B. After receiving the PACKET MEASUREMENT REPORT message, the SS waits for $1.1 * NC_NON_DRX_PERIOD$ and sends a PAGING REQUEST TYPE 1 message addressing the MS, in a Paging sub-channel not belonging to MS paging subgroup.

SS verifies that MS does not respond to the Paging.

Maximum duration of the test

5 min

Expected sequence

| Step | Direction | Message | Comments |
|-------|-----------|-------------------------------------|---|
| 1a | SS->MS | IMMEDIATE ASSIGNMENT | Sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment. Triggers the MS to monitor the assigned PDCH. |
| 1b | SS->MS | PACKET MEASUREMENT ORDER | -Sent on PACCH. See specific message contents |
| 2 | MS ->SS | CHANNEL REQUEST | -Cause 'Single block packet access' |
| 3 | SS->MS | IMMEDIATE ASSIGNMENT | |

42.4.8.1.5 Void

42.4.8.1.6 NC2 and DRX / NC_NON_DRX_PERIOD / NC2 non-DRX mode period / PBCCH absent / Default Value

42.4.8.1.6.1 Conformance requirement

A mobile station operating in NC2 mode shall enter the NC2 non-DRX mode period when it sends an NC measurement report. The duration of this period is defined by the NC_NON_DRX_PERIOD parameter.

The non-DRX mode periods have effect only in packet idle mode. In packet idle mode, the mobile station shall be in non-DRX mode during any of the non-DRX mode periods. Otherwise, the mobile station in packet idle mode may be in DRX mode.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

If no parameters have been brought from the old cell, and until individual measurement parameters are received in the new cell, the mobile station shall use the broadcast measurement parameters from PSI5 if a PBCCH is allocated in the cell or SI2quater if a PBCCH is not allocated in the cell or use the default parameter values.

The mobile station in idle mode is required to receive and analyse the paging messages and immediate assignment messages sent on the paging subchannel corresponding to its paging subgroup, as specified in 3GPP TS 05.02.

[...]

This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

- normal paging: no additional requirements;

[...]

- paging reorganization: The mobile station shall receive all messages on the CCCH regardless of the BS-AG-BLKS-RES setting. It is required to receive all BCCH messages. When the mobile station receives the next message to its (possibly new) paging subgroup the subsequent action is defined in the page mode information element in that message.

42.4.8.2.3 User Data vs Measurement Report Sending / Conflict situation / Expiry of T3182 and T3158

42.4.8.2.3.1 Conformance requirement

The mobile station shall apply to the timer T3158 either the NC_REPORTING_PERIOD_I when in packet idle mode or the NC_REPORTING_PERIOD_T when in packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network.

A mobile station in mode NC1 or NC2 may receive a new indicated reporting period or change packet mode while timer T3158 is active. If the new indicated reporting period is less than the time to expiry of timer T3158, the mobile station shall immediately restart timer T3158 with the new indicated reporting period. Otherwise, the timer T3158 shall continue to run.

The mobile station shall transmit RLC/MAC blocks with the following priority:

- RLC/MAC control blocks, except Packet Uplink Dummy Control Blocks
- RLC data blocks
 - RLC/MAC control blocks containing Packet Uplink Dummy Control Blocks

42.4.8.2.3.2 Test Purpose

To verify that if T3158 expires before the MS leaves Uplink Packet Transfer mode and after MS has started T3182

- 1 the MS will send a PACKET MEASUREMENT REPORT to the SS if uplink resource is allocated before the expiry of T3182.
- 2 the MS will initiate a Access procedure after T3182 is stopped, if no uplink resource is allocated to the MS while T3182 is running.

PIXIT Statements

-

Test procedure

An uplink TBF is established.

While the TBF is active SS sends a PACKET MEASUREMENT ORDER message to MS.

NETWORK_CONTROL_ORDER is commanded to be NC2. NC_REPORTING_PERIOD_T is chosen to be less than T3182.

The USF allocation is controlled by the SS so that T3158 is running when MS sends RLC Data block with CV=0

At the end of reporting period MS sends a PACKET MEASUREMENT REPORT.

SS sends a PACKET DOWNLINK DUMMY CONTROL BLOCK after the expiry of T3158 and while T3182 is running. SS verifies that MS sends a PACKET MEASUREMENT REPORT in the allocated radio block.

SS waits till T3158 expires while T3182 is still running. SS sends a PACKET UPLINK ACK/NACK with FAI set to '1'.

SS verifies that MS sends a PACKET CONTROL ACK and releases the TBF.

SS verifies that MS initiates an Access procedure to send PACKET MEASUREMENT REPORT after releasing the TBF.

Maximum duration of the test

5 min

Expected sequence

42.4.8.2.4 User Data vs Measurement Report Sending / Conflict situation / Random Access procedure for PMR sending and User Data transmission

42.4.8.2.4.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 and SI2quater messages on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station. The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network.

The sending of an RLC/MAC control message other than the PACKET RESOURCE REQUEST message from a mobile station in packet idle mode to the network may be initiated by the RR entity on the mobile station side using the packet access procedure. If access to the network is allowed, the packet access is done using the single block packet access option.

Further action depends on the RLC/MAC control message sent by the mobile station. Unless otherwise indicated by the RLC/MAC control message, the mobile station remains in packet idle mode.

42.4.8.2.4.2 Test Purpose

To verify that if the MS is triggered to send user data while random access procedure is ongoing to send a PACKET MEASUREMENT REPORT message, the MS will continue the random access procedure, send the PACKET MEASUREMENT REPORT message, will return to Idle mode and then will initiate a random access procedure to send user data.

3GPP TS 04.18, sub-clause 3.5.2.2

42.4.8.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported, PCCCH absent.

CCCH combined with SDCCH. Max Retrans = 7, TX-INTEGGER = 32

SI2quater present

SI2quater transmitted (Rest Octets as described in the Specific Message Contents)

Mobile Station:

MS is GPRS attached and is in Packet Idle mode.

Test PDP context3 established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

At the end of reporting period MS initiates a random access procedure to send PACKET MEASUREMENT REPORT. After receiving the first CHANNEL REQUEST message, the MS is triggered to send User data.

SS verifies that MS continues sending CHANNEL REQUEST messages for sending PACKET MEASUREMENT REPORT. SS allocates uplink resource to the MS to send PACKET MEASUREMENT REPORT. SS verifies that after sending the PACKET MEASUREMENT REPORT message, the MS initiates a random access procedure to send the user data triggered.

Maximum duration of the test

5 min

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS -> SS | CHANNEL REQUEST | Establishment Cause = 'Single block packet access' |
| 2 | MS | | Trigger the MS to send 500 octets data within 6 seconds |

42.4.8.3 Network Control measurement reporting and Dedicated connection

42.4.8.3.1 Network Control measurement reporting / Dedicated connection / Timer Ready expiry

42.4.8.3.1.1 Conformance requirement

42.4.8.3.1.1.1 Conformance requirement for R97 and R98 MS

When the mobile station leaves the MM Ready state, the timer T3158 shall be stopped and no more measurement reports shall be sent to the network.

Reference

3GPP TS 04.60, subclauses 5.6.1

42.4.8.3.1.1.2 Conformance requirement for R99 and later MS

The parameter values NC1 and NC2 only apply in Ready state. In Standby state, the MS shall always use normal MS control independent of the ordered NC mode.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it

overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.1.2 Test Purpose

To verify that some R97 or R98 MS involved in NC measurement reporting, stops its reporting if the Ready Timer expires within a dedicated connection.

For some R97 or R98 MS and for R99 or later MS, the NC measurement reporting is stopped when entering a dedicated connection.

42.4.8.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported. PBCCH not supported. Default Ready Timer (44s)

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in standby state

Test procedure

MS is in packet idle mode, SS sends a PACKET MEASUREMENT ORDER message to change NC reporting parameters. The MS sends measurement reports according to the new NC parameters. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST TYPE 1 message, the MS initiate the establishment of CS connection. The call lasts for 1 minute, thus the Ready Timer expires during the dedicated connection. At the end of the call, no more measurement should be sent by the MS.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | SS establishes a single block downlink TBF. |
| 2 | SS -> MS | PACKET MEASUREMENT ORDER | Sent on the blocks assigned in step 1. PMO message contains Network Control Order 2 (See the specific message content) |
| 3 | MS -> SS | CHANNEL REQUEST | With establishment cause 'single block access'. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 1seconds. |
| 5 | MS -> SS | PACKET MEASUREMENT REPORT | Received on the assigned block. |
| 6 | | {MT Call while GPRS Attach} | Macro parameters: T : 60 seconds R : 1, Resumption GPRS done Ready Timer expires before the end of the CS call |
| 7 | MS | | Stand-by state |
| 8 | SS | | Verify that no more PMR are sent by the MS. |

Specific message contents

PACKET MEASUREMENT ORDER in step 2:

| | |
|---|---------------------------|
| NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I | 10 (NC2) 110 (30,72 s) |
|---|---------------------------|

42.4.8.3.2 Network Control measurement reporting / Dedicated connection / Different NC parameters / No T3158 expiry

42.4.8.3.2.1 Conformance requirement

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used.

The measurement results shall be sent to the network using the procedures specified in sub-clause 7.3 for packet idle mode, and in sub-clause 8.3 for packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

42.4.8.3.2.1.1 Conformance requirement specific for R99 or later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.2.2 Test Purpose

To verify that a MS involved in NC measurement reporting on a NC2 cell, continue its measurement reporting after a dedicated call, with the same NC parameters for some R97 or R98 MS, and with the broadcasted parameters for other R97 or R98 MS and for R99 and later MS.

42.4.8.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported, NC2, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC2 Cell, and receive a PACKET MEASUREMENT ORDER to override the NC parameters broadcasted in SI2 quater. The MS sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the NC parameters of the PACKET MEASUREMENT ORDER. The MS is then paged on its paging channel. Upon receipt of the PACKET PAGING REQUEST message, the MS initiate the establishment of CS connection. SS stops the call after 5 seconds in order to avoid T3158 expiry during the dedicated connection (for R97 MS).

R97 MS should either continue to send PACKET MEASUREMENT REPORT every T3158, calculated with the NC parameters sent in the PACKET MEASUREMENT ORDER, or , like R99 and later release MS, restart the NC measurement reporting but with T3158 based on the broadcasted parameters sent in the PACKET SYSTEM INFORMATION 5.

Maximum duration of the test

|---|--|

42.4.8.3.3 Network Control measurement reporting / Dedicated connection / Handover / No T3158 expiry

42.4.8.3.3.1 Conformance requirement

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 message on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station. The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET, see 3GPP TS 05.08.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T field of the PSI5, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If no PBCCH is allocated in the cell or if no individual order has been received by the mobile station, the default values of the parameters NC_NON_DRX_PERIOD, NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PARAMETER_I when in packet idle mode or the NC_REPORTING_PARAMETER_T when in packet transfer mode. The measurement results shall be sent to the network using the procedures specified in subclause 7.3 for packet idle mode, and in subclause 8.3 for packet transfer mode.

A mobile station may reselect a new cell or may be ordered to reselect a new cell with mode NC1 or NC2 while timer T3158 is active. If time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the mobile station shall immediately restart timer T3158 with the indicated reporting period for the new cell. Otherwise, the timer T3158 shall continue to run.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.3.1.1 Conformance requirement specific for R99 or later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

42.4.8.3.3.2 Test Purpose

To verify that a MS involved in NC measurement reporting and making a handover to a new NC2 cell, uses the broadcasted NC reporting parameters of its new serving cell for its NC measurement reporting.

42.4.8.3.3.3 Method of test

Initial conditions

System Simulator:

2 cells (cell A and cell B), GPRS supported, NC2, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC2 cell A, and sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the broadcasted parameters. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST message, the MS initiate the establishment of CS connection. During the call, SS triggers the MS to do a handover to cell B. SS stops the call after 15 second in order to avoid T3158 expiry during the dedicated connection (for R97 MS).

As cell B has a NETWORK CONTROL ORDER set to NC2, all MS shall then restart measurement reporting by sending PACKET MEASUREMENT REPORT every T3158. The reporting timer is calculated with the NC parameters broadcasted in the second cell on SI2 quater.

Maximum duration of the test

42.4.8.3.4 Network Control measurement reporting / Dedicated connection / Different NC parameters / T3158 expiry

42.4.8.3.4.1 Conformance requirement

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used.

The measurement results shall be sent to the network using the procedures specified in sub-clause 7.3 for packet idle mode, and in sub-clause 8.3 for packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network.

After each reporting period, the MS shall send a measurement report to BSS (see 3GPP TS 04.60). The MS shall then discard any previous measurement report, which it has not been able to send.

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

3GPP TS 05.08, subclause 10.1.4.1

42.4.8.3.4.1.1 Conformance requirement specific for R99 or later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclause 10.1.4

42.4.8.3.4.2 Test Purpose

To verify that some R97 or R98 MS involved in NC measurement reporting, sends only its latest PACKET MEASUREMENT REPORT when many reporting periods had expired during a CS call on the same cell.

To verify that some other R97 or R98 MS and R99 and later releases MS stop their measurement reporting with the dedicated call and do not restart it if the broadcasted parameters give a NETWORK CONTROL ORDER set to NC0.

42.4.8.3.4.3 Method of test

Initial conditions

System Simulator:

2 cells, GPRS supported, NC0, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC0 Cell, and receive a PACKET MEASUREMENT ORDER changing the Network Control Order to NC2. The MS sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the NC parameters of the PACKET MEASUREMENT ORDER, including measurement done on its neighbour, cell B. 15 seconds after the second PACKET MEASUREMENT ORDER the MS is paged on its paging channel. Upon receipt of the PAGING REQUEST TYPE 1 message, the MS initiate the establishment of CS connection. After 30 seconds the cell B transmission is cut and the call lasts for 55 seconds more.

Some R97 or R98 MS and the R99 and later release MS should then be back on CCCH parameters and not trigger any PACKET MEASUREMENT REPORT anymore.

Other R97 or R98 MS should continue to send PACKET MEASUREMENT REPORT every T3158, calculated with the NC parameters sent in the PACKET MEASUREMENT ORDER. As the T3158 timer has expired 3 times during the dedicated connection (once before Cell B has been cut, twice after), and that the MS shall send only its latest PACKET MEASUREMENT REPORT, the first one sent after the dedicated call should not contain any Cell B measurement.

Maximum duration of the test

| 19B | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds. |
| 20B | MS -> SS | PACKET MEASUREMENT REPORT | Shall be sent in the assigned block. |
| Note: In step 13x, the test procedure follows either the 'a' branch or the 'b' branch. | | | |

PACKET MEASUREMENT ORDER in step 1:

| | |
|---|----------------------------|
| NC Measurement parameters NETWORK_CONTROL_ORDER NC_REPORTING_PERIOD_I | 10 (NC2) 110(30.72secs) |
|---|----------------------------|

42.4.8.3.5 Network Control measurement reporting / Dedicated connection / Handover / T3158 expiry

42.4.8.3.5.1 Conformance requirement

42.4.8.3.5.1.1 Conformance requirement for R97 and R98 MS

The behaviour of the mobile station is controlled by the parameter NETWORK_CONTROL_ORDER broadcast in the PSI5 message on PBCCH, in the SI13 message on the BCCH and in the PSI13 message on PACCH. Alternatively, the network may send the NETWORK_CONTROL_ORDER parameters in a PACKET MEASUREMENT ORDER or in a PACKET CELL CHANGE ORDER message on PCCCH or PACCH to a particular mobile station. The parameter NETWORK_CONTROL_ORDER may have one of the values NC0, NC1, NC2 or RESET, see 3GPP TS 05.08.

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T field of the PSI5, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If no PBCCH is allocated in the cell or if no individual order has been received by the mobile station, the default values of the parameters NC_NON_DRX_PERIOD, NC_REPORTING_PARAMETER_I and NC_REPORTING_PARAMETER_T shall be used. The mobile station shall apply to the timer T3158 either the NC_REPORTING_PARAMETER_I when in packet idle mode or the NC_REPORTING_PARAMETER_T when in packet transfer mode. The measurement results shall be sent to the network using the procedures specified in subclause 7.3 for packet idle mode, and in subclause 8.3 for packet transfer mode.

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state.

After each reporting period, the MS shall send a measurement report to BSS (see 3GPP TS 04.60). The MS shall then discard any previous measurement report, which it has not been able to send.

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

3GPP TS 05.08, subclauses 10.1.4 and 10.1.4.1

42.4.8.3.5.1.2 Conformance requirement for R99 and later MS

A set of measurement reporting parameters (NETWORK_CONTROL_ORDER and NC_REPORTING_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to the MS or there is a downlink signalling failure or the MS goes to the Standby state or the MS enters dedicated mode.

Reference

3GPP TS 05.08, subclauses 10.1.4

42.4.8.3.5.2 Test Purpose

To verify that some R97 MS involved in NC measurement reporting, and making a handover during a dedicated connection do not send any buffered PACKET MEASUREMENT REPORT when many reporting periods had expired during a CS call on the first cell. They shall restart their measurement reporting on the new serving cell only if the broadcasted parameters allow it.

For other R97 MS and for R99 or later MS, the NC measurement reporting is stopped when entering a dedicated connection. At the end of the CS call, after a handover, it shall restart its measurement reporting on the new serving cell only if the broadcasted parameters allow it.

42.4.8.3.5.3 Method of test

Initial conditions

System Simulator:

1 cell (Cell A), GPRS supported, NC2, Ready Timer set to 5 minutes

1 cell (Cell B), GPRS supported, NC0, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)
- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC2 Cell, and receive a PACKET MEASUREMENT ORDER. The MS then sends PACKET MEASUREMENT REPORT based on T3158 calculation done with the NC parameters in the PACKET MEASUREMENT ORDER. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST message, the MS initiate the establishment of CS connection. During the call, after 30 seconds in order to have T3158 expiry during the dedicated connection (for some R97 MS), SS triggers the MS to do a handover to the second cell. SS stops the call after 30 seconds on the new serving cell, cell B.

As cell B has a NETWORK CONTROL ORDER set to NC0, no MS should send any measurement reporting, even if some PACKET MEASUREMENT REPORT were not sent when the MS was camped on cell A (before the handover during the dedicated connection)

After 1 minute, a PACKET MEASUREMENT ORDER is then sent to the MS camped on cell B. The SS verifies that the PACKET MEASUREMENT REPORT sent by the MS is including cell A measurements and is not a previous PACKET MEASUREMENT REPORT not sent in cell A.

Maximum duration of the test

-

42.4.8.3.6 Network Control measurement reporting / Dedicated connection / Assignment Reject/

42.4.8.3.6.1 Conformance requirement

When in mode NC1 or NC2, the mobile station shall perform the NC measurements as defined in 3GPP TS 05.08. The reporting periods are indicated in the NC_REPORTING_PERIOD_I and NC_REPORTING_PERIOD_T field of the PSI5, the SI2quater, the PACKET CELL CHANGE ORDER or the PACKET MEASUREMENT ORDER message. If NC_NON_DRX_PERIOD, NC_REPORTING_PERIOD_I or NC_REPORTING_PERIOD_T have not been received by the mobile station the default values shall be used.

The measurement results shall be sent to the network using the procedures specified in sub-clause 7.3 for packet idle mode, and in sub-clause 8.3 for packet transfer mode.

On expiry of timer T3158, the mobile station shall restart timer T3158 with the indicated reporting period, perform the measurements and send either the PACKET MEASUREMENT REPORT message or the PACKET ENHANCED MEASUREMENT REPORT to the network

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station, stops sending CHANNEL REQUEST messages, starts timer T3122 with the indicated value, ("wait indication" information element), starts T3126 if it has not already been started, and listens to the downlink CCCH until T3126 expires.

The Wait Indication IE (i.e. T3122) relates to the cell from which it was received.

The mobile station in packet idle mode (only applicable to mobile station supporting GPRS) may initiate packet access in the same cell before T3122 has expired, see 3GPP TS 04.60 and sub-clause 3.5.2.1.3.4.

After T3122 expiry, no CHANNEL REQUEST message shall be sent as a response to a page until a PAGING REQUEST message for the mobile station is received.

Reference

3GPP TS 04.60/44.060, subclause 5.6.1

3GPP TS 04.08/44.018, subclause 3.3.1.1.3.2

42.4.8.3.6.2 Test Purpose

To verify that if a MS involved in NC measurement reporting is paged for CS connection but receives an IMMEDIATE ASSIGNMENT REJECT to its CHANNEL REQUEST sent in response to the paging, the MS continues its NC measurement reporting.

42.4.8.3.6.3 Method of test

Initial conditions

System Simulator:

1 cell, GPRS supported, NC0, Ready Timer set to 5 minutes

Mobile Station:

The MS is in packet idle mode, with a TMSI, P-TMSI allocated

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in packet idle mode

Test procedure

MS is in packet idle mode, on a NC0 Cell, and receive a PACKET MEASUREMENT ORDER to override the NC parameters broadcasted. The MS sends PACKET MEASUREMENT REPORT based on T3158 calculation done on the NC parameters of the PACKET MEASUREMENT ORDER. The MS is then paged on its paging channel. Upon receipt of the PAGING REQUEST message, the MS sends a CHANNEL REQUEST but the SS denies the dedicated connection by sending an IMMEDIATE ASSIGNMENT REJECT with a wait indication (T3122) of 20 seconds.

The MS does not enter any dedicated connection and should so continue its NC reporting measurement, even if T3122 is not expired at T3158 expiry.

Maximum duration of the test

-

PACKET MEASUREMENT ORDER in step 2:

| | |
|---------------------------|-----------------|
| NC Measurement parameters | |
| NETWORK_CONTROL_ORDER | 10 (NC2) |
| NC_REPORTING_PERIOD_I | 101 (15.36secs) |

42.4.8.4 Network Control measurement reporting / NC_FREQUENCY_LIST

42.4.8.4.1 Network Control measurement reporting / NC_FREQUENCY_LIST / NC_FREQUENCY_LIST in Packet measurement order.

42.4.8.4.1.1 Conformance requirement

The GSM Neighbour Cell list may be modified by "NC Frequency List" in a PACKET CELL CHANGE ORDER message (in which case the reference list is given on the new cell) or one or more instances of the PACKET MEASUREMENT ORDER message with the same BA_IND value or PSI3_CHANGE_MARK value.

The "NC Frequency List" may add cells to the GSM Neighbour Cell list (see sub-clause 11.2.4 and 11.2.9b, "PACKET CELL CHANGE ORDER" and "PACKET MEASUREMENT ORDER"). These cells shall be added at the end of the

GSM Neighbour Cell list and indexed in the order of occurrence within the PACKET CELL CHANGE ORDER message or ascending instances of the PACKET MEASUREMENT ORDER message. The list of added cells may contain GPRS cell re-selection parameters.

The "NC Frequency List" may delete frequencies from the BA(GPRS) list (see 11.2.9b). The frequencies to be removed are identified by their indices in the BA(GPRS). In this case all cells associated with the removed frequencies shall be removed from the GSM Neighbour Cell list. Removed cells/frequencies shall keep their indices but no measurements or reporting shall be performed. If the index points to a cell that does not exist, this shall not be considered as an error.

When ordered to send measurement reports, the MS shall continuously monitor all carriers in BA(GPRS) or as indicated by the parameter NC_FREQUENCY_LIST and the BCCH carrier of the serving cell. The measurement requirements are defined in subclause 10.1.1 for the actual packet mode.

Reference

3GPP TS 04.60, subclause 5.6.1.

3GPP TS 05.08, subclause 10.1.4

42.4.8.4.1.2 Test Purpose

To verify that if the NC_FREQUENCY_LIST is included in the PACKET MEASUREMENT ORDER, MS updates the neighbour cell list and uses the updated list for the measurement reporting and reselection.

42.4.8.4.1.3 Method of test

Initial conditions

System Simulator:

3 cells, GPRS supported.

Cell A (in case of GSM900 only): BS_PA_MFRMS = 2 (4 multi frames)

Initial conditions

| Parameter | Cell A | Cell B | Cell C |
|-------------------------|-----------|-----------|-----------|
| | Carrier 1 | Carrier 2 | Carrier 3 |
| Channel Type Carried | BCCH | BCCH | BCCH |
| RF Signal Level (dBm) | -60 | -75 | -75 |
| Serving Cell Parameters | | | |
| NETWORK_CONTROL_ORDER | NC0 | NC0 | NC0 |

NOTE 1: All cells support GPRS. None of the cells support PBCCH.

NOTE 2: Cell C is not a part of BA(GPRS) on cell A. Cell B is part of BA(GPRS) on cell A.

Mobile Station:

MS is in Packet Idle mode and GPRS attached, Ready Timer Deactivated.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER to MS, changing the NC mode to NC2. SS receives few measurement reports. SS checks that the measurements of cell B are included in the measurement report while that of the Cell C are not included in it. SS transmits a PACKET MEASUREMENT ORDER including

NC_FREQUENCY_LIST, adding Cell C while removing cell B. SS receives few measurement reports and checks that MS now includes cell C in the PACKET MEASUREMENT REPORT, while the measurements of the cell B are not included in it. SS reduces the signal strength of cell A to -85dBm . The signal strengths of cells B and C are increased to -50dBm and -60dBm respectively, making cell B better than cell C for cell reselection. SS changes the NC mode to NC0 by sending a PACKET MEASUREMENT ORDER. SS checks that the MS has done the reselection to cell C even though the cell B was better as the cell B is not a part of the measurement list.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS->MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment on PCH corresponding to MS. |
| 2 | SS->MS | PACKET MEASUREMENT ORDER | -Sent on blocks assigned in step 1 NETWORK_CONTROL_ORDER is set to NC2. NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I are specified. |
| 3 | MS ->SS | CHANNEL REQUEST | See specific message contents with establishment cause 'single block access'. Received on RACH. |
| 4 | SS->MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds. |
| 5 | MS ->SS | PACKET MEASUREMENT REPORT | Received on the allocated PDCH. |
| 6 | | | Steps 3-5 are repeated twice. SS Verifies that the measurement results for cells A, B are included in the PACKET MEASUREMENT REPORT, while the measurements of cell C is not included in it as the cell C is not a part of BA(GPRS) on cell A. |
| 7 | SS->MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment on PCH corresponding to MS. |
| 8 | SS->MS | PACKET MEASUREMENT ORDER | Sent on block assigned in step 7. NETWORK_CONTROL_ORDER is set to NC2. NC_REPORTING_PERIOD_T and NC_REPORTING_PERIOD_I are specified. NC_FREQUENCY_LIST is included. This list adds cell C while deletes cell B from the measurement list. |
| 9 | MS ->SS | CHANNEL REQUEST | See specific message contents with establishment cause 'single block access'. Received on RACH. |
| 10 | SS->MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds. |
| 11 | MS ->SS | PACKET MEASUREMENT REPORT | Received on the allocated PDCH. |
| 12 | | | Steps 9-11 are repeated twice. SS Verifies that the measurement results for cells A, C are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell B is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell C (but should not include cell B), due to the new BSIC synchronization. |
| 13 | SS | | Reduce the signal strength of cell A to –85dBm and increase the signal strength of cell B to –50dBm and cell C to –60 dBm. |
| 14 | SS->MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment on PCH corresponding to MS. |
| 15 | SS->MS | PACKET MEASUREMENT ORDER | Sent on block assigned in step 14. NETWORK_CONTROL_ORDER is set to NC0. See specific message contents |
| 16 | MS->SS | CHANNEL REQUEST | Establishment Cause is 'one phase packet access'. Received on cell C. |

42.4.8.4.2 Void

42.4.8.4.3 Network Control measurement reporting / NC_FREQUENCY_LIST / PMO with empty NC_FREQUENCY_LIST/ Return to BA(GPRS).

42.4.8.4.3.1 Conformance requirement

The “NC Frequency List” may add cells to the GSM Neighbour Cell list (see sub-clause 11.2.4 and 11.2.9b, “PACKET CELL CHANGE ORDER” and “PACKET MEASUREMENT ORDER”). These cells shall be added at the end of the GSM Neighbour Cell list and indexed in the order of occurrence within the PACKET CELL CHANGE ORDER message or ascending instances of the PACKET MEASUREMENT ORDER message. The list of added cells may contain GPRS cell re-selection parameters.

In case the same cell (ARFCN+BSIC) or the same ARFCN without BSIC occur more than once in the resulting GSM Neighbour Cell list, each occurrence shall be assigned an index but only the cell with the highest index shall be used for cell re-selection and referred to in measurement reports.

The "NC Frequency List" may delete frequencies from the BA(GPRS) list (see 11.2.9b). The frequencies to be removed are identified by their indices in the BA(GPRS). In this case all cells associated with the removed frequencies shall be removed from the GSM Neighbour Cell list. Removed cells/frequencies shall keep their indices but no measurements or reporting shall be performed. If the index points to a cell that does not exist, this shall not be considered as an error.

A parameter NC_FREQUENCY_LIST may also be sent individually to an MS on PCCCH or PACCH. This list adds/deletes frequencies to the BA(GPRS) both for cell re-selection and for measurement reports. For added frequencies, the corresponding cell re-selection parameters may be included. If no cell re-selection parameters are given for a particular cell, that cell shall only be used in mode NC2. The list is valid until an empty list is sent to the MS.

Reference

3GPP 04.60, subclause 5.6.3.2

3GPP 05.08, subclause 10.1.4

42.4.8.4.3.2 Test Purpose

To verify that MS involved in measurement reporting reverts to BA(GPRS) on reception of PMO with empty NC_FREQUENCY_LIST list.

42.4.8.4.3.3 Method of test

Initial Conditions

System Simulator:

- 3 cells. Cell B is part of BA(GPRS) of Cell A. Cell C is not a part of the BA(GPRS) of Cell A. None of the cells support PBCCH.
- Cell A (in case of GSM900 only): BS_PA_MFRMS = 2 (4 multi frames)

Mobile Station:

- The MS is in GPRS attached with a P-TMSI allocated on Cell A, Ready Timer deactivated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) Changing the NC mode to NC2, deleting the cell B, while adding the cell C in the measurement list. SS checks that the measurements of the cell C are included in the Packet measurement report while that of Cell B are not included. The SS sends a PACKET MEASUREMENT ORDER message with an empty NC_FREQUENCY_LIST. SS checks that the MS starts sending the measurements of cell B while stops sending the measurements of the cell C.

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS->MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment on PCH corresponding to MS. |
| 2 | SS -> MS | PACKET MEASUREMENT ORDER | Sent on block assigned in step 1. |
| 3 | MS -> SS | CHANNEL REQUEST | See specific message content with establishment cause 'single block access'. Received on RACH. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds. |
| 5 | MS -> SS | PACKET MEASUREMENT REPORT | -Sent on allocated PDCH -Contains "NC measurement report Struct" |
| 6 | | | Steps 3-5 are repeated twice. SS Verifies that the measurement results for cells A, C are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell B is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell C (but should not include cell B), due to the new BSIC synchronization. |
| 7 | SS->MS | IMMEDIATE ASSIGNMENT | for single block downlink assignment on PCH corresponding to MS. |
| 8 | SS -> MS | PACKET MEASUREMENT ORDER | -Sent on block assigned in step 1 See specific message content |
| 9 | MS -> SS | CHANNEL REQUEST | Empty NC_FREQUENCY_LIST list with establishment cause 'single block access'. Received on RACH. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future in the range 0.5 to 2 seconds. |
| 11 | MS -> SS | PACKET MEASUREMENT REPORT | -Sent on allocated PDCH -Contains "NC measurement report Struct" |
| 12 | | | Steps 9-11 are repeated twice. SS Verifies that the measurement results for cells A, B are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell C is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell B (but should not include cell C), due to the new BSIC synchronization. |

42.4.8.4.4 Network Control measurement reporting / NC_FREQUENCY_LIST / Changes in BA(GPRS)/ Return to BA(GPRS).

42.4.8.4.4.1 Conformance requirement

A parameter NC_FREQUENCY_LIST may also be sent individually to an MS on PCCCH or PACCH. This list adds/deletes frequencies to the BA(GPRS) both for cell re-selection and for measurement reports. For added frequencies, the corresponding cell re-selection parameters may be included. The list is valid until an empty list is sent to the MS, there is a downlink signalling failure or the MS selects a new cell or the BA(GPRS) that is modified by the NC_FREQUENCY_LIST changes or the MS enters dedicated mode. A list given by Packet Cell Change Order applies in the new cell. The lists may also include cells with other radio access technologies.

Reference

3GPP 05.08, subclause 10.1.4

42.4.8.4.4.2 Test Purpose

To verify that MS returns to BA(GPRS) if BA(GPRS) on which the NC_FREQ_LIST is built, is changed.

42.4.8.4.4.3 Method of test

Initial Conditions

System Simulator:

3 cells, default settings. Cell C is removed from the BA(GPRS) on cell A.

Mobile Station:

The MS is in GPRS attached with a P-TMSI allocated on Cell A. READY TIMER is set to 5 min.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) Changing the NC mode to NC2, deleting the cell B, while adding the cell C in the measurement list. SS checks that the measurements of the cell C are included in the Packet measurement report while that of Cell B are not included. The SS changes the BA(GPRS) given on the broadcast channels. SS waits for 35 seconds. SS checks that the MS reverts back to sending of the measurements of cell B while stops sending the measurements of the cell C.

Maximum Duration of Test

-

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1a | SS -> MS | IMMEDIATE ASSIGNMENT | SS establishes a single block downlink |
| 1b | SS -> MS | PACKET MEASUREMENT ORDER | See specific message content |
| 2 | MS -> SS | CHANNEL REQUEST | 'Single block packet access' |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Sent on AGCH. Single block assignment |
| 4 | MS -> SS | PACKET MEASUREMENT REPORT | -Sent on allocated PDCH -Contains "NC measurement report Struct" |
| 5 | SS | | Steps 2-4 are repeated twice. SS Verifies that the measurement results for cells A, C are included in, at least, the last PACKET MEASUREMENT REPORT, while the measurements of cell B is not included in it. Previous PACKET MEASUREMENT REPORT may not include cell C (but should not include cell B), due to the new BSIC synchronization. |
| 6 | SS | | SS Changes BA(GPRS) list broadcast in SI2 (SI2bis) on BCCH. SI2 change is indicated in SI13 rest octets. See Specific message content SS waits for 35 seconds While waiting, MS may send measurement reports, in that case repeat steps 2-4. |
| 7 | MS -> SS | CHANNEL REQUEST | 'Single block packet access' |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | -Sent on AGCH Single block assignment |
| 9 | MS -> SS | PACKET MEASUREMENT REPORT | -Sent on allocated PDCH -Contains "NC measurement report Struct" SS verifies that measurement reports for Cell B are included and not of Cell C. |

42.4.8.4.5 Network Control measurement reporting / NC_FREQUENCY_LIST / Dedicated connection/ Return to BA(GPRS)

42.4.8.4.5.1 Conformance requirement

The procedure for measurement report sending shall be initiated by the mobile station at expiry of either the NC measurement report interval timer T3158 or the EM measurement report interval timer T3178. At expiry of the timer T3158 or T3178 the mobile station shall restart the expired timer T3158 or T3178, perform the measurements and initiate the packet access.

The procedure for measurement report sending is initiated by the mobile station either on PCCCH (subclause 7.3.1) or, if a packet control channel not exists, on CCCH (subclause 7.3.2).

If the mobile station initiates an RR connection establishment, the timers T3158 and T3178 shall be stopped and no measurement reports shall be sent. When the RR connection is released and if the mobile station has not changed cell, the measurement reporting procedure shall be restarted.

In a cell with a PBCCH allocated, if PSI3_CHANGE_MARK is changed, the mobile station shall re-read and rebuild the GSM Neighbour Cell list.

Reference

3GPP 04.60, subclause 7.3
3GPP 04.60, subclause 5.6.3.2

42.4.8.4.5.2 Test Purpose

To verify that MS involved in measurement reporting successfully returns to BA(GPRS) broadcast on BCCH after a dedicated connection.

42.4.8.4.5.3 Method of test

Initial Conditions

System Simulator:

- 3 cells, default settings. Cell C is removed from the BA(GPRS) on both cell A and cell B.
- Ready Timer Deactivated on all cells.

Mobile Station:

The MS is in GPRS attached with a TMSI and a P-TMSI allocated.

Specific PICS Statements

- Support of Immediate Connect (TSPC_AddInfo_ImmConn)

PIXIT Statements

-

Test Procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) changing the NC mode to NC2, deleting the cell B, while adding the cell C to the measurement list. SS checks that the measurements of the cell C are included in the third Packet measurement report while that of Cell B are not included. The SS pages MS for a CS call. SS establishes a call with MS. After 5 seconds releases the call. SS reduces the signal strength of the cell A, in such a way that the cell B and C are better than cell A. Cell C is better than cell B. SS checks that the MS does the reselection to cell B, even though cell C is better. This way we will check that the MS returns to broadcast parameters after a dedicated connection.

Maximum Duration of Test

-

42.4.8.4.6 Network Control measurement reporting / NC_FREQUENCY_LIST / PMO sent in multiple instances.

42.4.8.4.6.1 Conformance requirement

If the mobile station receives a PACKET MEASUREMENT ORDER message (full set of instances) with changed PMO_IND parameter value, any old "NC frequency list" shall be deleted. If the last PACKET MEASUREMENT ORDER message (full set of instances) does not contain a "NC frequency list" (no added or deleted frequencies) the mobile station shall return to BA(GPRS).

MS receives NC_FREQUENCY_LIST in multiple instances by adding and deleting a cell in each of these instances. SS verifies that MS constructs Frequency list and checks PACKET MEASUREMENT REPORTS of these cells are included

Reference

3GPP TS 05.08 Sec 10.1.4

3GPP TS 04.60 Sec 5.6.1

42.4.8.4.6.2 Test Purpose

To verify that when instances of PACKET MEASUREMENT ORDER is sent including NC_FREQUENCY_LIST MS has to construct this frequency list and include the cells in the PACKET MEASUREMENT REPORTS.

42.4.8.4.6.3 Method of test

Initial conditions

System Simulator:

3 cells default settings.,

Cell A in NC2. Cell C is removed from the BA(GPRS) of cell A.

Mobile Station:

MS is in Packet Idle mode and GPRS attached on Cell A.

PDP context 2 established.

Specific PICS Statements

-

PIXIT Statements

-

Foreseen final state of the MS

- MS is in transfer mode.

Test procedure

SS receives few PACKET MEASUREMENT REPORTS. SS checks that the measurements of the cell B are included in the Packet measurement report while that of Cell C is not included.

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) in 2 instances. It deletes the cell B in instance 1, while adds the cell C in instance 2.

SS checks that the measurements of the cell C are included in the Packet measurement report while that of Cell B are not included.

Maximum duration of the test

-

Expected sequence

42.4.8.4.7 Network Control measurement reporting / NC_FREQUENCY_LIST / same cell present twice in the list.

42.4.8.4.7.1 Conformance requirement

The "NC Frequency List" may add cells to the GSM Neighbour Cell list . These cells shall be added at the end of the GSM Neighbour Cell list and indexed in the order of occurrence within the PACKET CELL CHANGE ORDER

message or ascending instances of the PACKET MEASUREMENT ORDER message. The list of added cells may contain GPRS cell re-selection parameters.

In case the same cell (ARFCN+BSIC) or the same ARFCN without BSIC occur more than once in the resulting GSM Neighbour Cell list, each occurrence shall be assigned an index but only the cell with the highest index shall be used for cell re-selection and referred to in measurement reports.

Reference

3GPP TS 04.60, subclause 5.6.1.

42.4.8.4.7.2 Test Purpose

To verify that if a same cell (ARFCN+BSIC) occurs more than once in the Neighbour cell list; MS reports the cell with the highest index.

42.4.8.4.7.3 Method of test

Initial conditions:

System Simulator:

2 cells, GPRS supported.

Mobile Station:

The MS is GPRS attached, in Packet Idle Mode.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

SS sends a PACKET MEASUREMENT ORDER message (including the NC_FREQUENCY_LIST) Changing the NC mode to NC2, adding the cell B to the Neighbour cell list.

SS checks that the MS is reporting the cell B, with the highest index number for the cell given by the NC_FREQUENCY_LIST.

Maximum duration of the test

5 min.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1A | SS->MS | IMMEDIATE ASSIGNMENT | SS establishes a single block down link |
| 1B | SS->MS | PACKET MEASUREMENT ORDER | Sent in the allocated block. See specific message contents. |
| 2 | MS->SS | CHANNEL REQUEST | ACCESS TYPE = 'Single block packet access' Received on RACH. |
| 3 | SS->MS | IMMEDIATE ASSIGNMENT | Sent on AGCH, assigning a single block. |
| 4 | MS ->SS | PACKET MEASUREMENT REPORT | Received on the allocated PDCH. Check that the MS reports the measurements for cell B with the highest Index . See specific message contents. |

42.4.8.5 NC2 and DTM

42.4.8.5.1 Ignoring Packet Measurement Order and Packet Cell Change Order whilst in DTM

42.4.8.5.1.1 Conformance requirements

An MS in network control mode NC1 or NC2 may enter an exceptional case if a circuit switched connection is established, which takes precedence over GPRS cell re-selection. This includes an MS operating in DTM.

References

3GPP TS 45.008, sub-clause 10.1.4.3

42.4.8.5.1.2 Test purpose

To verify that the MS operating in DTM ignores Packet Measurement Order and Packet Cell Change Order.

42.4.8.5.1.3 Method of test

Initial Conditions

System Simulator:

2 cells with default parameter: A, B with same LAI, both supporting GPRS DTM

Mobile Station:

The MS is in the active state (U10) of a call on Timeslot N (chosen arbitrarily) of cell A and has the PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. On receiving the PACKET ASSIGNMENT message, the MS starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH. Right after the beginning a PACKET UPLINK ACK/NACK is send from the SS to reset T3182 on MS side. Then the SS sends a PACKET CELL CHANGE ORDER to the MS containing BSIC and the BCCH frequency of cell B. The SS maintains the CS call and checks that no CHANNEL REQUESTS on cell B received. Then the transmission is completed.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|--|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H. |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 2000 octets. |
| 3 | MS -> SS | DTM REQUEST | See specific message contents Macro Sent on PACCH: Contains -BSIC + BCCH frequency of cell B. -The network control order, NC2 See specific message contents SS maintaining the CS call and check for 3 seconds that MS is not sending any Channel Requests on cell B Macro - Completion of the 2.000 octets of Data |
| 4 | SS -> MS | PACKET ASSIGNMENT | |
| 5 | SS<->MS | {Uplink Data} | |
| 6 | SS -> MS | PACKET CELL CHANGE ORDER | |
| 7 | SS<->MS | { Uplink data transfer } | |

Specific Message Contents

42.5 Downlink Transfer

42.5.1 Downlink Transfer / Normal Operation

42.5.1.1 Void

42.5.1.2 Downlink Transfer/ Normal Operation / Without TBF starting time

42.5.1.2.1 Void

42.5.1.2.2 Conformance Requirement

1. On receipt of a PACKET DOWNLINK ASSIGNMENT message, the mobile station shall switch to the assigned PDCHs.
2. The Packet downlink assignment procedure is completed when the mobile station receives a valid RLC/MAC block. The mobile station has entered the packet transfer mode.
3. If the MS is required to transmit a PACKET CONTROL ACKNOWLEDGEMENT subsequent to a PACKET DOWNLINK ASSIGNMENT, the MS shall be ready to receive on the new assignment no later than the next occurrence of block B((x+2) mod 12) where block B(x) is radio block containing the PACKET CONTROL ACKNOWLEDGEMENT.

3GPP TS 04.60, subclauses 7.2.1.1, 7.2.1.2 and 10.4.5.

3GPP TS 05.10, subclause 6.11.1.

42.5.1.2.3 Test purpose

Verify that an MS switches to the assigned PDCH when assigned to it without a starting time, within 3 blocks.

42.5.1.2.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported, CTRL_ACK_TYPE=0 in GPRS cell options.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF, Sent on PCH. |
| 1b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to the assigned PDCH. (no starting time) With valid RRBP field |
| 2 | MS->SS | PACKET CONTROL ACK | 4 access bursts. Sent in the block specified by RRBP field in step 1. |
| 3 | SS -> MS | RLC DATA BLOCK | 2 blocks after the previous message, with valid RRBP field, on assigned PDCH, addressed to MS. |
| 4 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges on PACCH the RLC data block sent in step 3. |
| 5 | | {Competition of downlink data transfer} | Macro |

Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1b:

| | |
|-----------------------|---------------------------------|
| TIMESLOT_ALLOCATION | <one timeslot assigned> |
| PACKET TIMING ADVANCE | Timing Advance Value as default |
| TBF STARTING TIME | <IE not present> |

DOWNLINK RLC DATA BLOCKS (various steps):

| | |
|------|---|
| RRBP | 00 – Response shall be sent by MS in N+13 frames. |
| S/P | 1 – RRBP field is valid |

42.5.2 Downlink Transfer / Polling

42.5.2.1 Downlink Transfer/ Polling/ Normal operation/RLC data block

42.5.2.1.1 Void

42.5.2.1.2 Conformance Requirement

Whenever the mobile station receives an RLC data block addressed to itself and with a valid RRBP field in the RLC data block header (i.e., is polled), the mobile station shall transmit a PACKET DOWNLINK ACK/NACK message in the uplink radio block specified by the RRBP field whatever the BSN value of the received RLC data block, unless another RLC/MAC control message is waiting to be transmitted, in which case the other RLC/MAC control message shall be sent.

