INTRODUCCIÓN

La dinámica de la población depende de distintos factores que determinan las características de su crecimiento. Esta dinámica se define por factores asociados a las condiciones individuales y propias de reproducción biológica, de mortalidad y de movilidad territorial; factores determinantes y fundamentales del crecimiento poblacional.

Posterior a la disponibilidad de los datos de los Censos Nacionales XII de Población y VII de Habitación del año 2018, el Instituto Nacional de Estadística realizó el proceso de análisis para la evaluación de los resultados y determinar las características de la evolución demográfica de donde se obtuvieron los insumos fundamentales para la actualización de las estimaciones y proyecciones de población.

El presente documento desarrolla y presenta los aspectos metodológicos básicos utilizados para el análisis de la dinámica demográfica del país y se entregan las **Estimaciones y proyecciones nacionales de población** correspondientes al período 1950 - 2100. El proceso fue elaborado conjuntamente entre el Instituto Nacional de Estadística (INE) y el Centro Latinoamericano y Caribeño de Demografía (CELADE) / División de Población de la Comisión Económica para América Latina y el Caribe (CEPAL), con apoyo del Fondo de Población de las Naciones Unidas (UNFPA).

Los resultados de las estimaciones y proyecciones que se presentan ofrecen datos de la población total por sexo e indicadores de los componentes del cambio demográfico (fecundidad, mortalidad y migración), que han dado lugar a la evolución del volumen y estructura de la población, para el período 1950 - 2100. Además, se da a conocer la desagregación de población total, por sexo y edad, al 30 de junio de cada año para el período 2000 - 2050.

Las nuevas cifras se convierten en insumos fundamentales para la determinación de los cambios en las demandas sociales y la elaboración de políticas, planes y programas en diversos campos del desarrollo.

ANTECEDENTES

A continuación, se exponen algunos hitos importantes en el contexto de elaboración de proyecciones de población para la República de Guatemala, la información disponible permite describir los insumos utilizados y en algunos casos una breve descripción metodológica.

A) Censo 1981

En enero de 1985 se presentaron las proyecciones de población total por sexo y edad para el período 1950 - 2025, el trabajo fue realizado en forma conjunta entre la Dirección General de Estadística y Censos, con la colaboración de la Secretaría General del Consejo Nacional de Planificación Económica (SEGEPLAN) y el Centro Latinoamericano de Demografía (CELADE). Como principales insumos se utilizaron, el IX Censo de Población de 1981 y los censos anteriores, así como las estadísticas vitales disponibles. En ese ejercicio se definió una población base correspondiente a 1950, a partir de la cual se estimó la población para el período 1950 - 1980 y se proyectó hasta el año 2025.¹

B) Censo 1994

En abril de 1997 se presentaron las estimaciones y proyecciones de población por sexo y edad para el período 1950 - 2050, se contó con el apoyo del CELADE. Para el efecto, se utilizaron los resultados del X Censo de Población de 1994, las estadísticas vitales hasta 1993, encuestas sociodemográficas así como la Encuesta Nacional de Salud Materno Infantil (ENSMI), insumos que evidenciaron cambios en las tendencias de la fecundidad, mortalidad y migración hacia el exterior, que se derivó de factores económicos y otros relacionados con el conflicto armado interno.²

C) Censo 2002

En diciembre de 2003 se presentaron las estimaciones y proyecciones de población para el período 1950 - 2050. Los insumos fueron los resultados del XI Censo Nacional de Población de 2002, así como otras fuentes sobre los componentes demográficos, entre ellas: estadísticas vitales hasta 2001, censos de población del período 1950 a 1994, encuestas sociodemográficas, encuestas nacionales de salud materno infantil hasta 2002, y la Encuesta Nacional sobre Emigración Internacional de Guatemaltecos y Remesas Familiares 2002 – 2003; se determinó la tendencia de crecimiento de la población 1950 - 2000, y se plantearon 4 escenarios acerca del curso posible de la población hasta 2050, en conjunto con el CELADE.³

D) Censo 2018

A partir de los resultados del XII Censo Nacional de Población 2018, se contó con información actualizada sobre la estructura y distribución espacial de la población residente en el país, además de las diferentes características demográficas. Con el insumo antes descrito, el Instituto

² Instituto Nacional de Estadística, GT y CELADE (Centro Latinoamericano de Demografía). 1997. Estimaciones y proyecciones de población 1950 – 2050 LC/DEM/R.264. Serie OI No. 116.