The RRBP value specifies a single uplink block in which the mobile station shall transmit either a PACKET CONTROL ACKNOWLEDGEMENT message or a PACCH block to the network. If the RRBP field is received as part of an RLC/MAC block containing an RLC/MAC control block containing any message except Packet Paging Request, Packet Access Reject, and Packet Queuing Notification, the mobile station shall transmit a PACKET CONTROL ACKNOWLEDGEMENT message in the uplink radio block specified. If the RRBP field is received as part of an RLC/MAC block containing an RLC/MAC control block containing a Packet Paging Request, Packet Access Reject, or Packet Queuing Notification message, the mobile station shall ignore this RRBP field. The mobile station shall only react on RLC/MAC control blocks containing a valid RRBP field if the mobile station is unambiguously addressed either in the downlink RLC/MAC control block header or in the control message itself.

42.5.3 Downlink Transfer / T3190 Expiry / Initial allocation

42.5.3.1 Downlink Transfer/ T3190 Expiry / Initial allocation / Restart with valid RLC data block

42.5.3.1.1 Void

42.5.3.1.2 Conformance Requirement

When receiving the PACKET DOWNLINK ASSIGNMENT message and after waiting the TBF Starting Time when applicable, the mobile station starts timer T3190. The timer is reset when receiving the first valid RLC/MAC block.

On expiry of timer T3190, the mobile station shall abort the procedure and return to packet idle mode.

If the mobile station receives a valid RLC data block addressed to itself, the mobile station shall reset and restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

References

3GPP TS 04.60, subclauses 7.2.1.1, 8.1.2.1 and 10.4.5.

42.5.3.1.3 Test purpose

Verify that an MS starts T3190 when receiving the PACKET DOWNLINK ASSIGNMENT, resets and restarts the timer when a valid RLC/MAC block is received, and returns to packet idle mode when T3190 expires.

42.5.3.1.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT, containing relative-encoded starting time.
2. (0.8*T3190) seconds after the starting time occurs, the SS transmits a downlink RLC data block with polling indicated.
3. MS sends PACKET DOWNLINK ACK/NACK on PACCH in response to the RLC data block.
4. (1.2*T3190) seconds after the previous downlink RLC data block, the SS transmits another downlink RLC data block with polling indicated.
5. The MS ignores the downlink block (because it has already returned to packet idle mode upon expiry of T3190).

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF, Sent on PCH. |
| 1b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to the assigned PDCH and start T3190 at the starting time indicated. Sent on assigned PDCH, (T3190*0.8) seconds after expiry of the TBF Starting Time indicated in Step 1, with valid RRBP field, addressed to MS. T3190 is then restarted. |
| 2 | SS -> MS | RLC DATA BLOCK | |
| 3 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges the previous RLC data block. Sent on assigned PDCH, (T3190*1.2) seconds after step 2, with valid RRBP field, addressed to MS. |
| 4 | SS -> MS | RLC DATA BLOCK | |
| 5 | SS | | Verify the MS does not respond to the previous RLC block, and that the MS does not transmit on the PACCH of the assigned PDCH. |
| 6 | SS->MS | IMMEDIATE ASSIGNMENT | Sent on assigned paging channel. This is to verify the MS is in packet idle mode with no starting time. |
| 7 | SS->MS | RLC DATA BLOCK | Sent on assigned PDCH, (T3190*0.8) seconds after step 6, with valid RRBP field, addressed to MS. |
| 8 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges the previous RLC data block. |
| 9 | | {Competition of downlink data transfer} | Macro |

Test Procedure

1. MS receives a IMMEDIATE ASSIGNMENT message establish downlink TBF, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.
4. SS transmits another PACKET DOWNLINK ASSIGNMENT message on PACCH, containing no starting time.
5. (T3190 * 1.2) seconds later, SS transmits a downlink RLC data block on the newly assigned resources.
6. MS ignores the downlink block (because it has already returned to packet idle mode because T3190 expired).
7. SS transmits another IMMEDIATE ASSIGNMENT message on PCH, containing no starting time.
8. (T3190 * 0.8) seconds later, SS transmits a downlink RLC data block on the newly assigned resources.
9. MS responds by sending a PACKET DOWNLINK ACK/NACK.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT | Triggers the MS to switch to PDCH0. (no starting time) |
| 2 | SS -> MS | RLC DATA BLOCK | 3 blocks after the previous message, with valid RRB field, on assigned PDCH0, addressed to MS. |
| 3 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges on PACCH the RLC data block sent on PDCH0. |
| 4 | SS -> MS | RLC DATA BLOCKS | SS continues to transmit RLC data blocks according to allocation from step 1. |
| 5 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to PDCH1. (no starting time) |
| 6 | SS -> MS | RLC DATA BLOCK | (T3190 * 1.2) seconds after the previous message, with valid RRB field, on PDCH1, addressed to MS. |
| 7 | SS | | Verify the MS does not transmit on the PACCH of PDCH1. |
| 8 | SS->MS | IMMEDIATE ASSIGNMENT | Sent on assigned paging channel (no starting time). This is to verify the MS is in idle mode. |
| 9 | SS->MS | RLC DATA BLOCK | Sent on assigned PDCH, (T3190*0.8) seconds after step 8, with valid RRB field, addressed to MS. |
| 10 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges the previous RLC data block. |
| 11 | | {Competition of downlink data transfer} | Macro |

Specific Message Contents

IMMEDIATE ASSIGNMENT message in step 1:

| | |

42.5.4.2 Downlink Transfer/ T3190 Expiry / Resource reallocation / With TBF starting time

42.5.4.2.1 Void

42.5.4.2.2 Conformance Requirement

On receipt of a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. Upon switching to the new PDCHs the mobile station shall restart timer T3190.

When the mobile station receives an RLC/MAC block addressed to itself on any of the new assigned resources it shall restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

References

3GPP TS 04.60, subclause 8.1.2.4.

42.5.4.2.3 Test purpose

Verify that an MS switches to the newly assigned PDCH at the starting time given, and returns to packet idle mode when T3190 expires.

42.5.4.2.4 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated and PDP context 3 activated.

42.5.5 Downlink Transfer / Reestablishment

42.5.5.1 Downlink Transfer/ Reestablishment/ T3192 Expiry

42.5.5.1.1 Void

42.5.5.1.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with

the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall release the downlink TBF. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the uplink assignment. If there is no ongoing uplink TBF, the mobile station in packet transfer mode shall return to packet idle mode; the mobile station in dual transfer mode shall return to dedicated mode. The DRX mode procedures shall be applied, as specified in subclause 5.5.1.5.

42.6 MAC Modes whilst in DTM

42.6.1 Exclusive allocation in single-slot configuration

42.6.1.1 Conformance requirements

The exclusive allocation shall be used in dual transfer mode during single slot operation with a half-rate PDCH.

When mobile station has received the uplink assignment and granted the right to transmit using exclusive allocation, the mobile station shall start timer T3184 and transmit an RLC/MAC block in every uplink radio block on the PDCHs assigned for the TBF. The timer T3184 shall be restarted every time the mobile station receives a PACKET UPLINK ACK/NACK message.

If the mobile station has an RR connection to the network on a half-rate TCH, the network may assign a downlink TBF using the other sub-channel of the same timeslot for a half-rate PDCH (see 3GPP TS 05.02). In this case, the downlink assignment message shall be encoded with a timeslot allocation including the timeslot number for the half-rate TCH and the half-rate PDCH and only that timeslot number. The mobile station shall interpret this allocation as an allocation of a half-rate PDCH.

If the mobile station has an RR connection to the network on a half-rate TCH, the network may assign an uplink TBF using the other sub-channel of the same timeslot for a half-rate PDCH (see 3GPP TS 05.02)

References

3GPP TS 04.60/44.060 sub-clauses 5.2.4, 8.1.1.3a.1, 11.2.7.1 & 11.2.29.1

42.6.1.2 Test purpose

To guarantee that the MS transmits an RLC/MAC block in every uplink radio block on the PDCH assigned for the single-slot TBF, ignoring the USF indicator in the downlink radio block corresponding to the uplink PDCH/H channel.

42.6.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported, DTM supported, PCCCH present.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in packet idle mode, with a P-TMSI allocated and PDP context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

The MS is in a active CS call with an assigned TCH/H. The MS is triggered to initiate an uplink TBF and the MS is allocated the same timeslot for use in a uplink TBF. The MS interprets this as a command to use a combined TCH/H and exclusive mode PDCH/H in a single Timeslot. The SS verifies that the MS sends uplink RLC blocks in each block in the PDCH/H

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|--|
| 1 | SS | | MS in the active state (U10) of a call on Timeslot N, with Channel Type=TCH/H |
| 2 | MS | | Trigger the MS to initiate an uplink packet transfer containing 1000 octets of data. |
| 3 | MS->SS | DTM REQUEST | |
| 4 | SS->MS | PACKET ASSIGNMENT | SS sends this message such that it is received before Timer T3148 expiry. |
| 5 | MS<->SS | { Uplink data transfer } | Macro – Test completes when 1000 octets of data is received. |

Specific Message Contents

PACKET ASSIGNMENT (Step 4):

|--|-------------------|
| As default message contents except: RR Packet Uplink Assignment IE - TIMESLOT_ALLOCATION RR Packet Downlink Assignment IE | N Not included |
|--|-------------------|

42.6.2 Void

42.6.3 Void

42.7 Packet assignment/ TA Value

42.7.1 Void

42.7.2 Packet Assignment / TA Value/TA not present in Packet uplink assignment sent On the PACCH

42.7.2.1 Conformance requirements

If TIMING_ADVANCE_VALUE field is not provided in the assignment message, the mobile station shall use its previous timing advance (either assigned in the previous IMMEDIATE ASSIGNMENT message received on AGCH or in the previous PACKET UPLINK ASSIGNMENT message received on PAGCH, or got through the continuous timing advance procedure).

Reference

3GPP TS 04.60 subclause 7.1.3.5.

42.7.2.2 Test purpose

To verify that the mobile station considers the previous timing advance contained in the PACKET UPLINK ASSIGNMENT allocating the single block allocation for sending the PACKET RESOURCE REQUEST message. When receiving the PACKET UPLINK ASSIGNMENT for the uplink TBF allocation without Timing advance, MS shall use the timing advance value given in the initial PACKET UPLINK ASSIGNMENT message.

42.7.2.3 Method of test

Initial conditions

System Simulator:

1cell, supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS initiates an uplink data transfer. The SS sends IMMEDIATE ASSIGNMENT with timing advance included with a single block allocation forcing two-phase access procedure. As response to the PACKET RESOURCE REQUEST message, the SS sends PACKET UPLINK ASSIGNMENT message on PACCH (not containing TA value). The MS shall complete the transfer of the uplink data.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|--|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 500 octets data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to order the MS to follow the two phase access procedure. Sent on AGCH. Including timing advance value. |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 3. |
| 5 | SS -> MS | PACKET UPLINK ASSIGNMENT | uplink dynamic allocation, no starting time, no timing advance value. Sent on PACCH of the same PDCH assigned in step 3. |
| 6 | SS | {Uplink data transfer} | Macro. Completion of the data transfer procedure. |

Specific message contents

None

42.7.3 Packet Assignment / TA Value/ PACKET POWER CONTROL/TIMING ADVANCE during contention resolution

42.7.3.1 Conformance requirements

For a R97 and R98 MS only:

During the contention resolution, the mobile station may receive a non-distribution RLC/MAC control message addressing the mobile station by TLLI or the TFI value associated with the uplink TBF, other than the PACKET UPLINK ACK/NACK message. The mobile station may act on the other non-distribution messages, using the procedure defined for that message when it is received in packet transfer mode during operation on an uplink TBF (see clause 8).

For a R99 or later MS only:

During the contention resolution, the mobile station shall not accept a PACKET MEASUREMENT ORDER message, a PACKET CELL CHANGE ORDER message and a PACKET POWER CONTROL/TIMING ADVANCE message addressing the mobile station with the TFI value associated with the uplink TBF.

Reference:

For a R97 and R98 MS only:

3GPP TS 04.60 subclause 7.1.2.3.

For a R99 or later MS only:

3GPP TS 04.60/44.060 subclause 7.1.2.3a.

42.7.3.2 Test purpose

For a R97 and R98 MS only:

To verify that during contention resolution the mobile station may accept the PACKET POWER CONTROL/TIMING ADVANCE addressed with TFI.

For a R99 or later MS only:

To verify that during contention resolution the mobile station does not accept PACKET POWER CONTROL/TIMING ADVANCE addressed with TFI.

42.7.3.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

- Release of GPRS Supported (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test procedure

For a R97 and R98 MS only:

The MS is triggered to initiate uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request one phase access and includes a Timing Advance Value field. The SS shall wait 2 seconds and then sends a PACKET POWER CONTROL/TIMING ADVANCE message with a valid timing advance information. The MS may accept this message even though the contention resolution was not solved. It is verified that the uplink transfer is successfully completed.

For a R99 or later MS only:

The MS is triggered to initiate uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request one phase access and includes a Timing Advance Value field. The SS shall wait 2 seconds and then sends a PACKET POWER CONTROL/TIMING ADVANCE message with a valid timing advance information. The MS shall not consider this message since the contention resolution was not solved. It is verified that the uplink transfer is successfully completed.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|--|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 440 octets data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Including Timing Advance Value. Indicating Packet UL Assignment struct. Sent on AGCH. |
| 4 | SS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigning USF to the MS. Sent at least 3 block periods from the assignment in step 3. |
| 5 | MS->SS | RLC DATA BLOCK | with TLLI included |
| 6 | SS -> MS | PACKET POWER CONTROL/TIMING ADVANCE | Include a valid Timing Advance Index. Sent on PACCH. Addressing MS with TFI assigned in step 3. |
| 7A | SS | | For R97/R98 terminals: SS waits 3 s. The MS may send access bursts on the PTCCH/U. |
| 7B | SS | | For R99 and later terminals: SS waits 3 s and verifies that the MS does not send access burst on the PTCCH/U. |
| 8 | SS->MS | PACKET UPLINK ACK/NACK | Including the TFI and TLLI of the MS, finishing the contention resolution. Assigning USF to the MS. |
| 9 | SS | {Uplink data transfer } | Macro. Completion of the macro procedure. |

Note: Step 7A is performed for R97/R98 terminals. Step 7B is performed for R99 and later terminals.

Specific message contents

None.

42.7.4 Packet Assignment / TA Value/TAI present/ multislot capabilities

42.7.4.1 Conformance requirements

If the PDCH containing the mobile station's only assigned TAI value is removed, the mobile station shall, if it is performing an uplink TBF, perform an abnormal release with access retry.

Reference

3GPP TS 04.60 subclause 8.7.

42.7.4.2 Test purpose

To verify that If the PDCH containing the mobile station's only assigned TAI value is removed, the mobile station shall, if it is performing an uplink TBF, perform an abnormal release with access retry.

42.7.4.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. SI13, ACCESS_BURST_TYPE indicates 8 bits access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data packet transfer. The SS responds with IMMEDIATE ASSIGNMENT message for two phase access. The PACKET UPLINK ASSIGNMENT message contains a Timing Advance Index. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. During the uplink data transfer, the SS shall verify that the access bursts are sent correctly (by the MS) in the PTCCH. Then PDCH containing the mobile station's only assigned TAI value is removed. Verify that MS perform an abnormal release with access retry.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------------|--|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of 2000 octets data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3a | SS -> MS | IMMEDIATE ASSIGNMENT | Single block allocation. |
| 3b | MS->SS | PACKET RESOURCE REQUEST | |
| 3c | SS -> MS | PACKET UPLINK ASSIGNMENT | Including Timing Advance Index = 0 (on TN0), Dynamic allocation struct. |
| 4 | MS->SS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PDCH. Assigning TN0 and TN1 |
| 5 | MS->SS | UPLINK RLC DATA BLOCK | USF assigned to MS, sent on TN0 |
| 6 | SS->MS | PACKET UPLINK ACK/NACK | Received on PDCH0 |
| 7 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | With correct TLLI (to complete the contention resolution). |
| 8 | MS->SS | UPLINK RLC DATA BLOCKS | USFs assigned to MS on TN0 and TN1 |
| 9 | SS | | Received on both PDCH0 and PDCH1 |
| 10 | SS->MS | PACKET PDCH RELEASE | Repeat steps 7 and 8 20 times. |
| 11 | SS | | Sent on PACCH of PDCH0 with TIMESLOTS_AVAILABLE indicating that only timeslot 1 is available |
| 12 | MS->SS | CHANNEL REQUEST | Verify that MS did not continue on both PDCH0 and PDCH1 (max 6 blocks should be received) MS re-initiates the packet access procedure |

Verification

During the uplink data transfer (steps 3b to 9) the SS monitors the access burst on PTCCH which are located on slots with numbers FN, such that $(FN \bmod (8 \cdot 52)) = 12$ for Timing Advance Index = 0 (3GPP TS 03.64 subclause 6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE_TYPE = 011111 and CTRL_ACK = 11.

Specific message contents

None.

42.7.5 Packet Assignment / TA Value/ Update of TA using PACKET POWER CONTROL/TIMING ADVANCE

42.7.5.1 Conformance requirements

The timing advance could be updated using a PACKET POWER CONTROL /TIMING ADVANCE message.

Reference

3GPP TS 04.60 subclause 7.2.2.1.

42.7.5.2 Test purpose

To verify that the mobile station is able to use the updated value received in a PACKET POWER CONTROL/TIMING ADVANCE message.

42.7.5.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data transfer. The SS responds with IMMEDIATE ASSIGNMENT message that request one phase access with Timing Advance Value field (=30bits). After contention resolution SS sends a PACKET POWER CONTROL/TIMING ADVANCE message with TA different from the assigned one. The SS verifies that MS is able to use the value received in PACKET POWER CONTROL/TIMING ADVANCE.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 440 octets data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Timing Advance Value=30. Indicating Packet UL Assignment struct. Sent on AGCH. |
| 4 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH with USF assigned to MS |
| 5 | MS->SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH. |
| 6 | SS->MS | PACKET UPLINK ACK/NACK | Sent on the PACCH with correct TLLI. |
| 7 | SS -> MS | PACKET POWER CONTROL/TIMING ADVANCE | Include a valid Timing Advance information. Sent on PACCH. Addressing MS with TFI assigned in step 3. With TA different from the previous value. (Change SS TA parameters) |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH with USF assigned to MS. |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | Sent on the PACCH with correct TLLI. Verify that MS uses the updated value sent in message of step 7. |
| 10 | SS<-> MS | Completion of macro {Uplink data transfer} | |

Specific message contents

None.

42.7.6 Packet Uplink Assignment / Timing Advance / TA Index change

42.7.6.1 Conformance requirements

If a Timing Advance Index is included in the assignment message, the mobile station shall use the continuous update timing advance mechanism, using its allocation on PTCCH (see 3GPP TS 05.10). If MS receives an other value of TAI in a PACKET POWER CONTROL /TIMING ADVANCE message, it shall use it.

Reference

3GPP TS 04.60 subclause 7.1.2.5.

3GPP TS 03.64 subclause 6.5.7.2.

42.7.6.2 Test purpose

To verify that the mobile station is able to update Timing Advance Index when received as part of PACKET POWER CONTROL /TIMING ADVANCE

42.7.6.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. SI13, ACCESS_BURST_TYPE indicates 8 bits access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Specific PICS Statements

-

PIXIT Statements

-

Test procedure

The MS is triggered to initiate uplink data packet transfer. The SS responds with IMMEDIATE ASSIGNMENT message for two phase access. The PACKET UPLINK ASSIGNMENT message contains a Timing Advance Index. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. During the Uplink data transfer, the SS shall verify that MS sends access bursts correctly in the PTCCH frames. The SS completes the contention resolution by including the TLLI of the MS in the PACKET UPLINK ACK/NACK message. Then SS sends PACKET POWER CONTROL /TIMING ADVANCE with new Timing advance index. Then SS verifies that MS uses correctly these values.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|---|
| 1 | MS | | The MS is triggered to initiate packet uplink transfer of 2000 octets data. |
| 2 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 3a | SS -> MS | IMMEDIATE ASSIGNMENT | Single block allocation. |
| 3b | MS->SS | PACKET RESOURCE REQUEST | |
| 3c | SS -> MS | PACKET UPLINK ASSIGNMENT | Including Timing Advance Index = 0, Dynamic allocation struct. |
| 4 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to MS. |
| 5 | MS->SS | UPLINK RLC DATA BLOCK | Received on the PDTCH |
| 6 | SS->MS | PACKET UPLINK ACK/NACK | USF assigned to MS. Including the TLLI of MS in the CONTENTION_RESOLUTION_TLLI field |
| 7 | MS->SS | UPLINK RLC DATA BLOCK | Received on the PDTCH |
| 8 | | | Repeat steps 6 and 7 20 times; excluding the TLLI for the contention resolution in step 6. |
| 9 | SS -> MS | PACKET POWER CONTROL/TIMING ADVANCE | Include a different Timing Advance Index (=2). Sent on PACCH 6 blocks before the MS PTCCH channel. |
| 10 | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Addressing MS with TFI assigned in step 3. USF assigned to MS. Sent after the 4 multiframe and 3 blocks of sending the message in step 9. |
| 11 | | {Uplink data transfer} | Macro. Completion of data transfer. Verification, see below. |

Verification

During the uplink data transfer in steps 3 to 8 the SS monitors the access burst on PTCCH which are located on slots with numbers FN, such that $(FN \bmod (8*52)) = 12$ for Timing Advance Index = 0 (3GPP TS 03.64/6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE_TYPE = 011111 and CTRL_ACK = 11.

During the uplink transfer in steps 9 to 11 the SS continues monitoring the access burst on PTCCH such that $(FN \bmod (8*52)) = 64$ (TAI =2).

Specific message contents

None.

42.7.7 Void

42.8 Dynamic allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168

42.8.1 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Expiry

42.8.1.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

- If timer T3168 expires, the mobile station shall retransmit the Channel Request Description information element in the next PACKET DOWNLINK ACK/NACK message unless it has been transmitted four times in which case the mobile station shall perform an abnormal release with random access. If the downlink TBF is released, including expiry of timer T3192, before expiry of timer T3168 the mobile station shall stop timer T3168 and perform an abnormal release with random access.
- Abnormal Release with Random Access: The mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF as defined in subclause 7.1.

References

3GPP TS 04.60, subclauses 8.1.2.5 and 8.7.2.

42.8.1.2 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS makes the request 4 times. Verify that if uplink resources are not assigned within T3168, the MS performs abnormal release with random access.

42.8.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to the polls.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field, and starts timer T3168.
6. When T3168 expires, MS repeats the Channel Request Description request. (This step is done 3 times, for a total of 4 Channel Request Descriptions.)
7. MS sends CHANNEL REQUEST again after returning to packet idle mode.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 1b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to assigned PDCH. (no starting time) |
| 2 | SS -> MS | RLC DATA BLOCKS | Sent on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling). |
| 3 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges the previously received RLC data blocks. |
| 4 | | | Steps 2 and 3 are repeated throughout |
| 5 | MS | | MS is triggered to begin an uplink data transfer. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | Message contains Channel Request Description IE. - MS starts timer T3168 |
| 7 | | | Steps 2 and 3 are repeated until the next Channel Request Description is sent in step 8. |
| 8 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS requests additional resources (message contains Channel Request Description IE) - Sent more than T3168 seconds after previous request for additional resources - MS re-starts timer T3168 |
| 9 | | | Steps 7 and 8 are repeated 2 more times such that a total of 4 Channel Request Descriptions are sent. |
| 10 | MS -> SS | CHANNEL REQUEST | Sent after T3168 seconds after step 8 is executed the last time. |

SYSTEM INFORMATION TYPE 13 (throughout):

| | |
|-------|--------------|
| T3168 | 1 (1 second) |
|-------|--------------|

42.8.2 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Stop with Packet Uplink Assignment

42.8.2.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure.
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall follow the procedure below. On reception of a complete uplink assignment the mobile station shall stop timer T3168.

References

3GPP TS 04.60, subclause 8.1.2.5.

42.8.2.2 Test purpose

Verify that during a downlink TBF, when the MS requests additional resources, that the MS stops timer T3168 when a PACKET UPLINK ASSIGNMENT is received.

42.8.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to the polls.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field, and starts timer T3168.
6. When T3168 expires, MS repeats the Channel Request Description request.
7. MS receives a PACKET UPLINK ASSIGNMENT message with a starting time such that more Channel Requests could be sent before the starting time.
8. MS does not repeat the Channel Request Description request.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 1b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to assigned PDCH. (no starting time) |
| 2 | SS -> MS | RLC DATA BLOCKS | Sent on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling). |
| 3 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges the previously received RLC data blocks. |
| 4 | | | Steps 2 and 3 are repeated throughout |
| 5 | MS | | MS is triggered to begin an uplink data transfer. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | Message contains Channel Request Description IE. - MS starts timer T3168 |
| 7 | | | Steps 2 and 3 are repeated until the next Channel Request Description is sent in step 8. |
| 8 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS requests additional resources (message contains Channel Request Description IE) - Sent after T3168seconds after previous request for additional resources - MS re-starts timer T3168 |
| 9 | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent (.5*T3168) seconds after step 8. Allocates one uplink timeslot (same timeslot as the downlink assignment) With valid RRBP field (polling). With starting time T3168*2 seconds from now. |
| 10 | MS -> SS | PACKET CONTROL ACK | Received according to RRBP in step 9 |
| 11 | | | Steps 2 and 3 are repeated until (1.5*T3168) seconds after step 9. Verify MS does not send additional Channel Request Description IE. |

SYSTEM INFORMATION TYPE 13 (throughout):

| | |
|-------|--------------|
| T3168 | 1 (1 second) |
|-------|--------------|

42.8.3 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Packet Access Reject/ With WAIT_INDICATION

42.8.3.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET ACCESS REJECT message containing a WAIT_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall stop timer T3168 and start timer T3172 with the indicated value (Wait Indication). The mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, but may attempt packet access in an other cell after successful cell reselection.

References

3GPP TS 04.60, subclause 8.1.2.5.

42.8.3.2 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS obeys a PACKET ACCESS REJECT message with WAIT_INDICATION by waiting the specified time before any possible subsequent attempt to request uplink resources.

42.8.3.3 Method of test

Initial Conditions

System Simulator:

1 cells, GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to each poll.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field.
6. MS receives a PACKET ACCESS REJECT message with WAIT_INDICATION.
7. MS acts on the PACKET ACCESS REJECT by waiting the indicated time.
8. MS shall not include the channel request description IE before T3172 expiry

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 1b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to assigned PDCH. (no starting time) |
| 2 | SS -> MS | RLC DATA BLOCKS | Sent on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling). |
| 3 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges the previously received RLC data blocks. |
| 4 | | | Steps 2 and 3 are repeated throughout until step 7. |
| 5 | MS | | MS is triggered to begin an uplink data transfer. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | Message contains Channel Request Description IE. - MS starts timer T3168 |
| 7 | SS -> MS | PACKET ACCESS REJECT | Sent (0.5 * T3168) seconds after step 6. - MS starts T3172 |
| 8 | SS->MS | RLC DATA BLOCK | With RRBP field valid |
| 9 | MS->SS | PACKET DOWNLINK ACK/NACK | Verify that Channel Request Description IE is not present |
| 10 | | | Repeat steps 8 and 9 until T3172 expiry. |

PACKET ACCESS REJECT message in step 8:

| | |
|----------------------|---|
| TLLI | Addressing this MS |
| WAIT_INDICATION | 2 |
| WAIT_INDICATION_SIZE | 0 – WAIT_INDICATION in units of seconds |

42.8.4 Dynamic Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Packet Access Reject/ No WAIT_INDICATION

42.8.4.1 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET ACCESS REJECT message that contains a Reject structure addressed to the mobile station, the mobile station shall stop timer T3168 and indicate a packet access failure to upper layer.

References

3GPP TS 04.60, subclause 8.1.2.5.

42.8.4.2 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS obeys a PACKET ACCESS REJECT message without WAIT_INDICATION.

42.8.4.3 Method of test

Initial Conditions

System Simulator:

GPRS supported.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field.
6. MS receives a PACKET ACCESS REJECT message without WAIT_INDICATION and with RRBP field indicating polling.
7. MS ignores the poll request.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1a | SS -> MS | IMMEDIATE ASSIGNMENT | For downlink TBF. Sent on PCH |
| 1b | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to assigned PDCH. (no starting time) |
| 2 | SS -> MS | RLC DATA BLOCKS | Sent on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling). |
| 3 | MS -> SS | PACKET DOWNLINK ACK/NACK | MS acknowledges the previously received RLC data blocks. |
| 4 | | | Steps 2 and 3 are repeated throughout until step 8. |
| 5 | MS | | MS is triggered to begin an uplink data transfer. |
| 6 | MS -> SS | PACKET DOWNLINK ACK/NACK | Message contains Channel Request Description IE. - MS starts timer T3168 |
| 7 | SS -> MS | PACKET ACCESS REJECT | Sent (0.5*T3168) seconds after step 6 (no wait time), with valid RRBP field (polling). |
| 8 | | | Verify that MS did not answer to poll in step 7 |

PACKET ACCESS REJECT message in step 8:

| | |
|------------------|---|
| RRBP | 00 – Response shall be sent by MS in N+13 frames. |
| S/P (MAC Header) | 1 – RRBP field is valid |
| WAIT_INDICATION | <not present> |

42.9 Extended Dynamic Allocation in Packet Transfer Mode

42.9.1 Default message contents

All default conditions, message contents and macros are defined in section 40, except for the messages as described in this subclause. These messages are applicable to the whole section 42.9, they shall be transmitted by the system simulator and are required to be received by the MS under test.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "Hex", or a binary value, indicated by a "Binary" is used.

PACKET DOWNLINK ASSIGNMENT message:

| | |
|------------------------------------|---|
| MESSAGE_TYPE | 000010 |
| PAGE_MODE | Normal Paging |
| {0 1<PERSISTENCE_LEVEL>} | 0 |
| - | 10 (address is TLLI) |
| - TLLI | same value as received from MS since GPRS attached |
| MAC_MODE | 0, message escape |
| RLC_MODE | Extended Dynamic Allocation |
| CONTROL_ACK | acknowledged mode |
| TIMESLOT_ALLOCATION | 0 |
| Packet Timing Advance | single slot arbitrarily chosen from valid values, default slot 2 |
| - {0 1<TIMING_ADVANCE_VALUE>} | 1 (presence of the timing advance value) |
| - TIMING_ADVANCE_VALUE | 30 bit periods |
| - {0 1<TIMING_ADVANCE_INDEX> | 0 (no timing advance index) |
| <TIMING_ADVANCE_TIMESLOT_NUMBER >} | |
| - {0 1<P0><BTS_PWR_CTRL_MODE>} | 0 |
| {0 1<Frequency Parameters>} | 0 (Frequency Parameters not present) |
| {0 1<DOWNLINK_TFI_ASSIGNMENT>} | 1 (assign downlink TFI) |
| - DOWNLINK_TFI_ASSIGNMENT | Arbitrarily chosen from valid values (default 3) |
| {0 1<Power Control Parameters>} | 1 (Power Control Parameters present) |
| - ALPHA | 0.5 |
| - {0 1<GAMMA_TN0>} | Depending on the value in TIMESLOT_ALLOCATION (default 0 no GAMMA_TN0) |
| - {0 1<GAMMA_TN1>} | Depending on the value in TIMESLOT_ALLOCATION (default 0 no GAMMA_TN1) |
| - {0 1<GAMMA_TN2>} | Depending on the value in TIMESLOT_ALLOCATION (default 1 GAMMA_TN2) |
| - GAMMA_TN2 | For GSM 700, T-GSM 810, GSM 850 and GSM 900, +8 dBm For DCS 1 800, +6 dBm For PCS 1 900, +6 dBm |
| - {0 1<GAMMA_TN3>} | Depending on the value in TIMESLOT_ALLOCATION (default 0 no GAMMA_TN0) |
| - {0 1<GAMMA_TN4>} | Depending on the value in TIMESLOT_ALLOCATION (default 0 no GAMMA_TN4) |
| - {0 1<GAMMA_TN5>} | Depending on the value in TIMESLOT_ALLOCATION (default 0 no GAMMA_TN5) |
| - {0 1<GAMMA_TN6>} | Depending on the value in TIMESLOT_ALLOCATION (default 0 no GAMMA_TN6) |
| - {0 1<GAMMA_TN7>} | Depending on the value in TIMESLOT_ALLOCATION (default 0 no GAMMA_TN7) |
| {0 1<TBF_STARTING_TIME>} | 1 (starting time present) |
| - TBF_STARTING_TIME | 0, absolute frame number encoding, indicating (current frame + 13 frames) |
| {0 1<Measurement Mapping>} | 0 (no measurement mapping) |
| spare padding | Spare Padding |

PACKET TIMESLOT RECONFIGURE message (dynamic allocation without assigning a new TBF):

| | |
|--|--|
| MESSAGE_TYPE | 000111 |
| PAGE_MODE | Normal Paging |
| 0<GLOBAL_TFI> | 0 The TFI value of the uplink TBF or downlink TBF which this message applies to (default 00101) |
| CHANNEL_CODING_COMMAND | 0, message escape arbitrarily chosen from valid values (default CS-1) |
| Global Packet Timing Advance | |
| - {0 1<TIMING_ADVANCE_VALUE>} | 1 (timing advance value present) |
| - TIMING_ADVANCE_VALUE | 30 bit periods |
| - {0 1<UPLINK_TIMING_ADVANCE_INDEX> | 0 (no uplink timing advance index) |
| <UPLINK_TIMING_ADVANCE_TIMESLOT_NUMBER>} | The MS stops the operation of the continuous timing advance procedure. |
| - {0 1<DOWNLINK_TIMING_ADVANCE_INDEX> | 0 (no downlink timing advance index) |
| <DOWNLINK_TIMING_ADVANCE_TIMESLOT_NUMBER>} | The MS stops the operation of the continuous timing advance procedure. |
| DOWNLINK_RLC_MODE | Same as in the Test PDP context used |
| CONTROL_ACK | 0 |
| {0 1<DOWNLINK_TFI_ASSIGNMENT> | 0 |
| {0 1<UPLINK_TFI_ASSIGNMENT> | 0 |

1. For re-assignment of an uplink TBF, the address information should be changed to UPLINK_TFI of Global_TFI. UPLINK_TFI_ASSIGNMENT is absent.

2. For assignment of an uplink TBF while a downlink TBF has been established, the address information should be changed to DOWNLINK_TFI of Global_TFI. UPLINK_TFI_ASSIGNMENT is present.

42.9.2 Extended Dynamic Allocation / Uplink Transfer

42.9.2.1 Extended Dynamic Allocation / Uplink Transfer / Normal

42.9.2.1.1 Extended Dynamic Allocation / Uplink Transfer / Normal / Successful

42.9.2.1.1.1 Conformance requirements

The mobile station shall monitor the downlink PDCHs corresponding to (i.e. with the same timeslot number as) its assigned uplink PDCHs starting with the lowest numbered PDCH, then the next lowest numbered PDCH, etc., up to the one corresponding to the highest numbered assigned uplink PDCH.

Whenever the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH and all higher numbered assigned PDCHs. The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 45.002. The number of RLC/MAC blocks to transmit on each PDCH is controlled by the USF_GRANULARITY parameter characterising the uplink TBF. The mobile station shall ignore the USF on those higher numbered PDCHs during the block period where the assigned USF value is detected.

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. Up to 4 timeslots are assigned, according to the mobile multislot class (TS 5.02 Annex B.1).

1) The SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDTCH. It is checked that the MS sends RLC/MAC data blocks in the next radio block period on all assigned PDTCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USF addressing the MS. The check is repeated.

The same procedure is going on until the MS completes the packet data transfer.

2) The SS signals to the MS the assigned USF addressing the MS on the highest assigned PDTCH. It is checked that the MS sends RLC/MAC data blocks in the next radio block period only on the highest assigned PDTCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USF addressing the MS. The check is repeated.

The same procedure is going on until the MS completes the packet data transfer.

Maximum Duration of Test

5 minutes.

42.9.2.1.2 Extended Dynamic Allocation / Uplink Transfer / Normal / USF_GRANULARITY = 4 blocks

42.9.2.1.2.1 Conformance requirements

The number of RLC/MAC blocks to transmit on each PDCH is controlled by the USF_GRANULARITY parameter characterising the uplink TBF. The mobile station shall ignore the USF on those higher numbered PDCHs during the block period where the assigned USF value is detected. In addition, if USF_GRANULARITY is set to four blocks allocation, it may ignore the USF on all other PDCHs during the first three block periods in which the mobile station has been granted permission to transmit. As specified in 3GPP TS 45.002, the USF corresponding to the last three blocks of a four blocks allocation shall be set to an unused value for each PDCH on which the mobile station has been granted permission to transmit.

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. 2 uplink timeslots are assigned.

- 1) The SS signals the assigned USF addressing the MS on the lowest assigned PDCH. It is checked that the MS sends RLC/MAC data blocks in the next 4 radio block periods on all assigned PDCHs and that each data block contains the correct TFI without TLLI.
- 2) The SS acknowledges the received data and assigns the USF addressing the MS. It is checked that the MS sends RLC/MAC data blocks in the next 4 radio block periods on all assigned PDCHs, except for the block allocated via the polling mechanism it is checked that the MS sends PACKET CONTROL ACKNOWLEDGEMENT.
- 3) In the last block period of the above procedure, the SS signals the assigned USF addressing the MS on the lowest assigned PDCH. It is checked that the MS sends RLC/MAC data blocks in the next 4 radio block periods on all assigned PDCH and that each data block contains the correct TFI without TLLI.
- 4) The same procedure is going on until the MS completes the packet data transfer.

Maximum Duration of Test

5 minutes.

42.9.2.1.3 Extended Dynamic Allocation / Uplink Transfer / Normal / Allocation via polling mechanism

42.9.2.1.3.1 Conformance requirements

During the block period where an uplink radio block is allocated on a PDCH via the polling mechanism (see sub-clause 10.4.4), the mobile station shall monitor for the assigned USF on the downlink PDCHs corresponding to its assigned uplink PDCHs starting with the lowest numbered assigned PDCH up to the highest numbered PDCH which is feasible when taking into account the PDCH's allocated for transmission in the block period and the switching requirements of the mobile station multislot class (see 3GPP TS 45.002)

The mobile station shall either transmit the uplink radio block on the same timeslot as the block where the RRBP was received or, if an UPLINK_CONTROL_TIMESLOT is assigned to the mobile station, the mobile station shall transmit the uplink radio block on this UPLINK_CONTROL_TIMESLOT. After receiving an RLC/MAC block containing a valid RRBP field the mobile station need not monitor the USF in the associated downlink RLC/MAC block appearing just before the uplink block it shall transmit. However, when Extended Dynamic Allocation or Shifted USF operation is used, corresponding USF monitoring procedure shall apply as described in sub-clause 8.1.1.2.1 and sub-clause 8.1.1.2.4 respectively.

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. Up to 3 timeslots are assigned, according to the mobile multi-slot class (3GPP TS 45.002 Annex B.1).

1) The SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDCH. It is checked that the MS sends the RLC/MAC data blocks in the next radio block period on all assigned PDCHs and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data with PACKET UPLINK ACK/NACK message with polling.

2) On the block before the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDCH.

On the same block as the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the lowest assigned PDCH.

It is checked that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT on the lowest assigned PDCH and RLC/MAC data blocks on all other assigned PDCH and that each data block contains the correct TFI without TLLI.

It is checked that the MS sends RLC/MAC data blocks on the next radio block period on all assigned PDCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data with PACKET UPLINK ACK/NACK message with polling.

3) On the same block as the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the second assigned PDCH. It is checked that the MS sends PACKET

CONTROL ACKNOWLEDGEMENT on the lowest assigned PDCH and in the next block period the MS sends RLC/MAC data blocks on all assigned PDCHs except the first assigned PDCH and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data with PACKET UPLINK ACK/NACK message with polling.

4) This sequence is applicable only for MS multislot classes class 7, 11, 12, 20 to 23, 25 to 29, 33, 34, 38, 39.

On the same block as the transmission of PACKET CONTROL ACKNOWLEDGEMENT the SS signals to the MS the assigned USF addressing the MS on the third assigned PDCH. It is checked that the MS sends PACKET CONTROL ACKNOWLEDGEMENT on the lowest assigned PDCH and no RLC/MAC data blocks are sent.

5) Successfully complete the packet data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

42.9.2.1.4 Extended Dynamic Allocation / Uplink Transfer / Normal / PACCH operation in downlink

42.9.2.1.4.1 Conformance requirements

The mobile station shall attempt to decode every downlink RLC/MAC block on the lowest numbered timeslot in the PDCH allocation. Whenever the mobile station receives a RLC/MAC block containing a RLC/MAC control block, the mobile station shall attempt to interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message.

The network shall transmit all PACCH messages on the PDCH carried on the lowest numbered timeslot in the allocation. Additionally for the concurrent TBF case, the network may transmit PACCH messages on any of the common timeslots assigned to the downlink and uplink PDCH allocation.

Whenever the mobile station detects an assigned USF value on any assigned PDCH, the mobile station may transmit a PACCH block on the same PDCH in the next block period. The mobile station shall not transmit a RLC data block in any uplink radio block allocated via the polling mechanism.

References

3GPP TS 44.060, subclause 8.1.1.2.2.

42.9.2.1.4.2 Test purposes

To verify that a MS having an uplink GPRS TBF with Extended Dynamic Allocation MAC mode:

1. Decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the lowest numbered timeslot in the PDCH allocation when there is no concurrent downlink TBF.
2. Decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the lowest numbered timeslot in the PDCH allocation or on any of the common timeslots assigned to the downlink and uplink PDCH allocation when there is a concurrent downlink TBF.
3. Does not transmit a RLC data block in any uplink radio block allocated via the polling mechanism.

42.9.2.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate a packet uplink data transfer in RLC acknowledged mode and with Extended Dynamic Allocation MAC mode. The SS orders the MS to use two-phase access procedure.

1) At this point in time the MS has an uplink GPRS TBF established with Extended Dynamic Allocation MAC mode. It may receive RLC/MAC blocks containing RLC/MAC control blocks for the uplink TBF on the PDCH carried on the lowest numbered timeslot in the allocation.

To test that the MS decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the lowest numbered timeslot in the PDCH allocation when there is no concurrent downlink TBF the SS process as follow:

- The SS sends on the lowest numbered timeslot in the PDCH allocation a PACKET DOWNLINK ASSIGNMENT message to establish a concurrent downlink GPRS TBF with the Extended Dynamic Allocation MAC mode. The SS checks that the MS sends in response a PACKET CONTROL ACKNOWLEDGEMENT message on the lowest numbered timeslot in the PDCH allocation.

2) At this point in time the MS has an uplink TBF and a downlink GPRS TBF established with Extended Dynamic Allocation MAC mode. It may receive RLC/MAC blocks containing RLC/MAC control blocks for the uplink GPRS TBF on the PDCH carried on the lowest numbered timeslot in the uplink PDCH allocation or on any of the common timeslots assigned to the downlink and uplink PDCH allocation.

To test, in case there is a concurrent downlink GPRS TBF, that the MS decodes and interprets correctly all RLC/MAC blocks containing RLC/MAC control blocks sent by the network on the PDCH carried on the lowest numbered timeslot in the uplink PDCH allocation or on any of the common timeslots assigned to the downlink and uplink PDCH allocation, the SS process as follow:

- The MS is triggered to transfer 64+1 (window size +1) GPRS RLC data blocks without acknowledgement from SS in such a way that the window is stalled.
- The SS sends on the PDCH carried on the lowest numbered timeslot in the uplink PDCH allocation a PACKET UPLINK ACK/NACK message acknowledging only the oldest GPRS RLC data block. Then the MS is triggered to transfer one GPRS RLC data block. If the MS has correctly decoded the PACKET UPLINK ACK/NACK message, the BSN of the GPRS RLC data block shall be the next in sequence expected BSN.
- The SS sends on one of the common timeslots assigned to the downlink and uplink PDCH allocation a PACKET UPLINK ACK/NACK message acknowledging only the oldest GPRS RLC data block. Then the MS is triggered to transfer one GPRS RLC data block. If the MS has correctly decoded the PACKET UPLINK ACK/NACK message, the BSN of the GPRS RLC data block shall be the next in sequence expected BSN. The test is repeated with all PDCHs common for both reception and transmission.

3) To test that the MS does not transmit a GPRS RLC data block in any uplink radio block allocated via the polling mechanism the SS process as follow:

- The SS sends on one of the common timeslots assigned to the downlink and uplink PDCH allocation a PACKET UPLINK ACK/NACK message containing the TFI value assigned to the uplink TBF and a valid RRBP. On the block period preceding the block period where the polling response to the PACKET UPLINK ACK/NACK message should be received, the SS assigns an USF to the MS on the lowest numbered timeslot of the uplink PDCH allocation. The SS checks that during the block period where the polling response should be received, the MS responds to the polling with a PACKET CONTROL ACKNOWLEDGEMENT message sent on the PDCH where the polling request was sent and sends RLC data blocks on the other PDCHs of the uplink PDCH allocation. The test is repeated with all PDCHs common for both reception and transmission.

Then the data transfer is completed.

The following table gives the number of timeslots allocated for the uplink and downlink TBFs during the test according to the multislot class (see 45.002 annex B.1):

| Multislot class | Number of PDCHs for the downlink TBF | Number of PDCHs for the uplink TBF |
|-----------------|--------------------------------------|------------------------------------|
| 3 | 1 | 2 |
| 5 | 2 | 2 |
| 6 | 2 | 2 |
| 7 | 2 | 2 |
| 9 | 3 | 2 |
| 10 | 3 | 2 |
| 11 | 3 | 2 |
| 12 | 3 | 2 |
| 13 | 3 | 3 |
| 14 | 4 | 4 |
| 15 | 5 | 5 |
| 16 | 6 | 6 |
| 17 | 7 | 7 |
| 18 | 8 | 8 |
| 19 | 6 | 2 |
| 20 | 6 | 3 |
| 21 | 6 | 4 |
| 22 | 6 | 4 |
| 23 | 6 | 6 |
| 24 | 8 | 2 |
| 25 | 8 | 3 |
| 26 | 8 | 4 |
| 27 | 8 | 4 |
| 28 | 8 | 6 |
| 29 | 8 | 8 |
| 31 | 4 | 2 |
| 32 | 3 | 3 |
| 33 | 3 | 3 |
| 34 | 3 | 3 |
| 36 | 4 | 2 |
| 37 | 3 | 3 |
| 38 | 3 | 3 |
| 39 | 3 | 3 |
| 41 | 5 | 2 |
| 42 | 4 | 3 |
| 43 | 4 | 3 |
| 44 | 4 | 3 |
| 45 | 4 | 3 |

NOTE: The multislot class of the MS under test may impose that the highest PDCH of the uplink allocation is not a member of the downlink allocation. In this case the SS shall transmit a downlink RLC data block on a PDCH common to the downlink and uplink PDCH allocation at least every 5 seconds to avoid expiry of timer T3190.

Maximum Duration of Test

1 minute.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | | {Uplink dynamic allocation two phase access} | Default PACKET UPLINK ASSIGNMENT message content for EDA defined in sub-clause 42.9.1 shall be used. n = 1500 octets, without starting time, |
| 2 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Default PACKET DOWNLINK ASSIGNMENT message content for EDA defined in sub-clause 42.9.1 shall be used. Sent on the PACCH of the lowest PDCH of the uplink PDCH allocation. Including the Polling bit set and a valid RRBP field. Including the TFI assigned to the uplink TBF. |
| 3 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on the PACCH of the lowest PDCH of the uplink PDCH allocation. |
| 4 | SS | | The SS verifies that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT message, on the uplink radio block specified by the RRBP of the lowest PDCH of the uplink PDCH allocation. |
| 5 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP. |
| 6 | MS -> SS | UPLINK GPRS RLC DATA BLOCK | Received on the highest PDCH of the uplink PDCH allocation. SI=0 |
| 7 | | | Repeat steps 5 and 6 for BSN=1 to 63. SS doesn't acknowledge any of the GPRS RLC data blocks with BSN from 0 to 63 (see note below). |
| 8 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP. |
| 9 | MS -> SS | UPLINK GPRS RLC DATA BLOCK | Received on the highest PDCH of the uplink PDCH allocation. SI=1 |
| 10 | SS->MS | PACKET UPLINK ACK/NACK | SS acknowledges the oldest GPRS RLC data block. Sent on the PACCH of the lowest PDCH of the uplink PDCH allocation. Including the TFI assigned to the uplink TBF. Including a USF not assigned to the MS on this PDCH. Wait for 6 blocks with no assigned USF |
| 11 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP. |
| 12 | MS -> SS | UPLINK GPRS RLC DATA BLOCK | Received on the highest PDCH of the uplink PDCH allocation. |
| 13 | SS | | The steps 11 and 12 are repeated k times <=8 until V(R) has been incremented by one (i.e. the MS has correctly understood the PACKET UPLINK ACK/NACK). |
| 14 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP. |
| 15 | MS -> SS | UPLINK GPRS RLC DATA BLOCK | Received on the highest PDCH of the uplink PDCH allocation. |
| 16 | | | The steps 14 and 15 are repeated until a RLC DATA BLOCK with SI=1 is received (see note below). |

| | | | |
|----|----------|---|--|
| 17 | SS->MS | PACKET UPLINK ACK/NACK | SS acknowledges the oldest GPRS RLC data block. Sent on a PDCH common to the downlink and uplink PDCH allocation. Including the TFI of the uplink TBF. Including an USF not assigned to the MS on this PDCH. Wait for 6 blocks with no assigned USF |
| 18 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on this PDCH. Including an invalid RRBP. |
| 19 | MS -> SS | UPLINK GPRS RLC DATA BLOCK | Received on the highest PDCH of the uplink PDCH allocation. |
| 20 | SS | | The steps 18 and 19 are repeated k times ≤ 8 until V(R) has been incremented by one (i.e. the MS has correctly understood the PACKET UPLINK ACK/NACK). |
| 21 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on the highest PDCH of the uplink PDCH allocation. Including the USF assigned to the MS on the highest PDCH of the uplink PDCH allocation. Including an invalid RRBP. |
| 22 | MS -> SS | UPLINK GPRS RLC DATA BLOCK | Received on the highest PDCH of the uplink PDCH allocation. |
| 23 | | | The steps 21 and 22 are repeated until a RLC DATA BLOCK with SI=1 is received (see note below). |
| 24 | | | The steps 17, 18, 19, 20, 21, 22 and 23 are repeated for each PDCH common to the downlink and uplink PDCH allocation. |
| 25 | SS->MS | PACKET UPLINK ACK/NACK | SS acknowledges all RLC data block. Sent on a PDCH common to the downlink and uplink PDCH allocation. Including the Polling bit set and a valid RRBP field Including the TFI assigned to the uplink TBF. |
| 26 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on the lowest PDCH of the uplink PDCH allocation on the block period preceding the response to the polling requested in step 25. Including the USF assigned to the MS on this PDCH. |
| 27 | MS -> SS | UPLINK GPRS RLC/MAC BLOCK | Received during the block period where the polling response should be sent. An UPLINK RLC CONTROL BLOCK should be received on the PDCH where the MS is polled or an UPLINK RLC DATA BLOCK should be received on the other PDCHs. |
| 28 | | | The step 27 is repeated a number of times equal to the number of PDCHs of the uplink PDCH allocation to get all RLC/MAC BLOCK sent by the MS. |
| 29 | SS | | Verify that the MS did not transmit a RLC data block on the reserved uplink radio block specified by the RRBP on the PDCH where it has been polled. A PACKET CONTROL ACKNOWLEDGEMENT shall be transmitted instead. Verify that the MS has transmitted RLC data blocks on the other PDCHs. |
| 30 | | | The steps 25, 26, 27, 28 and 29 are repeated for each PDCH common to the downlink and uplink PDCH allocation. |
| 31 | SS -> MS | DOWNLINK GPRS RLC DATA BLOCK | Sent on a PDCH common to the downlink and uplink PDCH allocation. Including a valid RRBP and FBI = 1. Including an USF not assigned to the MS on this PDCH. |
| 32 | MS -> SS | PACKET DOWNLINK ACK/NACK | |
| 33 | | {Completion of uplink RLC data block transfer in extended dynamic mode} | |

NOTE: If the multislot class of the MS under test imposes that the highest PDCH of the uplink allocation is not a member of the downlink allocation, the SS shall transmit a downlink RLC data block on a PDCH common to the downlink and uplink PDCH allocation at least every 5 seconds to avoid expiry of timer T3190. The RLC data block shall be transmitted including an invalid RRBP and an USF not assigned to the MS on this PDCH.

42.9.2.1.5 Extended Dynamic Allocation / Uplink Transfer / Normal / Polling for PDAN

42.9.2.1.5.1 Conformance requirements

In case of simultaneous uplink and downlink TBFs and extended dynamic allocation, the network may apply polling in downlink RLC data blocks only when sent on a PDCH common for both reception and transmission. A mobile station operating with extended dynamic allocation need to respond to polling in downlink RLC data blocks only when received on a PDCH common for both reception and transmission.

References

3GPP TS 44.060, subclause 8.1.2.2.

42.9.2.1.5.2 Test purposes

To verify, in case the MS has a simultaneous uplink and downlink GPRS TBF with Extended Dynamic Allocation MAC mode, that the MS responds to polling when it is polled on blocks belonging to PDCHs common for both reception and transmission.

42.9.2.1.5.3 Method of test

Initial Conditions

Test Procedure

The MS is triggered to initiate a packet uplink data transfer in RLC acknowledged mode and with Extended Dynamic Allocation MAC mode. The SS orders the MS to use two-phase access procedure. Then a concurrent downlink GPRS TBF is established. The PDCH allocation for the downlink and uplink TBFs is chosen to maximise the number of PDCHs common for both reception and transmission.

The SS sends on a PDCH common for both reception and transmission a GPRS RLC data block with polling and checks that the MS responds with a PACKET DOWNLINK ACK/NACK acknowledging the GPRS RLC data block in the uplink radio block specified by RRBP. The test is repeated on all PDCHs common for both reception and transmission.

The following table gives the number of timeslots allocated for the uplink and downlink TBFs during the test according to the multislot class (see 45.002 annex B.1):

| Multislot class | Number of PDCHs for the downlink TBF | Number of PDCHs for the uplink TBF |
|-----------------|--------------------------------------|------------------------------------|
| 3 | 1 | 2 |
| 5 | 2 | 2 |
| 6 | 2 | 2 |
| 7 | 2 | 2 |
| 9 | 3 | 2 |

42.9.2.2 Extended Dynamic Allocation / Uplink Transfer / Configuration Change

42.9.2.2.1 Extended Dynamic Allocation / Uplink Transfer / configuration change / Changes in the Allocation from Dynamic to Extended Dynamic.

42.9.2.2.1.1 Conformance requirements

When the mobile station receives an uplink assignment (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE) that does not contain a TBF starting time, the mobile station shall begin monitoring the assigned PDCHs for the assigned USF value for each assigned PDCH within the reaction time defined in 3GPP TS 45.010. If a TBF starting time information element is present and no uplink TBFs are in progress, but one or more downlink TBFs are in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs and using the newly assigned uplink TBF parameters. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs. If a TBF starting time information element is present and one or more uplink TBFs are already in progress, the mobile station shall continue to use the assigned parameters of the ongoing uplink TBFs until the TDMA frame number indicated by the TBF starting time occurs, at which time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters. The mobile station shall continue to use the newly assigned parameters of each uplink TBF until the TBF is either released or reconfigured. If while waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

42.9.2.2.1.2 Test purposes

To verify that the MS while on Uplink TBF in Dynamic Allocation mode receives a PACKET UPLINK ASSIGNMENT giving an extended Dynamic Allocation mode continues the TBF in Extended Dynamic Allocation.

42.9.2.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default settings.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context 2 activated.

Specific PICS Statements

- The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. In PACKET UPLINK ASSIGNMENT SS assigns a dynamic allocation TBF. Up to 2 timeslots are assigned, according to the mobile multislot class (TS 5.02 Annex B.1).

After receiving some data SS reconfigures the TBF to an Extended Dynamic allocation TBF giving up to 4 timeslots according to the mobile multislot class (TS 5.02 Annex B.1), giving PACKET UPLINK ASSIGNMENT. SS checks that MS has started using the TBF in Extended Dynamic allocation mode by giving the USFs only on the lower numbered PDCH and receiving the data on all the higher numbered PDCH.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | N = 1500 octets, without starting time, Assigning the TBF in dynamic mode. <u>Up to 2 timeslots are assigned according to MS multislot class (TS 05.02 Annex B.1):</u> - USF ₁ on TN ₁ , - USF ₂ on TN ₂ , |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF ₁ on PACCH ₁ addressing the MS sent on 3 blocks from the last radio block containing the uplink assignment. |
| 3 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | This step is optional; it is performed only if 2 timeslots have been assigned in step 1. Assigned USF ₂ on PACCH ₂ addressing the MS sent on the same TDMA frame as step 2. |
| 4 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH ₁ . |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | This step is optional; it is performed only if 2 timeslots have been assigned in step 1. Received on the assigned PDTCH ₂ on the same TDMA frame as in step 4. |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | Assigned USF ₁ on PACCH ₁ addressing the MS. |

42.9.2.2.4 Extended Dynamic Allocation / Uplink Transfer / configuration change / Reduction in number of uplink slots using PACKET PDCH RELEASE.

42.9.2.2.4.1 Conformance requirements

When the mobile station receives an uplink assignment (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE) that does not contain a TBF starting time, the mobile station shall begin monitoring the assigned PDCHs for the assigned USF value for each assigned PDCH within the reaction time defined in 3GPP TS 45.010. If a TBF starting time information element is present and no uplink TBFs are in progress, but one or more downlink TBFs

are in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs and using the newly assigned uplink TBF parameters. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs. If a TBF starting time information element is present and one or more uplink TBFs are already in progress, the mobile station shall continue to use the assigned parameters of the ongoing uplink TBFs until the TDMA frame number indicated by the TBF starting time occurs, at which time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters. The mobile station shall continue to use the newly assigned parameters of each uplink TBF until the TBF is either released or reconfigured. If while waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. In PACKET UPLINK ASSIGNMENT SS assigns a extended dynamic allocation TBF. Up to 4 timeslots are assigned, according to the mobile multislot class (TS 5.02 Annex B.1).

After receiving some data, SS reconfigures the TBF to have one slot less than given earlier, giving PACKET PDCH RELEASE. SS checks that MS using the new timeslot configuration properly.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| 1 | | {Uplink dynamic allocation two phase access} | N = 1500 octets, without starting time, Assigning the TBF in extended dynamic mode. Up to 4 timeslots are assigned according to MS multislot class (TS 05.02 Annex B.1) : - USF ₁ on TN ₁ , - USF ₂ on TN ₂ , - USF ₃ on TN ₃ , - USF ₄ on TN ₄ , |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Assigned USF ₁ on PACCH ₁ addressing the MS. Sent on third block from the last radio block containing the uplink assignment. |

42.9.2.2.5 Extended Dynamic Allocation / Uplink Transfer / configuration change / Increase in number of uplink slots.

42.9.2.2.5.1 Conformance requirements

When the mobile station receives an uplink assignment (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE) that does not contain a TBF starting time, the mobile station shall begin monitoring the assigned PDCHs for the assigned USF value for each assigned PDCH within the reaction time defined in 3GPP TS 45.010. If a TBF starting time information element is present and no uplink TBFs are in progress, but one or more downlink TBFs are in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs and using the newly assigned uplink TBF parameters. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs. If a TBF starting time information element is present and one or more uplink TBFs are already in progress, the mobile station shall continue to use the assigned parameters of the ongoing uplink TBFs until the TDMA frame number indicated by the TBF starting time occurs, at which time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters. The mobile station shall continue to use the newly assigned parameters of each uplink TBF until the TBF is either released or reconfigured. If while waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

Test Procedure

The MS is triggered to initiate packet uplink transfer in RLC acknowledged mode, and with Extended Dynamic Allocation MAC mode. The SS orders the MS to use two-phase access procedure. The maximum number of UL timeslots is assigned, according to the mobile multislot class (TS 45.002 Annex B.1).

For one block period, the SS allocates blocks on all but the two lowest-numbered assigned PDCHs, by signalling to the MS the USF assigned to the third PDCH using the third PDCH. It is checked that the MS sends RLC data blocks on all but the two lowest-numbered assigned PDCHs.

For the next block period, the SS increases the number of PDCHs allocated to the MS, and allocates blocks on all but the lowest PDCH, by signalling to the MS the USF assigned to the second PDCH using the second PDCH. It is checked that the MS sends RLC data blocks on all but the lowest-numbered assigned PDCH.

For the next block period, the SS increases the number of PDCHs again, and allocates blocks on all assigned PDCHs, by signalling to the MS the USF assigned to the first PDCH, but using the second PDCH. It is checked that the MS sends RLC data blocks on all PDCHs.

The MS completes the packet data transfer.

Maximum Duration of Test

5 minutes.

Expected Sequence

42.9.3.1.3 Extended Dynamic Allocation / Shifted USF / Normal / Release of 2nd PDCH

42.9.3.1.3.1 Conformance requirements

(1) If a PACKET PDCH RELEASE message releases the second PDCH in the current timeslot configuration of a mobile station using Shifted USF operation then the first timeslot shall be considered released. If any PDCHs remain in the new timeslot configuration then normal USF operation shall continue starting on the lowest available timeslot.

(2) If the current timeslot configuration requires Shifted USF operation (see sub-clause 8.1.1.2.4) and the PACKET PDCH RELEASE message modifies the configuration in such a way that Shifted USF operation is no longer required then normal USF operation shall apply after a suitable reaction time as defined in 3GPP TS 45.010.

(3) Upon a receipt of a commanding message or indication from the network requiring an action by the mobile station, if the reaction time for such action is not specified elsewhere, the mobile station shall begin to perform the required action no later than the next occurrence of block B((x+6) mod 12), where block B(x) is the radio block containing the commanding message or indication from the network.

Test Procedure

The MS is triggered to initiate packet uplink transfer in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure. The maximum number of UL timeslots is assigned, according to the mobile multislot class (TS 45.002 Annex B.1).

The SS signals to the MS the USF assigned to the lowest PDTCH on the second PDCH, and, in the next block period, it is checked that the MS sends RLC/MAC data blocks on all assigned PDTCH.

The SS sends a PACKET PDCH RELEASE message with TIMESLOTS_AVAILABLE indicating that the second lowest assigned PDCH timeslots is not available for packet data. For that block period, and the next five block periods, the SS continues signals to the MS the USF assigned to the lowest PDTCH on the second PDCH, and also the USF assigned to the third PDTCH on the corresponding PACCH.

On the sixth block period following the PACKET PDCH RELEASE message, it is checked that the MS has stopped transmitting on the two lowest timeslots, but continues to transmit on the remaining timeslots.

The SS completes the data transfer using the remaining timeslots.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | {Uplink dynamic allocation two phase access} | n = 2000 octets, without starting time, Up to 6 consecutive timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1): - USF ₁ on TN ₁ , - USF ₂ on TN ₂ , (USF ₂ ≠ USF ₁) - up to ... - USF _N on TN _N , where N = 5 or 6. |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | Sent on the PACCH of PDCH ₁ to PDCH _N , 3 blocks on from the last radio block containing the uplink assignment; the USF values are: PACCH ₁ - USF is not addressing the MS. PACCH ₂ - assigned USF ₁ is addressing the MS. PACCH ₃ - USF is not addressing the MS. up to ... PACCH _N - USF is not addressing the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCKS | Received on all assigned PDTCH ₁ to PDTCH _N |
| 4 | SS -> MS | PACKET PDCH RELEASE | Sent on the PACCH of PDCH ₂ on the same block period as step 3; the assigned USF ₁ is addressing the MS. |
| 5 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCKS | Sent on the PACCH of PDCH ₁ and PDCH ₃ to PDCH _N , on the same block period as step 3; the USF values are: PACCH ₁ - USF is not addressing the MS. | - TIMESLOTS_AVAILABLE | Indicating that TN ₁ and TN ₃ to TN _N are available for GPRS. TN ₂ is not available. |

43 RLC Test Cases

Default conditions and messages

The default conditions, message contents and macros not specified in this subclause must be set as in clause 40.

Initial conditions

Unless otherwise indicated, the initial conditions for all acknowledged mode tests, as a minimum, are as follows. Other initial conditions may apply. In the event of conflict between initial conditions stated here and those stated in a test case, the test case shall take precedence.

- The MS is GPRS attached.
- A PDP context has been established with RLC acknowledged mode operation.

43.1 Acknowledged Mode

43.1.1 Acknowledged mode / Uplink TBF

43.1.1.1 Acknowledged mode / Uplink TBF / Send state variable V(S)

43.1.1.1.1 Conformance requirements

1. The send state variable, V(S), can take on the values 0 through 127. Each RLC data block contains a block sequence number (BSN) field that is 7 bits in length. At the time that an in-sequence RLC data block is designated for transmission, the value of BSN is set equal to the value of the send state variable.
2. V(S) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(S) shall be incremented by 1 after transmission of the RLC data block with BSN = V(S).

References

3GPP TS 04.60, subclause 9.1.1.

43.1.1.1.2 Test purpose

1. To verify that the mobile station sets the V(S) to 0 at the beginning of each TBF.
2. To verify that the mobile station increases the V(S) by 1 after transmission of the RLC data block with BSN set to V(S).
3. To verify that the mobile station wraps the V(S) to 0 after 127.

43.1.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is made to send RLC data blocks. SS checks that the BSN in the RLC data block:

1. is set to the value 0 at the beginning of each TBF in which the mobile station is the transmitter;
2. is incremented by 1 in each subsequent RLC data block in the TBF; and
3. takes on all values in the range 0 to 127 and then back to 0.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|--|
| 1 | | { Uplink dynamic allocation two phase access} | n = 3500 octets, USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SS verifies that the BSN starts from 0. |
| 4 | SS -> MS | PACKET UPLINK ACK/NACK | SS acknowledges each RLC data block, RBB set to 1, containing USF assigned to the MS |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SS verifies that the BSN is updated according to $BSN(n) = (BSN(n-1) + 1) \bmod 128$ |
| 6 | - | Steps 4 & 5 are repeated at least 128 times | The PACCH of the PDCH assigned in step 2, containing USF assigned to the MS. |
| 7 | | { Completion of uplink RLC data block transfer} | |

43.1.1.2 Acknowledged mode / Uplink TBF / Transmit window size

43.1.1.2.1 Conformance requirements

1. $V(S)$ shall not exceed $V(A)$ modulo 128 by more than the maximum allowed number of outstanding RLC data blocks k (window size k is defined in 3GPP TS 04.60 subclause 9.1.9).
2. If $V(S) = V(A) + k$ modulo 128 (i.e., the transmit window is stalled), the mobile station shall set the stall indicator to 1 in each RLC data block transmitted and transmit the oldest RLC data block whose corresponding element in $V(B)$ has the value PENDING_ACK, then the next oldest RLC data block whose corresponding element in $V(B)$ has the value PENDING_ACK, etc.

References

3GPP TS 04.60, subclauses 9.1.1, 9.1.3 and 9.1.9.

43.1.1.2.2 Test purpose

1. To verify that the mobile station sets the stall indicator to 1 in each RLC data block transmitted once the transmit window is stalled.
2. To verify that the mobile station retransmits data blocks that are pending acknowledgment.
3. To verify that the mobile station retransmits unacknowledged RLC data blocks in correct order while the transmit window is stalled.

43.1.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS transmits k (window size) blocks without acknowledgement from SS. Confirm that the MS:

- a) sets the stall indicator bit once the window is stalled; and
- b) retransmits blocks that are pending acknowledgement, oldest first.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------------|-----------|---|--|
| 1 | | { Uplink dynamic allocation two phase access} | n = 1500 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, containing USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SI=0 |
| 4 | | | Repeat steps 2 and 3 for BSN=1 to 63. SS doesn't acknowledge any of the data blocks with BSN from 0 to 63 |
| 5 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SI=1 |
| 7 | | | Repeat steps 5 & 6 for BSN = 1 to 63 until all unacknowledged blocks are retransmitted. SS verifies that the unacknowledged data blocks are retransmitted with SI field set to 1. SS verifies that in the retransmitted blocks the BSN is from 0 to 63 |
| 8 | SS->MS | Packet Uplink Ack/Nack | SS acknowledges all the data blocks USF not assigned to the MS |
| 9 | | | Wait for 6 blocks with no assigned USF |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| A11 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH, BSN = 0 Repeat step 10 |
| 11 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |
| 12 | SS | | Verify that MS is not retransmitting any acknowledged blocks Verify transmitted data blocks are BSNs 64 and higher |
| 13 | | { Completion of uplink RLC data block transfer} | |

43.1.1.3 Acknowledged mode / Uplink TBF / Acknowledge state variable V(A)

43.1.1.3.1 Conformance requirements

1. The Acknowledge state variable V(A) contains the BSN value of the oldest RLC data block that has not been positively acknowledged by its peer. V(A) can take on the values 0 through 127.
2. V(A) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(A) shall be updated from the values received from its peer in the received block bitmap (RBB) of the Packet Ack/Nack message (see subclause 9.1.8).

References

3GPP TS 04.60, subclauses 9.1.2 and 9.1.8.

43.1.1.3.2 Test purpose

1. To verify that the mobile station correctly decodes the RBB and updates the values of V(A).

43.1.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

1. The mobile station transmits k (window size) blocks without acknowledgement from SS. SS then acknowledges the first N blocks. The MS retransmits the negatively acknowledged data blocks with BSN from N to 63 and then it transmits N more new data blocks (from 64 to N+63).
2. The test is performed for the values of N = 10,15 and 20.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------------|-----------|---|--|
| 1 | | { Uplink dynamic allocation two phase access} | n = 3000 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, containing USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SI=0 |
| 4 | | | Repeat steps 2 and 3 for BSN=1 to 63. SS doesn't acknowledge any of the data blocks with BSN from 0 to 63 |
| 5 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 6 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SI=1 |
| 7 | | | Repeat steps 5 and 6 until unacknowledged data blocks (BSN = 0 to 30) are retransmitted with SI field set to 1 |
| 8 | | | Wait BS_CV_MAX periods without granting USF. |
| 9 | SS -> MS | PACKET UPLINK ACK/NACK | SS acknowledges first N (=10) RLC data blocks, RBB set to 1 and negatively acknowledges all the other data blocks from BSN=N to BSN=63 with RBB set to 0 USF not assigned to the MS |
| 10 | | | Wait for 6 blocks with no USF |
| 11 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| A12 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit block BSN = 31 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. |
| A13 (optional step) | SS->MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 12 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN = N & SI = 0 |
| 13 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 14 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |
| 15 | SS | | Repeat steps 13 and 14 until all negatively acknowledged data blocks are retransmitted followed by new data blocks SS verifies that the negatively acknowledged data blocks are retransmitted before new data blocks are sent, by verifying that RLC data blocks with BSN from N to 63 are received subsequently first, then RLC data blocks with BSN from 64 to 63+N are received. |
| 16 | | { Completion of uplink RLC data block transfer} | |
| 17 | - | - | The procedure is repeated for different values of N |

43.1.1.4 Acknowledged mode / Uplink TBF / Negatively acknowledged RLC data blocks

43.1.1.4.1 Conformance requirements

1. The transmitter shall transmit the oldest RLC data block whose corresponding element in $V(B)$ indexed relative to $V(A)$ has the value NACKED.
2. If $[V(S) < V(A) + k]$ modulo 128 and no RLC data blocks have a corresponding element in $V(B)$ with the value NACKED, the RLC data block with $BSN = V(S)$ shall be transmitted.
3. As each RLC data block is transmitted the corresponding element in $V(B)$ shall be set to the value PENDING_ACK.

References

3GPP TS 04.60, subclause 9.1.3.

43.1.1.4.2 Test purpose

1. To verify that the mobile station retransmits Nacked data blocks before transmission of new information.
2. To verify that the mobile station retransmits Nacked blocks in order of age, older first.
3. To verify that the mobile station only retransmit Nacked blocks once per negative acknowledgment.

43.1.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, $BS_CV_MAX = 0$.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is made to transmit RLC data blocks. The SS randomly negatively acknowledges RLC data blocks. The MS retransmits the negatively acknowledged RLC data blocks, oldest first before transmitting new RLC data blocks.

The SS does not send further acknowledgements. The MS does not retransmit the previously negatively acknowledged RLC data blocks.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|--------------------|-----------|--|---|
| 1 | | { Uplink dynamic allocation two phase access} | n = 3000 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |
| 4 | | | Repeat steps 2 and 3 until received data block BSN = 30 |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | SS acknowledges RLC data blocks with BSN 10 to 30, RBB set to 1 and negatively acknowledges the rest with RBB set to 0 USF not assigned to the MS |
| 6 | | | Wait for 6 blocks with no USF |
| 7 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| A8 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit block BSN = 31 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 7 |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN = 0..9 |
| 9 | SS | | Repeat steps 7 & 8 ten (11 in case mobile sends BSN = 31 in step A8) times SS verifies that the Nacked data blocks are received before new data block once per negative acknowledgment. After these data blocks new data block BSN=31 (32 if MS sends BSN = 31 earlier in step A8) should be received |
| 10 | SS -> MS | PACKET UPLINK ACK/NACK | SS acknowledges retransmitted (BSN 0..9) RLC data blocks, RBB set to 1 |
| 11 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, containing USF assigned to the MS. |
| 12 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |
| 13 | SS | | Repeat steps 11 and 12 until the stall indication bit is set in the data block received in step 12. SS verifies that acknowledged blocks are not retransmitted |
| 14 | SS -> MS | PACKET UPLINK ACK/NACK | SS negatively acknowledges RLC data blocks with BSN 55 to 60, RBB set to 0 and acknowledges the rest with RBB set to 1 USF not assigned to the MS |
| 15 | | | Wait for 6 blocks with no USF. |
| 16 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| A17 | MS -> SS | UPLINK RLC DATA BLOCK | MS may retransmit block BSN = 32 (or 33) if it has already been scheduled while Packet Uplink Ack/Nack is being processed. |
| A18 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 17 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN = 55..60 |
| 18 | SS | | Repeat steps 16 & 17 until all Nacked blocks are received SS verifies that the Nacked data blocks are received before new data blocks once per negative acknowledgment. |
| 19 | | {Completion of uplink RLC data block transfer} | |

43.1.1.5 Acknowledged mode / Uplink TBF / Invalid Negative Acknowledgment

43.1.1.5.1 Conformance requirements

For a R97 and R98 MS only:

1. If the mobile station is the transmitter, it shall set an instance of timer T3198 for each RLC data block sent (subclause 9.1.3 3GPP TS 04.60).
2. The timer T3198 shall have the expiry value set to BS_CV_MAX block periods (subclause 9.1.3 3GPP TS 04.60).
3. The mobile station shall not modify the element in the acknowledge state array, V(B), corresponding to an RLC data block that cannot be validly negatively acknowledged (subclause 9.1.8 3GPP TS 04.60).

For a R99 or later MS only:

If the RLC transmitter is on the mobile station side, the bit contains the value '0' and the number of block periods between the end of the block period used for the last transmission of the corresponding RLC data block and the beginning of the block period containing the Packet Uplink Ack/Nack message is less than $(\max(\text{BS_CV_MAX}, 1) - 1)$ (i.e., the RLC data block was recently (re)transmitted and thus can not be validly negatively acknowledged in this particular Packet Uplink Ack/Nack message), the element in V(B) shall not be modified.

References

3GPP TS 04.60, subclauses 9.1.3 and 9.1.8.

43.1.1.5.2 Test purpose

To verify the correct response of the mobile station to an invalid negative acknowledgement.

43.1.1.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, BS_CV_MAX = 15.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

- GPRS Release (TSPC_MS_GPRS_RELEASE)

PIXIT Statements

-

Test Procedure

The MS is made to send RLC data blocks. The SS negatively acknowledges some RLC data blocks within BS_CV_MAX block periods. The MS shall not retransmit the RLC data blocks that were negatively acknowledged.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------------------------|-----------|---|--|
| 1 | | { Uplink dynamic allocation two phase access} | n = 440 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN = 0 |
| 4 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN = 1 |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN = 2 |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN =3 |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 11 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH BSN =4 |
| | | | Wait for BS_CV_MAX block period of Block BSN = 0 to expire |
| 12 | SS -> MS | PACKET UPLINK ACK/NACK | SS negatively acknowledges blocks BSN = 0 and BSN =3, RBB = 0 and acknowledges blocks BSN = 1, BSN = 2 and BSN = 4, RBB = 1, SSN = 5. USF not assigned to the MS |
| 13 | | | Wait for 6 blocks with no USF. |
| 14 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| A15 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may transmit block BSN = 5 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 14 |
| 15 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SS verifies that data block BSN = 0 is retransmitted |
| 16 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 17 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SS verifies that data block BSN = 3 is not retransmitted New data block received with BSN = 5 (6 if mobile sends BSN=5 earlier in step A15) |
| 18 | | { Completion of uplink RLC data block transfer} | |

43.1.1.6 Acknowledged mode / Uplink TBF / Decoding of Received Block Bitmap

43.1.1.6.1 Conformance requirements

For each bit in the RBB whose corresponding BSN value is within the transmit window, if the bit contains the value '1', the corresponding element in V(B) indexed relative to SSN shall be set to the value ACKED. If the bit contains the value '0', the element in V(B) shall be set to the value NACKED. A bit within the RBB whose corresponding BSN is not within the transmit window, shall be ignored.

References

3GPP TS 04.60, subclause 9.1.8.

43.1.1.6.2 Test purpose

- To verify the decoding of the received block bitmap of the Packet Uplink Ack/Nack message.

43.1.1.6.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is made to send RLC data blocks. The SS negatively acknowledges one or more RLC data blocks after BS_CV_MAX block periods. The MS retransmits these blocks.

The SS negatively acknowledges data blocks outside the transmit window. The MS ignores these negative acknowledgments.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|--------------------|-----------|---|---|
| 1 | | { Uplink dynamic allocation two phase access} | n = 4000 octets USF_GRANULARITY = 1 block CHANNEL_CODING_COMMAND: cs1 |
| 2 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 3 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |
| 4 | | | Repeat steps 2 and 3 until received data block BSN = 19 SS doesn't acknowledge any of the data blocks with BSN from 0 to 19 |
| 5 | | | Wait BS_CV_MAX periods without granting USF. |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | SS negatively acknowledges RLC data block with BSN 0, RBB set to 0 and acknowledges data blocks with BSN from 1 to 19, RBB set to 1 USF not assigned to the MS |
| 7 | | | Wait for 6 blocks with no USF. |
| 8 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| A9 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may transmit block BSN = 20 if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 8 |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SS verifies that the Nacked data block (BSN = 0) is received before new data blocks |
| 10 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, containing USF assigned to the MS. |
| 11 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |

| Step | Direction | Message | Comments |
|------------------------|-----------|--|---|
| 12 | | | Repeat steps 10 and 11 until BSN=63 SS doesn't acknowledge any of the data blocks until BSN = 63 |
| 13 | SS -> MS | PACKET UPLINK ACK/NACK | SS acknowledges all RLC data blocks with RBB set to 1 |
| 14 | | | Wait for 6 blocks with no USF. |
| 15 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| A16 (optional step) | MS -> SS | UPLINK RLC DATA BLOCK | MS may transmit block BSN = 0 (or BSN = 20 if step A09 was performed) if it has already been scheduled while Packet Uplink Ack/Nack is being processed. In this case repeat step 15 |
| 16 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH SS receives new data block with BSN = 64 |
| 17 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, containing USF assigned to the MS. |
| 18 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |
| 19 | | | Repeat steps 17 and 18 until BSN=80 SS doesn't acknowledge any of the data blocks |
| 20 | | | Wait BS_CV_MAX periods without granting USF. |
| 21 | SS -> MS | PACKET UPLINK ACK/NACK | SS negatively acknowledges RLC data block with bit corresponding to BSN 50 in RBB set to 0 and all other bits set to 1 USF not assigned to the MS |
| 22 | | | Wait for 6 blocks with no USF. |
| 23 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH, containing USF assigned to the MS. |
| 24 | MS -> SS | UPLINK RLC DATA BLOCK | Received on the assigned PDTCH |
| 25 | SS | | Repeat steps 23 and 24 until BSN=127 SS verifies that the MS ignored negative acknowledgment outside the window and sends new data blocks BSN=81 to 127 |
| 26 | | { Completion of uplink RLC data block transfer } | |

43.1.2 Acknowledged mode / Downlink TBF

43.1.2.1 Acknowledged mode / Downlink TBF / Receive state variable V(R)

43.1.2.1.1 Conformance requirements

1. In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive state variable V(R). The receive state variable denotes the BSN of the next in-sequence RLC data block expected to be received.
2. The mobile station shall set V(R) to the value 0 at the beginning of each TBF in which the RLC endpoint is the receiver.

References

3GPP TS 04.60, subclause 9.1.5.

43.1.2.1.2 Test purpose

1. To verify correct initialisation of the receive state variable, V(R).
2. To verify the receive state variable, V(R) is set to the next in sequence RLC data block expected to be received.

43.1.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS establishes a downlink TBF and sends RLC data blocks with BSN values between 0 to N in sequence. The MS is polled in each RLC data block by setting the S/P bit. SS verifies that the SSN in the Packet Downlink Ack/Nack messages sent by the MS are set to $[BSN+1]$ modulo 128. SS then sends RLC data block with random BSN N1 that holds a value between $[N+1]$ modulo 128 and $[N+64]$ modulo 128. The MS is polled in the last RLC data block by setting the S/P bit. SS verifies that the SSN in the Packet Downlink Ack/Nack message sent by the MS is set to $[N1+1]$ modulo 128.

The test is performed for the values of N = 1, 10, 63, 64, 126, 127.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | | {Downlink TBF establishment} | Macro parameters: Acknowledged mode |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | MS is polled S/P bit '1' RRBP 00 |
| 3 | MS -> SS | Packet Downlink Ack/ Nack | SS verifies that SSN = $[BSN + 1]$ modulo 128 |
| 4 | | | Repeat steps 2 and 3 until BSN = N |
| 5 | SS -> MS | DOWNLINK RLC DATA BLOCK | BSN = N1 a random number between $[N+1]$ mod 128 and $[N+64]$ modulo 128 MS is polled S/P bit '1' RRBP 00 |
| 6 | MS -> SS | Packet Downlink Ack/ Nack | SS verifies that SSN = $[N1+1]$ modulo 128. |

43.1.2.2 Acknowledged mode / Downlink TBF / Receive window state variable V(Q)

43.1.2.2.1 Conformance requirements

In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive window state variable, V(Q). The mobile station shall set V(Q) to the value 0 at the beginning of each TBF in which the RLC endpoint is the receiver.

The value of V(Q) shall be updated when the RLC receiver receives the RLC data block whose BSN is equal to V(Q).

References

3GPP TS 04.60, subclause 9.1.6.

43.1.2.2.2 Test purpose

1. To verify that V(Q) is not updated when data blocks with BSN not equal to V(Q) are received.

43.1.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS establishes a downlink TBF and sends an RLC data block with BSN value N (N in the range 1..63) and polls the MS. The MS shall accept the block and sends a Packet Downlink Ack/Nack message. SS verifies that SSN is set to [N+1] and RBB bit corresponding to N is set to 1. SS sends another RLC data block to the MS with BSN value 64 and polls the MS. SS verifies that the SSN and RBB fields in the Packet Downlink Ack/Nack message sent by the MS are not updated.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|---|
| 1 | | {Downlink TBF establishment} | Macro parameters: Acknowledged mode |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | BSN = N (N is in the range of [1..63]) polls the MS |
| 3 | MS -> SS | Packet Downlink Ack/ Nack | SSN value should be [N+1] RBB set for block N |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | BSN = 64, polls the MS |
| 5 | MS -> SS | Packet Downlink Ack/ Nack | SSN value should be [N+1]. No change in RBB |
| 6 | SS -> MS | DOWNLINK RLC DATA BLOCK | BSN = 0, polls the MS |
| 7 | MS -> SS | Packet Downlink Ack/ Nack | SSN value should be [N+1]. RBB updated |
| 8 | SS -> MS | DOWNLINK RLC DATA BLOCK | BSN = 64, polls the MS |
| 9 | MS -> SS | Packet Downlink Ack/ Nack | SSN value should be 65. |

43.1.2.3 Acknowledged mode / Downlink TBF / Re-assembly of RLC data blocks

43.1.2.3.1 Conformance requirements

RLC data blocks shall be collected at the receiver until all RLC data blocks comprising an LLC PDU have been received. The RLC headers shall be removed from each RLC data block at this time and the RLC data units re-assembled into an LLC PDU and passed to the next higher layer.

References

3GPP TS 04.60, subclause 9.1.11.

43.1.2.3.2 Test purpose

To verify the correct re-assembly of the RLC data blocks.

43.1.2.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP Context 12 is activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS establishes a downlink TBF and sends several data blocks in random sequence , but within the range of transmit and receive window.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---|---|
| 1 | | {Downlink TBF establishment} | Macro parameters: Acknowledged mode |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | A bit set (A=1) in LLC frame SS sends datablocks in random sequence |
| 3 | | | Repeat step 2 until all the data blocks in one LLC frame is transmitted |
| 4 | MS -> SS | Packet Downlink Ack/ Nack | |
| 5 | | {Uplink dynamic allocation two phase access} | USF_GRANULARITY = 1 block |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 7 | MS -> SS | UPLINK RLC DATA BLOCK | LLC Supervisory frame (RR) acknowledging a valid LLC frame |
| 8 | | { Completion of uplink RLC data block transfer} | |

43.1.2.4 Acknowledged mode / Downlink TBF / Re-assembly / Length Indicator

43.1.2.4.1 Conformance requirements

1. The Extension (E) bit is used to indicate the presence of an optional extension octet in the RLC data block header. The More (M) bit is used to indicate the presence of an LLC frame following the current LLC frame. The M bit, the E bit, and the Length Indicator, are used to delimit LLC frames within a TBF.
2. The Length Indicator (LI) field is six bits in length and shall be encoded as a binary number. The value 0 shall indicate that no LLC frame boundary does exist, that the M bit shall be ignored and that the E bit shall be interpreted as having the value 1.
3. A singular case occurs when the end of the LLC PDU would fit within the RLC data block but the addition of the Length Indicator octet (to indicate the LLC PDU boundary) causes the LLC PDU to extend into the next RLC data block. In this case, this additional LI field shall take the value 0 whatever is the length of the last but one LLC PDU segment.

References

3GPP TS 04.60, subclause 9.1.11 and clause B.2.

43.1.2.4.2 Test purpose

To verify the correct decoding of RLC data block length indication, more(M) and extension(E) bit fields during re-assembly of LLC frames into RLC data blocks.

43.1.2.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP Context 12 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS establishes a downlink TBF and sends data blocks containing two LLC frames (A bit set) with length indicator encoded. The MS is expected to decode these fields and re-assemble LLC frames correctly.

The size of the first LLC frame is 15 octets and second is 24 octets.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---------------|-----------|--|--|
| 1 | | {Downlink TBF establishment} | Macro parameters: Acknowledged mode |
| 2 | SS -> MS | DOWNLINK RLC DATA BLOCK | 15 octets of first LLC frame and 4 octets of second LLC frame Length Indicator = 15, M = 1, E = 1 A bit set (A = 1) in both LLC frames |
| 3 | SS -> MS | DOWNLINK RLC DATA BLOCK | 19 octets from second LLC frame Length indicator = 0, M = 0, E = 1 |
| 4 | SS -> MS | DOWNLINK RLC DATA BLOCK | 1 octet from second LLC frame Length indicator = 1, M = 0, E = 1, FBI = 1 |
| 5 | MS -> SS | PACKET DOWNLINK ACK/NACK | Optionally Including channel request description |
| 6 | | {Uplink dynamic allocation two phase access} | USF_GRANULARITY = 1 block |
| 7 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | LLC Supervisory frame (RR) acknowledging first LLC frame. If this UPLINK RLC DATA BLOCK contains a second RR frame acknowledging the second LLC frame steps A9 and B9 should be skipped. |
| A9 (Optional) | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on the PACCH of the PDCH assigned, USF assigned to the MS. |
| B9 (Optional) | MS -> SS | UPLINK RLC DATA BLOCK | LLC Supervisory frame (RR) acknowledging second LLC frame |
| 9 | | {Completion of uplink RLC data block transfer} | |

Note: If the negotiated window size is less than 2, the testcase ends at the PDP context activation and link establishment.

43.2 Control Blocks

43.2.1 Control Blocks Re-assembly

43.2.1.1 Conformance requirements

The network may segment RLC/MAC control messages into one or two RLC/MAC control blocks depending on the length of the RLC/MAC control message.

RLC/MAC control blocks shall be collected at the receiver until all RLC/MAC control blocks comprising a RLC/MAC control message have been received. The receiving side shall determine the length of the RLC/MAC control message contents by interpreting the RLC/MAC control block contents.

References

3GPP TS 04.60, subclauses 9.1.11a, 9.1.11b and 9.1.2.

43.2.1.2 Test purpose

To verify that the MS re-assembles a RLC control message If it spans across more than one RLC control block.

43.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is switched off.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends a PACKET UPLINK ASSIGNMENT message that spans more than one RLC control block. The PACKET UPLINK ASSIGNMENT message contains Dynamic Allocation struct (Timeslot allocation with power control parameters included) and frequency parameters with direct encoding 2 struct information fields. The SS verifies that RLC data blocks containing Attach Request message are received from the MS.. Switch off the MS.