³ Instituto Nacional de Estadística, GT y CELADE (Centro Latinoamericano de Demografía). 2003. Estimaciones y proyecciones de población 1950 – 2050. Serie OI. N.o 207.

Nacional de Estadística junto con el Centro Latinoamericano y Caribeño de Demografía, en noviembre de 2019 concluyeron el proceso de conciliación censal, que consiste en la estimación de la omisión censal, así como las estimaciones y proyecciones de población para el período 1950 - 2100.

Los insumos para el proceso de la conciliación censal son los censos de población (período 1950 - 2018), estadísticas vitales hasta el 2018, encuestas nacionales de salud materno infantil y encuestas sociodemográficas. Como información adicional importante para tener parámetros de validación de los resultados obtenidos, se utilizaron registros administrativos del Registro Nacional de Personas (RENAP), de inscripciones del Ministerio de Educación (MINEDUC), y de la Dirección General de Migración.

1. METODOLOGÍA DE LAS ESTIMACIONES Y PROYECCIONES DE POBLACIÓN POR SEXO Y EDADES SIMPLES

Existen varios métodos para la realización de las proyecciones de población a nivel nacional. El CELADE, organismo de las Naciones Unidas, recomienda utilizar el Método de los componentes demográficos. Este implica fórmulas matemáticas, así como técnicas estadísticas y demográficas.

La dinámica demográfica depende esencialmente de las variables de fecundidad, mortalidad y migración. Para analizar y proyectar las poblaciones se utiliza el Método de los componentes demográficos, el cual separa o descompone cada una de estas 3 variables. La técnica fue utilizada para ajustar, corregir, estimar y proyectar la población de Guatemala a partir del 30 de junio de 1950.

El Método de los componentes demográficos permite lograr una mayor coherencia entre la dinámica poblacional estimada y los censos de población. De esta manera se obtiene un período histórico, cuya tendencia de las variables demográficas será la base para las proyecciones de población, como resultado adicional se obtienen estimaciones de la omisión censal.

El método se basa en la ecuación conocida como ecuación compensadora, pero desglosada por sexo y edad. De esta manera se acompaña la evolución de cada cohorte de edad en un determinado punto de partida o año base del estudio durante un determinado período⁴.

$$\text{Ecuación compensadora: } N_{t+1} = N_t + B_{t,t+1} - D_{t,t+1} + I_{t+1} - E_{t+1}$$