Maximum Duration of Test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------------|---|
| 1 | MS | | The MS is switched on and triggered to perform a GPRS attach. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Indicating two phase access |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | |
| 5 | SS -> MS | PACKET UPLINK ASSIGNMENT | Frequency Parameter direct encoding 2 information element. Dynamic Allocation struct information element (Timeslot allocation and Power Control parameters included) Payload type = 10, Sent on PACCH.(See section below) |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | USF assigned to the MS |
| 7 | MS -> SS | UPLINK RLC DATA BLOCKS | Attach Request received on PDTCH assigned in step 5 |

43.3 Default Message Contents and Macros

43.3.1 Message Contents

none

43.3.2 Macros

43.3.2.1 Macro for uplink dynamic allocation two phase access (PBCCH not present)

| Step | Direction | Message | Comments |
|------|-----------|--|--|
| | | {Uplink dynamic allocation two phase access} | Macro parameters: n: the number of data octets to be transferred, USF_GRANULARITY: 1 or 4 blocks, RLC_DATA_BLOCKS_GRANTED: 9-261 (close-end), or absent (open-end) CHANNEL_CODING_COMMAND: CS-1, -2, -3, -4 TBF_STARTING_TIME |
| 0 | MS | | Trigger the MS initiating uplink transfer n octets data according to the test PDP context activated |
| 1 | MS -> SS | CHANNEL REQUEST | Received on RACH. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | Single block assignment, to order the MS to follow the two phase access procedure. Sent on AGCH. |
| 3 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 2. Check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used. |
| 4 | SS -> MS | PACKET UPLINK ASSIGNMENT | uplink dynamic allocation, no starting time (as default, otherwise use TBF_STARTING_TIME), Sent on PACCH of the same PDCH assigned in step 2. |

43.3.2.2 Macro for downlink TBF establishment (PBCCH not present)

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| | | {Downlink TBF establishment} | Macro parameters: TBF_STARTING_TIME |
| 1 | SS -> MS | PAGING REQUEST | Page info contains P-TMSI of the MS. Sent on PCH. |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause = "One phase access". Received on RACH. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Random Reference = pertaining to the message received in step 2. Dynamic allocation for RLC data blocks, Sent on AGCH. |
| 4 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 3. |
| 5 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data block. Sent on uplink PACCH. |
| 6 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Acknowledge the RLC control message. Received on uplink PACCH. |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | Downlink Assignment, TLLI value as received. Sent on PCH. Macro parameter as assigned in the test case. |

44 Test case requirements for GPRS mobility management

44.1 Default conditions and default messages

Note that only the layer 3 messages are described in the document. The mapping of the layer 3 messages to lower layers and the use of logical channels is not described in the present document.

The default conditions and default message contents not specified in this clause must be set as in "GPRS default conditions".

Below is a list of the RAI values and the corresponding RAC, LAC and MCC used in the test cases:

RAI-1: MCC1/MNC1/LAC1/RAC1 (Used if only one cell);

RAI-2: MCC2/MNC1/LAC1/RAC1;
RAI-3: MCC1/MNC1/LAC2/RAC1;
RAI-4: MCC1/MNC1/LAC1/RAC2;
RAI-5: MCC1/MNC1/LAC1/RAC3;
RAI-6: MCC2/MNC1/LAC2/RAC1;
RAI-7: MCC2/MNC1/LAC1/RAC2;
RAI-8: MCC1/MNC2/LAC1/RAC1;
RAI-9: MCC1/MNC2/LAC2/RAC1;
RAI10: MCC1/MNC2/LAC1/RAC2.

If the mobile station initial condition specifies that the mobile has a valid IMSI but the initial condition does not mention P-TMSI, then that shall be interpreted as that the mobile has no valid P-TMSI.

44.2 Elementary procedures of GPRS mobility management

The tests are based on 3GPP TS 04.08 / 3GPP TS 24.008.

44.2.1 GPRS attach procedure

This procedure is used to indicate for the network that the IMSI is available for traffic by establishment of a GMM context.

44.2.1.1 Normal GPRS attach

The normal GPRS attach procedure is a GMM procedure used by GPRS MSs of MS operation mode B or C to IMSI attach for GPRS services only.

44.2.1.1.1 GPRS attach / accepted

44.2.1.1.1.1 Conformance requirement

- 1) If the network accepts the GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the MS shall acknowledge the P-TMSI and continue communication with the P-TMSI.
- 2) If the network accepts the GPRS attach procedure (signalled by P-TMSI) and reallocates a new P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.
- 3) If the network accepts the GPRS attach procedure (signalled by a P-TMSI) from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is allocated;
- 2) P-TMSI / P-TMSI signature is reallocated;
- 3) Old P-TMSI / P-TMSI signature is not changed.

44.2.1.1.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

- 1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.
- 2) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS reallocates a new P-TMSI and returns ATTACH ACCEPT message with the new P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. The MS will not answer signalling addressed to the old P-TMSI.
- 3) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS accepts the P-TMSI and returns ATTACH ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the old P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 26. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' |
| 4 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 6 | SS -> MS | | SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 7 | MS -> SS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 8 | MS | | The MS is switched off or power is removed (see PICS). |
| 9 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 10 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 11 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-1 |
| 12 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 13 | MS -> SS | ATTACH COMPLETE | |
| 14 | SS -> MS | GMM INFORMATION | Message sent with P-TMSI-1 |
| 14b | MS -> SS | GMM STATUS | Message sent in case the MS does not support reception of GMM information message Cause #97 |
| 15 | SS -> MS | | SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 16 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 17 | MS | | The MS is switched off or power is removed (see PICS). |
| 18 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 19 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 20 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 21 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Routing area identity = RAI-1 Attach result = 'GPRS only attached' Negotiated Ready timer value IE should not be included. |
| 22 | SS -> MS | | Force to standby indicator set SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 23 | MS -> SS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response. |
| 24 | MS | | The MS is switched off or power is removed (see PICS). |
| 25 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 26 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 25. |

Specific message contents

None.

44.2.1.1.1a GPRS attach / accepted / Attach with IMSI

44.2.1.1.1a.1 Conformance requirement

1) If the MS is configured for "AttachWithIMSI" and the selected PLMN is neither the registered PLMN nor in the list of equivalent PLMNs, the MS shall include the IMSI in the Mobile identity IE in the ATTACH REQUEST message

2) If the network accepts the GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the UE shall acknowledge the P-TMSI and continue communication with the P-TMSI.

Reference(s):

3GPP TS 24.008 clause 4.7.3.1 and 4.4.4.1

44.2.1.1.1a.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

- 1) To verify that the Attach with IMSI indicator can be set in the MS
2. To verify that the MS registers with IMSI (not Temporary ID) when registering with a new PLMN if the selected PLMN is neither the registered PLMN nor in the list of equivalent PLMNs.

44.2.1.1.1a.3 Method of test

Initial conditions

System Simulator:

Two cells; cell A with MCC1/MNC1/LAC1/RAC1 (RAI-1) and cell B in MCC2/MNC1/LAC2/RAC1 (RAI-6).

Both cells are operating in network operation mode II (in case of MS operation mode A).

The PLMN that contains Cell B is not equivalent to the PLMN that contains Cell A.

Mobile Station:

The MS has a valid IMSI.

The MS has been registered in the CS domain.

The MS is configured for "AttachWithIMSI"

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.

2) The SS changes the serving cell to a cell that belongs to a new PLMN. When the MS selects the new cell it sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT

message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | SS MS | | Make cell A available and cell B not available The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 16. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS -> MS | | SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 7 | MS -> SS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response. |
| 8 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 9 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 10 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-6 |
| 11 | MS -> SS | ATTACH COMPLETE | |
| 12 | SS -> MS | | SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 13 | MS -> SS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC Data Block as a paging response. |
| 14 | MS | | The MS is switched off or power is removed (see PICS). |
| 15 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 16 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 15. |

Specific message contents

None.

44.2.1.1.2 GPRS attach / rejected / IMSI invalid / illegal MS

44.2.1.1.2.1 Conformance requirements

- 1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.
- 3) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS' the Mobile Station shall delete the LAI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'illegal MS'.

44.2.1.1.2.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A with MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC2/RAC1, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

SpecificPICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Illegal MS'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|--|
| 1 | MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 5 | SS -> MS | ATTACH REJECT | GMM cause = 'Illegal MS'. |
| 6 | SS | | The following messages are sent and shall be received on cell B. The SS deactivates cell A and activates cell B. Cell B is preferred by the MS. |
| 7 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 8 | MS | | The MS initiates an attach by MMI or by AT command. |
| 9 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 10 | MS | | |
| 11 | SS | | The following messages are sent and shall be received on cell C. The SS deactivates cell B and activates cell C. Cell C is preferred by the MS. |
| 12 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 13 | MS | | The MS initiates an attach by MMI or by AT command. |
| 14 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 15 | MS | | If possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 16 | MS | | |
| 17 | MS | | The MS is powered up or switched on. Step 18 is only performed for MS Operation Mode B. |
| 18 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 19 | MS | | The MS initiates an attach (see PICS). |
| 20 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 21 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 |
| 22 | MS -> SS | ATTACH COMPLETE | |
| 23 | MS | | The MS is switched off or power is removed (see PICS). |
| 24 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.3 GPRS attach / rejected / IMSI invalid / GPRS services not allowed

44.2.1.1.3.1 Conformance requirement

- 1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.3.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed' (no valid GPRS-subscription for the IMSI).

44.2.1.1.3.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (HPLMN) and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal attach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in another PLMN.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. |
| 3 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 19. |
| 4 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 5 | SS -> MS | ATTACH REJECT | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 GMM cause = 'GPRS services not allowed' |
| 6 | SS | | The following messages are sent and shall be received on cell B. |
| 7 | MS | | The SS deactivates cell A and activates cell B. Cell B is preferred by the MS. |
| 8 | | {Location Update Procedure} | Step 8 is only performed for NW Mode II / MS Operation Mode B. Macro. MOBILE_IDENTITY set to IMSI. Location Update Procedure initiated from the MS. |
| 9 | | | The MS initiates an attach automatically (see PICS), by MMI or AT commands. |
| 10 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 11 | MS | | If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 12 | MS | | The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS). |
| 13 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' |
| 14 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 15 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 |
| 16 | MS | | The MS is switched off or power is removed (see PICS). |
| 17 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 18 | | | The SS deactivates cell B and activates cell A. |
| 19 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 17. |

Specific message contents

None.

44.2.1.1.4 GPRS attach / rejected / PLMN not allowed

44.2.1.1.4.1 Conformance requirement

1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall:

- 1.1 not perform GPRS attach when switched on in the same routing area or location area;
- 1.2 not perform GPRS attach when in the same PLMN and when that PLMN is not selected manually;
- 1.3 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
- 1.4 store the PLMN in the 'forbidden PLMN' list.

2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall perform GPRS attach when a new PLMN is entered.

3) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' and if after that the PLMN from which this rejection was received, is manually selected, the Mobile Station shall perform a GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.4.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'PLMN not allowed'.

44.2.1.1.4.3 Method of test

44.2.1.1.4.3.1 Test procedure 1

Initial conditions

System Simulator:

Four cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC1/MNC2/LAC1/RAC1, cell C in MCC1/MNC2/LAC2/RAC1 and cell D in MCC2/MNC1/LAC1/RAC1.

- All four cells are operating in network operation mode II. The PLMN of the four cells should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-8. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'PLMN not allowed'. The SS checks that the MS does not perform GPRS attach if activated in the same routing area or location area and performs GPRS attach only when a new PLMN is entered.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-8 |
| 5 | SS -> MS | ATTACH REJECT | GMM cause = 'PLMN not allowed' |
| 6 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | MS | | The SS deactivates cell A and activates cell B. |
| 9 | MS | | Cell B is preferred by the MS. No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 10 | SS | | The following messages are sent and shall be received on cell C. |
| 11 | MS | | The SS deactivates cell B and activates cell C. |
| 12 | MS | | Cell C is preferred by the MS. No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 13 | SS | | The following messages are sent and shall be received on cell D. |
| 14 | MS | | The SS deactivates cell C and activates cell D. |
| 15 | | {Location Update Procedure} | Cell D is preferred by the MS. Step 15 is only performed for MS Operation Mode B. Macro. MOBILE_IDENTITY set to IMSI. Location Update Procedure initiated from the MS. |
| 16 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 17 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 18 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 |
| 19 | MS -> SS | ATTACH COMPLETE | |
| 20 | MS | | The MS is switched off or power is removed (see PICS). |
| 21 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.4.3.2 Test procedure 2

Initial conditions

System Simulator:

One cell operating in network operation mode II: MCC2/MNC1/LAC1/RAC1. The PLMN of the cell should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'PLMN not allowed'. The subscribers access rights is changed to allow GPRS attach. Then the PLMN from which this rejection was received is manually selected and the SS check that a GPRS attach is performed.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2 |
| 4 | SS -> MS | ATTACH REJECT | GMM cause = 'PLMN not allowed' |
| 5 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds) |
| 6 | MS | | The current PLMN is selected manually. Step 7 is only performed for MS Operation Mode B. |
| 7 | | {Location Update Procedure} | Macro. MOBILE IDENTITY set to IMSI. Location Update Procedure initiated from the MS. |
| 8 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 9 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 10 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 |
| 11 | MS -> SS | ATTACH COMPLETE | |
| 12 | MS | | The MS is switched off or power is removed (see PICS). |
| 13 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.5 GPRS attach / rejected / roaming not allowed in this location area

44.2.1.1.5.1 Conformance requirement

1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station shall:

- 1.1 not perform GPRS attach when in the same location area;
- 1.2 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
- 1.3 store the LA in the 'forbidden location areas for roaming' list;
- 1.4 perform GPRS attach when a new location area is entered;
- 1.5 Periodically search for its HPLMN.

2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.

3) The MS shall be capable of storing at least 6 entries in the list of 'Forbidden location areas for roaming'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.5.2 Test purpose

Test purpose 1

To test that on receipt of a rejection using the 'roaming not allowed in this location area' cause code, the MS ceases trying to attach on that location area. Successful GPRS attach procedure is possible in other location areas.

Test purpose 2

To test that if the MS is switched off or the SIM is removed the list of 'forbidden location areas for roaming' is cleared.

Test purpose 3

To test that at least 6 entries can be held in the list of 'forbidden location areas for roaming' (the requirement in 3GPP TS 04.08 / 3GPP TS 24.008 is to store at least 10 entries. This is not fully tested by the third procedure).

Test purpose 4

To test that if a cell of the Home PLMN is available then the MS returns to it in preference to any other available cell.

44.2.1.1.5.3 Method of test

44.2.1.1.5.3.1 Test procedure 1

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC2/RAC1 (Not HPLMN) and cell C in MCC2/MNC1/LAC1/RAC2 (Not HPLMN).

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. A new attempt for a GPRS attach is not possible. Successful GPRS attach / detach procedures are performed in another location area. A new attempt for a GPRS attach is performed in the 1st location area. This attempt shall not succeed, as the LA is on the forbidden list.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|---|
| 1 | SS MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, go to step 21. |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2 |
| 5 | SS -> MS | ATTACH REJECT | GMM cause = 'Roaming not allowed in this area' |
| 6 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | MS | | The SS Deactivates cell A and activates cell B. Cell B is preferred by the MS. |
| 9 | | {Location Update Procedure} | Step 9 is only performed for NW Mode II / MS Operation Mode B. Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 10 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 11 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 12 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-6 |
| 13 | MS -> SS | ATTACH COMPLETE | |
| 14 | MS | | The MS initiates a GPRS detach (without power off) by MMI or by AT command . |
| 15 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 16 | SS -> MS | DETACH ACCEPT | |
| 17 | SS | | The following messages are sent and shall be received on cell C. |
| 18 | MS | | The SS deactivates cell B and activates cell C. Cell C is preferred by the MS. |
| 19 | MS | | No LOCATION UPDATE REQUEST sent to SS (SS waits 30 seconds). Initiate GPRS Attach by MMI or AT command. Check that the No ATTACH REQUEST is sent to the SS (SS waits for 30 seconds). The MS is switched off or power is removed (see PICS). |
| 20 | SS | | The SS deactivates cell C. |
| 21 | MS | | The MS is set in MS operation mode B, if supported (see PICS) and the test is repeated from step 2 to step 20. |

Specific message contents

None.

44.2.1.1.5.3.2 Test procedure 2

Initial conditions

System Simulator:

One cell in MCC2/MNC1/LAC1/RAC1 (Not HPLMN) operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).

Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach updating with the cause value 'Roaming not allowed in this area'. The MS is switched off for 10 s and switched on again. The SS check that a GPRS attach is possible on the cell on which the GPRS attach had been rejected.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|--|
| 1 | MS | | If MS operation mode C is supported, the MS is set in MS operation mode C (see PICS). If MS operation mode C is not supported, the MS is set in MS operation mode B. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2 |
| 4 | SS -> MS | ATTACH REJECT | GMM cause = 'Roaming not allowed in this area' |
| 5 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 6 | MS | | If possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 7 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Step 8 is only performed for NW Mode II / MS Operation Mode B. |
| 8 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 9 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 10 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 |
| 11 | MS -> SS | ATTACH COMPLETE | |
| 12 | MS | | The MS is switched off or power is removed (see PICS). |
| 13 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.5.3.3 Test procedure 3

Initial conditions

System Simulator:

Six cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC2/RAC1 (Not HPLMN), cell C in MCC2/MNC1/LAC3/RAC1 (Not HPLMN), cell D in MCC2/MNC1/LAC4/RAC1 (Not HPLMN), cell E in MCC2/MNC1/LAC5/RAC1 (Not HPLMN), cell F in MCC2/MNC1/LAC6/RAC1 (Not HPLMN).

All six cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).

- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. This is done for 6 different location areas. Then the SS checks that the MS does not attempt to perform an attach procedure on the non-allowed location areas.

Different types of MS may use different methods to periodically clear the list of forbidden areas (e.g. every day at 12 am) for roaming. If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 4 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-2 |
| 5 | SS -> MS | ATTACH REJECT | GMM cause = 'Roaming not allowed in this area' |
| 6 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds) |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | SS | | The SS deactivates cell A and activates cell B. |
| 9 | MS | | Cell B is preferred by the MS. Step 9 is only performed for MS Operation Mode B. |
| 9 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 10 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 11 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 12 | SS -> MS | ATTACH REJECT | GMM cause = 'Roaming not allowed in this area' |
| 13 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 14 | SS | | The following messages are sent and shall be received on cell C. |
| 15 | SS | | The SS deactivates cell B and activates cell C. |
| 16 | MS | | Cell C is preferred by the MS. Step 16 is only performed for NW Mode II / MS Operation Mode B. |
| 16 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 17 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 18 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 19 | SS -> MS | ATTACH REJECT | GMM cause = 'Roaming not allowed in this area' |

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|--|
| 20 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 21 | SS | | The following messages are sent and shall be received on cell D. |
| 22 | MS | | The SS deactivates cell C and activates cell D. Cell D is preferred by the MS. |
| 23 | | {Location Update Procedure} | Step 23 is only performed for MS Operation Mode B. |
| 24 | MS | | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 25 | MS -> SS | ATTACH REQUEST | The MS initiates an attach automatically, by MMI or by AT command. |
| 26 | SS -> MS | ATTACH REJECT | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 27 | MS | | GMM cause = 'Roaming not allowed in this area' No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 28 | SS | | The following messages are sent and shall be received on cell E. |
| 29 | MS | | The SS deactivates cell D and activates cell E. Cell E is preferred by the MS. |
| 30 | | {Location Update Procedure} | Step 30 is only performed for MS Operation Mode B. |
| 31 | MS | | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 32 | MS -> SS | ATTACH REQUEST | The MS initiates an attach automatically, by MMI or by AT command. |
| 33 | SS -> MS | ATTACH REJECT | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 34 | MS | | GMM cause = 'Roaming not allowed in this area' No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 35 | SS | | The following messages are sent and shall be received on cell F. |
| 36 | MS | | The SS deactivates cell E and activates cell F. Cell F is preferred by the MS. |
| 37 | | {Location Update Procedure} | Step 37 is only performed for MS Operation Mode B. |
| 38 | MS | | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 39 | MS -> SS | ATTACH REQUEST | The MS initiates an attach automatically, by MMI or by AT command. |
| 40 | SS -> MS | ATTACH REJECT | Attach type = 'GPRS attach' Mobile identity = IMSI |

| 42 | SS | | The following messages are sent and shall be received on cell E. |
| 43 | SS | | The SS deactivates cell F and activates cell E. Cell E is preferred by the MS. |
| 44 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 45 | MS | | No ATTACH REQUEST or LOCATION UPDATE REQUEST is sent to SS (SS waits 30 seconds). |
| 46 | SS | | The following messages are sent and shall be received on cell C. |
| 47 | SS | | The SS deactivates cell E and activates cell C. Cell C is preferred by the MS. |
| 48 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |

| Step | Direction | Message | Comments |
|------|-----------|---------|--|
| 49 | MS | | No ATTACH REQUEST or LOCATION UPDATE REQUEST is sent to SS (SS waits 30 seconds). |
| 50 | SS | | The following messages are sent and shall be received on cell A. The SS deactivates cell C and activates cell A. Cell A will be preferred by the MS. The MS initiates an attach automatically, by MMI or by AT command. No ATTACH REQUEST or LOCATION UPDATE REQUEST is sent to SS (SS waits 30 seconds). |
| 51 | SS | | |
| 52 | MS | | |
| 53 | MS | | |

Specific message contents

None.

44.2.1.1.5.3.4 Test procedure 4

Initial conditions

System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1 (not HPLMN) and cell B in MCC1/MNC1/LAC1/RAC1 (HPLMN).

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. Two cells are then available. The cell with the weakest level belongs to the HPLMN. It is checked that the MS returns to its HPLMN.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|---|
| 1 | SS MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 |
| 5 | SS -> MS | ATTACH REJECT | Routing area identity = RAI-2 GMM cause = 'Roaming not allowed in this area' |
| 6 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 7 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. |
| 8 | MS | | The RF level of cell A is lowered until cell B is preferred by the MS. Step 9 is only performed for MS Operation Mode B |
| 9 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 10 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 11 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 12 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature |
| 13 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-1 |
| 14 | MS | | The MS is switched off or power is removed (see PICS). |
| 15 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.6 GPRS attach / abnormal cases / access barred due to access class control

44.2.1.1.6.1 Conformance requirement

- 1) The MS shall not perform GPRS attach procedure, but stays in the current serving cell and applies normal cell reselection process.
- 2) The Mobile Station shall perform the GPRS attach procedure when:
 - 2.1 Access is granted.
 - 2.2 Cell is changed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.6.2 Test purpose

Test purpose 1

To test the behaviour of the MS in case of access class control (access is granted).

Test purpose 2

To test the behaviour of the MS in case of access class control (cell is changed).

44.2.1.1.6.3 Method of test

44.2.1.1.6.3.1 Test procedure 1

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is initially indicated to be barred.

System Simulator:

One cell operating in network operation mode II.

Access class x barred.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS indicates access class x barred. A GPRS attach procedure is not performed.

The SS indicates that access class x is not barred. A GPRS attach procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The SIM is programmed with access class x. |
| 2 | MS | | The MS is set in MS operation mode C or B (see PICS). If MS operation mode C not supported, goto step 12. |
| 3 | MS | | The MS is powered up or switched on and attempts to initiate an attach (see PICS). |
| 4 | MS | | No ATTACH REQUEST sent to SS, as access class x is barred (SS waits 30 seconds). |
| 5 | SS | | The access class x is not barred anymore. |
| 6 | MS | | The MS initiates a GPRS attach either automatically or manually (see PICS). |
| 7 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 8 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | MS -> SS | ATTACH COMPLETE | |
| 10 | MS | | The MS is switched off or power is removed (see PICS). |
| 11 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 12 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 11. |

Specific message contents

None.

44.2.1.1.6.3.2 Test procedure 2

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is indicated to be barred on cell A.

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 has access class x barred, cell B in MCC1/MNC1/LAC1/RAC1 has access class x not barred.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-2 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS indicates access class x barred. A GPRS attach procedure is not performed.

A cell change is performed into a cell where access class x is not barred. A GPRS attach procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS SS | | The SIM is programmed with access class x. The following messages are sent and shall be received on cell A. |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 4 | MS | | The MS is powered up or switched on and attempts to initiate an attach (see PICS). |
| 5 | MS | | No ATTACH REQUEST sent to SS, as access class x is barred (SS waits 30 seconds). |
| 6 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS | | The MS initiates an attach either automatically or manually (see PICS). |
| 8 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-1 |
| 9 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 10 | MS -> SS | ATTACH COMPLETE | |
| 11 | MS | | The MS is switched off or power is removed (see PICS). |
| 12 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.7 GPRS attach / abnormal cases / change of cell into new routing area

44.2.1.1.7.1 Conformance requirement

When a change of cell into a new routing area is performed before ATTACH ACCEPT message is received by the MS, the MS shall abort the GPRS attach procedure and re-initiate it immediately.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.7.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.1.7.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

If the MS automatically performs a GPRS Attach on power on, is the attach procedure performed and then is the MS triggered to perform a normal GPRS Detach.

Sufficient time is given for the MS to identify the neighbour cell before the MS is triggered to initiate a GPRS attach procedure. The ATTACH ACCEPT message is delayed from the SS. The MS performs a cell reselection to a cell in a new routing area. The MS shall re-initiate a GPRS attach procedure in the new routing area.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A and B. The RF level of cell A is -50 dBm and cell B - 60 dBm. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | | | Go to step 10 if the MS <u>not</u> automatically performs a GPRS attach when switched on. |
| 5 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 6 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included |
| 7 | MS | | Force to standby indicator set |
| 8 | MS -> SS | DETACH REQUEST | Trigger the MS to perform a GPRS detach |
| 9 | SS -> MS | DETACH ACCEPT | Detach type = 'normal detach, GPRS detach' |
| 10 | | | Wait 20 sec. |
| 11 | MS | | The MS is triggered to initiate a GPRS Attach. |
| 12 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 13 | SS | | No response to the ATTACH REQUEST message is given by the SS. |
| | | | The following messages are sent and shall be received on cell B. |
| 14 | SS | | The RF level of cell A is lowered to -100 dBm. |
| 15 | MS | | The MS automatically re-initiates the attach in the new cell. |
| 16 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 17 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-4 Negotiated Ready timer value IE should not be included |
| 18 | MS | | Force to standby indicator set |
| 19 | MS -> SS | DETACH REQUEST | The MS is switched off or power is removed (see PICS). Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.8 GPRS attach / abnormal cases / power off

44.2.1.1.8.1 Conformance requirement

When power is switched off before ATTACH ACCEPT message is received by the MS, the MS shall abort the GPRS attach procedure and perform a GPRS detach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.1.8.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).-
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS is switched off after initiating an attach procedure. A GPRS detach is automatically performed by the MS before power is switched off.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 7. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 4 | SS | | No response to the ATTACH REQUEST message is given by the SS. |
| 5 | MS | | The MS is powered off and initiates a GPRS detach (with power off) |
| 6 | MS -> SS | DETACH REQUEST | Detach type = 'power switched off, GPRS detach' |
| 7 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 6. |

Specific message contents

None.

44.2.1.1.9 GPRS attach / abnormal cases / GPRS detach procedure collision

44.2.1.1.9.1 Conformance requirement

- 1) When a DETACH REQUEST message is received by the MS (Detach type 're-attach not required') while waiting for an ATTACH ACCEPT message, the MS shall terminate the GPRS attach procedure and continue with the GPRS detach procedure.
- 2) When a DETACH REQUEST message is received by the MS (Detach type 're-attach required') while waiting for an ATTACH ACCEPT message, the MS shall ignore the GPRS detach procedure and continue with the GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.1.9.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Re-attach automatically when the network commands a detach with no cause value (TSPC_AddInfo_GPRS_Attach_on_NW_Detach_NoCause).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure. The SS does not answer the GPRS attach procedure, but initiates a GPRS detach procedure (Detach type 're-attach not required'). The MS shall terminate the GPRS attach procedure and continue with the GPRS detach procedure.

The MS initiates a GPRS attach procedure. The SS does not answer the GPRS attach procedure, but initiates a GPRS detach procedure (Detach type 're-attach required'). The MS shall ignore the GPRS detach procedure and continue with the GPRS attach.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 4 | SS | | The SS ignores the ATTACH REQUEST message and initiates a detach procedure. |
| 5 | SS -> MS | DETACH REQUEST | Detach type = 're-attach not required' |
| 6 | MS -> SS | DETACH ACCEPT | |
| 7 | MS | | The MS is attached by MMI or AT command if the MS does not re-attach automatically upon receiving a network initiated detach with no cause value, (See PICS). |
| 8 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 9 | SS | | The SS ignores the ATTACH REQUEST message and initiates a detach procedure. |
| 10 | SS-> MS | DETACH REQUEST | Detach type = 're-attach required' |
| 11 | MS | | The MS ignores the DETACH REQUEST message and continue with the attach procedure. |
| 12 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 13 | MS -> SS | ATTACH COMPLETE | |
| 14 | MS | | The MS is switched off or power is removed (see PICS). |
| 15 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.1.10 GPRS attach / rejected / GPRS services not allowed in this PLMN

44.2.1.1.10.1 Conformance requirement

If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed in this PLMN':

1. The MS shall delete any RAI, P-TMSI, P-TMSI signature, and GPRS ciphering key sequence number stored, shall set the GPRS update status to GU3 ROAMING NOT ALLOWED (and shall store it according to section 4.1.3.2) and shall change to state GMM-DEREGISTERED.
2. The MS shall store the PLMN identity in the "forbidden PLMNs for GPRS service" list. A GPRS MS operating in MS operation mode C shall perform a PLMN selection instead of a cell selection.
3. A GPRS MS operating in MS operation mode A or B in network operation mode II, is still IMSI attached for CS services in the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

44.2.1.1.10.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed in this PLMN'.

44.2.1.1.10.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC2/MNC1/LAC1/RAC1.

All two cells are operating in network operation mode II.. The PLMN of the two cells should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-8. MS is Idle Updated on Cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C). (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'GPRS services not allowed in this PLMN'. The SS checks that the MS does not perform GPRS attach if activated in the same PLMN and performs GPRS attach only when a new PLMN is entered.

Maximum duration of test

10 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | MS | | The MS is set in MS operation mode B or C (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 |
| 5 | SS -> MS | ATTACH REJECT | Routing area identity = RAI-8 GMM cause = ' GPRS services not allowed in this PLMN ' |
| 6 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds) Steps 7, 8 and 9 are only performed for MS Operation Mode B. |
| 7 | MS | | SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 8 | | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE |
| 9 | SS | | SS releases the RR connection. |
| 10 | SS | | SS pages the MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 11 | MS | | No response from the MS to the request. This is checked for 10 seconds. |
| 12 | SS | | The following messages are sent and shall be received on cell B. |
| 13 | MS | | The SS deactivates cell A and activates cell B. Cell B is preferred by the MS. Step 14 is only performed MS Operation Mode B. |
| 14 | | {Location Update Procedure} | Location Update Procedure initiated from the MS. |
| 15 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 16 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 17 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature |
| 18 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-2 |
| 19 | SS | | The following messages are sent and shall be received on cell A. |
| 20 | MS | | The SS deactivates cell B and activates cell A again. Cell A is preferred by the MS. Step 21 is only performed for MS Operation Mode B. |
| 21 | | {Location Update Procedure} | Location Update Procedure initiated from the MS. |
| 22 | | | Verify No ATTACH REQUEST sent to SS (SS waits 30 seconds) in case auto attach |
| 23 | MS | | The MS initiates an attach by MMI or by AT command. |
| 24 | | | Verify No ATTACH REQUEST sent to SS (SS waits 30 seconds) |
| 25 | MS | | The MS is switched off or power is removed (see PICS). |

Specific message contents

None.

44.2.1.1.11 GPRS attach / access barred due to EAB

44.2.1.1.11.1 Conformance requirement

For a mobile originated access attempt, a mobile station configured for EAB shall perform a preliminary access barring check (see sub-clause 3.3.1.4). If the preliminary access barring check indicates network access is barred then access to the network is not allowed. Otherwise, the mobile station shall proceed according to the remainder of this sub-clause.

The preliminary access barring check shall indicate network access is barred if all of the following conditions are satisfied:

- the establishment cause for the request received from the MM sublayer is not "emergency call".
- the SYSTEM INFORMATION TYPE 21 message is broadcast in the cell and includes EAB information;
- the mobile station is a member of a subcategory of mobile stations targeted by the EAB information;
- the EAB Authorization Mask sent in the EAB information indicates the mobile station's access class is not authorized;
- the mobile station is not a member of any of the authorized special access classes (i.e. an Access Class in the range 11-15) permitted by the network;

Otherwise, the preliminary access barring check shall indicate network access is not barred.

A network operator can also restrict some MSs to access the network for location registration, although via common access class control or domain specific access class control the MSs are permitted to access the network for other purposes. Therefore, for each access to the network the mobile station shall determine from the information received via the system information broadcast whether access is allowed or not:

- For paging response the mobile station shall evaluate the control information for common access control (as specified in 3GPP TS 44.018 [84], 3GPP TS 44.060 [76], and 3GPP TS 25.331 [23c]), domain specific access control (as specified in 3GPP TS 25.331 [23c]), and the specific control information for paging response (as specified in 3GPP TS 25.331 [23c]; see "Paging Permission with Access Control").
- For generic location updating, GPRS attach and routing area updating procedures the mobile station shall evaluate the control information for:
 - common access control (as specified in 3GPP TS 44.018 [84], 3GPP TS 44.060 [76], and 3GPP TS 25.331 [23c]);
 - domain specific access control (as specified in 3GPP TS 25.331 [23c]);
 - specific control information for location registration (as specified in 3GPP TS 25.331 [23c]; see "Paging Permission with Access Control"); and
 - EAB as specified in 3GPP TS 44.018 [84] and 3GPP TS 44.060 [76].

Reference

3GPP TS 44.018 subclauses 3.3.1.1.1, 3.3.1.4. 3GPP TS 24.008 subclause 4.1.1.5

44.2.1.1.11.2 Test purpose

To verify that Extended Access class Barring can be activated in the MS.

To verify that the MS does not perform location updating, GPRS attach or routing area updating if the network broadcast EAB and EAB is enabled in the MS.

44.2.1.1.11.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

The SYSTEM INFORMATION TYPE 3 message indicates that the SYSTEM INFORMATION TYPE 21 is sent on the BCCH by setting the SYSTEM INFORMATION 21 Indicator in the SI3 Rest Octet IE.

The SYSTEM INFORMATION TYPE 21 is sent on the BCCH. The SI 21 Rest Octets information element is configured with: EAB Authorization Mask set to "xxxxxxxx1" and EAB Subcategory set to "00".

Mobile Station:

The MS is in "idle, updated" state on cell A, with a TMSI allocated.

The MS is configured for "Extended Access Barring"

The MS belong to access class 0

Specific PICS statements

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements

-

Test Procedure

The MS, configured for Extended Access Class barring reads the system information block 21. The MS initiates the location updating procedure and the SS verifies that no access attempt is made by the MS. The SS sends SYSTEM INFORMATION TYPE 21 is sent on the BCCH with the SI 21 Rest Octets information element in configured with EAB Authorization Mask set to "0000000000". The MS successfully performs the location updating procedure and is powered off.

The SS then reactivates EAB by configuring the SI 21 Rest Octets IE configured with EAB Authorization Mask set to "xxxxxxxx1" in the SYSTEM INFORMATION TYPE 21 and the MS is powered on. The SS verifies that the MS does not make any access attempts. The SS deactivates EAB and the SS verifies that the MS performs a GPRS attach.

The SS then reactivates EAB again. The RF level of cell A is lowered until cell B is preferred by the MS but the SS verifies that the MS does not perform the routing area update procedure. The SS deactivates EAB and verifies that the MS successfully perform the routing area update procedure.

Maximum duration of test

10 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | MS | | The following messages are sent and shall be received on cell A |
| 2 | SS | | Make the MS perform the location updating procedure |
| 3 | SS -> MS | SYSTEM INFORMATION TYPE 21 | Verify that the MS does not access the network within 1 minute |
| 4 | MS | | The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to "0000000000" and the SS waits for 30 seconds to allow the MS to read the modified system information. |
| 5 | MS | {Location Update Procedure} | Location Update Procedure initiated from the MS. |
| 6 | SS | SYSTEM INFORMATION TYPE 21 | The MS is switched off or power is removed (see PICS). |
| 7 | SS | | The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to "xxxxxxx1" and EAB Subcategory set to "00". |
| 8 | MS | | The following messages are sent and shall be received on cell A. |
| 9 | MS | | The SS activates cell A but not cell B. |
| 10 | SS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 22. |
| 11 | SS -> MS | SYSTEM INFORMATION TYPE 21 | The MS is powered up or switched on and initiates an attach (see PICS). |
| 12 | MS -> SS | ATTACH REQUEST | Verify that the MS does not access the network within 1 minute |
| 13 | SS -> MS | ATTACH ACCEPT | The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to "0000000000" and the SS waits for 30 seconds to allow the MS to read the modified system information. |
| 14 | MS -> SS | ATTACH COMPLETE | Attach type = 'GPRS attach' |
| 15 | SS | SYSTEM INFORMATION TYPE 21 | Mobile identity = IMSI |
| 16 | SS | | Attach result = 'GPRS only attached' |
| 17 | SS | | Mobile identity = P-TMSI-2 |
| 18 | SS -> MS | SYSTEM INFORMATION TYPE 21 | P-TMSI-2 signature |
| 19 | MS -> SS | ROUTING AREA UPDATING REQUEST | Routing area identity = RAI-1 |
| 20 | SS -> MS | ROUTING AREA UPDATING ACCEPT | The SI 21 Rest Octets information element is configured with EAB Authorization Mask set to "xxxxxxx1" and EAB Subcategory set to "00". |
| 21 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 22 | MS | | The MS is switched off or power is removed (see PICS). |
| 22 | MS | | The MS is set in MS operation mode B (see PICS), reset the RF level of Cell A to default state, deactivate Cell B and the test is repeated from step 6 to step 21. |

Specific message contents

SYSTEM INFORMATION TYPE 3 broadcast by Cell A and B:

Same as default content except

| Information Element | Value/remark |
|---|---|
| SI 3 Rest Octets SYSTEM INFORMATION 21 Indicator | H (SYSTEM INFORMATION TYPE 21 message is available) |
| SI21_POSITION | 0 (SYSTEM INFORMATION TYPE 21 message is sent on BCCH Norm) |

SYSTEM INFORMATION TYPE 21 broadcast by Cell A initially and in steps 6 and 15:

Same as default content except

| Information Element | Value/remark |
|---|--|
| SI 21 Rest Octets EAB Authorization Mask | 'xxxxxxxx1' (MSs configured for EAB and a member of Access Class 0 are barred) |
| EAB Subcategory | '00' (applicable to all mobile stations configured for EAB) |

SYSTEM INFORMATION TYPE 21 broadcast by Cell A in step 3 and 11 and by Cell B in step 18:

Same as default content except

| Information Element | Value/remark |
|---|---|
| SI 21 Rest Octets EAB Authorization Mask | '000000000' (MSs configured for EAB are authorized) |
| EAB Subcategory | '00' (applicable to all mobile stations configured for EAB) |

44.2.1.2 Combined GPRS attach

The combined GPRS attach procedure is a GMM procedure used by GPRS MSs of MS operation mode A or B to IMSI attach for GPRS or non-GPRS services. In order to use the combined GPRS attach procedure, the network must be in network operation mode I. All Combined GPRS test case are only applicable when the MS operates in Class- A or B mode.

44.2.1.2.1 Combined GPRS attach / GPRS and non-GPRS attach accepted

44.2.1.2.1.1 Conformance requirement

- 1) If the network accepts the combined GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the MS shall acknowledge the P-TMSI and continue communication with the P-TMSI.
- 2) If the network accepts the combined GPRS attach procedure (signalled by P-TMSI) and reallocates a new P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.
- 3) If the network accepts the combined GPRS attach procedure (signalled by a P-TMSI) from the MS without reallocation of the previously used P-TMSI, the MS shall continue communication with the previously used P-TMSI.
- 4) If the network accepts the combined GPRS attach procedure and determines that IMSI shall be used in CS operations, the MS shall continue communication with the IMSI for CS operations.
- 5) If the network accepts the combined GPRS attach procedure and determines that a TMSI shall be used in CS operations, the MS shall continue communication with the TMSI for CS operations.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is allocated;
- 2) P-TMSI / P-TMSI signature is reallocated;
- 3) Old P-TMSI / P-TMSI signature is not changed;
- 4) Mobile terminating CS call is allowed with IMSI;
- 5) Mobile terminating CS call is not allowed with TMSI.

44.2.1.2.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

- 1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.
- 2) The MS is CS paged in order to verify that the IMSI is used for CS calls.
- 3) The MS is GPRS paged in order to verify that the new P-TMSI is used for GPRS services.
- 4) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS allocates a new P-TMSI and returns ATTACH ACCEPT message with the new P-TMSI and a new TMSI. The MS acknowledge the P-TMSI and the TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the new TMSI is used. The MS is CS paged in order to verify that the new TMSI is used for CS services.
- 5) The MS is GPRS paged in order to verify that the new P-TMSI is used for GPRS services. The MS will not answer signalling addressed to the old P-TMSI.
- 6) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS accepts the P-TMSI and returns ATTACH ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the previously used P-TMSI.
- 7) The MS is GPRS paged in order to verify that the previously used P-TMSI is used for GPRS services.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS | | SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell. |
| 7 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with IMSI. |
| 8 | SS | | SS releases the RR connection, indicating a successful resumption of GPRS services and pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. Comment: A TBF will be established on lower layers. |
| 9 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. Comment: The TBF will be released on lower layers. |
| 10 | MS | | The MS is switched off or power is removed (see PICS). |
| 11 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |
| 12 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 13 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 TMSI status = no valid TMSI available |
| 14 | SS -> MS | ATTACH ACCEPT | Routing area identity = RAI-1 Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-1 Routing area identity = RAI-1 |
| 15 | MS -> SS | ATTACH COMPLETE | |
| 16 | SS -> MS | GMM INFORMATION | Message sent with P-TMSI-2 |
| 16b | MS -> SS | GMM STATUS | Message sent in case the MS does not support reception of GMM information message Cause #97 |
| 17 | SS | | SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell. |

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 18 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1. |
| 19 | SS | | SS releases the RR connection, indicating a successful resumption of GPRS services and pages the MS with mobile identity of P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 20 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 21 | SS | | SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 22 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 23 | MS | | The MS is switched off or power is removed (see PICS). |
| 24 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |
| 25 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 26 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-2 Routing area identity = RAI-1 |
| 27 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. TMSI and P-TMSI not included. Attach result = 'Combined GPRS / IMSI attached' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included |
| 28 | SS | | Force to standby indicator set SS pages the MS with mobile identity of P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 29 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 30 | MS | | The MS is switched off or power is removed (see PICS). |
| 31 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.1.2.2 Combined GPRS attach / GPRS only attach accepted

44.2.1.2.2.1 Conformance requirement

- 1) If the network accepts the combined GPRS attach procedure, but GMM cause code 'IMSI unknown in HLR' is sent to the MS the Mobile Station shall delete the stored TMSI, LAI and CKSN. The Mobile Station shall consider SIM invalid for non-GPRS services until power is switched off or SIM is removed.

2) If the network accepts the combined GPRS attach procedure, but GMM cause code 'MSC temporarily not reachable', or 'Network failure' is sent to the MS, an MS operation mode B MS may perform an MM IMSI attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.2.2 Test Purpose

Test purpose 1

To test the behaviour of the MS if the network accepts the GPRS attach procedure with indication GPRS only, GMM cause 'IMSI unknown in HLR'.

Test purpose 2

To test the behaviour of the MS if the network accepts the GPRS attach procedure with indication GPRS only, GMM cause 'MSC temporarily not reachable', or 'Network failure'.

44.2.1.2.2.3 Method of test

44.2.1.2.2.3.1 Test Procedure 1

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. GMM cause 'IMSI unknown in HLR' is indicated from SS. Further communication MS - SS is performed by the P-TMSI. CS services are not possible.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The MS is set in MS operation mode B. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature GMM cause = 'IMSI unknown in HLR' Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS -> MS | | SS pages MS with Mobile identity = IMSI according to the channel combination of the cell. |
| 7 | MS | | Paging order is for RR-connection. The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 8 | MS | | The MS is switched off or power is removed (see PICS). |
| 9 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.1.2.2.3.2 Test Procedure 2

Initial conditions

System Simulator:

One cell operating in network operation mode I. T3212 is set to 6 minutes.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Automatic MM IMSI attach procedure at switch-on/power-on (TSPC_AddInfo_auto_MM_IMSI_AP_on_off).
- Switch off on button Yes/No (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends an ATTACH REQUEST message. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. GMM cause 'MSC temporarily not reachable', or 'Network failure' is indicated from SS. The cause code is arbitrarily chosen. The MS sends a ROUTING AREA UPDATE REQUEST message. The SS returns a ROUTING AREA UPDATE ACCEPT message. GMM cause 'MSC temporarily not reachable', or 'Network failure' is indicated from SS. The cause code is arbitrarily chosen. The ROUTING AREA UPDATE procedure is repeated four times. An MS operation mode B MS may then perform an MM IMSI attach procedure (according to the PICS statement). Further communication MS - SS is performed by the P-TMSI. The existence of a signalling channel is verified by a request for mobile identity.

Maximum duration of test

15 minutes.

Expected sequence

Dependent whether the option 'Automatic MM IMSI attach procedure at switch-on/power-on' is supported or not, the steps 1-19 or 20-39 apply depending on manufacturer (see PICS).

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | MS | | The MS is set in MS operation mode B and no automatic MM IMSI attach procedure is indicated (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 7 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-1 |
| 8 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |
| 10 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-3 signature Routing area identity = RAI-1 |
| 11 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-4 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 12 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-4 signature Routing area identity = RAI-1 |
| 13 | SS | | The SS verifies that the time between the previous routing area update accept and routing area update request is T3311 (+/- 10%) |
| 14 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-5 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |
| 16 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-5 signature Routing area identity = RAI-1 |
| 17 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-6 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |
| 18 | MS | | The MS is switched off or power is removed (see PICS). |
| 19 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach'. Stop the sequence. |
| 20 | MS | | Automatic MM IMSI attach procedure is indicated (see PICS). |
| 21 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 22 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted |
| 23 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI not included. Attach result = 'GPRS only attached' P-TMSI-2 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Negotiated Ready timer value IE should not be included. Force to standby indicator set. |
| 24 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-1 |
| 25 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |

| Step | Direction | Message | Comments |
|-----------------------|-----------|------------------------------------|--|
| 26 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-3 signature Routing area identity = RAI-1 |
| 27 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-4 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |
| 28 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-4 signature Routing area identity = RAI-1 |
| 29 | SS | | The SS verifies that the time between the previous routing area update accept and routing area update request is T3311 (+/- 10%) |
| 30 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-5 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |
| 31 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA / LA updating with IMSI attach' P-TMSI-5 signature Routing area identity = RAI-1 |
| 32 | SS | | The SS verifies that the time between the previous routing area update accept and routing area update request is T3311 (+/- 10%) |
| 33 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-6 signature Routing area identity = RAI-1 GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) Force to standby indicator set. |
| 34 (optional step) | | {Location Update Procedure} | Macro. Location Update Procedure may be initiated from the MS. Parameter is TMSI-1. Steps 35, 36 and 37 are only performed if the MS has performed the Location Update Procedure in step 34. |
| 35 | SS -> MS | | SS pages MS with Mobile identity = TMSI-1 and Paging order is for RR-connection. |
| 36 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with Mobile identity = TMSI-1 |
| 37 | SS | | SS releases the RR connection and indicate the successfully resumption of GPRS services. |
| 38 | MS | | The MS is switched off or power is removed (see PICS). |
| 39 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. |

Specific message contents

SYSTEM INFORMATION TYPE 3 (Cell A) in Test Procedure 2:

| Information element | Value/remark |
|--|--------------|
| As default message contents except: | |
| Control Channel Description T3212 timeout value | 6 min |

Note: An R97 MS will use this value to set T3302.

ATTACH ACCEPT and ROUTING AREA UPDATE ACCEPT in Test Procedure 2:

| Information Element | Value/remark |
|--|--------------|
| As default message contents except: T3302 value | 6 min |

Note: This IE is only read by MSs supporting R99 and onwards.

44.2.1.2.3 Combined GPRS attach / GPRS attach while IMSI attach

44.2.1.2.3.1 Void

44.2.1.2.3.2 Conformance requirement

If the GPRS MS is already attached for non-GPRS services by the MM specific attach procedure, but wants to perform an attach for GPRS services, the combined GPRS attach procedure is performed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.3.3 Test Purpose

To test the behaviour of the MS if GPRS attach performed while IMSI attached.

44.2.1.2.3.4 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I. ATT flag is set.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS attaches for non-GPRS services. The MS does not answer to paging orders for GPRS. The MS attaches for GPRS services. Paging orders for GPRS are answered.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS) and configured not to perform a GPRS attach. |
| 2 | MS | | The MS is powered up or switched on. No GPRS attach is performed (see PICS). |
| 3 | MS | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1. |
| 4 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 5 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 6 | MS | | The MS is triggered to perform a GPRS attach (in combination with IMSI attach). |
| 7 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach while IMSI attached' or 'Combined GPRS/IMSI attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 8 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' No new mobile identity assigned. TMSI and P-TMSI not included P-TMSI-2 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included. |
| 9 | SS -> MS | | Force to standby indicator set. SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 10 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 11 | MS | | The MS is switched off or power is removed (see PICS). |
| 12 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.1.2.3a Combined GPRS attach / NMO-I enabled in MS

44.2.1.2.3a.1 Conformance requirement

1) The network operation mode (mode I, II, or III) shall be indicated as system information to MSs. Additional system information can indicate that MSs configured to use the extended NMO I system information (see TS 24.368 [111]) shall use NMO I, regardless of what NMO is indicated by system information for other MSs. If this additional system information is absent, MSs configured to use the extended NMO I system information shall use the system information that represents the network operation mode for other MSs. From these indications, the MS determines which mode applies to it. That mode shall be used when using the procedures described in other clauses of this specification.

2) If the parameter "NMO_I_Behaviour" in the NAS configuration Management Object or USIM is set to the value of "1", the bit 2 "NMO I" of system information is applied

3) If the network accepts the combined PS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the UE shall acknowledge the P-TMSI and continue communication with the P-TMSI.

Reference(s):

3GPP TS 24.008 clauses 4.7.3.2 and 4.1.1.4.2. 3GPP TS 23.060 clause 5.3.13.2

44.2.1.2.3a.2 Test Purpose

To verify that if "Network mode of operation I" is set in the MS, the MS performs a combined attach when the extended NMO-I system information is broadcast from the network

44.2.1.2.3a.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II. ATT flag is set to 0.

System Information Type 13: The GPRS Cell Info IE has the NMO_I_ALTERNATE bit set to "1"

Mobile Station:

The MS has a valid IMSI.

The MS has the parameter "NMO_I_Behaviour" set to "1"

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

- 1) The MS reads the NMO_I_ALTERNATE bit in the GPRS Cell Info IE, received in the System Information Type 13 message.
- 2) The MS sends an ATTACH REQUEST message with identity IMSI and type 'Combined GPRS/IMSI attach'. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledges the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.
- 2) The MS is CS paged in order to verify that the IMSI is used for CS calls.
- 3) The MS is PS paged in order to verify that the new P-TMSI is used for PS services.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS) |
| 2 | MS | | The MS is powered up or switched on and initiates attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS/IMSI attach' Mobile identity =IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS/IMSI attached' Allocated P-TMSI = P-TMSI-1 P-TMSI Signature = P-TMSI-1 signature MS identity =IMSI Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS | | The SS releases the signalling connection and waits 5s to allow the MS to read system information. |
| 7 | SS | | SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell. |
| 8 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with IMSI. |
| 9 | SS | | The SS releases the signalling connection and waits 5s to allow the MS to read system information. |
| 10 | SS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 11 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 12 | MS | | The MS is switched off or power is removed (see PICS). |
| 13 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.1.2.4 Combined GPRS attach / rejected / IMSI invalid / illegal ME

44.2.1.2.4.1 Conformance requirement

- 1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall consider SIM invalid for GPRS and non-GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall delete the stored TMSI, LAI, CSKN, RAI, GPRS-CSKN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.4.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure of the MS with the cause 'Illegal ME'.

44.2.1.2.4.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on Yes/No (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'Illegal ME'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN. CS services are not possible as the SIM is blocked for CS services. GPRS services are not possible as the SIM is blocked for GPRS services.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. |
| 3 | MS | | The MS is set in MS operation mode B (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted |
| 5 | SS -> MS | ATTACH REJECT | GMM cause 'Illegal ME'. |
| 6 | SS -> MS | | SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 7 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 8 | SS -> MS | | SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell. |
| 9 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 10 | SS -> MS | | SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 11 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 12 | SS | | The following messages are sent and shall be received on cell B. |
| 13 | MS | | The SS deactivates cell A and activates cell B. |
| 14 | MS | | Cell B is preferred by the MS. |
| 15 | SS -> MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 16 | MS | | SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell. The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 17 | SS | | The following messages are sent and shall be received on cell C. |
| 18 | MS | | The SS deactivates cell B and activates cell C. |
| 19 | MS | | Cell C is preferred by the MS. |
| 20 | SS -> MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 21 | MS | | SS pages the MS with mobile identity of IMSI and paging order for RR connection according to the channel combination of the cell. No response from the MS to the request. This is checked for 10seconds. |
| 22 | MS | | If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|---|
| 23 | MS | | The MS gets the SIM replaced, is powered up or switched on. Step 22 is only performed for non-auto attach MS. |
| 24 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter Mobile identity is IMSI. |
| 25 | MS | | MS initiates an attach automatically (see PICS), via MMI or AT commands. |
| 26 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 27 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-2 |
| 28 | MS -> SS | ATTACH COMPLETE | |
| 29 | SS -> MS | | SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 30 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1. |
| 31 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 32 | MS | | The MS is switched off or power is removed (see PICS). |
| 33 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.1.2.5 Combined GPRS attach / rejected / GPRS services and non-GPRS services not allowed

44.2.1.2.5.1 Conformance requirement

1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services and non-GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS and non-GPRS services until power is switched off or SIM is removed.

2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services and non-GPRS services not allowed', the Mobile Station shall delete the stored TMSI, LAI, CSKN, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.5.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure of the MS with the cause 'GPRS services and non-GPRS services not allowed'.

44.2.1.2.5.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a GPRS attach with the cause value 'GPRS services and non-GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN. CS services are not possible as the SIM is blocked for CS services. GPRS services are not possible as the SIM is blocked for GPRS services.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. |
| 3 | MS | | The MS is set in MS operation mode B (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted |
| 5 | SS -> MS | ATTACH REJECT | GMM cause 'GPRS services and non-GPRS services not allowed' |
| 6 | MS | | No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds). |
| 7 | SS -> MS | | SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell. |
| 8 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 9 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 10 | MS | | No response from the MS to the request. This is checked for 10 s |
| 11 | SS | | The SS deactivates cell A and activates cell B. |
| 12 | MS | | Cell B is preferred by the MS. |
| 13 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 14 | SS -> MS | | No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds). |
| 15 | MS | | SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell. |
| 16 | SS -> MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 17 | MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 18 | MS | | No response from the MS to the request. This is checked for 10seconds. If possible (see PICS) switch off is performed. Otherwise the power is removed. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 19 | MS | | The MS is powered up or switched on. Step 20 is only performed for non-auto attach MS. |
| 20 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 21 | MS | | MS initiates an attach automatically (see PICS), via MMI or AT commands. |
| 22 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 23 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-2 |
| 24 | MS -> SS | ATTACH COMPLETE | |
| 25 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 26 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1. |
| 27 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 28 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 29 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 30 | MS | | The MS is switched off or power is removed (see PICS). |
| 31 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.1.2.6 Combined GPRS attach / rejected / GPRS services not allowed

44.2.1.2.6.1 Conformance requirement

- 1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.
- 3) A GPRS class B MS shall perform an MM IMSI attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.6.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed'.

44.2.1.2.6.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode I.

ATT flag set to 1.

Mobile Station:

The MS has a valid TMSI, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal attach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach. GPRS services are not possible. After receiving the ATTACH REJECT message from the SS the mobile can react in several ways, due to an ambiguity in the core specification. Part 3 of the conformance requirements can be interpreted in the following ways:

1. The MS shall in any case perform a Location Update with the update type set to IMSI attach.
2. The MS shall perform the IMSI attach by means of a explicit Location update procedure only if the conditions specified for the IMSI attach procedure in 3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.4.3 are fulfilled.
3. The MS shall perform a Location Update with the update type set either to IMSI attach or normal updating.

Because all three options are allowed a GPRS class B MS may perform an MM IMSI attach. Therefore step 8 in the expected sequence is an optional step.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode B (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on. Step 4 is only performed for non-auto attach MS. |
| 4 | MS | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1. |
| 5 | | | MS initiates an attach automatically (see PICS), via MMI or AT commands. |
| 6 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 7 | SS -> MS | ATTACH REJECT | GMM cause 'GPRS services not allowed' |
| 8 | MS | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-2. |
| 9 | SS -> MS | | SS pages the MS with mobile identity of TMSI-2 or TMSI-1 for MS which did not perform step 8 and paging order for RR connection on CCCH. |
| 10 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-2 or TMSI-1 for MS which did not perform step 8. |
| 11 | SS | | SS releases the RR connection. |
| 12 | SS | | The following messages are sent and shall be received on cell B. |
| 13 | MS | | The SS deactivates cell A and activates cell B. Cell B is preferred by the MS. |
| 14 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1. |
| 15 | SS -> MS | | SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 16 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. |
| 17 | | | SS releases the RR connection. |
| 18 | SS -> MS | | SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 19 | MS | | No response from the MS to the request. This is checked for 10seconds. |
| 20 | MS | | If possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 21 | MS | {IMSI Detach} | Macro. If switch off is performed then MS performs IMSI detach. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 22 | MS | | The MS is powered up or switched on. Step 23 is only performed for non-auto attach MS. |
| 23 | MS | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1. |
| 24 | | | MS initiates an attach automatically (see PICS), via MMI or AT commands. |
| 25 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' |
| 26 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-2 Routing area identity = RAI-2 |
| 27 | MS -> SS | ATTACH COMPLETE | |
| 28 | SS -> MS | | SS pages the MS with mobile identity of TMSI-2 and paging order for RR connection according to the channel combination of the cell. |
| 29 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-2 |
| 30 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 31 | MS | | The MS is switched off or power is removed (see PICS). |
| 32 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.1.2.7 Combined GPRS attach / rejected / location area not allowed

44.2.1.2.7.1 Conformance requirement

1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

- 1.1 not perform combined GPRS attach when in the same location area;
- 1.2 delete the stored LAI, CKSN, TMSI, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
- 1.3 store the LA in the 'forbidden location areas for regional provision of service'.

2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

- 2.1 perform combined GPRS attach when a new location area is entered;
- 2.2 delete the list of forbidden LAs when power is switched off.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.3.2.

44.2.1.2.7.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

44.2.1.2.7.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC2/RAC1.

All cells are operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
 - GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).

PIXIT statements:

-

Test procedure

The SS rejects a combined GPRS attach with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform combined GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off. CS services are not possible unless an IMSI attach procedure is performed.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12 am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is set in MS operation mode B (see PICS). |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 5 | SS -> MS | ATTACH REJECT | GMM cause 'Location Area not allowed' |
| 6 | MS | | No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds). |
| 7 | SS -> MS | | SS pages the MS with mobile identity TMSI and paging order for RR connection according to the channel combination of the cell. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 8 | MS | | The MS shall not initiate an RR connection. |
| 9 | SS -> MS | | This is checked during 3 seconds. SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 10 | MS | | No response from the MS to the request. This is checked for 10 s |
| 11 | SS | | The following messages are sent and shall be received on cell B. |
| 12 | MS | | The SS deactivates cell A and activates cell B. |
| 13 | MS | | Cell B is preferred by the MS. |
| 14 | SS -> MS | | No ATTACH REQUEST or LOCATION UPDATING REQ is sent to SS (SS waits 60 seconds) |
| 15 | MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 16 | MS | | No response from the MS to the request. This is checked for 10seconds. |
| 17 | MS | | The MS initiates an attach by MMI or AT command. No attach is performed by the MS. This is checked for 10 s. |
| 18 | SS | | The following messages are sent and shall be received on cell C. |
| 19 | MS | | The SS deactivates cell B and activates cell C. |
| 20 | | {Location Update Procedure} | Cell C is preferred by the MS. |
| 21 | MS | | Steps 20 and 21 are only performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS). Macro. Location Update Procedure initiated from the MS. Parameter Mobile identity is IMSI. |
| 22 | MS -> SS | ATTACH REQUEST | MS initiates an attach via MMI or AT commands. |
| 23 | SS -> MS | ATTACH ACCEPT | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-3 |
| 24 | MS -> SS | ATTACH COMPLETE | |
| 25 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 26 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. |
| 27 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 28 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 29 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 30 | MS | | The MS is switched off or power is removed (see PICS). |

| Step | Direction | Message | Comments | |
|------|-----------|------------------------------------|--|---|
| 31 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' | |
| 32 | MS | {Location Update Procedure} | The following messages are sent and shall be received on cell B. | |
| 33 | MS | | The SS deactivates cell C and activates cell B. Cell B is preferred by the MS. | |
| 34 | | | The MS is powered up or switched on. Step 34 is only performed for non-auto attach MS. | |
| 35 | MS | | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1. | |
| 36 | MS -> SS | | ATTACH REQUEST | MS initiates an attach automatically (see PICS), via MMI or AT commands. Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-3 |
| 37 | SS -> MS | | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-2 Routing area identity = RAI-4 |
| 38 | MS -> SS | | ATTACH COMPLETE | SS pages the MS with mobile identity TMSI-2 and paging order for RR connection according to the channel combination of the cell. |
| 39 | SS -> MS | | | |
| 40 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-2. | |
| 41 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. | |
| 42 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. | |
| 43 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. | |
| 44 | MS | | The MS is switched off or power is removed (see PICS). | |
| 45 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' | |

Specific message contents

None.

44.2.1.2.7a Combined GPRS attach / rejected / network reject with Extended Wait Timer

44.2.1.2.7a.1 Conformance requirement

If the attach request can neither be accepted by the network for GPRS nor for non-GPRS services, an ATTACH REJECT message is transferred to the MS. The MS receiving the ATTACH REJECT message stops timer T3310, and for all causes except #12, #14, #15, #22 and #25 deletes the list of "equivalent PLMNs".

If the attach request is rejected due to NAS level mobility management congestion control, the network shall set the MM cause value to #22 "congestion" and assign a back-off timer T3346.

22 (Congestion);

If the T3346 value IE is present in the ATTACH REJECT message and the value indicates that this timer is neither zero nor deactivated, the MS shall proceed as described below, otherwise it shall be considered as an abnormal case and the behaviour of the MS for this case is specified in subclause 4.7.3.1.5.

The MS shall abort the attach procedure, reset the attach attempt counter, set the GPRS update status to GU2 NOT UPDATED and enter state GMM-DEREGISTERED.ATTEMPTING-TO-ATTACH.

The MS shall stop timer T3346 if it is running.

If the ATTACH REJECT message is integrity protected, the MS shall start timer T3346 with the value provided in the T3346 value IE.

If the ATTACH REJECT message is not integrity protected, the MS shall start timer T3346 with a random value from the default range specified in table 11.3a.

The MS stays in the current serving cell and applies the normal cell reselection process. The attach procedure is started, if still necessary, when timer T3346 expires or is stopped.

A GPRS MS operating in MS operation mode A or B which is already IMSI attached for CS services in the network is still IMSI attached for CS services in the network.

If S1 mode is supported in the MS, the MS shall handle the EMM parameters EMM state, EPS update status, and attach attempt counter as specified in 3GPP TS 24.301 [120] for the case when the attach procedure is rejected with the EMM cause with the same value.

Reference(s):

3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.7a.2 Test purpose

To verify that the MS uses the extended back-off timer if the network reject a request with the Extended Wait Timer.

44.2.1.2.7a.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II MCC1/MNC1/LAC1/RAC1

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on Yes/No (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a combined GPRS attach with the cause value #22 'Congestion'. The SS includes the T3346 timer in the reject message. The SS checks that the MS does not perform GPRS attach before the timer T3346 has expired.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted Device properties = 'MS is configured for NAS signalling low priority' |
| 4 | SS -> MS | ATTACH REJECT | GMM cause #22 'Congestion' T3346 value = 2 min |
| 5 | SS | | The SS verifies that the MS does not initiate the attach procedure before timer T3346 has expired |
| 6 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available |
| 7 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-1 |
| 8 | MS -> SS | ATTACH COMPLETE | |
| 9 | SS -> MS | | SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 10 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1. |
| 11 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |

Specific message contents

None.

44.2.1.2.8 Combined GPRS attach / abnormal cases / attempt counter check / miscellaneous reject causes

44.2.1.2.8.1 Conformance requirement

- 1) When a combined GPRS attach procedure is rejected with the attach attempt counter less than five, the Mobile Station shall repeat the combined GPRS attach procedure after T3311 timeout.
- 2) When a combined GPRS attach procedure is rejected with the attach attempt counter five, the Mobile Station shall delete the stored TMSI, LAI, CKSN, P-TMSI, P-TMSI signature, GPRS CKSN and RAI and start T3302.
- 3) When the T3302 expire, a new combined GPRS attach procedure shall be initiated.
 - GMM cause codes that can be selected are:
 - 'IMSI unknown in HLR';
 - 'MS identity cannot be derived by the network';
 - 'Network failure';
 - 'Congestion';

- 'retry upon entry into a new cell';
- 'Message type not compatible with the protocol state';
- 'Conditional IE error';
- 'Message not compatible with the protocol state';

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.8.2 Test purpose

To test the behaviour of the MS with respect to the attach attempt counter.

44.2.1.2.8.3 Method of test**Initial conditions****System Simulator:**

One cell operating in network operation mode I. T3302 is set to 12 minutes.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Switch off on button (TSPC_Feat_OnOff).

PIXIT statements:

-

Test procedure

The MS initiates a combined GPRS attach procedure (attach attempt counter zero). The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter one) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter two) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter three) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter four) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is not started, as the attach attempt counter is five. T3302 is started.

The MS initiates a combined GPRS attach procedure with attach attempt counter zero after T3302 expires without P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|-----------------|-----------|------------------------------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |

| 24 | SS -> MS | | |
| 25 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-1. |
| 26 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 27 | SS -> MS | | SS pages the MS with mobile identity of P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 28 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 29 | MS | | The MS is switched off or power is removed (see PICS). |
| 30 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.1.2.9 Combined GPRS attach / abnormal cases / GPRS detach procedure collision

44.2.1.2.9.1 Conformance requirement

44.2.1.2.9.1 Conformance requirement

1) When a DETACH REQUEST message is received by the MS (Detach type 're-attach not required') while waiting for an ATTACH ACCEPT message or ATTACH REJECT message, the MS shall terminate the combined GPRS attach procedure and continue with the combined GPRS detach procedure.

2) When a DETACH REQUEST message is received by the MS (Detach type 're-attach required') while waiting for an ATTACH ACCEPT message or ATTACH REJECT message, the MS shall ignore the combined GPRS detach procedure and continue with the combined GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.1.2.9.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Re-attach automatically when the network commands a detach with no cause value (TSPC_AddInfo_GPRS_Attach_on_NW_Detach_NoCause).

PIXIT statements:

-

Test procedure

The MS initiates a combined GPRS attach procedure. The SS does not answer the combined GPRS attach procedure, but initiates a combined GPRS detach procedure (Detach type 're-attach not required'). The MS shall terminate the combined GPRS attach procedure and continue with the combined GPRS detach procedure.

The MS initiates a combined GPRS attach procedure. The SS does not answer the combined GPRS attach procedure, but initiates a combined GPRS detach procedure (Detach type 're-attach required'). The MS shall ignore the combined GPRS detach procedure and continue with the combined GPRS attach. CS services are also possible.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 4 | SS | | The SS ignores the ATTACH REQUEST message and initiates a detach procedure. |
| 5 | SS -> MS | DETACH REQUEST | Detach type = 're-attach not required' |
| 6 | MS -> SS | DETACH ACCEPT | |
| 7 | MS | | The MS is attached by MMI or AT command if the MS does not re-attach automatically upon receiving a network initiated detach with no cause value, (see PIXIT). |
| 8 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 9 | SS | | The SS ignores the ATTACH REQUEST message and initiates a detach procedure. |
| 10 | SS -> MS | DETACH REQUEST | Detach type = 're-attach required' |
| 11 | MS | | The MS ignores the DETACH REQUEST message and continue with the attach procedure |
| 12 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-2 Routing area identity = RAI-1 |
| 13 | MS -> SS | ATTACH COMPLETE | |
| 14 | SS -> MS | | SS pages the MS with mobile identity of TMSI-2 and paging order for RR connection according to the channel combination of the cell. |
| 15 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity with TMSI-2. |
| 16 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 17 | SS -> MS | | SS pages the MS with mobile identity of P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 18 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 19 | MS | | The MS is switched off or power is removed (see PICS). |
| 20 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.2 GPRS detach procedure

This procedure is used to indicate for the network that the IMSI is not available for traffic. The GMM context is removed.

44.2.2.1 MS initiated GPRS detach procedure

44.2.2.1.1 GPRS detach / power off / accepted

44.2.2.1.1.1 Conformance requirement

The MS detaches the IMSI for GPRS services if the MS is switched off.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.1.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.1.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 8. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS | | The MS is switched off (see PICS). |
| 7 | MS -> SS | DETACH REQUEST | Detach type = 'power switched off, GPRS detach' |
| 8 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 7. |

Specific message contents

None.

44.2.2.1.2 GPRS detach / accepted

44.2.2.1.2.1 Conformance requirement

- 1) The MS detaches the IMSI for GPRS services if the MS is ordered to do so with MMI or AT commands.
- 2) (For R99 or after MS only) Upon completion of the subsequent attach, routing area update, service request or detach procedure the used P-TMSI signature shall be deleted.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

3GPP TS 24.008 subclause 4.7.1.3 (additional reference for R99 or after MS only)

44.2.2.1.2.2 Test purpose

To test the behaviour of the MS for the detach procedure, including treatment of P-TMSI signature by R99 and after MS.

44.2.2.1.2.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).

- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- MS Higher Layer release(TSPC_MS_HIGHER_LAYER_RELEASE)

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 17. |

44.2.2.1.3 GPRS detach / abnormal cases / attempt counter check / procedure timeout

44.2.2.1.3.1 Conformance requirement

- 1) When a T3321 timeout has occurred during a GPRS detach procedure with the retransmission counter less than five, the Mobile Station shall repeat the GPRS detach procedure.
- 2) When a T3321 timeout has occurred during a GPRS detach procedure with the retransmission counter five, the Mobile Station shall not repeat the procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.3.2 Test purpose

To test the behaviour of the MS with respect to the retransmission counter.

44.2.2.1.3.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Switch off on button (TSPC_Feat_OnOff).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS detach procedure. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is set to one.

The MS initiates a new GPRS detach procedure (retransmission counter one) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter two) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter three) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter four) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS then deletes the logical link since the retransmission has been repeated four times.

The MS performs a new GPRS attach procedure.

Maximum duration of test

8 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 25. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 4 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set |
| 5 | MS | | The MS initiates a GPRS detach (without power off) by MMI or AT command. |
| 6 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 7 | SS | | No response is given from the SS. |
| 8 | SS | | The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%) |
| 9 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 10 | SS | | No response is given from the SS. |
| 11 | SS | | The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%) |
| 12 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 13 | SS | | No response is given from the SS. |
| 14 | SS | | The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%) |
| 15 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 16 | SS | | No response is given from the SS. |
| 17 | SS | | The SS verifies that the time between the detach requests is T3321 seconds (+/- 10%) |
| 18 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 19 | SS | | No response is given from the SS within 40 seconds and SS verifies that the MS will not send a DETACH REQUEST again. |
| 20 | MS | | Initiate a GPRS attach |
| 21 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 22 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set |
| 23 | | | MS is switched off or power is removed (see PICS) |
| 24 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 25 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 24. |

Specific message contents

None.

44.2.2.1.4 GPRS detach / abnormal cases / GMM common procedure collision

44.2.2.1.4.1 Conformance requirement

When any of the GMM common messages P-TMSI REALLOCATION COMMAND, GMM STATUS or GMM INFORMATION is received by the MS while waiting for a DETACH ACCEPT message with detach cause different from "power off", the MS shall ignore the GMM common message.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.4.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.2.1.4.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The following test procedure is repeated for sequence counter k = 1, 2, 3:

- The MS performs a GPRS attach.
- The MS initiates a GPRS detach. The SS initiates a P-TMSI REALLOCATION COMMAND message (k = 1), a GMM STATUS message (k = 2) and a GMM INFORMATION message (k = 3). The MS shall ignore the GMM common messages and continue with the GPRS detach procedure. The sending of the P-TMSI REALLOCATION COMMAND message (k = 1), the GMM STATUS message (k = 2), the GMM INFORMATION message (k = 3) and the DETACH ACCEPT message shall be completed within Timer T3321 -10%.
- The SS signal to the MS, but no response is received, as the signalling link is disconnected.

Maximum duration of test

5 minutes.

Expected sequence

The test sequence is repeated for $k = 1 \dots 3$

| Step | Direction | Message | Comments |
|--|-----------|-----------------------------|---|
| 1 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS | | The MS initiates a detach (without power off) by MMI or AT command. |
| 7 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 8A | SS | | The SS sends a P-TMSI REALLOCATION COMMAND message |
| (k=1) 9A | SS -> MS | P-TMSI REALLOCATION COMMAND | |
| (k=1) 10A | MS | | The MS ignores the message. This is verified for 10 seconds. |
| (k=1) 8B | SS | | The SS sends a GMM STATUS message |
| (k=2) 9B | SS -> MS | GMM STATUS | |
| (k=2) 10B | MS | | The MS ignores the message. This is verified for 10 seconds. |
| (k=2) 8C | SS | | The SS sends a GMM INFORMATION message |
| (k=3) 9C | SS -> MS | GMM INFORMATION | |
| (k=3) 10C | MS | | The MS ignores the message which is verified for 10 seconds or, if GMM INFORMATION message not implemented, sends a GMM STATUS with GMM Cause 'Message type non-existent or not implemented'. |
| 11 | SS -> MS | DETACH ACCEPT | The SS responds to the DETACH REQUEST |
| 12 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity = P-TMSI-1 Paging order is for TBF establishment. |
| 13 | MS | | No response from the MS to the request. This is checked for 10 s. |
| NOTE: Steps 8x, 9x, 10x and 11 shall be completed within Timer T3321 -10%. | | | |

Specific message contents

None.

44.2.2.1.5 GPRS detach / power off / accepted

44.2.2.1.5.1 Conformance requirement

The MS detach the IMSI for GPRS and non-GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.5.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.1.5.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode A (TSPC_operation_mode_A).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS sends a DETACH REQUEST message to the SS. The MS then deletes the logical link.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS | | The MS is switched off (see PICS). |
| 7a | MS -> SS | DETACH REQUEST | Detach type = 'power switched off, combined GPRS / IMSI detach'. If MS supports TSPC_Feat_OnOff |
| 7b | SS | | It is verified that the MS does not send DETACH REQUEST, if the MS does not support TSPC_Feat_OnOff |

Specific message contents

None.

44.2.2.1.6 GPRS detach / accepted / GPRS/IMSI detach

44.2.2.1.6.1 Conformance requirement

The MS detach the IMSI for GPRS and non-GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.6.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.1.6.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS sends a DETACH REQUEST message to the SS. When the MS receives the DETACH ACCEPT, the MS then deletes the logical link.

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS | | The MS initiates a detach (without power off) by MMI or AT command. |
| 7 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, combined GPRS / IMSI detach' |
| 8 | SS -> MS | DETACH ACCEPT | |
| 9 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 10 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 11 | SS -> MS | | SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell. |
| 12 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |

Specific message contents

None.

44.2.2.1.7 GPRS detach / accepted / IMSI detach

44.2.2.1.7.1 Conformance requirement

The MS shall detach for CS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.7.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.1.7.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS performs an GPRS detach (for non-GPRS services).

CS services are not possible.

The MS attach for non-GPRS services by a routing area update procedure and CS services are again possible.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS | | The MS initiates a detach for non-GPRS services without power off. |
| 7 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, IMSI detach' |
| 8 | SS -> MS | DETACH ACCEPT | |
| 9 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 10 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 11 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 12 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 13 | MS | | The MS initiates an attach for non-GPRS services by a RA update procedure. |
| 14 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = "combined RA/LA updating with IMSI attach" Routing area identity = RAI-1 |
| 15 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-1 Routing area identity = RAI-1 |
| 16 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 17 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 18 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. |
| 19 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 20 | MS | | The MS is switched off or power is removed (see PICS). |
| 21 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.2.1.8 GPRS detach / abnormal cases / change of cell into new routing area

44.2.2.1.8.1 Conformance requirement

When a change of cell into a new routing area is performed before DETACH ACCEPT message is received by the MS, the MS shall abort the GPRS detach procedure and re-initiate it after the routing area update procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.2.1.8.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

Sufficient time is given for the MS to identify the neighbour cell before the MS is triggered to initiate a GPRS detach procedure. The DETACH ACCEPT message is delayed from the SS. The MS performs a cell reselection to a cell in a new routing area and performs a routing area update procedure.

The Ms shall re-initiate a GPRS detach procedure when the routing area update procedure is finished.

The MS deletes the logical link.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A and B. The RF level of cell A is -50 dBm and cell B -60 dBm. |
| 2 | MS | | The MS is set in MS operation mode B (see PICS) or mode C if mode B is not supported. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 3A | MS | {Location Update Procedure} | Macro for Class B MS. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 5 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 6 | MS -> SS | ATTACH COMPLETE | |
| 7 | SS | | Wait 30 sec |
| 8 | MS | | The MS initiates a GPRS detach (without power off) by MMI or AT command. |
| 9 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' |
| 10 | SS | | No response to the DETACH REQUEST message is given by the SS |
| | | | The following messages are sent and shall be received on cell B. |
| 11 | SS | | The RF level of cell A is lowered to -100 dBm. |
| 12 | MS | | The MS performs a RA update in the new cell. |
| 13 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-1 TMSI status = valid TMSI available or IE omitted |
| 14 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-4 |
| 15 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 16 | MS -> SS | DETACH REQUEST | The detach is automatically re-attempted. Detach type = 'normal detach, GPRS detach' |
| 17 | SS -> MS | DETACH ACCEPT | |

Specific message contents

None.

44.2.2.1.9 GPRS detach / abnormal cases / GPRS detach procedure collision

44.2.2.1.9.1 Conformance requirement

When a DETACH REQUEST is received by the MS while waiting for a DETACH ACCEPT message, the MS shall answer the network initiated GPRS detach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

44.2.2.1.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.2.1.9.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure for Class B devices and a normal GPRS attach for Class C devices. The MS initiates a GPRS detach. The SS does not answer the detach procedure, but initiates a detach procedure (cause re-attach not required). The MS shall continue with the network initiated detach procedure.

The MS deletes the logical link.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS) or mode C if mode B is not supported. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = For Class B: 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' For Class C: ' GPRS Attach' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status(Class B) = no valid TMSI available Attach result for Class B = 'Combined GPRS / IMSI attached' Attach result for Class C: 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity (Class B)= TMSI-1 Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS | | The MS initiates a GPRS detach (without power off) by MMI or AT command. |
| 7 | MS -> SS | DETACH REQUEST | Detach type for Class B = 'normal detach, combined GPRS / IMSI detach' Detach type for Class C = 'normal detach, GPRS detach' |
| 8 | SS -> MS | DETACH REQUEST | Detach type = 're-attach not required', GMM cause = 'GPRS services and non-GPRS services not allowed' |
| 9 | MS -> SS | DETACH ACCEPT | The MS answers the network initiated detach. |
| 10 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 11 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 12 | SS -> MS | | For Class C MS, test is over. SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 13 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |

Specific message contents

None.

44.2.2.2 Network initiated GPRS detach procedure

44.2.2.2.1 GPRS detach / re-attach not required / accepted

44.2.2.2.1.1 Conformance requirement

The MS detach the IMSI for GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

44.2.2.2.1.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.2.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a GPRS attach procedure.

The SS sends a DETACH REQUEST message to the MS. The MS then deletes the logical link.

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|----------------|-----------|-----------------|--|
| 1 | SS | | The SS is set in network operation mode II. |
| 2 | MS | | The MS is set in MS operation mode B or C (see PICS). |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 5 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 6 | MS -> SS | ATTACH COMPLETE | |
| 7 | SS -> MS | DETACH REQUEST | Detach type = 're-attach not required' |
| 8 | MS -> SS | DETACH ACCEPT | |
| 9 | SS -> MS | | SS pages MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 10 optional | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS Attach' Mobile identity = P-TMSI-1 |
| 11 | MS | | No response from the MS to the request of step 9. This is checked for 10 s. |

Specific message contents

None.

44.2.2.2.2 GPRS detach / rejected / IMSI invalid / GPRS services not allowed

44.2.2.2.1 Conformance requirement

1) If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.

2) If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

44.2.2.2.2 Test purpose

To test the behaviour of the MS if the network orders a GPRS detach procedure with the cause 'GPRS services not allowed' (no valid GPRS-subscription for the IMSI).

44.2.2.2.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (HPLMN) and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS performs a detach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in another PLMN.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| | | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 22. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 5 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 6 | MS -> SS | ATTACH COMPLETE | |
| 7 | SS -> MS | DETACH REQUEST | Detach type = 're-attach not required' Cause = 'GPRS services not allowed' |
| 8 | MS -> SS | DETACH ACCEPT | |
| | | | The following messages are sent and shall be received on cell B. |
| 9 | SS | | The SS deactivates cell A and activates cell B. |
| 10 | MS | | Cell B is preferred by the MS. |
| | | | Step 11 is only performed for MS Operation Mode B. |
| 11 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 12 | | | The MS initiates an attach automatically (see PICS), by MMI or AT commands. |
| 13 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 14 | MS | | If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 15 | MS | | The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS). |
| 16 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 17 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 |
| 18 | MS -> SS | ATTACH COMPLETE | |
| 19 | MS | | The MS is switched off or power is removed (see PICS). |
| 20 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 21 | | | The SS deactivates cell B and activates cell A. |
| 22 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 20. |

Specific message contents

None.

44.2.2.2.3 GPRS detach / IMSI detach / accepted

44.2.2.2.3.1 Conformance requirement

The MS detach the IMSI for GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

44.2.2.2.3.2 Test purpose

To test the behaviour of the MS for the detach procedure.

44.2.2.2.3.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The SS sends a DETACH REQUEST message to the MS. The MS then performs an IMSI detach (detach for non-GPRS services).

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

The MS attach for non-GPRS services by a routing area update procedure. Both GPRS and CS services are possible.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS | | The SS initiates a detach for non-GPRS services. |
| 7 | SS -> MS | DETACH REQUEST | Detach type = 'IMSI detach' |
| 8 | MS -> SS | DETACH ACCEPT | |
| 9 | MS | | The MS initiates an attach for non-GPRS services (see PICS). |
| 10 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'Combined RA/LA updating with IMSI attach' P-TMSI-1 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available |
| 11 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Update result = 'Combined RA/LA updating' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity = TMSI-1 Routing area identity = RAI-1 |
| 12 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 13 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 14 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. |
| 15 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 16 | MS | | The MS is switched off or power is removed (see PICS). |
| 17 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.2.2.4 GPRS detach / re-attach requested / accepted

44.2.2.2.4.1 Conformance requirement

When receiving the DETACH REQUEST message and the detach type IE indicates "re-attach required", the MS shall deactivate the PDP contexts and deactivate the logical link(s), if any. The MS shall then send a DETACH ACCEPT message to the network and shall change state to GMM-DEREGISTERED. The MS shall, after the completion of the GPRS detach procedure, initiate a GPRS attach procedure. The MS should also activate PDP context(s) to replace any previously active PDP contexts.

NOTE: In some cases, user interaction may be required and then the MS cannot activate the PDP context(s) automatically.

A GPRS MS operating in MS operation mode A or B in network operation mode I, which receives an DETACH REQUEST message with detach type indicating "re-attach required" or "re-attach not required" and no cause code, is only detached for GPRS services in the network.

.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.2.

44.2.2.2.4.2 Test purpose

To test the behaviour of the MS for the detach procedure in case automatic re-attach.

44.2.2.2.4.3 Method of test

Initial conditions

System Simulator:

One cell in operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI(for Class B MS), P-TMSI and RAI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS performs a combined GPRS attach procedure for Class B devices and a normal GPRS attach for Class C devices.

The SS sends a DETACH REQUEST message to the MS with cause re-attach. The MS then detaches for GPRS services. The MS automatically performs a new combined GPRS attach procedure with Attach Type "GPRS attach while IMSI attached" (for Class B) or normal GPRS Attach procedure for Class C devices. GPRS and CS (only for Class B) services are again possible.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS) or mode C if mode B is not supported. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = For Class B: 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' For Class C: ' GPRS Attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = For Class B: 'Combined GPRS / IMSI attached' For Class C: 'GPRS only attached' Mobile identity (for Class B) = TMSI-1 Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS | | The SS initiates a detach with re-attach. |
| 7 | SS -> MS | DETACH REQUEST | Detach type = 're-attach required', GMM cause omitted |
| 8 | MS -> SS | DETACH ACCEPT | |
| 9 | MS -> SS | ATTACH REQUEST | Attach type = For Class B: 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' For Class C: ' GPRS Attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-1 |

44.2.2.2.5 GPRS detach / rejected / location area not allowed

44.2.2.2.5.1 Conformance requirement

44.2.2.2.5.1.1 Conformance requirement for a R97 and R98 MS

1) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

- 1.1 not perform combined GPRS attach when in the same location area;
- 1.2 delete any RAI or LAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number;
- 1.3 store the LAI in the list of in the 'forbidden location areas for regional provision of service';
- 1.4 delete any TMSI, LAI and ciphering key sequence number for GPRS MS operating in MS operation mode A or B.

2) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

- 2.1 perform combined GPRS attach when a new location area is entered;
- 2.2 delete the list of forbidden LAs when power is switched off.

Reference(s):

3GPP TS 04.08 subclauses 4.7.4.2.

44.2.2.2.5.1.2 Conformance requirement for a R99 or later MS

1) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

- 1.1 not perform combined GPRS attach when in the same location area;
- 1.2 delete any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number;
- 1.3 store the LAI in the list of 'forbidden location areas for regional provision of service';
- 1.4 delete any TMSI, LAI and ciphering key sequence number if the MS is IMSI attached and if no RR connection exists or if the MS is operating in MS operation mode A and an RR connection exists when the RR connection is subsequently released.

2) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:

- 2.1 perform combined GPRS attach when a new location area is entered;
- 2.2 delete the list of forbidden LAs when power is switched off.

Reference(s):

3GPP TS 24.008 subclauses 4.7.4.2.

44.2.2.2.5.2 Test purpose

To test the behaviour of the MS if the network orders the GPRS detach procedure with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

44.2.2.2.5.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC1/RAC2 (Not HPLMN), cell C in MCC2/MNC1/LAC2/RAC1 (Not HPLMN).

All cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).

PIXIT statements:

-

Test procedure

The SS orders a GPRS detach with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform (combined) GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off. For Class B MS, CS services are not possible unless an IMSI attach procedure is performed.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is set in MS operation mode B, or mode C if mode B is not supported (see PICS) |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type for Class B = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Attach type for Class C = 'GPRS attach' |
| 5 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI TMSI status = no valid TMSI available (Class B Only) Attach result for Class B = 'Combined GPRS / IMSI attached' Attach Result for Class C = 'GPRS Only attached' |
| 6 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 (Class B Only) Routing area identity = RAI-2 |

| Step | Direction | Message | Comments |
|---------------------|-----------|------------------------------------|---|
| 7 | SS -> MS | DETACH REQUEST | Detach type = 're-attach not required' Cause 'Location Area not allowed' |
| 8 | MS -> SS | DETACH ACCEPT | |
| | | | For Class C MS, go to Step 12 |
| 9 | MS | | No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds). |
| 10 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 11 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 12 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 13 | MS -> SS | | No response from the MS to the request. This is checked for 10 s |
| | | | The following messages are sent and shall be received on cell B. |
| 14 | SS | | The SS deactivates cell A and activates cell B. Cell B is preferred by the MS. |
| 15 | MS | | The MS initiates an attach automatically, by MMI or by AT command. |
| 16 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds) |
| 17 | MS | | For Class C MS, go to Step 21 |
| 18 | MS | | No LOCATION UPDATING REQ with type 'IMSI attach' is sent to the SS (SS waits 30 seconds). |
| 19 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 20 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 21 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 22 | | | No response from the MS to the request. This is checked for 10 s |
| | | | The following messages are sent and shall be received on cell C. |
| 23 | SS | | The SS deactivates cell B and activates cell C. Cell C is preferred by the MS. |
| 24 | MS | | Steps 25 and 26 are only performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS) |
| 25 (conditional) | | {Location Update Procedure} | For Class C MS, go to Step 26 Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 26 (conditional) | MS | | MS initiates an attach via MMI or AT command. |
| 27 | MS -> SS | ATTACH REQUEST | Attach type for Class B = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Attach type for Class C = 'GPRS attach' Mobile identity = IMSI TMSI status = no valid TMSI available (Class B Only) |

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 28 | SS -> MS | ATTACH ACCEPT | Attach result for Class B = 'Combined GPRS / IMSI attached' Attach Result for Class C = 'GPRS Only attached' Mobile identity = P-TMSI1 P-TMSI-1 signature Mobile identity (for Class B)= TMSI-1 Routing area identity = RAI-6 |
| 29 | MS -> SS | ATTACH COMPLETE | For Class C MS, go to Step 33 |
| 30 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 31 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. |
| 32 | SS | | SS releases the RR connection indicating a successful resumption of GPRS services. |
| 33 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 34 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 35 | MS | | The MS is switched off or power is removed (see PICS). |
| 36 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type for Class B = 'power switched off, combined GPRS / IMSI detach' Detach type for Class C = 'power switched off, GPRS detach' |
| | | | The following messages are sent and shall be received on cell B. |
| 37 | MS | | The SS deactivates cell C and activates cell B. Cell B is preferred by the MS. |
| 38 | MS | | The MS is powered up or switched on. Step 39 is only performed for non-auto attach Class B MS. |
| 39 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is TMSI-1. |
| 40 | MS | | MS initiates an attach automatically (see PICS), via MMI or AT commands. |

44.2.2.2.6 GPRS detach / rejected / GPRS services not allowed in this PLMN

44.2.2.2.6.1 Conformance requirement

If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed in this PLMN' the Mobile Station shall:

1. The MS shall delete any RAI, P-TMSI, P-TMSI signature, and GPRS ciphering key sequence number stored, shall set the GPRS update status to GU3 ROAMING NOT ALLOWED (and shall store it according to section 4.1.3.2) and shall change to state GMM-DEREGISTERED.
2. The MS shall store the PLMN identity in the "forbidden PLMNs for GPRS service" list.
3. A GPRS MS operating in MS operation mode A or B in network operation mode I shall set the timer T3212 to its initial value and restart it, if it is not already running.
4. A GPRS MS operating in MS operation mode A or B, is still IMSI attached for CS services in the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.2

44.2.2.2.6.2 Test purpose

To test the behaviour of the MS if the network orders the GPRS detach procedure with the cause 'GPRS services not allowed in this PLMN'.