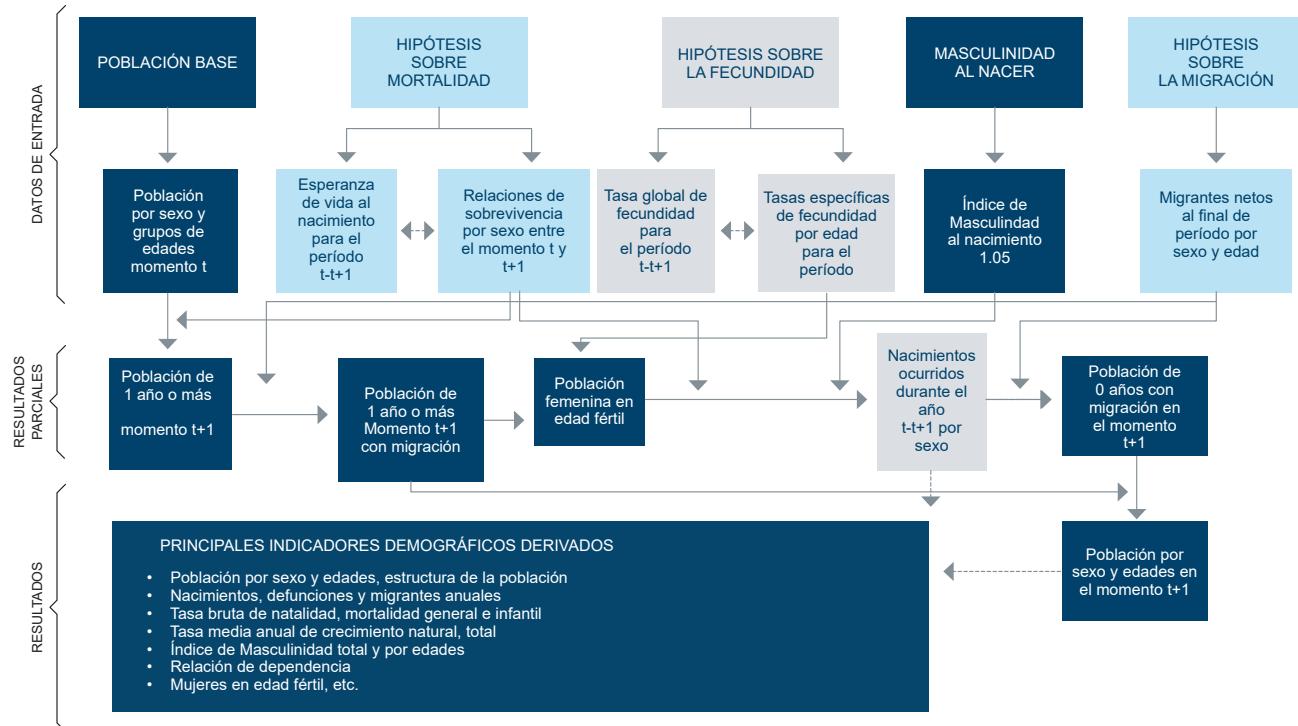

Donde:

- N_{t+1} representa la población estimada por el modelo al 30 de junio del año t+1.
- N_t corresponde a la población estimada al 30 de junio del año t.
- B_{t,t+1} representa los nacimientos ocurridos entre 30 de junio del año t y 30 de junio del año t+1.
- D_{t,t+1} representa las defunciones ocurridas entre 30 de junio del año t y 30 de junio del año t+1.
- I_{t+1} y E_{t+1} representan el total de inmigrantes y de emigrantes estimados entre el 30 de junio del año t y 30 de junio del año t+1.

⁴ Naciones Unidas. CELADE (Centro Latinoamericano y Caribeño de Demografía) / División de Población de la CEPAL, CL. 2011. Observatorio Demográfico N.º 11. Proyecciones de población a largo plazo.

La ecuación compensadora se encuentra supeditada a la disponibilidad de información confiable del área geográfica objeto de proyección, para el caso de Guatemala se contó con series históricas de nacimientos y defunciones provenientes de las estadísticas vitales hasta el año 2018, así como patrones de migración e indicadores demográficos procedentes de fuentes censales y encuestas especializadas.

Esquema 1 Método de los componentes, según Programa de proyecciones de población de las Naciones Unidas

2. POBLACIÓN BASE

Como resultado de la aplicación de la metodología antes descrita, se definió la población base o población inicial de la proyección a partir de la evaluación, conciliación y ajuste de los datos demográficos a nivel nacional, tales como fecundidad, mortalidad y migración. Adicional al proceso de evaluar y ajustar los volúmenes y estructuras de la población censada, el modelo permitió establecer los niveles de omisión de los distintos censos de población realizados durante el período 1950 - 2018.

Se estimó una población de 3,123,095, estimada al 30 de junio de 1950, como población base del período de estimación de la dinámica demográfica (1950 - 2018). Del proceso de conciliación demográfica, se estimó la población base conciliada para el período de proyección, estimada al 30 de junio de 2018 de 16,346,950 personas. De las hipótesis de evolución futura de los componentes demográficos se proyecta la población por año calendario hasta el 2100 (las

proyecciones son al 30 de junio de cada año), con los respectivos indicadores demográficos que permiten hacer una evaluación de tendencias, niveles y estructuras durante el período.

Los datos de la omisión censal como resultado de esta conciliación demográfica se presentan en el siguiente cuadro:

Cuadro 1 Estimación de la omisión censal resultante del proceso de conciliación demográfica

Año censal	Total	Hombres	Mujeres
1950	9.5	9.4	9.7
1964	7.1	7.3	6.8
1973	11.4	11.9	10.8
1981	13.8	14.2	13.4
1994	16.6	17.6	15.6
2002	8.3	9.6	7.0
2018	9.0	10.4	7.6

Fuente: INE. Conciliación censal 2019.

Como se observa, la menor omisión de los eventos censales fue en 1964 y la más alta en 1994. En todos los eventos la omisión es diferencial por sexo; en el Censo 2018, en los hombres fue 10.4% y en las mujeres fue 7.6%. La omisión total fue 9.0%.

El procedimiento aplicado a nivel nacional permitió obtener los datos de omisión por edades. Para el 2018, los resultados se presentan en el siguiente cuadro:

Cuadro 2 Omisión censal estimada por grupos de edad y sexo

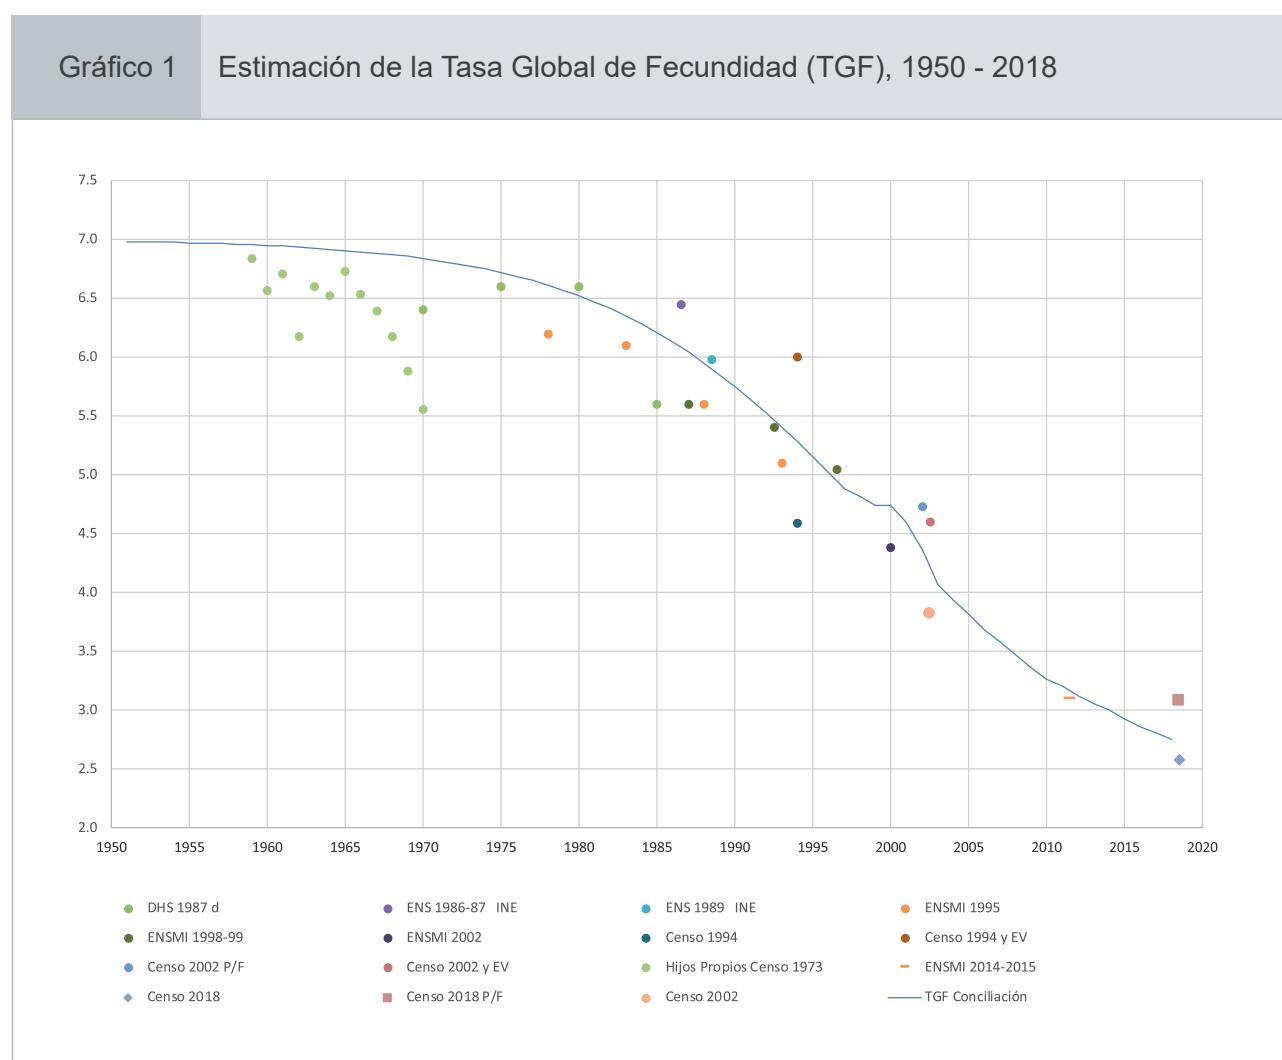

Grupos de edad	Omisión censal estimada		
	Total	Hombres	Mujeres
Total	9.0	10.4	7.6
0 - 4	11.1	12.1	10.1
5 - 14	8.9	9.6	8.2
15 - 29	10.6	13.9	7.4
30 - 49	11.8	13.8	10.1
50 - 64	-1.9	-5.0	0.6
65 y más	-1.2	-4.0	1.1

Fuente: INE. Conciliación censal 2019.