44.2.2.2.6.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC2/MNC1/LAC1/RAC1.

All two cells are operating in network operation mode II. The PLMN of the two cells should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-8. MS is Idle Updated on Cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS orders a GPRS detach with the cause value 'GPRS services not allowed in this PLMN'. The SS checks that the MS responds to RR paging (in case of MS operation mode B) and does not respond to packet paging, does not perform periodic ROUTING AREA UPDATE procedure in this PLMN and performs periodic ROUTING AREA UPDATE procedure when new PLMN is entered.

T3312: set to 6 minutes.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | MS | | The MS is set in MS operation mode B or C (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 |

| 8 | MS -> SS | DETACH ACCEPT | Steps 9, 10 and 11 are only performed for MS Operation Mode B. |
| 9 | SS -> MS | | SS pages the MS with mobile identity of TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 10 | MS -> SS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. |
| 11 | SS | | SS releases the RR connection. |
| 12 | | | SS pages the MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 13 | | | No response from the MS to the request. This is checked for 10 seconds. |
| 14 | | | No ROUTING AREA UPDATE REQUEST sent to the SS (SS waits Ready Timer Period (T3314) + Periodic Routing Area Updating timer (T3312) (+10%)). |
| 15 | SS | | The following messages are sent and shall be received on cell B. |
| 16 | MS | | The SS deactivates cell A and activates cell B. Cell B is preferred by the MS. |
| 17 | MS | {Location Update Procedure} | Step 17 is only performed for MS Operation Mode B. Location Update Procedure initiated from the MS. |
| 18 | MS -> SS | ATTACH REQUEST | The MS initiates an attach automatically, by MMI or by AT command. Attach type = 'GPRS attach' Mobile identity = IMSI |
| 19 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 T3312 = 6 minutes |
| 20 | MS -> SS | ATTACH COMPLETE | |
| 21 | SS | | The SS verifies that the time between the Attach and the periodic RA updating is Ready Timer Period (T3314) + Periodic Routing Area Updating timer (T3312) (+/- 10%) |
| 22 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-2 |

| | | | |
|----|----------|---------------------------------|---|
| 23 | SS -> MS | ROUTING AREA UPDATING ACCEPT | No new mobile identity assigned. P-TMSI and TMSI not included. Update result = 'RAUpdated' Negotiated Ready timer value IE should not be included. Force to standby indicator set |
| 24 | MS | | The MS is switched off or power is removed (see PICS). |
| 25 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, |

Specific message contents

None.

44.2.3 Routing area updating procedure

This procedure is used to update the actual routing area of an MS in the network.

44.2.3.1 Normal routing area updating

The routing area updating procedure is a GMM procedure used by GPRS MSs of MS operation mode B or C that are IMSI attached for GPRS services only.

44.2.3.1.1 Routing area updating / accepted

44.2.3.1.1.1 Conformance requirement

- 1) If the network accepts the routing area updating procedure and reallocates a P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.
- 2) If the network accepts the routing area updating procedure from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the routing area updating procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is reallocated;
- 2) Old P-TMSI / P-TMSI signature is not changed.

44.2.3.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).

- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

- 1) The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. The MS will not answer signalling addressed to the old P-TMSI.
- 2) The MS sends a ROUTING AREA UPDATING REQUEST message. The SS accepts the P-TMSI and returns ROUTING AREA UPDATING ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A but not cell B. |
| 3 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 22. |
| 4 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'GPRS attach' |
| 5 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 6 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS. Update type = 'RA updating' |
| 9 | SS -> MS | ROUTING AREA UPDATING ACCEPT | P-TMSI-2 signature Routing area identity = RAI-1 |
| 10 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Update result = 'RA updated' |
| 11 | SS->MS | GMM INFORMATION | Mobile identity = P-TMSI-1 |
| 11b | MS->SS | GMM STATUS | P-TMSI-1 signature |
| 12 | SS -> MS | PAGING REQUEST TYPE 1 | Routing area identity = RAI-4 Message sent in case the MS does not support reception of GMM information message. Cause #97 |
| 13 | MS | | Mobile identity = P-TMSI-2 Paging order is for TBF establishment. No response from the MS to the request. This is checked for 10 s. |
| 14 | SS | | The following messages are sent and shall be received on cell A. |
| 15 | MS | | The RF level of cell B is lowered until cell A is preferred by the MS. |
| 16 | MS -> SS | ROUTING AREA UPDATING REQUEST | Cell A is preferred by the MS. Update type = 'RA updating' |
| 17 | SS -> MS | ROUTING AREA UPDATING ACCEPT | P-TMSI-1 signature Routing area identity = RAI-4 No new mobile identity assigned. |
| 18 | SS -> MS | PAGING REQUEST TYPE 1 | P-TMSI not included. Update result = 'RA updated' |
| 19 | MS -> SS | UPLINK RLC DATA BLOCK | P-TMSI-2 signature Routing area identity = RAI-1 |
| 20 | MS | | Mobile identity = P-TMSI-1 Paging order is for TBF establishment. |
| 21 | MS -> SS | DETACH REQUEST | LLC PDU implicitly indicating paging response. The MS is switched off or power is removed (see PICS). Message not sent if power is removed. |
| 22 | MS | | Detach type = 'power switched off, GPRS detach' The MS is set in MS operation mode B (see PICS), reset the RF level of Cell A to default state, deactivate Cell B and the test is repeated from step 3 to step 21. |

Specific message contents

None.

44.2.3.1.1a Routing area updating / accepted / old P-TMSI

44.2.3.1.1a.1 Conformance requirement

Upon receipt of a GMM message containing a new P-TMSI the MS shall consider the new P-TMSI and new RAI and also the old P-TMSI and old RAI as valid in order to react to paging requests and downlink transmission of LLC frames.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.1.5.1.

44.2.3.1.1a.2 Test purpose

To test the validity of old and new P-TMSI the network accepts the routing area updating procedure.

44.2.3.1.1a.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. The MS will answer signalling addressed to the old P-TMSI and to the new P-TMSI. The SS sends a GMM INFORMATION MESSAGE. The MS will answer signalling addressed only to the new P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A but not cell B. |
| 3 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 23. |
| 4 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'GPRS attach' |

44.2.3.1.2 Routing area updating / rejected / IMSI invalid / illegal ME

44.2.3.1.2.1 Conformance requirement

- 1) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'Illegal ME'.

44.2.3.1.2.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a routing area updating with the cause value 'Illegal ME'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 5 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'GPRS only attached' Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set |
| 6 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS | | Cell B is preferred by the MS. |
| 8 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' Routing area identity = RAI-1 |
| 9 | SS -> MS | ROUTING AREA UPDATE REJECT | GMM cause = 'Illegal ME' |
| 10 | SS -> MS | | SS page MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 11 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 12 | SS | | The following messages are sent and shall be received on cell C. The SS deactivates both cell A and cell B. The SS activates cell C. |
| 13 | MS | | Cell C is preferred by the MS. |
| 14 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 15 | MS | | If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 16 | MS | | The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS). |
| 17 | | {Location Update Procedure} | Step 17 is only performed by MS in operation mode B Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 18 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 19 | SS -> MS | ATTACH ACCEPT | |
| 20 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 |
| 21 | MS | | The MS is switched off or power is removed (see PICS). |
| 22 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.3.1.3 Routing area updating / rejected / MS identity cannot be derived by the network

44.2.3.1.3.1 Conformance requirement

If the network rejects a routing area updating procedure from the Mobile Station with the cause 'MS identity cannot be derived by the network', the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Depending on the manufacturer the MS may or may not perform a GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.3.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'MS identity cannot be derived by the network'.

44.2.3.1.3.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Automatic attach procedure when MS identity cannot be derived by the network (TSPC_AddInfo_auto_AP_no_MS ID).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal routing area updating with the cause value 'MS identity cannot be derived by the network'. The MS detach locally. A new GPRS attach may be performed.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. |
| 3 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 |
| 5 | SS -> MS | ATTACH ACCEPT | Routing area identity = RAI-1 Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature |
| 6 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-1 |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | MS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 9 | MS -> SS | ROUTING AREA UPDATE REQUEST | Cell B is preferred by the MS. Update type = 'RA updating' P-TMSI-2 signature |
| 10 | SS -> MS | ROUTING AREA UPDATE REJECT | Routing area identity = RAI-1 GMM cause = 'MS identity cannot be derived by the network' |
| 11 | MS | | If an automatic attach procedure by the MS is not possible when the MS identity cannot be derived by the network (see PICS) goto step 19. |
| 12 | MS | | An Automatic GPRS attach procedure is initiated (see PICS). |
| 13 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 14 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature |
| 15 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-4 |
| 16 | MS | | The MS is switched off or power is removed (see PICS). |
| 17 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 18 | | | Stop the sequence |
| 19 | SS -> MS | | SS page MS with Mobile identity = P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 20 | MS | | No response from the MS to the request, as the MS has detached locally. This is checked for 10 s. |

Specific message contents

None.

44.2.3.1.4 Routing area updating / rejected / location area not allowed

44.2.3.1.4.1 Conformance requirement

1) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

- 1.1 not perform GPRS attach when in the same location area;
- 1.2 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
- 1.3 store the LA in the 'forbidden location areas for regional provision of service'.

2) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:

- 2.1 perform GPRS attach when a new location area is entered;
- 2.2 delete the list of forbidden LAs after switch off (power off).

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.5.1.

44.2.3.1.4.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

44.2.3.1.4.3 Method of test

Initial conditions

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC2/RAC1.

All cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell C.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a routing area updating with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12 am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | SS MS | | The following messages are sent and shall be received on cell C. The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 42. |
| 2 | SS | | The SS activates cell C. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell C is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 5 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-3 |
| 6 | MS -> SS | ATTACH COMPLETE | |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | SS | | The SS deactivates cell C and activates cell B. Cell B is preferred by the MS. |
| 9 | | | The following step is only performed for MS Operation Mode B. |
| 10 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 11 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-3 |
| 12 | SS -> MS | ROUTING AREA UPDATE REJECT | GMM cause = 'Location Area not allowed' |
| 13 | SS -> MS | | SS pages MS with Mobile identity = P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 14 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 15 | | | The following messages are sent and shall be received on cell A. |
| 16 | SS | | The SS deactivates cell B and activates cell A. Cell A is preferred by the MS. |
| 17 | MS | | No ATTACH REQUEST sent to SS |
| 18 | MS | | (SS waits 30 seconds) |

| Step | Direction | Message | Comments |
|------------------------|-----------|-----------------------------|---|
| 19 | | | The following messages are sent and shall be received on cell C. |
| 20 | SS | | The SS deactivates cell A and activates cell C. |
| 21 | MS | | Cell C is preferred by the MS. |
| 22 | | | The following step is only performed for MS Operation Mode B. |
| 23 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| | MS | | The MS initiates a GPRS attach either automatically or manually (see PICS). |
| 24 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 25 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature |
| 26 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-3 |
| | | | If SIM removal is possible (see PICS), perform steps 27A, 28A-1, 28A-2. Otherwise if switch off is possible (see PICS) perform steps 27B, 28B. Otherwise perform step 27C. |
| 27A | MS | | SIM removal is performed. |
| 28A-1 | MS -> SS | DETACH REQUEST | Detach type = Normal Detach, 'GPRS detach' or 'power switched off, GPRS detach' If Detach Type is 'power switched off, GPRS detach' go to step 29 |
| 28A-2 (conditional) | SS -> MS | DETACH ACCEPT | |
| 27B | MS | | Switch off is performed. |
| 28B | MS -> SS | DETACH REQUEST | Detach type = 'power switched off, GPRS detach' |
| 27C | MS | | Power is removed. |
| 29 | MS | | The MS gets the SIM replaced, is powered up or switched on and initiates an attach (see PICS). |
| 30 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-2 Routing area identity = RAI-3 |
| 31 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature |
| 32 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-3 |
| 33 | SS | | The following messages are sent and shall be received on cell A. |
| 34 | | | The SS deactivates cell C and activates cell A. |
| 35 | | | Cell A is preferred by the MS. |
| 36 | | | The following step is only performed for MS Operation Mode B. |
| 37 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 38 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-1 signature |
| 39 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Routing area identity = RAI-3 No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Update result = 'RA updated' Routing area identity = RAI-1 Negotiated Ready Timer IE is not included Force to standby indicator set |
| 40 | MS | | The MS is switched off or power is removed (see PICS). |
| 41 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

| Step | Direction | Message | Comments |
|------|-----------|---------|--|
| 42 | MS | | The MS is set in MS operation mode B (see PICS), cell A is switched off and the test is repeated from step 2 to step 41. |

Specific message contents

None.

44.2.3.1.5 Routing area updating / abnormal cases / attempt counter check / miscellaneous reject causes

44.2.3.1.5.1 Conformance requirement

- 1) When a routing area updating procedure is rejected with the routing area updating attempt counter less than five, the Mobile Station shall repeat the routing area updating procedure after T3311 timeout.
- 2) When a routing area updating procedure is rejected with the routing area updating attempt counter five, the Mobile Station shall start timer T3302.
- 3) When the T3302 expires, a new routing area updating procedure shall be initiated.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.5.2 Test purpose

To test the behaviour of the MS with respect to the routing area updating attempt counter.

44.2.3.1.5.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2. T3302 is set to 12 minutes. The ATT-flag shall indicate that the MS should use IMSI attach/detach procedures.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS has a valid IMSI and is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure (routing area updating attempt counter zero). The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter one) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter two) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter three) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter four) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented but T3311 is not started, as the routing area updating attempt counter is five. T3302 is started.

The MS initiates a routing area updating procedure with routing area updating attempt counter zero after T3302 expires with the stored P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | SS MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | | | The following step is only performed for MS Operation Mode B. |
| 5 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. Location updating type = "IMSI Attach". Parameter mobile identity is IMSI. T3212 is started at the end of the procedure. |
| 6 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 7 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI not included. Attach result = 'GPRS only attached' P-TMSI-2 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included. Force to standby indicator set |
| 8 | | | The following messages are sent and shall be received on cell B. |
| 9 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 10 | SS | | Cell B is preferred by the MS. |
| 11 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 12 | SS -> MS | ROUTING AREA UPDATE REJECT | GMM cause = 'Congestion' |
| 13 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 14 | SS | | The SS verifies that the time between the routing area update reject and the routing area update request is T3311 (+/- 10%) |
| 15 | SS -> MS | ROUTING AREA UPDATE REJECT | GMM cause = 'Congestion' |
| 16 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' |
| 17 | SS | | P-TMSI-2 signature Routing area identity = RAI-1 The SS verifies that the time between the previous routing area update reject and the previous routing area update request is T3311 (+/- 10%) |
| 18 | SS -> MS | ROUTING AREA UPDATE REJECT | GMM cause = 'Congestion' |
| 19 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' |

44.2.3.1.6 Routing area updating / abnormal cases / change of cell into new routing area

44.2.3.1.6.1 Conformance requirement

When a change of cell into a new routing area is performed before the routing area updating procedure is finished, the MS shall abort the routing area updating procedure and re-initiate it in the new routing area.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.6.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.1.6.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2 and cell C In MCC1/MNC1/LAC1/RAC3.

All cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update into a new routing area. The MS shall re-initiate a routing area updating procedure in the new routing area.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 18. |
| 2 | SS | | The SS activates cell A, B and C. The RF level of cell A is -50 dBm, cell B - 60 dBm and cell C - 70 dBm. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 5 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 6 | MS -> SS | ATTACH COMPLETE | |
| 7 | | | Wait 30 sec to let the MS identify the neighbour cells B and C. |
| 8 | SS | | The following messages are sent and shall be received on cell B. |
| | SS | | The RF level of cell A is lowered to -100 dBm. |
| 9 | SS | | Cell B is preferred by the MS. |
| 10 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 11 | SS | | No response to the ROUTING AREA UPDATING REQUEST message is given by the SS |
| 12 | SS | | The following messages are sent and shall be received on cell C. |
| | SS | | The RF level of cell B is lowered to -100 dBm. |
| 13 | MS -> SS | ROUTING AREA UPDATE REQUEST | The following message may be sent and shall be received on cell B. Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| | SS | | Cell C is preferred by the MS. |
| 14 | SS | | Cell C is preferred by the MS. |
| 15 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 16 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-3 signature Routing area identity = RAI-5 |
| 17 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 18 | MS | | The MS is switched off or power is removed (see PICS). |
| 19 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 20 | MS | | The MS is set in MS operation mode B (see PICS), and the test is repeated from step 2 to step 19. |

Specific message contents

None.

44.2.3.1.7 Routing area updating / abnormal cases / change of cell during routing area updating procedure

44.2.3.1.7.1 Conformance requirement

When a change of cell within a new routing area is performed before the routing area updating procedure is finished, the MS shall perform the cell update before the routing area updating procedure is finished.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.7.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.1.7.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2 and cell C in MCC1/MNC1/LAC1/RAC2.

All three cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update within the routing area. The MS then waits for the ROUTING AREA UPDATE ACCEPT message.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| 1 | SS MS | | The following messages are sent and shall be received on cell A. The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A, B and C. The RF level of cell A is –50 dBm, cell B – 60 dBm and cell C – 70 dBm. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach result = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 5 | SS -> MS | ATTACH ACCEPT | No new mobile identity assigned. P-TMSI-1 included. Attach result = 'GPRS only attached' P-TMSI-2 signature Routing area identity = RAI-1 |
| 6 | MS -> SS | ATTACH COMPLETE | |
| 7 | | | Wait 30 sec to let the MS identify the neighbour cells B and C. |
| 8 | SS | | The following messages are sent and shall be received on cell B. |
| 9 | SS | | The RF level of cell A is lowered to –100 dBm. |
| 10 | MS -> SS | ROUTING AREA UPDATE REQUEST | Cell B is preferred by the MS. Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 11 | SS | | No response to the ROUTING AREA UPDATE REQUEST message is given by the SS |
| 12 | SS | | The following messages are sent and shall be received on cell C. |
| 13 | MS -> SS | ROUTING AREA UPDATING REQUEST | The RF level of cell B is lowered to –100 dBm. The following message may be sent and shall be received on cell B. Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 14 | SS | | Cell C is preferred by the MS. |
| 15 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating cell update. |
| 16 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 17 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-3 signature Routing area identity = RAI-4 |
| 18 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 19 | MS | | The MS is switched off or power is removed (see PICS). |

None.

44.2.3.1.8 Routing area updating / abnormal cases / P-TMSI reallocation procedure collision

44.2.3.1.8.1 Conformance requirement

When a P-TMSI REALLOCATION COMMAND message is received by the MS while waiting for a ROUTING AREA UPDATE ACCEPT message, the MS shall ignore the P-TMSI reallocation procedure and continue with the routing area updating procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

44.2.3.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.1.8.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The SS does not answer the routing area updating procedure, but initiates a P-TMSI reallocation procedure. The MS shall ignore the P-TMSI reallocation procedure and continue with the routing area updating procedure.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | MS | | The MS is set in MS operation mode C or B (see PICS). |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| 4 | MS -> SS | ATTACH REQUEST | Attach result = 'GPRS attach' Mobile identity = IMSI |
| 5 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 6 | MS -> SS | ATTACH COMPLETE | |
| | SS | | The following messages are sent and shall be received on cell B. |
| 7 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 8 | SS | | Cell B is preferred by the MS. |
| 9 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-1 |
| 10 | SS -> MS | P-TMSI REALLOCATION COMMAND | Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 11 | MS | | The MS ignores the P-TMSI reallocation command. |
| 12 | SS -> MS | ROUTING AREA UPDATE ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-4 |
| 13 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 14 | MS | | The MS is switched off or power is removed (see PICS). |
| 15 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.3.1.9 Routing area updating / abnormal cases / Network reject with Extended Wait Timer

44.2.3.1.9.1 Conformance requirement

#22 (Congestion);

If the T3346 value IE is present in the ROUTING AREA UPDATE REJECT message and the value indicates that this timer is neither zero nor deactivated, the MS shall proceed as described below, otherwise it shall be considered as an abnormal case and the behaviour of the MS for this case is specified in subclause 4.7.5.1.5.

The MS shall abort the routing area updating procedure, reset the routing area updating attempt counter and set the GPRS update status to GU2 NOT UPDATED. If the rejected request was not for initiating a PDN connection for emergency bearer services, the MS shall change to state GMM-REGISTERED.ATTEMPTING-TO-UPDATE.

The MS shall stop timer T3346 if it is running.

If the ROUTING AREA UPDATE REJECT message is integrity protected, the MS shall start timer T3346 with the value provided in the T3346 value IE.

If the ROUTING AREA UPDATE REJECT message is not integrity protected, the MS shall start timer T3346 with a random value from the default range specified in table 11.3a.

The MS stays in the current serving cell and applies the normal cell reselection process. The routing area updating procedure is started, if still necessary, when timer T3346 expires or is stopped.

If the update type is "periodic updating", a GPRS MS operating in MS operation mode A or B in network operation mode I is still IMSI attached for CS services in the network.

If S1 mode is supported in the MS, the MS shall handle the EMM parameters EMM state, EPS update status, and tracking area updating attempt counter as specified in 3GPP TS 24.301 [120] for the case when the tracking area update procedure is rejected with the EMM cause with the same value.

An MS configured for NAS signalling low priority indicates this by including the Device properties IE in the appropriate NAS message and setting the low priority indicator to "MS is configured to NAS signalling low priority
"Extended wait time" for PS domain from the lower layers

If the ROUTING AREA UPDATE REQUEST message contained the low priority indicator set to "MS is configured for NAS signalling low priority", the MS shall start timer T3346 with the "Extended wait time" value.

Timer T3346 is running

The MS shall not start the routing area updating procedure unless:

- the READY timer is running (A/Gb mode);
- the MS is accessing the network with access class 11 – 15; or
- the MS is in PMM-CONNECTED mode (Iu mode);
- the MS receives a paging;
- the MS has a PDN connection for emergency bearer services established; or
- the MS is establishing a PDN connection for emergency bearer services; or
- the MS has a PDN connection established without the NAS signalling low priority indication or is establishing a PDN connection without the NAS signalling low priority indication and if the timer T3346 was started due to a NAS request message (ATTACH REQUEST, ROUTING AREA UPDATE REQUEST or SERVICE REQUEST) which contained the low priority indicator set to "MS is configured for NAS signalling low priority". The MS stays in the current serving cell and applies the normal cell reselection process.

The routing area updating procedure is started, if still necessary, when timer T3346 expires or is stopped.

NOTE 2: It is considered an abnormal case if the MS needs to initiate an routing area updating procedure while timer T3346 is running independent on whether timer T3346 was started due to an abnormal case or a non successful case.

Reference(s):

3GPP TS 24.008 clause 1.8, 3GPP TS 24.008 clauses 4.7.5.1.4, 4.7.5.1.5

44.2.3.1.9.2 Test purpose

1. To verify that the LAP indicator can be set in the UE
2. To verify that the Delay Tolerant indicator is sent by the UE
3. To verify that the UE uses the back-off timer if the network reject a request with the Extended Wait Timer

44.2.3.1.9.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

The MS is configured for “low access priority”

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS rejects a normal routing area updating with the cause value 'Congestion'. The SS includes the T3346 timer in the reject message. The SS checks that the MS does not perform new Routing Area Updating before the timer T3346 has expired.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 17. |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS. |
| | | | Step 4 is only performed for MS Operation Mode B. |
| 4 | | {Location Update Procedure} | Macro. MOBILE_IDENTITY set to IMSI. Location Update Procedure initiated from the MS. |
| 5 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 6 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 7 | MS -> SS | ATTACH COMPLETE | |
| | | | The following messages are sent and shall be received on cell B. |
| 8 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 9 | MS | | Cell B is preferred by the MS. |
| 10 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 Device properties = 'MS is configured for NAS signalling low priority' |
| 11 | SS -> MS | ROUTING AREA UPDATE REJECT | GMM cause = 'Congestion' T3346 value = 2 minutes |
| 12 | SS | | The SS verifies that the MS does not initiate the routing area update procedure before timer T3346 has expired |
| | | | Step 13 is only performed for MS Operation Mode B. |
| 13 | | {Location Update Procedure} | Macro. MOBILE_IDENTITY set to TMSI. Location Update Procedure initiated from the MS. |
| 14 | MS -> SS | ROUTING AREA UPDATE REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 Device properties = 'MS is configured for NAS signalling low priority' |
| 15 | SS -> MS | ROUTING AREA UPDATE ACCEPT | No new mobile identity assigned. P-TMSI-1 and P-TMSI-1 signature not included. Update result = 'RA updated' Routing area identity = RAI-2 |
| 16 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 17 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 16. |

Specific message contents

None.

44.2.3.2 Combined routing area updating

The combined routing area updating procedure is a GMM procedure used by GPRS MSs of MS operation mode A or B that are IMSI attached for GPRS and non-GPRS services. In order to use the combined routing area updating procedure, the network must operate in network operation mode I.

44.2.3.2.1 Combined routing area updating / combined RA/LA accepted

44.2.3.2.1.1 Conformance requirement

- 1) If the network accepts the combined routing area updating procedure and reallocates a P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.
- 2) If the network accepts the combined routing area updating procedure from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the combined routing area updating procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is reallocated;
- 2) Old P-TMSI / P-TMSI signature is not changed;
- 3) Mobile terminating CS call is allowed with IMSI;
- 4) Mobile terminating CS call is allowed with TMSI.

44.2.3.2.1.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

- 1) A combined GPRS attach procedure is performed. The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI, unassigns the TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI and IMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.

- 2) The MS is CS paged in order to verify that the IMSI is used for CS calls.
- 3) The MS sends an ROUTING AREA UPDATING REQUEST message. The SS accepts the P-TMSI signature and returns ROUTING AREA UPDATING ACCEPT message without any P-TMSI and with a new TMSI. The MS acknowledge the new TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS-SS is performed by the old P-TMSI. For CS calls, the new TMSI is used.
- 4) The MS is CS paged in order to verify that the TMSI is used for CS calls.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|-----------------|-----------|--------------------------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature |
| 5 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-1 |
| 6 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |

| 25 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 26 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 27 | MS | | The MS is switched off or power is removed (see PICS). |
| 28 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.3.2.2 Combined routing area updating / MS in CS operation at change of RA

44.2.3.2.2.1 Conformance requirement

GPRS MS that is in an ongoing CS transaction at change of routing area shall initiate the routing area updating procedure only after the CS transaction has been released.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.2.2 Test purpose

To test the behaviour of the MS when using the combined routing area updating procedure in cases where the MS is CS connected at change of RA.

44.2.3.2.2.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A combined GPRS attach procedure is performed. The MS initiates a CS call. The routing area change. MS will not send a ROUTING AREA UPDATE REQUEST message until the CS operation is terminated.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS | | A CS call is initiated. |
| 7 | SS | | Activate cell B with the same signal strength as cell A. |
| 8 | SS -> MS | | Handover commanded by SS on to DCCH of cell B |
| 9 | MS | | The following messages are sent and shall be received on cell B. No RA updating procedure is initiated. This is checked for 60 seconds. |
| 10 | MS | | The CS call is terminated |
| 11 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = no valid TMSI available |
| 12 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-4 |
| 13 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 14 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 15 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 16 | SS -> MS | | SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell. |
| 17 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity IMSI. |
| 18 | SS | | SS releases the RR connection. |
| 19 | MS | | The MS is switched off or power is removed (see PICS). |
| 20 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.3.2.3 Combined routing area updating / RA only accepted

44.2.3.2.3.1 Conformance requirement

- 1) If the network accepts the combined routing area updating procedure, but GMM cause code 'IMSI unknown in HLR' is sent to the MS the Mobile Station shall delete the stored TMSI, LAI and CKSN. The Mobile Station shall consider SIM invalid for non-GPRS services until power is switched off or SIM is removed.
- 2) If the network accepts the combined routing area updating procedure, but GMM cause code 'MSC temporarily not reachable', or 'Network failure' is sent to the MS, an MS operation mode B MS may perform an MM IMSI attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.3.2 Test Purpose

Test purpose 1

To test the behaviour of the MS if the network accepts the routing area updating procedure with indication RA only, GMM cause 'IMSI unknown in HLR'.

Test purpose 2

To test the behaviour of the MS if the network accepts the routing area updating procedure with indication RA only, GMM cause 'MSC temporarily not reachable', or 'Network failure'.

44.2.3.2.3.3 Method of test

44.2.3.2.3.3.1 Test Procedure 1

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

After attach, the MS sends an ROUTING AREA UPDATE REQUEST message. The SS allocates a P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a P-TMSI. GMM cause 'IMSI unknown in HLR' is indicated from SS. Further communication MS - SS is performed by the P-TMSI. CS services are not possible.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 8 | SS -> MS | ROUTING AREA UPDATING ACCEPT | TMSI status = no valid TMSI available Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 GMM cause = 'IMSI unknown in HLR' |
| 9 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 10 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 11 | MS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 12 | SS -> MS | | SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell. |
| 13 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 14 | MS | | The MS is switched off or power is removed (see PICS). |
| 15 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.3.2.3.3.2 Test Procedure 2

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I. T3212 is set to 6 minutes.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode A (TSPC_operation_mode_A).
- Automatic MM IMSI attach procedure at switch-on/power-on (TSPC_AddInfo_auto_MM_IMSI_AP_on_off).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

After attach, the MS sends an ROUTING AREA UPDATE REQUEST message . The SS allocates a new P-TMSI signature and returns ROUTING AREA UPDATE ACCEPT message. GMM cause 'MSC temporarily not reachable', or 'Network failure' is indicated from SS. The cause code is arbitrarily chosen. This procedure is repeated until the routing area updating attempt counter is equal to five. An MS operation mode B MS may perform an MM IMSI attach procedure (according to the PICS statement). Further communication MS - SS is performed by the P-TMSI. The existence of a signalling channel is verified by a request for mobile identity. It is further verified that the MS after a successful IMSI attach procedure can perform CS services.

Maximum duration of test

10 minutes.

Expected sequence

Dependent whether the option Automatic MM IMSI attach procedure at switch-on/power-on ' is supported or not, the steps 1-28 or 29-62 apply depending on manufacturer (see PICS).

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | MS | | The following messages are sent and shall be received on cell A The MS is set in MS operation mode B and no automatic MM IMSI attach procedure is indicated (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 8 | SS -> MS | ROUTING AREA UPDATING ACCEPT | TMSI status = no valid TMSI available Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 9 | MS -> SS | ROUTING AREA UPDATING COMPLETE | GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) |
| 10 | | | The routing area updating attempt counter =1. The combined routing area updating procedure is reinitialized at the expiry of T3311 |
| 11 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating with IMSI Attach' P-TMSI-1 signature Routing area identity = RAI-4 |
| 12 | SS -> MS | ROUTING AREA UPDATING ACCEPT | TMSI status = no valid TMSI available Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 13 | MS -> SS | ROUTING AREA UPDATING COMPLETE | GMM cause = 'MSC temporarily not reachable', or 'Network failure' (arbitrarily chosen) |
| 14 | | | The routing area updating attempt counter =2. The combined routing area updating procedure is reinitialized at the expiry of T3311 |

Specific message contents

SYSTEM INFORMATION TYPE 3 (Cell A) in Test Procedure 2:

| Information element | Value/remark |
|--|--------------|
| As default message contents except: | |
| Control Channel Description T3212 timeout value | 6 min |

Note: An R97 MS will use this value to set T3302.

ATTACH ACCEPT and ROUTING AREA UPDATE ACCEPT in Test Procedure 2:

| Information Element | Value/remark |
|--|--------------|
| As default message contents except: T3302 value | 6 min |

Note: This IE is only read by MS's supporting R99 and onwards.

44.2.3.2.4 Combined routing area updating / rejected / PLMN not allowed

44.2.3.2.4.1 Conformance requirement

1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall:

- 1.1. not perform combined GPRA attach when switched on in the same location area or PLMN;
- 1.2. delete the stored RAI, GPRS-CKSN, P-TMSI, P-TMSI signature, TMSI CKSN and LAI;
- 1.3. store the PLMN in the 'forbidden PLMN list'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.4.2 Test purpose

To test the behaviour of the MS if the network rejects the combined routing area updating procedure of the MS with the cause 'PLMN not allowed'.

44.2.3.2.4.3 Method of test

Initial conditions

System Simulator:

Four cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC1/MNC2/LAC1/RAC2, cell C in MCC1/MNC2/LAC2/RAC1 and cell D in MCC2/MNC1/LAC1/RAC1.

All four cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).

PIXIT statements:

-

Test Procedure

The SS rejects a combined routing area updating with the cause value 'PLMN not allowed'. The SS checks that the MS does not perform GPRS attach if activated in the same PLMN. The SS checks that the MS does not perform IMSI attach if activated in the same PLMN.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | SS | | The SS activates cell A. |
| 3 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-8 |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = TMSI-1 |
| 6 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS | | Cell B is preferred by the MS. |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature |
| 9 | SS -> MS | ROUTING AREA UPDATING REJECT | Routing area identity = RAI-8 GMM cause = 'PLMN not allowed' |
| 10 | MS | | The MS initiates an attach by MMI or AT command. |
| 11 | MS | | No ATTACH REQUEST sent to SS |
| 12 | SS -> MS | | (SS waits 30 seconds). SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 13 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 14 | SS | | The following messages are sent and shall be received on cell C. |
| 15 | MS | | The SS deactivates cell B and activates cell C. |
| 16 | MS | | Cell C is preferred by the MS. |
| 17 | MS | | The MS initiates an attach by MMI or by AT command. |
| 18 | SS -> MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. |
| 19 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 20 | SS | | The following messages are sent and shall be received on cell A. |
| 21 | MS | | The SS deactivates cell C and activates cell A. |
| 22 | MS | | Cell A is preferred by the MS. |
| 23 | MS | | The MS initiates an attach by MMI or by AT command. |
| 24 | SS -> MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 25 | MS | | No response from the MS to the request. This is checked for 10 s. |

| Step | Direction | Message | Comments |
|---------------------|-----------|------------------------------------|---|
| 26 | SS | | The following messages are sent and shall be received on cell D. |
| 27 | MS | | The SS deactivates cell A and activates cell D. Cell D is preferred by the MS. |
| 28 (conditional) | | {Location Update Procedure} | Steps 28 and 29 are only performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS) |
| 29 (conditional) | MS | | Macro. Location Update Procedure initiated from the MS. |
| 30 | MS -> SS | ATTACH REQUEST | MS initiates an attach via MMI or AT commands. |

44.2.3.2.5 Combined routing area updating / rejected / roaming not allowed in this location area

44.2.3.2.5.1 Conformance requirement

For a R97 and R98 MS only:

1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station:

- 1.1 shall not perform combined GPRS attach when in the same location area;
- 1.2 shall delete the stored RAI, GPRS-CKSN, P-TMSI P-TMSI signature, TMSI, CKSN and LAI;
- 1.3 shall store the LA in the 'forbidden location areas for roaming';
- 1.4 may perform combined GPRS attach when a new location area is entered.

2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.

For a R99 or later MS only:

1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station:

- 1.1 shall not perform combined GPRS attach when in the same location area;
- 1.2 shall store the LA in the 'forbidden location areas for roaming';

1.3 shall perform a routing area update when entering in a new location area if the LAI or the PLMN identity is not contained in any of the lists "forbidden LAs for roaming", "forbidden LAs for regional provision of service", "forbidden PLMNs for GPRS service" or "forbidden PLMNs" and the current update status is different from "IDLE NO IMSI".

2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

Additional references for R99 or after MS only, TS 23.122 subclause 4.5.2.

44.2.3.2.5.2 Test purpose

Test purpose 1

To test that on receipt of a rejection using the 'Roaming not allowed in this area' cause code, the MS ceases trying a routing area updating procedure on that location area. Successful combined routing area updating procedure is possible in other location areas.

Test purpose 2

To test that if the MS is switched off or the SIM is removed the list of 'forbidden location areas for roaming' is cleared.

44.2.3.2.5.3 Method of test

44.2.3.2.5.3.1 Test procedure 1

Initial conditions

System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1 (RAI-2), cell B in MCC2/MNC1/LAC2/RAC1 (RAI-6).

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- GPRS attach attempted automatically due to outstanding request (TSPC_AddInfo_GPRS_Attach_Attempt_Outstanding).
- MS Higher Layer release (TSPC_MS_HIGHER_LAYER_RELEASE)

PIXIT statements:

-

Test procedure

The SS rejects a combined routing area updating with the cause value 'Roaming not allowed in this area'. A new attempt for a combined GPRS attach is not possible.

For a R97 and R98 MS only, successful combined GPRS attach procedure is performed in another location area.

For a R99 or after MS only, successful combined routing area updating procedure is performed in another location area.

The MS is moved back to the 1st location area. A combined routing area updating shall not be performed, as the LA is on the forbidden list.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|-------------------|-----------|------------------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | SS MS | | The SS activates cell A. The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = TMSI-1 |
| 6 | SS | | The following messages are sent and shall be received on cell B. |
| 7 | MS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Cell B is preferred by the MS. Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-2 |
| 9 | SS -> MS | ROUTING AREA UPDATING REJECT | The RF level of cell A is lowered until cell A is no more suitable. GMM cause = 'Roaming not allowed in this area' |
| 10 | MS | | The MS initiates an attach by MMI or by AT command. |
| 11 | MS | | This step is only performed for a R97 and R98 mobile. No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 12 | SS -> MS | | This step is only performed for a R97 and R98 mobile. SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 13 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 14 | SS -> MS | | SS pages the MS with mobile identity TMSI and paging order for RR connection according to the channel combination of the cell. |
| 15 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 16 | SS | | The following messages are sent and shall be received on cell A. |
| 17 | MS | | The RF level of cell A is increased and the RF level of cell B is lowered until cell A is preferred by the MS. |
| 18 | | {Location Update Procedure} | Cell A is preferred by the MS. Macro. Location Update Procedure initiated from the MS. |
| (optional) | | | Step 19 is performed by an MS which will not initiate a GPRS attach automatically due to outstanding request (see PICS). |
| A19 (conditional) | MS | | MS initiates an attach via MMI or AT commands. This step is only performed for a R97 and R98 mobile. |

| Step | Direction | Message | Comments |
|--|-----------|-------------------------------|--|
| A20 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI TMSI status = no valid TMSI available (See note) |
| A21 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 Mobile identity = TMSI-1 |
| A22 | MS -> SS | ATTACH COMPLETE | Update type = 'Combined RA/LA updating' or 'Combined RA/LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-2 (See note) Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-2 Mobile identity = TMSI-1 |
| B20 | MS -> SS | ROUTING AREA UPDATING REQUEST | |
| B21 | SS -> MS | ROUTING AREA UPDATE ACCEPT | |
| B22 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 23 | SS -> MS | | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. SS releases the RR connection indicating a successful resumption of GPRS services. SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. |
| 24 | MS | | |
| 25 | SS | | |
| 26 | SS -> MS | | |
| 27 | MS | | |
| 28 | SS | | The following messages are sent and shall be received on cell B. The RF level of cell B is increased and the RF level of cell A is lowered until cell B is preferred by the MS. No ROUTING AREA UPDATING REQUEST sent to SS (SS waits 30 seconds). SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. No response from the MS to the request. This is checked for 10 s. |
| 29 | MS | | |
| 30 | SS -> MS | | |
| 31 | MS | | |
| NOTE: An R97 and R98 MS follows the steps in the order specified as A. An R99 or later MS follows the steps in the order specified as B. | | | |

Specific message contents

None.

44.2.3.2.5.3.2 Test procedure 2

Initial conditions

System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1, cell B in MCC2/MNC1/LAC2/RAC1.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- SIM removal possible without powering down (TSPC_AddInfo_SIMRmv).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- MS Higher Layer release (TSPC_MS_HIGHER_LAYER_RELEASE).

PIXIT statements:

-

Test procedure

The SS rejects a combined routing area updating with the cause value 'Roaming not allowed in this area'. The MS is switched off for 10 s and switched on again. The SS checks that a combined GPRS attach is possible on the cell on which the previous combined routing area updating had been rejected.

For a R97 and R98 MS only, the Mobile identity is IMSI for the combined GPRS attach.

For a R99 or after MS only, the Mobile identity is either IMSI or P-TMSI for the combined GPRS attach.

If SIM removal is possible without switching off: The SS rejects a routing area updating with the cause value 'Roaming not allowed in this area'. The SIM is removed and inserted in the MS. The SS checks that a GPRS attach procedure and routing area updating procedure is possible on the cell on which the routing area updating had previously been rejected.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-2 |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = TMSI-1 |
| | | | The following messages are sent and shall be received on cell B. |
| 6 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS | | Cell B is preferred by the MS. |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-2 |
| 9 | SS -> MS | ROUTING AREA UPDATING REJECT | The RF level of cell A is lowered until cell A is no more suitable. GMM cause = 'Roaming not allowed in this area' |
| 10 | MS | | The MS initiates an attach by MMI or by AT command. |
| 11 | MS | | No ATTACH REQUEST sent to SS (SS waits 30 seconds). |
| 12 | SS -> MS | | SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. |
| 13 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 14 | SS -> MS | | SS pages the MS with mobile identity TMSI and paging order for RR connection according to the channel combination of the cell. |
| 15 | MS | | The MS shall not initiate an RR connection. This is checked during 3 seconds. |
| 16 | MS | | If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 17 | MS | | The MS gets the SIM replaced, is powered up or switched on. Step 18 is only performed for non-auto attach MS. |
| 18 | | {Location Update Procedure} | Macro. Location Update Procedure initiated from the MS. |
| 19 | MS | | MS initiates an attach automatically (see PICS), via MMI or AT commands. |
| A20 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI TMSI status = no valid TMSI available (See note) |
| B20 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity =IMSI or P-TMSI (See note) |

| Step | Direction | Message | Comments |
|--|-----------|-----------------|--|
| 21 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-6 Mobile identity = TMSI-1 |
| 22 | MS -> SS | ATTACH COMPLETE | SS pages the MS with mobile identity TMSI-1 and paging order for RR connection according to the channel combination of the cell. Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity TMSI-1. SS releases the RR connection indicating a successful resumption of GPRS services. SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. The MS is switched off or power is removed (see PICS). Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach' |
| 23 | SS -> MS | | |
| 24 | MS | | |
| 25 | SS | | |
| 26 | SS -> MS | | |
| 27 | MS | | |
| 28 | MS | | |
| 29 | MS -> SS | | |
| NOTE: An R97 and R98 MS shall perform step A20. An R99 or later MS shall perform step B20. | | | |

Specific message contents

None.

44.2.3.2.6 Combined routing area updating / abnormal cases / access barred due to access class control

44.2.3.2.6.1 Conformance requirement

- 1) The MS shall not perform combined routing area updating procedure, but stays in the current serving cell and applies normal cell reselection process.
- 2) The Mobile Station shall perform the combined routing area updating procedure when:
 - 2.1 Access is granted.
 - 2.2 Cell is changed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.6.2 Test purpose

Test purpose 1

To test the behaviour of the MS in case of access class control (access is granted).

Test purpose 2

To test the behaviour of the MS in case of access class control (cell is changed).

44.2.3.2.6.3 Method of test

44.2.3.2.6.3.1 Test procedure 1

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is initially indicated to be barred on Cell B.

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 has Access Class x not barred, cell B in MCC1/MNC/LAC1/RAC2 has Access Class x barred.

Both cells are operating in network operation mode I.

Access class x barred.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach procedure is performed. The routing area is changed. The SS indicates access class x barred. A routing area updating procedure is not performed.

The SS indicates that access class x is not barred. A routing area updating procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | SS MS | | The SS activates cell A. The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = IMSI |
| 6 | SS | | The following messages are sent and shall be received on cell B. |
| 7 | MS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. No ROUTING AREA UPDATE REQUEST sent to SS, as access class x is barred (SS waits 30 seconds). |
| 8 | SS | | The access class x is not barred anymore. The value of the BCCH_CHANGE_MARK in the SI13 is altered to indicate the access class change. |
| 9 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 10 | SS -> MS | ROUTING AREA UPDATING ACCEPT | TMSI status = no valid TMSI available Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = TMSI-1 |
| 11 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Routing area identity = RAI-4 |
| 12 | MS | | The MS is switched off or power is removed (see PICS). |
| 13 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach' |

Specific message contents

None.

44.2.3.2.6.3.2 Test procedure 2

Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is indicated to be barred on cell B.

System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 has access class x not barred, cell B in MCC1/MNC1/LAC1/RAC2 has access class x barred, cell C in MCC1/MNC1/LAC1/RAC2 has access class x not barred.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach procedure is performed. The routing area is changed. The SS indicates access class x barred. A routing area updating procedure is not performed.

A cell change is performed into a cell where access class x is not barred. A routing area updating procedure is performed.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | SS MS | | The SS activates cell A. The MS is powered up or switched on and initiates an attach (see PICS). |

44.2.3.2.7 Combined routing area updating / abnormal cases / attempt counter check / procedure timeout

44.2.3.2.7.1 Conformance requirement

- 1) When a T3330 timeout has occurred during a routing area updating procedure, the Mobile Station shall repeat the routing area updating procedure after T3330 timeout until the procedure is repeated five times.
- 2) When a routing area updating procedure is repeated five times, the routing area updating attempt counter is incremented and five more routing area updating procedures are performed. This procedure is repeated until the routing area updating attempt counter is five, the Mobile Station shall then start timer T3302.
- 3) When the T3302 expire, a new routing area updating procedure shall be initiated.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.7.2 Test purpose

To test the behaviour of the MS with respect to the routing area updating attempt counter.

44.2.3.2.7.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC/LAC1/RAC2. T3302 is set to 12 minutes.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure (routing area updating attempt counter zero). The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter one) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter two) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter three) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter four) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and as the routing area updating attempt counter is five. T3302 is started.

The MS may perform a Location Update procedure.

The MS initiates a routing area updating procedure with routing area updating attempt counter zero after T3302 expires with the stored P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

Maximum duration of test

30 minutes.

Specific message contents

SYSTEM INFORMATION TYPE 3 (Cell A):

| Information element | Value/remark |
|--|--------------|
| As default message contents except: | |
| Control Channel Description T3212 timeout value | 12 min |

Note: An R97 MS will use this value to set T3302.

ATTACH ACCEPT:

| Information Element | Value/remark |
|-------------------------------------|--------------|
| As default message contents except: | |
| T3302 value | 12 min |

Note: This IE is only read by MS's supporting R99 and onwards.

44.2.3.2.8 Combined routing area updating / abnormal cases / change of cell into new routing area

44.2.3.2.8.1 Conformance requirement

When a change of cell into a new routing area is performed before the routing area updating procedure is finished, the MS shall abort the routing area updating procedure and re-initiate it in the new routing area.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.2.8.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC1/RAC3.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update into a new routing area. The Ms shall re-initiate a routing area updating procedure in the new routing area. The MS shall not increment the attempt counter.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | SS | | The SS activates cell A, B and C. The RF level of cell A is –50 dBm, cell B – 60 dBm and cell C – 70 dBm. |
| 3 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = IMSI |
| 6 | | | Wait 30 sec to let the MS identify the neighbour cells B and C. |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | MS | | The RF level of cell A is lowered to –100 dBm. Cell B is preferred by the MS. |
| 9 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 10 | SS | | TMSI status = no valid TMSI available No response id given from the SS. |
| 11 | MS | | The following messages are sent and shall be received on cell C. |
| 12 | MS -> SS | ROUTING AREA UPDATE REQUEST | The RF level of cell B is lowered to –100 dBm. The following message may be sent and shall be received on cell B. Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 13 | MS | | TMSI status = no valid TMSI available |
| 14 | MS -> SS | ROUTING AREA UPDATING REQUEST | Cell C is preferred by the MS. Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 15 | SS -> MS | ROUTING AREA UPDATING ACCEPT | TMSI status = no valid TMSI available Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI |
| 16 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Routing area identity = RAI-5 |
| 17 | MS | | The MS is switched off or power is removed (see PICS). |
| 18 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach' |

Specific message contents

None.

44.2.3.2.9 Combined routing area updating / abnormal cases / change of cell during routing area updating procedure

44.2.3.2.9.1 Conformance requirement

When a change of cell within new routing area is performed before the routing area updating procedure is finished, the MS shall perform the cell update before the routing area updating procedure is finished.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.2.9.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC1/RAC2.

All three cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update within the routing area. The MS then waits for the ROUTING AREA UPDATE ACCEPT message.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | SS | | The SS activates cell A, B and C. The RF level of cell A is –50 dBm, cell B – 60 dBm and cell C – 70 dBm. |
| 3 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = IMSI |
| 6 | | | Wait 30 sec to let the MS identify the neighbour cells B and C. |
| 7 | SS | | The following messages are sent and shall be received on cell B. |
| 8 | MS | | The RF level of cell A is lowered to –100 dBm. Cell B is preferred by the MS. |

| 17 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 18 | MS | | The MS is switched off or power is removed (see PICS). |
| 19 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach' |

Specific message contents

None.

44.2.3.2.10 Combined routing area updating / abnormal cases / GPRS detach procedure collision

44.2.3.2.10.1 Conformance requirement

- 1) When a detach request is received with cause 'GPRS detach' or 'combined GPRS/IMSI detach' by the MS while waiting for a ROUTING AREA UPDATE ACCEPT message, the MS shall terminate the routing area updating procedure and continue with the GPRS detach procedure.
- 2) When a detach request is received with cause 'IMSI detach' by the MS while waiting for a ROUTING AREA UPDATE ACCEPT message, the MS shall ignore the detach request and continue with the routing area updating procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.10.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

44.2.3.2.10.3 Method of test

44.2.3.2.10.3.1 Test procedure 1

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The SS does not answer the routing area updating procedure, but initiates a GPRS detach procedure with cause 'GPRS detach' or 'combined GPRS/IMSI detach'. The MS shall terminate the routing area updating procedure and continue with the GPRS detach procedure.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | TMSI status = no valid TMSI available Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = IMSI |
| | | | The following messages are sent and shall be received on cell B. |
| 6 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS | | Cell B is preferred by the MS. |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | SS | | TMSI status = no valid TMSI available The SS ignores the ROUTING AREA UPDATING REQUEST message and initiates a detach procedure. |
| 10 | SS -> MS | DETACH REQUEST | Detach type = 're-attach not required' |
| 11 | MS -> SS | DETACH ACCEPT | |

Specific message contents

None.

44.2.3.2.10.3.2 Test procedure 2

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)- MS operation mode A (TSPC_operation_mode_A).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a routing area updating procedure. The SS does not answer the routing area updating procedure, but initiates a GPRS detach procedure with cause 'IMSI detach'. The MS shall ignore the detach procedure and continue with the routing area updating procedure.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |

| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = IMSI |
| | | | The following messages are sent and shall be received on cell B. |
| 6 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | MS | | Cell B is preferred by the MS. |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | SS | | TMSI status = no valid TMSI available The SS ignores the ROUTING AREA UPDATING REQUEST message and initiates a detach procedure. |
| 10 | SS -> MS | DETACH REQUEST | Detach type = 'IMSI detach' |
| 11 | MS | | The MS ignores the DETACH REQUEST message and continue the routing area updating procedure. |
| 12 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Mobile identity = IMSI Routing area identity = RAI-4 |
| 13 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 14 | MS | | The MS is switched off or power is removed (see PICS). |
| 15 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS/IMSI detach' |

Specific message contents

None.

44.2.3.3 Periodic routing area updating

44.2.3.3.1 Periodic routing area updating / accepted

44.2.3.3.1.1 Conformance requirement

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.2 and 4.7.5.1.

44.2.3.3.1.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure with identity P-TMSI. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. A routing area updating procedure is performed at T3312 timeout.

T3312; set to 6 minutes.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| 1 | SS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 11. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 6 minutes |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 7 | SS | | The SS verifies that the time between the attach and the periodic RA updating is Ready Timer Period (T3314) + Periodic Routing Area Updating timer (T3312) (+/- 10%) |
| 8 | SS -> MS | ROUTING AREA UPDATING ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready Timer IE is not included |
| 9 | MS | | Force to standby indicator set The MS is switched off or power is removed (see PICS). |
| 10 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 11 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 10. |

Specific message contents

None.

44.2.3.3.2 Periodic routing area updating / accepted / T3312 default value

44.2.3.3.2.1 Conformance requirement

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.2 and 4.7.5.2.

44.2.3.3.2.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.2.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a (combined) GPRS attach procedure (see PICS). The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. After 54 minutes, a periodic routing area updating procedure is initiated by the MS.

T3312; default value 54 minutes.

Maximum duration of test

60 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| 1 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 2 | MS -> SS | ATTACH REQUEST | Attach type for Class B = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Attach type for Class C = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 3 | SS -> MS | ATTACH ACCEPT | Attach result for Class B = 'Combined GPRS /IMSI attached' Attach result for Class C = ' GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Mobile identity for Class B = TMSI-1 Routing area identity = RAI-1 T3312 = 54 min |
| 4 | MS -> SS | ATTACH COMPLETE | |
| 5 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = valid TMSI available or IE not present |

| 7 | SS -> MS | ROUTING AREA UPDATING ACCEPT | No new mobile identity assigned. P-TMSI and TMSI not included. Update result = 'RAupdated' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready Timer IE is not included Force to standby indicator set |
| 8 | MS | | The MS is switched off or power is removed (see PICS). |
| 9 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type for Class B = 'power switched off, combined GPRS/IMSI detach' Detach type for Class C= 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.3.3.2a Periodic routing area updating / accepted / per-device value

44.2.3.3.2a.1 Conformance requirement

Periodic routing area updating is used to periodically notify the availability of the MS to the network. The procedure is controlled in the MS by timer T3312. The value of timer T3312 is sent by the network to the MS in the messages ATTACH ACCEPT and ROUTING AREA UPDATE ACCEPT. The value of timer T3312 shall be unique within a RA.

The network may include timer T3312 extended value IE in the ATTACH ACCEPT message or ROUTING AREA UPDATE ACCEPT message only if the MS indicates support of the timer T3312 extended value in the MS network feature support IE.

If the network includes the timer T3312 extended value IE in the ATTACH ACCEPT message or ROUTING AREA UPDATE ACCEPT message, the network shall use the timer T3312 extended value IE as the value of timer T3312.

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

Reference(s):

3GPP TS 24.008 clauses 4.7.2.2 and 4.7.5.1

44.2.3.3.2a.2 Test purpose

To verify that the MS uses the per-device timer value for Periodic Routing Area Update received in an Attach Accept or RAU Accept message

44.2.3.3.2a.3 Method of test

Initial conditions

System Simulator:

- One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- MS operation mode C (TSPC_operation_mode_C)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure with identity P-TMSI. In the GPRS attach procedure the MS indicates support of the extended timer value. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI, timer T3312 and the extended value of T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. A routing area updating procedure is performed when the extended value of timer T3312 times out.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1 | SS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 11. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 MS network feature support = 1 (MS support of extended timer) |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 4 minutes T3312 extended value = 6 min |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 7 | SS | | The SS verifies that the time between the attach and the periodic RA updating is Ready Timer Period (T3314) + the extended value of the Periodic Routing Area Updating timer (T3312 extended value) (+/- 10%) |
| 8 | SS -> MS | ROUTING AREA UPDATING ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RA updated' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready Timer IE is not included |
| 9 | MS | | Force to standby indicator set The MS is switched off or power is removed (see PICS). |
| 10 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 11 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 10. |

Specific message contents

None.

44.2.3.3.3 Periodic routing area updating / no cell available / network mode I

44.2.3.3.3.1 Conformance requirement

If the MS is both IMSI attached for GPRS and non-GPRS services, and if the MS lost coverage of the registered PLMN and timer T3312 expires; if the MS returns to coverage in a cell that supports GPRS and the network is in network operation mode I, then the MS shall perform a combined routing area update procedure indicating 'combined RA/LA updating with IMSI attach'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.2.2 and 4.7.5.1.

44.2.3.3.3.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Cell A is operating in network operation mode II and cell B is in network operation mode I.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B)
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. GPRS radio contact is distorted before T3312 timeout. GPRS radio contact is established again (after T3312 timeout), and a routing area updating procedure is performed immediately.

T3312; set to 6 minutes.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| | SS | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | SS | | The MS is set in MS operation mode B (see PICS). |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 |
| 5 | SS -> MS | ATTACH ACCEPT | Routing area identity = RAI-1 Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 6 minutes |
| 6 | MS -> SS | ATTACH COMPLETE | |
| 7 | SS | | After 5 minutes, the signal strength is lowered until the MS has lost contact with the SS. |
| 8 | SS | | Wait 2 minutes. |
| | | | The following messages are sent and shall be received on cell B. |
| 9 | SS | | The SS activates cell B. |
| 10 | MS | | Cell B is preferred by the MS. |
| 11 | MS | | The MS immediately starts a combined RA updating procedure |
| 12 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating with IMSI attach' P-TMSI-2 signature Routing area identity = RAI-1 TMSI status = valid TMSI available or IE is omitted |
| 13 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-3 P-TMSI-3 signature Mobile identity = TMSI-2 Routing area identity = RAI-4 |
| 14 | MS -> SS | ROUTING AREA UPDATE COMPLETE | |
| 15 | MS | | The MS is switched off or power is removed (see PICS). |
| 16 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |

Specific message contents

None.

44.2.3.3.4 Periodic routing area updating / no cell available

44.2.3.3.4.1 Conformance requirement

If the MS is both IMSI attached for GPRS and non-GPRS services, and if the MS lost coverage of the registered PLMN and timer T3312 expires; if the MS returns to coverage in a cell that supports GPRS and the network is in network operation mode II, then the MS shall perform a periodic routing area update procedure and a periodic location update procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.2.2 and 4.7.5.2.

44.2.3.3.4.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

44.2.3.3.4.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The MS initiates a GPRS attach procedure. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. GPRS radio contact is distorted before T3312 timeout. GPRS radio contact is established again (after T3312 timeout), and a periodic routing area updating procedure is performed immediately (no periodic location update procedure is performed as T3212=0).

T3312; set to 6 minutes.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 2 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 Routing area identity = RAI-1 |
| 3 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3312 = 6 minutes |
| 4 | MS -> SS | ATTACH COMPLETE | |
| 5 | SS | | After 5 minutes, the signal strength is lowered until the MS have lost contact with the SS. |
| 6 | SS | | After 2 minutes, the signal strength is increased until the MS have got contact with the SS. |
| 7 | MS | | The MS immediately start the periodic RA updating procedure |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Periodic updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | SS -> MS | ROUTING AREA UPDATING ACCEPT | No new mobile identity assigned. P-TMSI not included. Update result = 'RAupdated' P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready Timer IE is not included Force to standby indicator set |
| 10 | MS | | The MS is switched off or power is removed (see PICS). |
| 11 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.4 P-TMSI reallocation

44.2.4.1 Conformance requirement

- 1) A Mobile Station shall acknowledge a new P-TMSI when explicitly allocated.
- 2) The P-TMSI shall be updated on the SIM when the Mobile Station is correctly deactivated in accordance with the manufacturer's instructions.
- 3) A Mobile Station shall use the given P-TMSI in further communication with the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.6.

44.2.4.2 Test Purpose

To verify that the MS is able to receive and acknowledge a new P-TMSI by means of an explicit P-TMSI reallocation procedure.

To verify that the MS has stored the P-TMSI in a non-volatile memory.

The implicit reallocation procedure is tested in the attach procedure.

44.2.4.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An explicit P-TMSI reallocation procedure is performed (P-TMSI reallocation command sent from the SS and acknowledged from the MS by P-TMSI reallocation complete). The MS is GPRS detached and switched off. Its power supply is interrupted for 10 s. The power supply is resumed and then the MS is switched on. A GPRS attach procedure is performed with the given P-TMSI as identity.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|---|
| 1 | MS | | The MS is set in MS operation mode B (see PICS). If MS operation mode B not supported set the MS in operation mode C. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' |
| 4 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-1 |
| 6 | SS -> MS | P-TMSI REALLOCATION COMMAND | P-TMSI-1 signature Routing area identity = RAI-1 |
| 7 | MS -> SS | P-TMSI REALLOCATION COMPLETE | Mobile identity = P-TMSI-2 |
| 8 | MS | | P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | MS -> SS | DETACH REQUEST | The MS is switched off or power is removed (see PICS). Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 10 | MS | | Ensure the power is removed from the MS for at least 10 s |
| 11 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 12 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' |
| 13 | SS -> MS | ATTACH ACCEPT | Mobile identity = P-TMSI-2 Routing area identity = RAI-1 No new mobile identity assigned. P-TMSI not included. Attach result = 'GPRS only attached' |
| 14 | SS -> MS | PAGING REQUEST TYPE 1 | P-TMSI-3 signature Routing area identity = RAI-1 Negotiated Ready timer value IE should not be included Force to standby indicator set |
| 15 | MS -> SS | UPLINK RLC DATA BLOCK | Mobile identity = P-TMSI-2 Paging order is for TBF establishment. LLC PDU implicitly indicating paging response. |
| 16 | MS | | The MS is switched off or power is removed (see PICS). |
| 17 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.5 GPRS authentication and ciphering

44.2.5.1 Test of authentication

The purpose of this procedure is to verify the user identity. A correct response is essential to guarantee the establishment of the connection. If not, the connection will drop.

44.2.5.1.1 Authentication accepted

44.2.5.1.1.1 Conformance requirement

A Mobile Station shall correctly respond in an authentication and ciphering procedure by sending a response with the SRES information field set to the same value as the one produced by the authentication and ciphering algorithm in the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

44.2.5.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the authentication and ciphering procedure.

44.2.5.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure.

The SS checks the value SRES sent by the MS in the AUTHENTICATION AND CIPHERING RESPONSE message.

The MS initiates a routing area updating procedure and the SS checks the value of the GPRS Ciphering Key Sequence Number sent by the MS in the ROUTING AREA REQUEST message.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. |
| 3 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 18. |
| 4 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'GPRS attach' Mobile identity = IMSI |
| 5 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request authentication. Set GPRS-CKSN-1 RAND |
| 6 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | SRES |
| 7 | SS | | The SS checks the SRES value. "Auth. Response Parameter (extension)" IE might be included if the RES value is more than 4 octets long. |
| 8 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | MS -> SS | ATTACH COMPLETE | |
| 10 | SS | | The following messages are sent and shall be received on cell B. |
| 11 | MS -> SS | ROUTING AREA UPDATING REQUEST | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 GPRS-CKSN-1 |
| 12 | SS | | The value of GPRS-CKSN is checked |
| 13 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 14 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 15 | MS | | The MS is switched off or power is removed (see PICS). |
| 16 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 17 | SS | | Reset the RF level of cell A to default state. Deactivate cell B. |
| 18 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 16. |

Specific message contents

None.

44.2.5.1.2 Authentication rejected

44.2.5.1.2.1 Conformance requirement

1. Upon receipt of an AUTHENTICATION AND CIPHERING REJECT message, the MS shall set the GPRS update status to GU3 ROAMING NOT ALLOWED and shall delete the P-TMSI, P-TMSI signature, RAI and GPRS ciphering key sequence number stored.
2. The SIM shall be considered as invalid until switching off or the SIM is removed.

3. If the AUTHENTICATION AND CIPHERING REJECT message is received, the MS shall abort any GMM procedure, shall stop the timers T3310 and T3330 (if running) and shall enter state GMM-DEREGISTERED.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.5.

44.2.5.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the authentication and ciphering procedure.

44.2.5.1.2.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The test sequence is repeated for $k = 1, 2$.

A complete GPRS attach procedure is performed. The SS rejects the following authentication and ciphering procedure. The MS is paged with its former P-TMSI and shall not respond.

The Cell is changed into a new Routing Area.

The SS checks that the MS does not perform normal routing area updating.

The SS then checks that the MS does not perform a GPRS attach.

The SS checks that the MS does not perform a GPRS detach if switched off.

The MS is switched on or powered up. The SS checks that the MS performs a GPRS Attach procedure.

Maximum duration of test

10 minutes.

Expected sequence

The test sequence is repeated for $k = 1, 2$.

For $k = 1$, the MS is set in MS operation mode C. If MS operation mode C not supported then $k = 2$.

For $k = 2$ the MS is set in MS operation mode B.

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. |
| 3 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'GPRS attach' Mobile identity = IMSI |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-1 |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request authentication. Set GPRS-CKSN-1 RAND |
| 7 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | SRES |
| 8 | SS -> MS | AUTHENTICATION AND CIPHERING REJECT | |
| 9 | SS -> MS | | The SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. |
| 10 | MS | | No response from the MS to the request. This is checked for 10 s. |
| 11 | SS | | The following messages are sent and shall be received on cell B. |
| 12 | MS | | The SS deactivates cell A and activates cell B. |
| 13 | MS | | Cell B is preferred by the MS. |
| 14 | MS | | No ROUTING AREA UPDATING REQUEST sent to the SS (SS waits 30 seconds). |
| 15 | MS | | If possible (see PICS) the MS initiates an attach by MMI or by AT command. |
| 16 | MS | | No ATTACH REQUEST sent to the SS (SS waits 30 seconds). |
| 17 | SS | | The MS is switched off (see PICS). |
| 18 | | | No DETACH REQUEST sent to the SS (SS waits 30 seconds). |
| 19 | | {Location Update Procedure} | The MS is powered up or switched on. Step 19 is only performed for k =2 |
| 19a | | | Macro. Location Update Procedure initiated from the MS. Parameter mobile identity is IMSI. |
| 20 | MS -> SS | ATTACH REQUEST | MS initiates an attach (see PICS). Attach type = 'GPRS only attached' Mobile identity = IMSI |
| 21 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS attach' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 22 | MS -> SS | ATTACH COMPLETE | |
| 23 | MS | | The MS is switched off or power is removed. (see PICS) |
| 24 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. |
| 25 | MS | | If k=1 then the test is repeated for k=2. |

Specific message contents

None.

44.2.5.1.3 Authentication accepted with USIM

44.2.5.1.1.1 Conformance requirement

A Mobile Station shall correctly respond in an authentication and ciphering procedure by sending a response with the SRES information field set to the same value as the one produced by the authentication and ciphering algorithm in the network.

In a UMTS authentication challenge, if the AUTHENTICATION_AND_CIPHERING REQUEST message includes the UMTS authentication parameters GPRS CKSN, RAND and AUTN, then upon receipt of the message, the MS verifies the AUTN parameter and if this is accepted, the MS processes the challenge information and sends an AUTHENTICATION_AND_CIPHERING RESPONSE message to the network.

Reference(s):

3GPP TS 24.008 subclause 4.7.7.2.

44.2.5.1.1.2 Test purpose

To verify that the MS is able to authenticate itself for GPRS transmission using the USIM application through an UMTS challenge.

44.2.5.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II, SGSN is R99

Mobile Station:

Test USIM is plugged into the MS.
The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure with an UMTS challenge request.

The SS checks the value RES sent by the MS in the AUTHENTICATION AND CIPHERING RESPONSE message (calculated with UMTS AKA algorithm).

The MS initiates a routing area updating procedure and the SS checks the value of the GPRS Ciphering Key Sequence Number sent by the MS in the ROUTING AREA REQUEST message.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|---|
| | | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 18. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 5 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content) |
| 6 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | RES |
| 7 | SS | | The SS checks the RES value. |
| 8 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | MS -> SS | ATTACH COMPLETE | |
| | | | The following messages are sent and shall be received on cell B. |
| 10 | SS | | Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS. |
| 11 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 GPRS-CKSN-1 |
| 12 | SS | | The value of GPRS-CKSN is checked |
| 13 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 14 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 15 | MS | | The MS is switched off or power is removed (see PICS). |
| 16 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 17 | SS | | Reset the RF level of cell A to default state. Deactivate cell B. |
| 18 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 16. |

Specific message contents

AUTHENTICATION AND CIPHERING REQUEST in step 5:

Same as default content except :

| Information element | Value/remark |
|---------------------|-------------------------------------|
| IE AUTN | Calculated as defined for Test USIM |

44.2.5.2 Test of ciphering mode setting

The purpose of this procedure is to let the network to trigger the start and stop of stream ciphering.

The SS shall start and synchronise ciphering and deciphering according to 3GPP TS 03.20 / 3GPP TS 33.102, 3GPP TS 33.220. The bitstream shall be generated according to the commanded algorithm GExA.

44.2.5.2.1 Ciphering mode / start ciphering

44.2.5.2.1.1 Conformance requirements

1. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the attach procedure, with Ciphering indicator information element set to 'ciphering mode off', the Mobile Station shall:
 - 1.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
 - 1.2. not start ciphering.
2. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the routing area updating procedure, with Ciphering indicator information element set to 'ciphering mode on', the Mobile Station shall:
 - 2.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
 - 2.2. start ciphering and deciphering with the algorithm indicated by the Ciphering algorithm information element;
 - 2.3. the ciphering uses the cipher key determined during the authentication procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

44.2.5.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the authentication and ciphering procedure with ciphering.

44.2.5.2.1.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

For execution counter $K = 4$ (GEA4) Test USIM has to be plugged into the MS
The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Supported encryption Algorithm : GEA1 (TSPC_Feat_GEA1)
- Supported encryption Algorithm : GEA2 (TSPC_Feat_GEA2)
- Supported encryption Algorithm : GEA3 (TSPC_Feat_GEA3)

- Supported encryption Algorithm : GEA4 (TSPC_Feat_GEA4)

PIXIT statements:

-

Test procedure

A GPRS attach is performed. Authentication procedure without ciphering is performed.

The MS initiates a routing area updating procedure, and the SS initiates an authentication and ciphering procedure to start ciphering. GEA1, GEA2, GEA3 or GEA4 encryption is used depending on the execution counter K.

The test is performed for all GEAx encryption algorithm supported by the MS.

Maximum duration of test

15 minutes.

Expected sequence

The sequence is performed for execution counter K=1 when the MS supports GEA1, for K=2 when the MS supports GEA2, for K=3 when the MS supports GEA3 and for K=4 when the MS supports GEA4.

| 15 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 Message ciphered |
| 16 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Message ciphered |
| 17 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity = P-TMSI-1 Paging order is for TBF establishment. Message not ciphered |
| 18 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating paging response. Message may be ciphered depending on the type of LLC PDU that are sent. The 'E' bit is therefore not checked. |
| 19 | SS -> MS | P-TMSI REALLOCATION COMMAND | Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-4 Message ciphered |
| 20 | MS -> SS | P-TMSI REALLOCATION COMPLETE | Message ciphered |
| 21 | SS -> MS | IDENTITY REQUEST | Identity type = IMEI Message not ciphered |
| 22 | MS -> SS | IDENTITY RESPONSE | Mobile identity = IMEI Message not ciphered |
| 23 | SS -> MS | P-TMSI REALLOCATION COMMAND | Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 Message ciphered |
| 24 | MS -> SS | P-TMSI REALLOCATION COMPLETE | Message ciphered |
| 25 | MS | | The MS is switched off or power is removed (see PICS). |
| 26 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' Message ciphered |
| 27 | SS | | Cell B is powered down and Cell A is restored to full power. |
| 28 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 26. |

Note that due to the test of ciphering, it is in this test case indicated whether each message is ciphered or not.

Specific message contents

AUTHENTICATION AND CIPHERING REQUEST in step 5:

Same as default content except :

| Information element | Value/remark |
|--|---|
| IE AUTN | Not present for K = 1 Not present for K = 2 Not present for K = 3 Present for K = 4, calculated as defined for Test USIM |
| Ciphering Algorithm Type of Algorithm | No ciphering |

AUTHENTICATION AND CIPHERING REQUEST in step 13:

Same as default content except:

| Information element | Value/remark |
|--|---|
| IE AUTN | Not present for K = 1 Not present for K = 2 Not present for K = 3 Present for K = 4, calculated as defined for Test USIM |
| Ciphering Algorithm Type of Algorithm | GEA/1 for K = 1 GEA/2 for K = 2 GEA/3 for K = 3 GEA/4 for K = 4 |

44.2.5.2.2 Ciphering mode / stop ciphering

44.2.5.2.2.1 Conformance requirements

1. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the attach procedure, with Ciphering indicator information element set to 'ciphering mode on', the Mobile Station shall:
 - 1.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
 - 1.2. start ciphering and deciphering with the algorithm indicated by the Ciphering algorithm information element;
 - 1.3. the ciphering uses the cipher key determined during the authentication procedure.
2. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the routing area updating procedure, with Ciphering indicator information element set to 'ciphering mode off', the Mobile Station shall:
 - 2.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
 - 2.2. stop ciphering.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

44.2.5.2.2.2 Test purpose

To test the behaviour of the MS if the network accepts the authentication and ciphering procedure without ciphering.

44.2.5.2.2.2 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure to start ciphering.

A RA updating procedure is initiated, and authentication procedure without ciphering is performed. Ciphering is turned off.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|--|
| | | | The following messages are sent and shall be received on cell A. |
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 22. |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI Message not ciphered |
| 5 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request authentication. Ciphering on Set GPRS-CKSN-1 RAND Message not ciphered |
| 6 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | SRES Message not ciphered |
| 7 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Message ciphered |
| 8 | MS -> SS | ATTACH COMPLETE | Message ciphered |
| 9 | SS -> MS | | The SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. Message not ciphered |
| 10 | MS -> SS | | Verify that the MS initiates a TBF connection And sends an UPLINK RLC DATA BLOCK as a Response to the paging request. Message may or may not be ciphered |
| | | | The following messages are sent and shall be received on cell B. |
| 11 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 12 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 Message not ciphered |
| 13 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request authentication. Ciphering off Set GPRS-CKSN-2 RAND Message not ciphered |
| 14 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | SRES Message not ciphered |
| 15 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 Message not ciphered |
| 16 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Message not ciphered |
| 17 | SS -> MS | | The SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. Message not ciphered |

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 18 | MS -> SS | | Verify that the MS initiates a TBF connection And sends an UPLINK RLC DATA BLOCK as a Response to the paging request. Message not ciphered |
| 19 | MS | | The MS is switched off or power is removed (see PICS). |
| 20 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' Message not ciphered |
| 21 | SS | | Cell B is switched off and Cell A is restored to full power. |
| 22 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 20. |

Note that due to the test of ciphering, it is in this test case indicated whether each message is ciphered or not.

Specific message contents

None.

44.2.5.2.3 Ciphering mode / IMEISV request

44.2.5.2.3.1 Conformance requirements

1 When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the attach procedure, with Ciphering indicator information element set to 'ciphering mode on' and 'IMEISV requested', the Mobile Station shall:

- 1.1 responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
- 1.2 include IMEISV;
- 1.3 start ciphering and deciphering with the algorithm indicated by the Ciphering algorithm information element;
- 1.4 the ciphering uses the cipher key determined during the authentication procedure.

2 When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the routing area updating procedure, with Ciphering indicator information element set to 'ciphering mode off' and 'IMEISV not requested', the Mobile Station shall:

- 2.1 responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
- 2.2 not include IMEISV;
- 2.3 not start ciphering.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

44.2.5.2.3.2 Test purpose

To test the behaviour of the MS with respect to return IMEISV on request only.

44.2.5.2.3.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure. IMEISV is requested.

The MS initiates a routing area updating procedure, and the SS initiates a new authentication and ciphering procedure without requesting IMEISV.

Maximum duration of test

15 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|--|
| | | | The following messages are sent and shall be received on cell A. |
| 1 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 21. |
| 2 | SS | | The SS activates cell A. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI Message not ciphered |
| 5 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request authentication. Ciphering on IMEISV requested Message not ciphered |
| 6 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | SRES Mobile identity = IMEISV Message not ciphered |
| 7 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Message ciphered |
| 8 | MS -> SS | ATTACH COMPLETE | Message ciphered |
| 9 | SS -> MS | | The SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell. Message not ciphered |
| 10 | MS -> SS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. Message may or may not be ciphered |
| | | | The following messages are sent and shall be received on cell B. |
| 11 | SS | | Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS. |
| 12 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 Message not ciphered |
| 13 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request authentication. Ciphering off IMEISV not requested Message not ciphered |
| 14 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | SRES No IMEISV included Message not ciphered |
| 15 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 Message not ciphered |
| 16 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Message not ciphered |
| 17 | SS -> MS | | The SS pages the MS with mobile identity P-TMSI-1 and paging order for TBF establishment according to the channel combination of the cell. Message not ciphered |

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 18 | MS -> SS | | Verify that the MS initiates a TBF connection and sends an UPLINK RLC DATA BLOCK as a response to the paging request. Message not ciphered |
| 19 | MS | | The MS is switched off or power is removed (see PICS). |
| 20 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' Message not ciphered |
| 21 | MS | | The MS is set in MS operation mode B (see PICS), cell B is switched off, Cell A is restored to full power and the test is repeated from step 3 to step 20. |

Note that due to the test of ciphering, it is in this test case indicated whether each message is ciphered or not.

Specific message contents

None.

44.2.5.2.4 Ciphering mode/Cipher key Kc_{128} and algorithm changes

44.2.5.2.4.1 Conformance requirement

A Mobile Station shall correctly respond in an authentication and ciphering procedure by sending a response with the SRES information field set to the same value as the one produced by the authentication and ciphering algorithm in the network.

In a UMTS authentication challenge, if the AUTHENTICATION_AND_CIPHERING REQUEST message includes the UMTS authentication parameters GPRS CKSN, RAND and AUTN, then upon receipt of the message, the MS verifies the AUTN parameter and if this is accepted, the MS processes the challenge information and sends an AUTHENTICATION_AND_CIPHERING RESPONSE message to the network.

In a UMTS authentication challenge, the new UMTS ciphering key, the new GSM ciphering key and the new UMTS integrity key calculated from the challenge information shall overwrite the previous UMTS ciphering key, GSM ciphering key and UMTS integrity key. The new UMTS ciphering key, GSM ciphering key and UMTS integrity key are stored on the USIM together with the ciphering key sequence number. Furthermore, in A/Gb mode when after the authentication procedure an A5 ciphering algorithm that requires a 128-bit ciphering key is taken into use, then a new GSM Kc_{128} shall also be calculated as described in the subclause 4.3.2.3a

Reference(s):

3GPP TS 24.008 subclause 4.7.7.2.

3GPP TS 24.008 subclause 4.3.2.2.

44.2.5.2.4.2 Test purpose

To verify that the MS uses correctly Kc and Kc_{128} when the GPRS Encryption Algorithm is changed from GEA2/GEA3 to GEA4 and from GEA4 to GEA2/GEA3.

44.2.5.2.4.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II, SGSN is R99

Mobile Station:

Test USIM is plugged into the MS. The MS has a valid IMSI. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Supported encryption Algorithm: GEA2 (TSPC_Feat_GEA2)
- Supported encryption Algorithm: GEA3 (TSPC_Feat_GEA3)

PIXIT statements:

-

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure with an UMTS challenge request; type of algorithm is GEA2 or GEA3 dependent on supported algorithm.

The SS checks the value RES sent by the MS in the AUTHENTICATION AND CIPHERING RESPONSE message (calculated with UMTS AKA algorithm).

The cell A is deactivated and cell B activated .

The MS initiates a routing area updating procedure and the SS initiates an authentication and ciphering procedure with an UMTS challenge request. The SS sends ROUTING ARE UPDATING ACCEPT ciphered with GEA4 and the MS answer with ciphered ROUTING ARE UPDATING COMPLETE.

The cell B is deactivated and cell A activated

The MS initiates a routing area updating procedure and the SS initiates an authentication and ciphering procedure with an UMTS challenge request. The SS sends ROUTING ARE UPDATING ACCEPT ciphered with GEA2/GEA3 and the MS answer with ciphered ROUTING ARE UPDATING COMPLETE.

Expected sequence

The sequence is executed with GEAx = GEA3 when GEA2 is not supported or GEA2 when GEA2 is supported.

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|---|
| | | | The following messages are sent and shall be received on cell A. |
| 1 | SS | | The SS activates cell A. |
| 2 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 23. |
| 3 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 4 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 5 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content) Type of algorithm : GEAx |
| 6 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | The SS checks the RES value. "Auth. Response Parameter (extension)" IE included if the RES value is more than 4 octets long. |
| 7 | SS -> MS | ATTACH ACCEPT | Message ciphered with GEAx Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 8 | MS -> SS | ATTACH COMPLETE | Message ciphered |
| 9 | SS | | The SS deactivates cell A and activates cell B. |
| | | | The following messages are sent and shall be received on cell B. |
| 10 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'RA updating' P-TMSI-2 signature Routing area identity = RAI-1 GPRS-CKSN-1 |
| 11 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content) Type of algorithm: GEA4 |
| 12 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | The SS checks the RES value. "Auth. Response Parameter (extension)" IE included if the RES value is more than 4 octets long. |
| 13 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Message ciphered with GEA4 Update result = 'RA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 14 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Message ciphered |
| 15 | SS | | The SS deactivates cell B and activates cell A. |
| | | | The following messages are sent and shall be received on cell A. |
| 16 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'RA updating' P-TMSI-1 signature Routing area identity = RAI-4 GPRS-CKSN-1 |
| 17 | SS -> MS | AUTHENTICATION AND CIPHERING REQUEST | Request UMTS authentication. Set GPRS-CKSN-1 RAND & AUTN included (see specific message content) Type of algorithm: GEAx |
| 18 | MS -> SS | AUTHENTICATION AND CIPHERING RESPONSE | The SS checks the RES value. "Auth. Response Parameter (extension)" IE included if the RES value is more than 4 octets long. |

| | | | |
|----|----------|-----------------------------------|---|
| 19 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Message ciphered with GEAx Update result = 'RA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 20 | MS -> SS | ROUTING AREA UPDATING COMPLETE | Message ciphered |
| 21 | MS | | The MS is switched off or power is removed (see PICS). |
| 22 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 23 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 3 to step 22. |

Specific message contents

AUTHENTICATION AND CIPHERING REQUEST in step 5:

Same as default content except :

| Information element | Value/remark |
|---|--|
| IE AUTN Ciphering Algorithm Type of Algorithm | Calculated as defined for Test USIM GPRS Encryption Algorithm - GEA2 when supported - GEA3 when GEA2 is not supported |

AUTHENTICATION AND CIPHERING REQUEST in step 11:

Same as default content except :

| Information element | Value/remark |
|---|---|
| IE AUTN Ciphering Algorithm Type of Algorithm | Calculated as defined for Test USIM GPRS Encryption Algorithm GEA4 |

AUTHENTICATION AND CIPHERING REQUEST in step 17:

Same as default content except :

| Information element | Value/remark |
|---|--|
| IE AUTN Ciphering Algorithm Type of Algorithm | Calculated as defined for Test USIM GPRS Encryption Algorithm - GEA2 when supported - GEA3 when GEA2 is not supported |

44.2.5.2.5 Ciphering mode / Non support of GEA1

44.2.5.2.5.1 Conformance requirement

It is mandatory for GEA2, GEA3 and non encrypted mode (i.e. GEA0) to be implemented in mobile stations. GEA1 and GEA4 may be implemented in the mobile stations.

NOTE: As mobile stations are not allowed to implement GEA1 from Release 12 onwards, it is strongly discouraged to support GEA1 in Release 11 MS.

Reference(s):

3GPP TS 43.020 Annex D.4.9

44.2.5.2.5.2 Test Purpose

To verify that MS does not apply GEA1 ciphering algorithm.

44.2.5.2.5.3 Method of Test

Initial Conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

MS sends ATTACH REQUEST. The SS checks that GPRS Encryption Algorithm GEA/1 bit is 0.

The SS sends GMM CIPHERING AND AUTHENTICATION REQUEST with Cipher algorithm GEA1. MS sends GMM STATUS message with Cause Value #95.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--|---|
| 1 | MS | | The MS is set in MS operation mode B or C (see PICS). |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | GPRS Encryption Algorithm GEA/1= 0 Attach type = 'GPRS attach' Mobile identity = IMSI Message not ciphered |
| 4 | SS -> MS | GMM AUTHENTICATION AND CIPHERING REQUEST | Request authentication. Cipher algorithm = GEA1 Ciphering On Set GPRS-CKSN-1 RAND Message not ciphered |
| 5 | MS -> SS | GMM STATUS | Cause Value #95 Message not ciphered |
| 6 | SS -> MS | ATTACH REJECT | GMM cause = "Network failure" Message not ciphered |

Specific message contents

None.

44.2.6 Identification procedure

The purpose of this procedure is to check that the MS gives its identity as requested by the network. If this procedure does not work, it will not be possible for the network to rely on the identity claimed by the MS.

44.2.6.1 General Identification

44.2.6.1.1 Conformance requirement

- 1) When requested by the network the Mobile Station shall send its IMSI.
- 2) When requested by the network the Mobile Station shall send its IMEI as stored in the Mobile Equipment.
- 3) When requested by the network the Mobile Station shall send its IMEISV as stored in the Mobile Equipment.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.8.

44.2.6.1.2 Test purpose

To verify that the MS sends identity information as requested by the system. The following identities can be requested: IMSI, IMEI and IMEISV.

44.2.6.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

The SS requests identity information from the MS:

- IMSI;
- IMEI;
- IMEISV.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------|--|
| 1 | SS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 14. |
| 2 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' |
| 4 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-1 |
| 6 | SS -> MS | IDENTITY REQUEST | P-TMSI-1 signature Routing area identity = RAI-1 |
| 7 | MS -> SS | IDENTITY RESPONSE | Identity type = IMSI |
| 8 | SS -> MS | IDENTITY REQUEST | Mobile identity = IMSI |
| 9 | MS -> SS | IDENTITY RESPONSE | Identity type = IMEI |
| 10 | SS -> MS | IDENTITY REQUEST | Mobile identity = IMEI |
| 11 | MS -> SS | IDENTITY RESPONSE | Identity type = IMEISV |
| 12 | MS | | Mobile identity = IMEISV |
| 13 | MS -> SS | DETACH REQUEST | The MS is switched off or power is removed (see PICS). Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |
| 14 | MS | | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 13. |

Specific message contents

None.

44.2.7 GMM READY timer handling

The READY timer, T3314 is used in the MS and in the network per each assigned P-TMSI to control the cell updating and paging procedure.

When the READY timer is running the MS shall perform cell update each time a new cell is selected (see 3GPP TS 03.22 [3]). If a routing area border is crossed a routing area updating procedure shall be performed instead of a cell update.

44.2.7.1 Conformance requirement

- 1) When the READY timer is running the MS shall perform cell update each time a new cell is selected.
- 2) The READY timer shall be restarted in the MS when the GMM entity receives an indication from lower layers that user data or GMM or SM signalling messages have been transmitted.
- 3) The READY timer shall be stopped when force to standby is received in a signalling message from the network, after successful completion of the signalling procedure.
- 4) if the negotiated READY timer value indicates that the ready timer function is deactivated, then the MS shall behave as if READY timer never expires (i.e. the MS remains in READY state all the time).
- 5) If the READY timer length is set to zero, the MS shall immediately be forced into STANDBY state .MS shall not perform cell update.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.1.

44.2.7.2 Test Purpose

To verify the functionality of the READY timer.

44.2.7.3 Method of test

44.2.7.3.1 Test procedure 1

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An attach is performed. The SS negotiates T3314. The MS selects a new cell within the old RA. A cell update is performed.

T3314; set to 60 s.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |

44.2.7.3.2 Test procedure 2

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An attach is performed. The SS negotiates T3314. A page is responded by the MS. The MS selects a new cell within the old RA. A cell update is performed, as T3314 is reset by the paging response.

T3314; set to 60 s.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported set the MS in operation mode B. The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' |
| 4 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3314 = 60 seconds |
| 6 | SS | | No action for 90 seconds |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity = P-TMSI-2 Paging order is for TBF establishment. |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating paging response. T3314 reset. |
| 9 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 10 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating cell update. |
| 11 | MS | | The MS is switched off or power is removed (see PICS). |
| 12 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.7.3.3 Test procedure 3

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test procedure

An attach is performed. The SS indicates 'force to standby'. The MS selects a new cell within the old RA. No cell update is performed as the MS is in STANDBY state.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS | | The SS activates cell A. The MS is set in MS operation mode B (see PICS). If MS operation mode B not supported set the MS in operation mode C. |
| 3 | MS -> SS | ATTACH REQUEST | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'GPRS attach' |
| 4 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'GPRS only attached' |
| 5 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 Force to standby indicator set |
| 6 | SS | | The following messages are sent and shall be received on cell B. Activate cell B with a lower signal strength than cell A The RF level of cell A is lowered until cell B is preferred by the MS. |
| 7 | SS | | The SS verifies for 45 seconds that no cell update is received, as the MS is in STANDBY state |
| 8 | MS | | The MS is switched off or power is removed (see PICS). |
| 9 | MS -> SS | DETACH REQUEST | Message not sent if power is removed. Detach type = 'power switched off, GPRS detach' |

Specific message contents

None.

44.2.7.3.4 Test procedure 4

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).

44.2.8 DTM mobility management

44.2.8.1 Change of cell between two LAs in idle mode

44.2.8.1.1 Change of cell between two LAs in idle mode / RAU completes first

44.2.8.1.1.1 Conformance requirements

RA update and LA update procedures shall be supported in parallel in the main DCCH with SAPI 0. This helps reduce the congestion caused by GPRS signalling on GPRS TCHs that naturally exists in cells on the border of a RA or RA/LA without noticeably affecting the QoS of the CS connection.

In network mode of operation II and III, whenever a Class-A MS determines that it shall perform both a LA update and an RA update it shall initiate the LA update and then initiate the RA update.

A MS supporting the «GPRS» option whose CHANNEL REQUEST message contained a packet access establishment cause shall obey an IMMEDIATE ASSIGNMENT message to a channel which is to be used in dedicated mode.

References

3GPP TS 04.18/44.018, sub-clause 3.3.1.3

44.2.8.1.1.2 Test purpose

To verify that both Location Updating and Routing Area Updating procedures are completed in parallel and also to guarantee that the GPRS mobile obeys a command to use the SDCCH for signalling.

44.2.8.1.1.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with different LAIs, both operating in network operation mode II and both support DTM.

Mobile Station:

The MS is in packet idle mode with a TMSI and P-TMSI allocated.