3. ESTIMACIÓN DE LA FECUNDIDAD

Para la estimación del nivel y estructura de la fecundidad a nivel nacional, se llevó a cabo la evaluación entre las estimaciones obtenidas con la información censal 1994, 2002 y 2018 a través del método indirecto P/F propuesto por W. Brass⁵, y las resultantes del método directo considerando los datos de nacidos vivos según la residencia de la madre, proveniente de las estadísticas vitales, series disponibles desde 1986 hasta 2018; como punto de comparación y referencia, también se emplearon fuentes de datos como las Encuestas Nacionales de Salud Materno Infantil (ENSMI) y encuestas sociodemográficas de diferentes períodos.

Con la información disponible se estimaron niveles de fecundidad a través de la metodología de conciliación demográfica, la cual se encuentra representada a través de una línea continua en el siguiente gráfico.

Fuente: INE. Conciliación censal 2019.

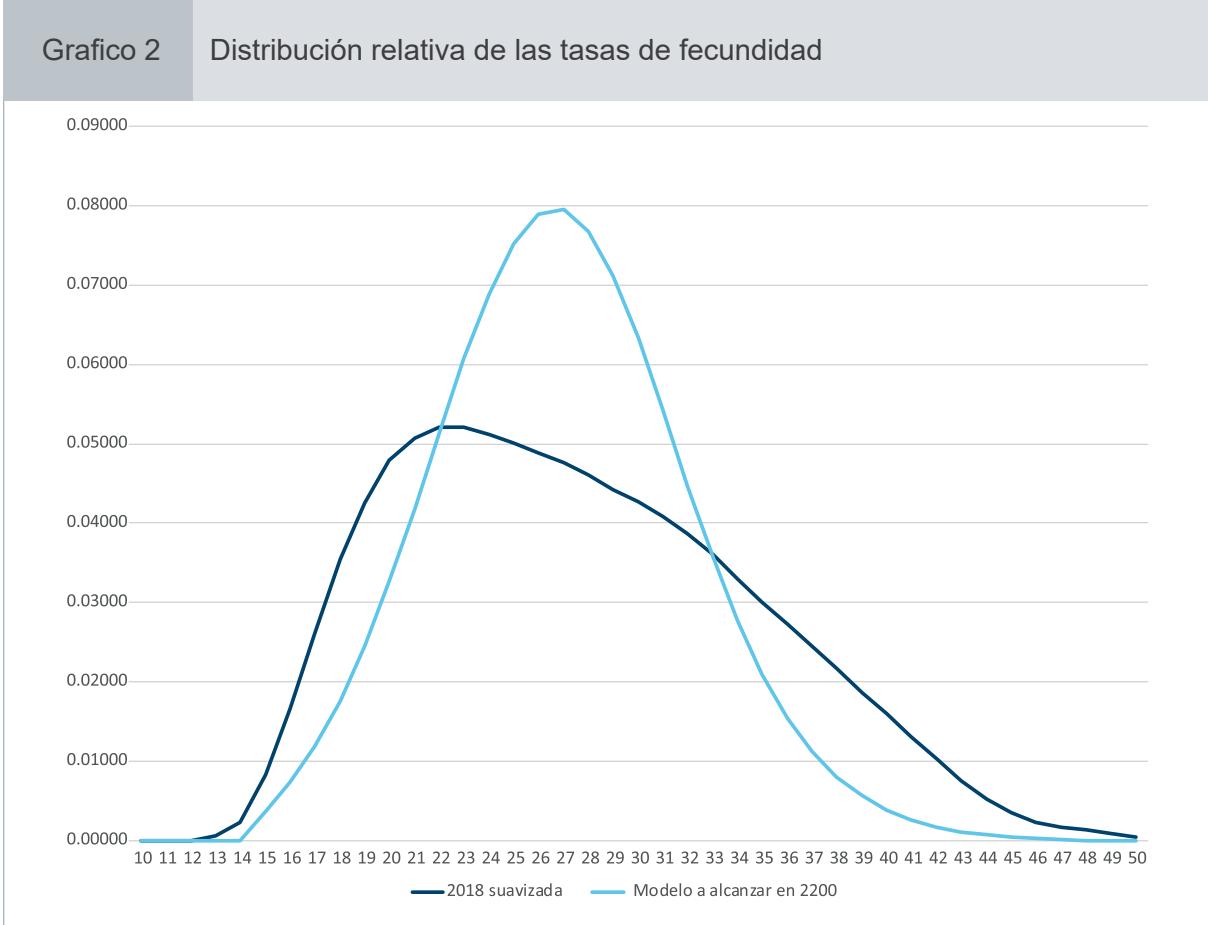

⁵ Naciones Unidas. CELADE (Centro Latinoamericano y Caribeño de Demografía) / División de Población de la CEPAL. 2019. Estimación Indirecta de la Fecundidad por medio del módulo EIF del programa Redatam + SP.

Como se observa en el gráfico anterior, Guatemala ha tenido un descenso sostenido de la fecundidad; en el período 1950 - 1951 fue de 7 hijos por mujer y en el período 2018 - 2019 fue de 2.7 hijos por mujer.

Para determinar la estructura de la fecundidad, se hizo un promedio de las tasas específicas de fecundidad por edades simples de las madres, obtenidas con el Censo 2018 y calculadas con las estadísticas vitales del 2017 y 2018.

Las dos fuentes de información permitieron considerar las tasas específicas de mujeres que normalmente quedan fuera del grupo de mujeres consideradas en edad fértil (15 a 49 años). En el Censo 2018 se preguntó a las mujeres de 10 años o más sobre la cantidad de hijos tenidos vivos, de la misma manera, las estadísticas vitales tienen registros de mujeres que son madres a partir de esa edad. La estructura relativa de las tasas específicas de fecundidad por edades se puede observar en el gráfico siguiente.

Grafico 2 Distribución relativa de las tasas de fecundidad

Fuente: INE. Conciliación censal 2019.

Además de representar la estructura de la fecundidad observada, se muestra una estructura de la fecundidad elegida como modelo, la cual se caracteriza por presentar una fecundidad tardía y como hipótesis se espera que Guatemala alcance la misma estructura en el año 2200, el horizonte lejano implica un cambio lento en la estructura de la fecundidad para el país.

3.1. Proyección del nivel y estructura de la fecundidad

Para proyectar la Tasa Global de Fecundidad (TGF), se utilizó una curva logística que generalmente expresa, en forma satisfactoria, el comportamiento y evolución de la fecundidad en función del tiempo.

Para atender los criterios de evolución de la TGF establecidos por la División de Población de las Naciones Unidas, se definió la función logística que toma como asymptota superior el valor de 7 hijos por mujer y para la asymptota inferior, 1.6 hijos; como pivotes se utilizaron los valores calculados de 4.1 para el 2003 y 2.75 para el 2018, de esta manera se logra mantener el ritmo de descenso de la TGF observada con las estimadas para el período de la proyección. El cuadro siguiente muestra los valores de la TGF proyectados hasta el año 2100.

Cuadro 3		Tasa Global de Fecundidad (TGF), 2020 - 2050	
Período	TGF	Período	TGF
2020 - 2021	2.6	2036 - 2037	1.9
2021 - 2022	2.5	2037 - 2038	1.9
2022 - 2023	2.4	2038 - 2039	1.9
2023 - 2024	2.4	2039 - 2040	1.9
2024 - 2025	2.3	2040 - 2041	1.8
2025 - 2026	2.3	2041 - 2042	1.8
2026 - 2027	2.2	2042 - 2043	1.8
2027 - 2028	2.2	2043 - 2044	1.8
2028 - 2029	2.2	2044 - 2045	1.8
2029 - 2030	2.1	2045 - 2046	1.8
2030 - 2031	2.1	2046 - 2047	1.8
2031 - 2032	2.1	2047 - 2048	1.8
2032 - 2033	2.0	2048 - 2049	1.8
2033 - 2034	2.0	2049 - 2050	1.7
2034 - 2035	2.0	2050 - 2051	1.7
2035 - 2036	1.9		

Fuente: INE. Conciliación censal 2019.