Specific PICS statements:

-

PIXIT statements:

-

Test Procedure

Once the MS is camped on cell A in the first LA, the SS commences the test by lowering the RF level of cell A below that of cell B prompting the MS to complete cell reselection. Once cell B has been selected by the MS, the MS initiates the Location Updating and Routing Area Updating procedures. The SS responds to the ROUTING AREA UPDATE REQUEST message with a ROUTING AREA UPDATE ACCEPT message and then completes the Location Updating procedure by replying with a LOCATION UPDATING ACCEPT message to the LOCATION UPDATING REQUEST sent by the MS. The SS then releases the RR connection.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS->SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS->MS | IMMEDIATE ASSIGNMENT | Allocates an SDCCH to the MS. |
| 4 | MS->SS | LOCATION UPDATING REQUEST | SS verifies that all signalling sent on the main DCCH is transmitted on the allocated SDCCH. |
| 5 | MS->SS | GPRS INFORMATION | Contains the ROUTING AREA UPDATE REQUEST message. SS verifies that all signalling sent on the main DCCH is transmitted on the allocated SDCCH |
| 6 | SS->MS | GPRS INFORMATION | Contains the ROUTING AREA UPDATE ACCEPT message |
| 7 | SS->MS | LOCATION UPDATING ACCEPT | |
| 8 | SS->MS | CHANNEL RELEASE | |

44.2.8.1.2 Change of cell between two LAs in idle mode / LAU completes first / SS releases channel

44.2.8.1.2.1 Conformance requirements

RA update and LA update procedures shall be supported in parallel in the main DCCH with SAPI 0. This helps reduce the congestion caused by GPRS signalling on GPRS TCHs that naturally exists in cells on the border of a RA or RA/LA without noticeably affecting the QoS of the CS connection.

In network mode of operation II and III, whenever a Class-A MS determines that it shall perform both a LA update and an RA update it shall initiate the LA update and then initiate the RA update.

44.2.8.1.2.2 Test purpose

To verify that:

- both Location Updating and Routing Area Updating procedures are completed in parallel.
- the MS can complete the Routing Area Updating procedure on TBFs when the channel is removed.
- the GPRS mobile obeys a command to use a TCH/F for signalling.

44.2.8.1.2.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with different LAIs, both operating in network operation mode II and both support DTM.

Mobile Station:

The MS is in "idle" state with a TMSI and P-TMSI allocated.

Specific PICS statements:

-

PIXIT statements:

-

Test Procedure

Once the MS is camped on cell A in the first LA, the SS commences the test by lowering the RF level of cell A below that of cell B prompting the MS to complete cell reselection. Cell B is selected by the MS and then initiates Location Updating and Routing Area Updating procedures. The SS completes the Location Updating Procedure by responding to the LOCATION UPDATING REQUEST message with a LOCATION UPDATING ACCEPT message. The SS then releases the RR connection. After the RR connection has been released, the SS establishes a downlink TBF, and transmits a ROUTING AREA UPDATE ACCEPT message reallocating the P-TMSI of the MS. The MS initiates the establishment of an uplink TBF, to complete the Routing Area Updating procedure by sending a ROUTING AREA UPDATE COMPLETE message and accepts the new P-TMSI.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS->SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS->MS | IMMEDIATE ASSIGNMENT | Allocates a TCH/F to the MS. |
| 4 | MS->SS | LOCATION UPDATING REQUEST | SS verifies that all signalling sent on the main DCCH is transmitted on the allocated TCH. |
| 5 | MS->SS | GPRS INFORMATION | Contains the ROUTING AREA UPDATE REQUEST message. SS verifies that all signalling sent on the main DCCH is transmitted on the allocated TCH. |
| 6 | SS->MS | LOCATION UPDATING ACCEPT | |
| 7 | SS->MS | CHANNEL RELEASE | |
| 8 | | | A downlink TBF is then established to allow the RAU ACCEPT message to be returned to the MS. |
| 9 | SS->MS | ROUTING AREA UPDATE ACCEPT | Allocates a new P-TMSI. See specific message contents. |
| 10 | | | An uplink TBF is then established to allow the RAU COMPLETE message to be returned by the MS. |
| 11 | MS->SS | ROUTING AREA UPDATE COMPLETE | |

Specific message contents

ROUTING AREA UPDATE ACCEPT (Step 9):

| As default message contents except: - Allocated P-TMSI - Type of Identity - P-TMSI value | P-TMSI C2345678 (Hex) |

44.2.8.2 Void

44.2.9 Network Identity and Timezone (NITZ)

44.2.9.1 NITZ and GPRS procedures

44.2.9.1.1 NITZ / GPRS / Timezone, Time and DST Handling

44.2.9.1.1.1 Conformance requirement

The feature Network Identities and Timezone shall make it possible for a serving PLMN to transfer its current identity, universal time, DST and LTZ to MSs, and for the MS to store and use this information. Each one of these elements is optional. The feature significantly enhances roaming as it enables the accurate indication of network identities that are either newer than the ME or have changed their name since the ME was manufactured or sold. Additionally time and timezone information can be utilised by MEs as desired.

The serving PLMN shall make Local Time Zone (LTZ) available to the MS as an offset from Universal Time in units of 15 minutes.

When the LTZ is compensated for DST (summertime), the serving PLMN shall provide a DST parameter to indicate this. The adjustment for DST can be +1h or +2h.

The Time Zone code enables the receiver to calculate the equivalent time in GMT from the other semi-octets in the Service-Centre-Time-Stamp, or indicate the time zone (GMT, GMT+1H etc.), or perform other similar calculations as required by the implementation. The value contained in the Time Zone field must take into account daylight saving time, such that when the sending entity changes from regular (winter) time to daylight saving (summer) time, there is a change to the value in the Time Zone field.

The mobile station should assume that this time zone applies to the routing area the MS is currently in. The mobile station shall not assume that the time information is accurate.

If the local time zone has been adjusted for Daylight Saving Time, the network shall indicate this by including the IE Network Daylight Saving Time.

Reference(s):

3GPP TS 02.42 / 3GPP TS 22.042 subclause 4

3GPP TS 03.40 / 3GPP TS 23.040 subclause 9.2.3.11

3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.4.19.4

44.2.9.1.1.2 Test purpose

To verify that a MS supporting any of the NITZ Time related feature (Local Time Zone, Universal Time and DST IE (and thus GMM Information)) is able to handle them properly.

44.2.9.1.1.3 Method of test

Initial conditions

System Simulator:

Two cells operating in network operation mode I, cell A in MCC1/MNC1/LAC1/RAC1 (RAI-1), cell B in MCC1/MNC1/LAC1/RAC2 (RAI-4).

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Use of NITZ DST (TSPC_NITZ_DST)
- Use of NITZ Universal Time for PLMN (TSPC_NITZ_Universal_Time)
- Use of NITZ Local Time Zone for PLMN (TSPC_NITZ_Time_Zone)

PIXIT statements:

-

Test procedure

Following the GPRS attachment on Cell A, SS sends its local time and date (on GMT+1, Winter Time) using the GMM INFORMATION Message to the MS. The operator verifies then the parameters and/or the time and date stored in the MS.

The MS is then moved to a second cell (Cell B), and after a ROUTING AREA UPDATE procedure, the time is changed to “Summer Time” with the DST IE using a GMM INFORMATION Message. The operator verifies then the parameters and/or the time and date stored in the MS and switches Off the MS

The MS is re-attached on Cell A, the Time Zone is then changed, no DST present (GMT+2, Winter Time), using GMM INFORMATION message. The operator verifies then the parameters and/or the time stored on the MS

Maximum duration of test

-

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 2 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' |
| 3 | SS -> MS | ATTACH ACCEPT | Mobile identity = IMSI Attach result = 'Combined GPRS / IMSI attached' |
| 4 | MS -> SS | ATTACH COMPLETE | Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 5 | SS ->MS | GMM INFORMATION | Universal Time IE is included : “< Current Year >/05/08 05:15:00” for Local Time “+ 1 hour” for Timezone No DST or Local Time Zone IE included See specific message content |

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 6 | MS | | Operator Action : The use of the supported Fields is checked: Universal Time: Year: < Current Year > Month: May Day: 8 th Hour: 5 Hours Minute: 15 Minutes Timezone: GMT+1 Local Time Zone: Not sent DST: Daylight Saving Time not in use (i.e. winter time) cf note |
| 7 | SS | | Activate cell B with a lower signal strength than cell A. The RF level of cell A is lowered until cell B is preferred by the MS. |
| 8 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 9 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 10 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 11 | SS ->MS | GMM INFORMATION | Local Time Zone IE and DST IE are included : "+ 2 hours" for Timezone (including DST) "+ 1 hour" for DST See specific message content |
| 12 | MS | | Operator Action : The use of the supported Fields is checked: Universal Time Year: < Current Year > Month: May Day: 8 th Hour: 6 Hours Minutes: 15 Minutes Timezone: GMT+1 Local Time Zone Timezone: GMT+1 (DST included) DST: Daylight Saving Time in use (i.e. "summer time") cf note |
| 13 | SS | | The RF level of cell B is lowered and the RF level of cell A is increased until cell A is preferred by the MS. |
| 14 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-1 signature Routing area identity = RAI-4 |
| 15 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 |
| 16 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 17 | SS ->MS | GMM INFORMATION | Only Local Time Zone IE is included : "+ 2 hours" for Timezone No DST IE included See specific message content |

| Step | Direction | Message | Comments |
|------|-----------|---------|---|
| 18 | MS | | Operator Action : The use of the supported Fields is checked: Universal Time: Year: < Current Year > Month: MayDay: 8 th Hour: 6 Hours Minutes: 15 Minutes Timezone: GMT+2 Local Time Zone: Timezone: GMT+2 DST: Daylight Saving Time not in use (i.e. winter time) cf note |

Note: In step 6, 12 and 18 the “minute” is not so relevant and can be higher than “15” depending on operator’s action time.

The check of Timezone and DST is done implicitly by checking the time only in case MS does not support the display of these two fields.

Current Year is derived by the SS.

Specific message contents

GMM Information on step 5:

| Information element | Value/remark |
|---------------------|---|
| Universal Time IE | 47 |
| Year | 40 - < Current Year > |
| Month | 50 - May |
| Day | 80 - 8 th |
| Hour | 40 - 4 hours |
| Minute | 51 - 15 Minutes |
| Second | 00 - 0 second |
| Time Zone | 40 - GMT+1 (4*15 minutes+ 0*15 minutes DST) |

GMM Information on step 11:

| Information element | Value/remark |
|-------------------------|--|
| Local Time Zone IE | 46 |
| Time Zone | 80 - GMT+1+1(4*15 minutes+ 4*15 minutes DST) |
| Daylight Saving Time IE | 49 |
| Length of DST Content | 1 |

GMM Information on step 17:

| Information element | Value/remark |
|---------------------|---|
| Local Time Zone IE | 46 |
| Time Zone | 80 - GMT+2 (8*15 minutes+ 0*15 minutes DST) |

44.2.9.1.2 NITZ / GPRS / NITZ Parameters / Storage / Deletion

44.2.9.1.2.1 Conformance requirement

The feature Network Identities and Timezone shall make it possible for a serving PLMN to transfer its current identity, universal time, DST and LTZ to MSs, and for the MS to store and use this information. Each one of these elements is optional. The feature significantly enhances roaming as it enables the accurate indication of network identities that are either newer than the ME or have changed their name since the ME was manufactured or sold. Additionally time and timezone information can be utilised by MEs as desired.

When using the default character set (see TS 23.038 [4]), the serving PLMN shall make both a "short" and a "long" name available to the MS. As an alternative or, in addition, to the default character set, the serving PLMN can make a name available in UCS2. The MS shall be free to choose one of these names depending upon its own characteristics and/or limitations, such as those of its display.

Switching off the MS should not cause the updated name of the network(s) to be deleted.

Reference(s):

3GPP TS 02.42 / 3GPP TS 22.042 subclause 4 and 6.2

44.2.9.1.2.2 Test purpose

To verify that a MS supporting any of the NITZ Name related feature (Short or Full PLMN name and thus GMM Information) is able to handle the names properly and does not erase the PLMN name sent using NITZ procedure at switch off.

44.2.9.1.2.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Use of NITZ Full name for PLMN (TSPC_NITZ_Full_Name)
- Use of NITZ Short name for PLMN (TSPC_NITZ_Short_Name)PIXIT statements:

Test procedure

Following the GPRS attachment, SS sends a Short and a Full Name for the PLMN using the GMM INFORMATION Message to the MS. The operator verifies then the parameters stored in the MS.

The MS is then switched Off. The MS is re-attached after switching on, and the operator verifies then that the names are still stored/used in the MS.

Maximum duration of test

5 minutes

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 2 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' |
| 3 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature |

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 4 | MS -> SS | ATTACH COMPLETE | Full Name for Network and Short Name for Network IE are included : "NITZDeletionPLMN" for Full Name "NITZPLMN" for Short Name See specific message content Operator Action : Verify that the names are stored and handled correctly according to Specific PICS Statements: "NITZDeletionPLMN" for Full name, "NITZPLMN" for Short name The MS is switched off or power is removed (see PICS). Message not sent if power is removed. Detach type = 'power switched off, combined GPRS / IMSI detach' |
| 5 | SS ->MS | GMM INFORMATION | |
| 6 | MS | | |
| 7 | MS | | |
| 8 | MS -> SS | DETACH REQUEST | |
| 9 | MS | | |
| 10 | MS -> SS | ATTACH REQUEST | |
| 11 | SS -> MS | ATTACH ACCEPT | |
| 12 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' No new mobile identity assigned. P-TMSI and P-TMSI signature not included. Attach result = 'Combined GPRS / IMSI attached' Operator Action : Verify that the same names are still stored and handled correctly according to Specific PICS Statements: "NITZDeletionPLMN" for Full name, "NITZPLMN" for Short name |

Specific message contents

GMM Information on step 5:

44.2.9.1.3 NITZ / GPRS / MM and GMM Signalling

44.2.9.1.3.1 Conformance requirement

The feature Network Identities and Timezone shall make it possible for a serving PLMN to transfer its current identity, universal time, DST and LTZ to MSs, and for the MS to store and use this information. Each one of these elements is optional. The feature significantly enhances roaming as it enables the accurate indication of network identities that are

either newer than the ME or have changed their name since the ME was manufactured or sold. Additionally time and timezone information can be utilised by MEs as desired.

When using the default character set (see TS 23.038 [4]), the serving PLMN shall make both a "short" and a "long" name available to the MS. As an alternative or, in addition, to the default character set, the serving PLMN can make a name available in UCS2. The MS shall be free to choose one of these names depending upon its own characteristics and/or limitations, such as those of its display.

It is expected that the MS will display the most up to date information transferred to it.

Reference(s):

3GPP TS 02.42 / 3GPP TS 22.042 subclause 4 and 6.2

44.2.9.1.3.2 Test purpose

To verify that a MS supporting NITZ (any of the Fields) is able to handle both MM INFORMATION and GMM INFORMATION messages and that parameters set in the latest message override the previous ones.

44.2.9.1.3.3 Method of test

Initial conditions

System Simulator:

Two cells operating in network operation mode I (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (RAI-1), cell B in MCC1/MNC1/LAC1/RAC2 (RAI-4).

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).
- Use of NITZ DST (TSPC_NITZ_DST)
- Use of NITZ Full name for PLMN (TSPC_NITZ_Full_Name)
- Use of NITZ Short name for PLMN (TSPC_NITZ_Short_Name)
- Use of NITZ Universal Time for PLMN (TSPC_NITZ_Universal_Time)
- Use of NITZ Local Time Zone for PLMN (TSPC_NITZ_Time_Zone)

PIXIT statements:

-

Test procedure

Following its GPRS Attachment procedure, the MS receives from SS, through the GMM INFORMATION a complete set of NITZ parameters (PLMN long name, short name, and Universal time with local time adjustment). The operator verifies then the names used and the time and date stored in the MS (according to specific PICS Statements).

The MS is then paged on its paging group with its IMSI. SS verifies that the MS sends a PAGING RESPONSE. SS sends back a MM INFORMATION message changing the NITZ PLMN names (short and full names) and the local time information.

The operator verifies then that the new NITZ names are used and the time information changed (if supported).

The serving cell is then lowered and the MS triggers a ROUTING AREA UPDATE procedure on the second cell. Following this procedure, SS sends some new NITZ PLMN names (full and short) using the GMM INFORMATION message.

The operator verifies then that the new NITZ names are used, if supported, and, if possible, that the time information is not changed.

Maximum duration of test

5 minutes

Expected sequence:

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | MS | | The MS is powered up or switched on and initiates an attach (see PICS). |
| 2 | MS -> SS | ATTACH REQUEST | Attach type = 'Combined GPRS / IMSI attach' or 'GPRS attach while IMSI attached' Mobile identity = IMSI |
| 3 | SS -> MS | ATTACH ACCEPT | Attach result = 'Combined GPRS / IMSI attached' Routing area identity = RAI-1 Mobile identity = P-TMSI-2 P-TMSI-2 signature |
| 4 | MS -> SS | ATTACH COMPLETE | |
| 5 | SS ->MS | GMM INFORMATION | Full Name for Network, Short Name for Network and Universal Time IE are included : "NITZ GMM PLMN" for Full Name "GMM PLMN" for Short Name "< Current Year >/05/08 05:15:00" for Local Time "+ 1 hour" for Timezone No DST or Local Time Zone IE included See specific message content |
| 6 | MS | | Operator Action : Verify that the names and time are stored and handled correctly according to specific PICS Statements: "NITZ GMM PLMN" for Full name, "GMM PLMN" for Short name The use of the supported Fields is checked: Universal Time: Year: < Current Year > Month: May Day: 8 th Hour: 5 Hours Minute: 15 Minutes Timezone: GMT+1 Local Time Zone: Not Sent DST: Daylight Saving Time not in use (i.e. "winter time" cf note |

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 7 | SS -> MS | | SS pages the MS with mobile identity IMSI and paging order for RR connection according to the channel combination of the cell. |
| 8 | MS | | Verify that the MS initiates a RR connection and sends a PAGING RESPONSE with mobile identity IMSI. |
| 9 | SS -> MS | MM INFORMATION | Full Name for Network, Short Name for Network, Local Time Zone and DST IE are included: "NITZ MM PLMN" for Full Name "MM PLMN" for Short Name "+ 2 hours" for Timezone (including DST) "+ 1 hour" for DST See specific message content |
| 10 | SS | | SS releases the RR connection and indicates the successfully resumption of GPRS services. |
| 11 | | | Operator Action : Verify that the names and time are stored and handled correctly according to specific PICS Statements: "NITZ MM PLMN" for Full name, "MM PLMN" for Short name The use of the supported Fields is checked: Universal Time: Year: < Current Year > Month: May Day: 8 th Hour: 6 Hours Minute: 15 Minutes Timezone: GMT+1 Local Time Zone: Timezone: GMT+1 (including DST) DST: Daylight Saving Time in use (i.e. "summer time") cf note |
| 12 | SS | | The SS deactivates cell A and activates cell B. |
| 13 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'Combined RA/LA updating' P-TMSI-2 signature Routing area identity = RAI-1 |
| 14 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'Combined RA/LA updated' Mobile identity = P-TMSI-1 P-TMSI-1 signature Routing area identity = RAI-4 |
| 15 | MS -> SS | ROUTING AREA UPDATING COMPLETE | |
| 16 | SS ->MS | GMM INFORMATION | Full Name for Network and Short Name for Network IE are included : "NITZ GMM PLMN" for Full Name "GMM PLMN" for Short Name See specific message content |
| 17 | MS | | Operator Action : Verify that the names and time are stored and handled correctly according to specific PICS Statements: "NITZ GMM PLMN" for Full name, "GMM PLMN" for Short name if possible, verify that no change is done on the time information |

Note: In step 6, 11 and 17 the "minute" is not so relevant and can be higher than "15" depending on operator's action time.

The check of Timezone and DST is done implicitly by checking the time only in case MS does not support the display of these two fields.

Current Year is derived by the SS.

44.2.10 MS Radio Access Capability Interrogation

This procedure allows the network to request the MS to supply its radio access capability information to the network.

44.2.10.1 Conformance requirements

In state GMM-DEREGISTERED, the MS initiates the GPRS attach procedure by sending an ATTACH REQUEST message to the network, starts timer T3310 and enters state GMM-REGISTERED-INITIATED.

The ATTACH REQUEST message contains the MS Radio Access capability information element.

The purpose of the *MS RA capability* information element is to provide the radio part of the network with information concerning radio aspects of the mobile station. The contents might affect the manner in which the network handles the operation of the mobile station.

The *MS RA capability* is a type 4 information element, with a maximum length of 52 octets.

DARP is contained in the Release 6 specifications. In order to implement an MS conforming to Release 99 but supporting DARP, it is necessary for the MS to additionally conform to some parts of the Release 6 specifications, such as the radio frequency requirements for DARP and some signalling extensions relating to the MS Classmark and radio access capabilities.

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.3.1.1, 9.4.1 and 10.5.5.12a.

3GPP TS 05.15 / 3GPP TS 45.015

44.2.10.2 Test purpose

To verify that the MS supplies all its radio access capabilities and Network MS Capabilities, when attaching to the network for GPRS services.

44.2.10.3 Method of test

44.2.10.3.1 Initial Conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Specific PICS statements:

- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

- Contents of MS Radio Access Capability.

Maximum duration of test

3 minutes.

44.2.10.3.2 Test procedure

The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | MS | | The MS is powered up or switched on and initiates an attach procedure (see PICS). |
| 2 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = IMSI |
| 3 | SS -> MS | ATTACH ACCEPT | Contents as defined for default message. Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature |
| 4 | MS -> SS | ATTACH COMPLETE | Routing area identity = RAI-1 |

Specific message Contents

Contents of ATTACH REQUEST message:

| | |
|---------------------------------|--|
| Protocol discriminator | 1000 (MM message for GPRS service) |
| Skip indicator | 0000 |
| Attach request message identity | 00000001 |
| MS network capability | See PICS/PIXIT. |
| MS Radio Access capability | See PICS/PIXIT. |
| | Note for R99 and onwards a MS that supports "Downlink Advance Receiver Performance" shall include the Downlink Advanced Receiver Performance indication. |

44.2.11 Cell Notification

44.2.11.1 Conformance Requirement

When the READY timer is running or has been deactivated the MS shall perform cell update each time a new cell is selected.

When the READY timer has expired the MS shall:

- perform the routing area updating procedure when a routing area border is crossed;
- not perform a cell update when a new cell is selected.

The READY timer is started:

- in the MS when the GMM entity receives an indication from lower layers that an LLC frame other than LLC NULL frame has been transmitted on the radio interface; and

- in the network when the GMM entity receives an indication from lower layers that an LLC frame other than LLC NULL frame has been successfully received by the network.

If a new READY timer value is negotiated, the MS shall upon the reception of the ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT message perform a initial cell update (either by transmitting a LLC frame or, if required, a ATTACH COMPLETE or ROUTING AREA UPDATE COMPLETE message), in order to apply the new READY timer value immediately. If both the network and the MS supports the Cell Notification, the initial cell update shall use any LLC frame except the LLC NULL frame.

In A/Gb mode, if the ATTACH ACCEPT message contains the Cell Notification information element, then the MS shall start to use the LLC NULL frame to perform cell updates.

In A/Gb mode, if the ROUTING AREA UPDATE ACCEPT message contains the Cell Notification information element, then the MS shall start to use the LLC NULL frame to perform cell updates.

44.2.11.2 Test Purpose

Test purpose 1

The MS shall start to use the LLC NULL frame to perform cell updates following receipt of an ATTACH ACCEPT message containing the Cell Notification information element.

Test purpose 2

The MS shall start to use the LLC NULL frame to perform cell updates following receipt of a ROUTING AREA UPDATE ACCEPT message containing the Cell Notification information element.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.2.1.1, 4.7.3.1.3, 4.7.5.1.3

44.2.11.3 Method of Test

44.2.11.3.1 Test Procedure 1 – Ready Timer Behaviour

Initial Conditions

System Simulator:

Two cells (not simultaneously activated), Cell A in MCC1/MNC1/LAC1/RAC1, Cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is switched off.

Specific PICS statements:

- MS operation mode B (TSPC_operation_mode_B).
- MS operation mode C (TSPC_operation_mode_C) (only if mode B not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test Procedure

The MS switches on and performs GPRS ATTACH on Cell A. Cell Notification is indicated in the ATTACH ACCEPT message. The MS is made to re-select to Cell B whilst the READY timer is still running. The MS performs Cell Update / Cell Notification on Cell B by sending an LLC NULL frame. The SS then waits for the READY TIMER to expire.

The MS is made to re-select to Cell A. It is checked that the MS does not perform Cell Update / Cell Notification. The MS is paged to confirm the cell-reselection to Cell A.

NOTE: the READY timer is not reset following the cell update from Cell A to Cell B but is runs uninterrupted since being started following transmission of the ATTACH COMPLETE message in the initial Cell Update - during the GPRS ATTACH Procedure on Cell A. The value of the ready timer is chosen such that if the MS were to have erroneously re-set the READY timer following the Cell Update from Cell A to Cell B it would perform a Cell Update when returning to Cell B from Cell A.

Maximum Duration of Test

10 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| | | | The following messages are sent and shall be received on Cell A. |
| 1 | SS | | The SS activates Cell A. |
| 2 | MS | | The MS is set in MS operation mode B (see PICS). If MS operation mode B not supported set the MS in operation mode C. The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Mobile identity = P-TMSI-2 P-TMSI-2 signature Routing area identity = RAI-1 T3314 = 3 mins Cell Notification IE = Present |
| 5 | MS -> SS | ATTACH COMPLETE | |
| 6 | SS | | The SS waits for 1.5 mins. |
| | | | The following messages are sent and shall be received on Cell B. |
| 7 | SS | | Activate Cell B with a lower signal strength than Cell A The RF level of Cell A is lowered until Cell B is preferred by the MS. |
| 8 | MS -> SS | UPLINK RLC DATA BLOCK | Contains the LLC NULL frame. Received within T3314 of Step 5. |
| 9 | SS | | The SS waits for 1.5 minutes for the READY timer to expire. |
| | | | The following messages are sent and shall be received on Cell A. |
| 10 | SS | | The RF level of cell A is increased until cell A is preferred by the MS. |
| 11 | SS | | The SS checks that no LLC frame is received on Cell A for a period equivalent to T3314 following Step 8. |
| 12 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity = P-TMSI-2 Paging order is for TBF establishment. |
| 13 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating paging response. |

Specific Message Contents

None.

44.2.11.3.2 Test Procedure 2 – Use of LLC NULL Frame

Initial Conditions

System Simulator:

Three cells (not simultaneously activated), Cell A in MCC1/MNC1/LAC1/RAC1, Cell B in MCC1/MNC1/LAC1/RAC2 and Cell C in MCC1/MNC1/LAC1/RAC2.

All cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI and P-TMSI-1 stored. MS is switched off.

Specific PICS statements:

- MS operation mode C (TSPC_operation_mode_C).
- MS operation mode B (TSPC_operation_mode_B) (only if mode C not supported).
- Switch off on button (TSPC_Feat_OnOff).
- Automatic GPRS attach procedure at switch on or power on (TSPC_AddInfo_on_auto_GPRS_AP).

PIXIT statements:

-

Test Procedure

The MS switches on and performs GPRS ATTACH on Cell A. In the ATTACH ACCEPT message the SS assigns a new (non-default) value for the READY timer but does not assign a new P-TMSI. Cell Notification is indicated in the ATTACH ACCEPT message. The MS performs an initial Cell Update by sending an LLC frame. It is checked that the MS does not send the LLC NULL frame. The MS is made to re-select to Cell B. The MS sends a ROUTING AREA UPDATE REQUEST. The SS sends a ROUTING AREA UPDATE ACCEPT message assigning a new value for the Ready timer but does not assign a new P-TMSI. Cell Notification is indicated in the ROUTING AREA UPDATE ACCEPT message. The MS performs an initial Cell Update by sending an LLC frame. It is checked that the MS does not send the LLC NULL frame. Before the Ready timer expires, the MS is made to re-select to Cell C. The MS performs Cell Update / Cell Notification by sending an LLC NULL frame.

NOTE : The SS does not assign a new value of P-TMSI in either the ATTACH ACCEPT or ROUTING AREA UPDATE ACCEPT messages to prevent the sending of ATTACH COMPLETE and ROUTING AREA UPDATE COMPLETE messages by the MS which would obscure possible erroneous use of the LLC NULL frame for the initial cell update by the MS.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| | | | The following messages are sent and shall be received on Cell A. |
| 1 | SS | | The SS activates Cell A. |
| 2 | MS | | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported set the MS in operation mode B. The MS is powered up or switched on and initiates an attach (see PICS). |
| 3 | MS -> SS | ATTACH REQUEST | Attach type = 'GPRS attach' Mobile identity = P-TMSI-1 |
| 4 | SS -> MS | ATTACH ACCEPT | Attach result = 'GPRS only attached' Routing area identity = RAI-1 T3314 = 3 mins Allocated P-TMSI = Not Included Cell Notification IE = Present |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU for initial cell update. Must not contain the LLC NULL frame. |
| | | | The following messages are sent and shall be received on Cell B. |
| 6 | SS | | Activate Cell B with a lower signal strength than Cell A The RF level of Cell A is lowered until Cell B is preferred by the MS. |
| 7 | MS -> SS | ROUTING AREA UPDATING REQUEST | Update type = 'RA updating' Routing area identity = RAI-1 |
| 8 | SS -> MS | ROUTING AREA UPDATING ACCEPT | Update result = 'RA updated' Routing area identity = RAI-4 T3314 = 4 mins Allocated P-TMSI = Not Included Cell Notification IE = Present |
| 9 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU for initial cell update. Must not contain the LLC NULL frame. |
| | | | The following messages are sent and shall be received on Cell C. |
| 10 | SS | | Activate Cell C with a lower signal strength than Cell B. The RF level of Cell B is lowered until Cell C is preferred by the MS. |
| 11 | MS -> SS | UPLINK RLC DATA BLOCK | Contains the LLC NULL frame. Received within T3314 of Step 9. |

Specific Message Contents

None.

45 Session Management Procedures

45.1 Definition

-

45.2 PDP context activation

45.2.1 Initiated by the mobile station

45.2.1.1 Attach initiated by context activation/QoS Offered by Network is the QoS Requested

45.2.1.1.1 Conformance requirement

PDP context activation shall initiate GPRS Attach by the MS when the MS is GPRS Detached.

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network. If the QoS offered by the network is the same as the QoS requested by the mobile, then upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT the MS shall stop timer T3380 and shall initiate establishment of the logical link with the offered QoS.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.1 and 6.1.3.1.1.

45.2.1.1.2 Test purpose

To check the MS initiates a GPRS ATTACH if one is not already active. To test the behaviour of the MS when the network responds to a PDP context activation request with the requested QoS.

45.2.1.1.3 Method of test

Specific PICS statements:

- GPRS Auto Attach (TSPC_AddInfo_on_auto_GPRS_AP)

PIXIT statements:

-Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- The MS is in GMM-state "GMM-DEREGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

If the MS is attached, it should be triggered to initiate a GPRS detach procedure. A context activation is then requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message a ACTIVATE PDP CONTEXT ACCEPT is returned by the SS with the same requested QoS. The contents of the ACTIVATE PDP CONTEXT REQUEST message shall then be checked. The SS then waits for T3380 +10% seconds to ensure T3380 has been stopped and no more ACTIVATE PDP CONTEXT REQUEST messages are sent by the MS. The SS then sends a MODIFY PDP CONTEXT REQUEST message to which the MS shall reply with a MODIFY PDP CONTEXT ACCEPT message to ensure the context has been set up.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | MS | | If MS is not configured for GPRS auto attachment (see PICS), go to step 5. The MS initiates a GPRS detach (without power off) by MMI or by AT command. |
| 2 | MS | | |
| 3 | MS -> SS | DETACH REQUEST | Detach type = 'normal detach, GPRS detach' Initiate a context activation Request attach Accept attach Negotiated Ready timer value IE should not be included Force to standby indicator set Request a PDP context activation |
| 4 | SS -> MS | DETACH ACCEPT | |
| 5 | MS | | |
| 6 | MS -> SS | ATTACH REQUEST | |
| 7 | SS -> MS | ATTACH ACCEPT | |
| 8 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | |
| 9 | SS -> MS | ACTIVATE PDP CONTEXT ACCEPT | |
| 10 | SS | | Wait for T3380 +10% seconds to ensure no further activate request messages come from the MS Send a modify request for the activated context Accept the modification request to show context is activated |
| 11 | SS -> MS | MODIFY PDP CONTEXT REQUEST | |
| 12 | MS -> SS | MODIFY PDP CONTEXT ACCEPT | |
| | | | |

Specific message contents

As default except:

Activate PDP Context Request

45.2.1.2 QoS Offered by Network is a lower QoS

45.2.1.2.1 QoS Accepted by MS

45.2.1.2.1.1 Conformance requirement

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network. If the QoS offered by the network is acceptable to mobile, then upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT the MS shall initiate establishment of the logical link with the offered QoS.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.1.

45.2.1.2.1.2 Test purpose

To test the behaviour of the MS when the network responds to a PDP context activation request with a lower QoS than that requested.

45.2.1.2.1.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

The requested QoS and Minimum QoS are set. A context activation is requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message a ACTIVATE PDP CONTEXT ACCEPT is returned by the SS with a QoS lower than the requested but higher than or equal to the minimum. The SS then sends a MODIFY PDP CONTEXT REQUEST message and the MS shall respond with a MODIFY PDP CONTEXT ACCEPT message to confirm the context is active.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|--|
| 1 | MS | | Initiate a context activation |
| 2 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 3 | SS -> MS | ACTIVATE PDP CONTEXT ACCEPT | Accept a PDP context activation |
| 4 | SS -> MS | MODIFY PDP CONTEXT REQUEST | Send a modify request for the activated context |
| 5 | MS -> SS | MODIFY PDP CONTEXT ACCEPT | Accept the modification request to show context is activated |

Specific message contents

As default except:

Activate PDP Context Request

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | In the range 0-6 |
| Transaction identifier flag | 0 |
| NSAPI | In the range 5-15 |
| Requested LLC SAPI | 3, 5, 9 or 11 |
| Requested QoS | Arbitrarily chosen |

Activate PDP Context Accept

| Information Element | Value/remark |
|-----------------------------|--|
| Transaction identifier | As above |
| Transaction identifier flag | 1 |
| Negotiated LLC SAPI | As above |
| Negotiated QoS | At least one value lower than in above but higher than or equal to minimum |
| Radio priority level | Arbitrarily chosen |
| Spare half octet | 0 |
| PDP address | omitted |

Modify PDP Context Request

| Information Element | Value/remark |
|-----------------------------|--------------|
| Transaction identifier | As above |
| Transaction identifier flag | 1 |
| Radio priority level | As above |
| Spare half octet | 0 |
| Requested LLC SAPI | As above |
| New QoS | As above |

Modify PDP Context Accept

| Information Element | Value/remark |
|-----------------------------|--------------|
| Transaction identifier | As above |
| Transaction identifier flag | 0 |

45.2.1.2.2 QoS Rejected by MS

45.2.1.2.2.1 Conformance requirement

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network.

Upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT offering a QoS which is not acceptable to the mobile, the MS shall initiate the PDP context deactivation procedure.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.1.

45.2.1.2.2.2 Test purpose

To test the behaviour of the MS when the QoS offered by the network in response to a PDP context activation request is not acceptable to the MS.

45.2.1.2.2.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

The requested QoS and Minimum QoS are set. A context activation is requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message an ACTIVATE PDP CONTEXT ACCEPT message is returned by the SS with a QoS lower than the minimum. The MS shall then send a DEACTIVATE PDP CONTEXT REQUEST message. A DEACTIVATE PDP CONTEXT ACCEPT message will be sent in return by the SS.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|-------------------------------------|
| 1 | MS | | Initiate a context activation |
| 2 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 3 | SS -> MS | ACTIVATE PDP CONTEXT ACCEPT | Accept the PDP context activation |
| 4 | MS -> SS | DEACTIVATE PDP CONTEXT REQUEST | Deactivate the PDP context |
| 5 | SS -> MS | DEACTIVATE PDP CONTEXT ACCEPT | Accept the PDP context deactivation |

Specific message contents

As default except:

Activate PDP Context Request

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | In the range 0-6 |
| Transaction identifier flag | 0 |
| NSAPI | In the range 5-15 |
| Requested LLC SAPI | 3, 5, 9 or 11 |
| Requested QoS | Arbitrarily chosen |
| Requested PDP address | Arbitrarily chosen |

Activate PDP Context Accept

| Information Element | Value/remark |
|-----------------------------|---|
| Transaction identifier | As above |
| Transaction identifier flag | 1 |
| Negotiated LLC SAPI | As above |
| Negotiated QoS | At least one value lower than in above and lower than minimum |
| Radio priority level | Arbitrarily chosen |
| Spare half octet | 0 |

Deactivate PDP Context Request

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | As above |
| Transaction identifier flag | 0 |
| SM cause | QoS not acceptable |

Deactivate PDP Context Accept

| Information Element | Value/remark |
|-----------------------------|--------------|
| Transaction identifier | As above |
| Transaction identifier flag | 1 |

45.2.2 PDP context activation requested by the network, successful and unsuccessful

Applicability

This test needs to take into account the number of contexts supported by the MS to be able to test the response when all contexts are activated and the network tries to initiate a new context.

45.2.2.1 Conformance requirement

- 1) Upon receipt of a REQUEST PDP CONTEXT ACTIVATION message:
 - If the MS accepts the request the MS shall then initiate the PDP context activation procedure.
 - If the MS rejects the request, the MS shall send a REQUEST PDP CONTEXT ACTIVATION REJECT message with one of the following causes:
 - #26: insufficient resources;
 - #31: activation rejected, unspecified;
 - #40: feature not supported; or
 - #95 – 111: protocol errors.
- 2) The MS shall not ignore the request.

- 3) If the MS accepts the request, the ACTIVATE PDP CONTEXT REQUEST message sent by the MS shall contain the parameters requested by the network in the REQUEST PDP CONTEXT ACTIVATION message, except for the offered QoS which may be changed by the MS.
- 4) Whenever a REQUEST PDP CONTEXT ACTIVATION message is received by the MS specifying a transaction identifier relating to a PDP context not in state PDP-INACTIVE, the MS shall locally deactivate the old PDP context relating to the received transaction identifier. Furthermore, the MS shall continue with the activation procedure of a new PDP context as indicated in the received message.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.3.1.2, 6.1.3.1.4 and 8.3.2 (f).

45.2.2.2 Test purpose

To test the behaviour of the MS upon receipt of a context activation request from the network.

45.2.2.3 Method of test

Specific PICS statements:

-

PIXIT statements:

- Number of network initiated PDP contexts supported

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Case 1

For an MS that supports PDP Context Activation requested by the network.

Test procedure

A REQUEST PDP CONTEXT ACTIVATION message is sent by the SS. On receipt of the ACTIVATE PDP CONTEXT REQUEST message an ACTIVATE PDP CONTEXT ACCEPT message is returned by the SS. This is repeated until the maximum number of contexts supported by the MS are activated. If the MS cannot support seven PDP contexts then one greater than the maximum supported by the MS should be requested. In response to this activation request the MS shall return a REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-#111. A REQUEST PDP CONTEXT ACTIVATION message is then sent using a currently activated context transaction identifier. The MS shall activate this context in place of the previous context.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|---|
| 1 | SS -> MS | REQUEST PDP CONTEXT ACTIVATION | Request a PDP context activation request |
| 2 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 3 | SS -> MS | ACTIVATE PDP CONTEXT ACCEPT | Accept the PDP context activation |
| 4 | SS | | Steps 1-3 are repeated for Min(number of Network Initiated contexts supported, 7) NOTE: If all 7 contexts are supported steps 5 and 6 should not be performed |
| 5 | SS -> MS | REQUEST PDP CONTEXT ACTIVATION | Request a PDP context activation request |
| 6 | MS -> SS | REQUEST PDP CONTEXT ACTIVATION REJECT | The context activation request is rejected with cause 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-111. |
| 7 | SS -> MS | REQUEST PDP CONTEXT ACTIVATION | Request a PDP context activation request for an existing context |
| 8 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation to replace the existing context |
| 9 | SS -> MS | ACTIVATE PDP CONTEXT ACCEPT | Accept the PDP context activation |

Case 2

For an MS that does not support PDP Context Activation requested by the network.

Test procedure

A REQUEST PDP CONTEXT ACTIVATION message is sent by the SS. The MS shall then send an REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources' or 'feature not supported' or 'activation rejected, unspecified' or 'protocol errors'.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|--|
| 1 | SS -> MS | REQUEST PDP CONTEXT ACTIVATION | Request a PDP context activation request |
| 2 | MS -> SS | REQUEST PDP CONTEXT ACTIVATION REJECT | Reject the PDP context activation request with cause 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-111. |

Specific message contents

As default except:

Request PDP Context Activation

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | In the range 0-6 |
| Transaction identifier flag | 0 |
| Offered PDP address | Arbitrarily chosen |

Activate PDP Context Request

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | As above |
| Transaction identifier flag | 1 |
| NSAPI | In the range 5-15 |
| Requested LLC SAPI | 3, 5, 9 or 11 |
| Requested QoS | Arbitrarily chosen |
| Requested PDP address | As above |

Activate PDP Context Accept

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | As above |
| Transaction identifier flag | 0 |
| Negotiated LLC SAPI | As above |
| Negotiated QoS | As above |
| Radio priority level | Arbitrarily chosen |
| Spare half octet | 0 |

Request PDP Context Activation Reject

| Information Element | Value/remark |
|-----------------------------|--|
| Transaction identifier | As above |
| Transaction identifier flag | 1 |
| PDP address | As above |
| SM cause | 'insufficient resources' or 'feature not supported' or 'activation rejected, unspecified' or 'protocol errors' |

45.2.3 Void

45.2.4 Abnormal cases

45.2.4.1 T3380 Expiry

45.2.4.1.1 Conformance requirement

- 1) On the first expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 2) On the second expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 3) On the third expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 4) On the fourth expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 5) On the fifth expiry of the timer T3380, the MS shall release all resources possibly allocated for this invocation and shall abort the procedure; no automatic PDP context activation re-attempt shall be performed.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.5.

45.2.4.1.2 Test purpose

To test the behaviour of the MS when the network does not reply to PDP CONTEXT ACTIVATION REQUEST

45.2.4.1.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Test procedure

A context activation is requested by the user. The MS shall send the ACTIVATE PDP CONTEXT REQUEST message five times with T3380 ±10 % seconds between each message. After this no further ACTIVATE PDP CONTEXT REQUEST messages shall be sent by the MS.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------|---|
| 1 | MS | | Initiate a context activation |
| 2 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 3 | SS | | T3380 ±10% seconds |
| 4 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 5 | SS | | T3380 ±10% seconds |
| 6 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 7 | SS | | T3380 ±10% seconds |
| 8 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 9 | SS | | T3380 ±10% seconds |
| 10 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 11 | SS | | Wait for T3380 +10% seconds to ensure no further ACTIVATE PDP CONTEXT REQUEST messages are sent by the MS |

Specific message contents

As default except:

Activate PDP Context Request

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | In the range 0-6 |
| Transaction identifier flag | 0 |
| NSAPI | In the range 5-15 |
| Requested LLC SAPI | 3, 5, 9 or 11 |
| Requested QoS | Arbitrarily chosen |
| Requested PDP address | Arbitrarily chosen |

45.2.4.2 Collision of MS initiated and network requested PDP context activation

45.2.4.2.1 Conformance requirement

In the event of collision between MS initiated and network initiated PDP context activation requests, the MS shall discard the REQUEST PDP CONTEXT ACTIVATION message and shall wait for an ACTIVATE PDP CONTEXT ACCEPT message.

Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.5.

45.2.4.2.2 Test purpose

To test the behaviour of the MS when there is a collision between an MS initiated and network requested PDP context activation.

45.2.4.2.3 Method of test

Specific PICS statements:

-

PIXIT statements:

-

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

Case 1

For an MS that supports PDP Context Activation requested by the network.

Test procedure

A context activation is requested by the user. After receipt of the ACTIVATE PDP CONTEXT REQUEST message the SS sends a REQUEST PDP CONTEXT ACTIVATION message followed by an ACTIVATE PDP CONTEXT ACCEPT message in a time less than T3380 (Use T3380/2). The MS shall send no messages within this time.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|--|
| 1 | MS | | Initiate a context activation |
| 2 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 3 | SS -> MS | REQUEST PDP CONTEXT ACTIVATION | Request a PDP context activation request |
| 4 | SS | | Wait for T3380/2 seconds to ensure MS does not resend ACTIVATE PDP CONTEXT REQUEST |
| 5 | SS -> MS | ACTIVATE PDP CONTEXT ACCEPT | Accept the PDP context activation |

Case 2

For an MS that does not support PDP Context Activation requested by the network.

Test procedure

A context activation is requested by the user. After receipt of the ACTIVATE PDP CONTEXT REQUEST message the SS sends a REQUEST PDP CONTEXT ACTIVATION message. The MS shall send a REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources' or 'feature not supported' or 'activation rejected, unspecified' or 'protocol errors'. The SS then sends an ACTIVATE PDP CONTEXT ACCEPT.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------------------|---|
| 1 | MS | | Initiate a context activation |
| 2 | MS -> SS | ACTIVATE PDP CONTEXT REQUEST | Request a PDP context activation |
| 3 | SS -> MS | REQUEST PDP CONTEXT ACTIVATION | Request a PDP context activation request |
| 4 | MS -> SS | REQUEST PDP CONTEXT ACTIVATION REJECT | The context activation request is rejected with cause 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-111. |
| 5 | SS -> MS | ACTIVATE PDP CONTEXT ACCEPT | Accept the PDP context activation |

Specific message contents

As default except:

Activate PDP Context Request

| Information Element | Value/remark |
|-----------------------------|--------------------|
| Transaction identifier | In the range 0-6 |
| Transaction identifier flag | 0 |
| NSAPI | In the range 5-15 |