Se puede observar que en el período 2050 – 2051 se espera que la tasa global de fecundidad siga descendiente hasta el nivel mínimo de 1.7 hijos por mujer.

4. ESTIMACIÓN DE LA MORTALIDAD

Para la estimación de la mortalidad se contó con la información de la población censada y de los registros de estadísticas vitales de las defunciones por sexo y edades simples (0 a 100 años y más).

En el caso de la estimación de la mortalidad infantil (menores de un año) y en la niñez (1 a 4 años), por una parte se obtuvo, a través de las aplicaciones de métodos indirectos (con información de hijos nacidos vivos e hijos sobrevivientes), provenientes de los censos de población y encuestas de hogares, y por la otra, estimaciones obtenidas de manera directa, con base a estadísticas vitales (nacimientos y defunciones).

Para la estimación de la mortalidad infantil y en la niñez, con el método indirecto, se realizó con el módulo R+SP EIM⁶, el cual utiliza el procedimiento desarrollado por Brass (1974) y una de sus variantes, la propuesta por Trussell (1975), este método permite determinar las probabilidades de morir desde el nacimiento hasta una edad exacta x , $q(x)$, para $X = 1, 2, 3, 5, 10, 15, 20$ ⁷.

Para la estimación de la mortalidad infantil con el método directo se requirió de la información de defunciones por sexo y edades simples de 0 a 4 años de edad. Para obtener las probabilidades de morir se aplicó el diagrama de Lexis y los factores de separación de Glover.

Con las estimaciones de la mortalidad infantil obtenidas de las diversas fuentes y métodos, se hizo la serie de estimaciones anuales de mortalidad infantil del período 1950 - 2018, que se presentan en el gráfico 3 y en el cuadro 4, también se obtuvieron las estimaciones para la construcción de las tablas de mortalidad en los momentos censales.

Se realizaron estimaciones de la mortalidad para las edades de 0 a 4 años, para lo cual se utilizaron los cálculos de las estimaciones de la mortalidad del Grupo Interagencial de Estimación de la Mortalidad en la Niñez (IGME por sus siglas en inglés)⁸, como referencia y consistencia de los valores obtenidos.

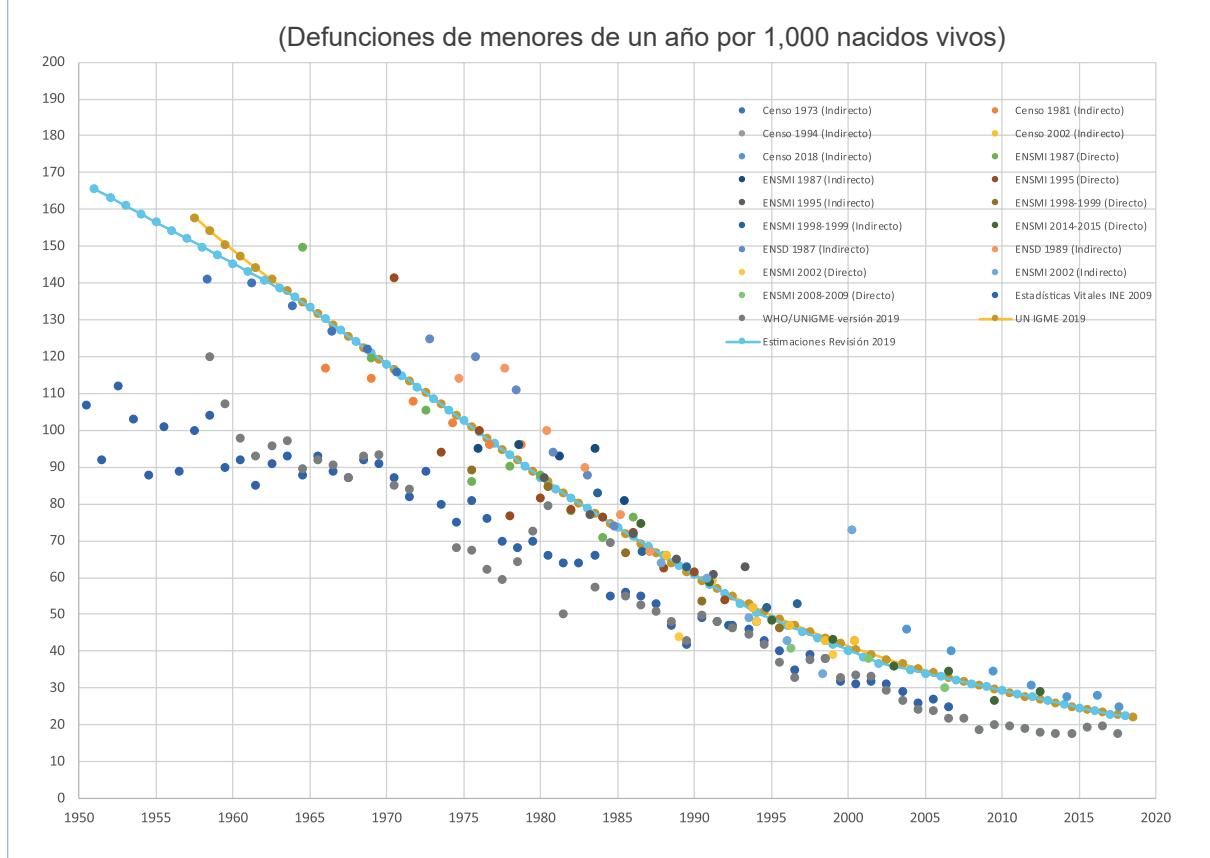

⁶ Naciones Unidas. CELADE (Centro Latinoamericano y Caribeño de Demografía) / División de Población de la CEPAL. Estimación Indirecta de la Mortalidad por medio del módulo EIM del programa Redatam + SP.

Gráfico 3

Tasa de Mortalidad Infantil estimada según diversas fuentes, 1950 - 2018

Fuente: INE. Conciliación censal 2019.

La tasa de mortalidad de los menores de 1 año en 1950 era de 167.8 defunciones por cada 1,000 nacidos vivos, en el año 2002 la tasa desciende a 36.8 y en el 2018 la tasa es de 22.3 defunciones por cada 1,000 nacidos vivos (una reducción del 87% respecto a 1950).

Para la mortalidad adulta, con las defunciones de los años 1950, 1964, 1973, 1981, 1994, 2002 y el promedio de las defunciones de 2017 y 2018, diferenciadas por sexo, y las poblaciones censadas llevadas al 30 de junio de los años censales y al 31 de diciembre de 2017, respectivamente, se obtuvieron las tasas centrales de mortalidad por edades simples de 0 a 100 años y más, las que luego de ser suavizadas y ajustadas, donde se utilizó el método de distribución de las muertes de W. Brass, fueron convertidas en probabilidades de morir específicas por edad. Con este conjunto de probabilidades de morir, se construyeron las tablas de mortalidad por sexo para los años censales. Con estas tablas de mortalidad, mediante interpolación, se obtuvieron las tablas correspondientes a los quinquenios entre 1950 y 2020.

4.1. Proyección del nivel y estructura de la mortalidad

Se estableció una sola hipótesis sobre la tendencia futura de la mortalidad, debe considerarse que es la variable que tiene un comportamiento previsible. Con una función logística⁹, se proyectó la tendencia de la esperanza de vida al nacer, por sexo, como medida del nivel de mortalidad, según los criterios establecidos en la proyección a largo plazo del CELADE. Las asíntotas y pivotes de las logísticas utilizadas en la proyección de la esperanza de vida al nacer por sexo son las siguientes:

Esquema 2		Asíntotas y pivotes utilizados en la proyección de la esperanza de vida al nacer por sexo				
Sexo	Asíntotas		Pivotes			
	Inferior	Superior	Año	Valor	Año	Valor
Hombres	25.0	95.0	2002.5	66.17	2018 .0	69.36
Mujeres	35.0	98.0	2002.5	72.95	2018.0	95.94

Para obtener las tablas de mortalidad proyectadas se utilizó el módulo de Mortalidad del Programa de Proyecciones Demográficas en planillas Excel (PRODEX)¹⁰, como tabla inicial se utilizó la de 1950 y como tabla límite, las tablas modelo de Coale y Demeny, modelo oeste con esperanza de vida de 89.1 años para hombres y 92.4 para mujeres¹¹ y las esperanzas de vida resultantes de la proyección logística. La estructura de la mortalidad por sexo y edad, para cada año de la proyección, se calculó interpolando entre los valores de las tablas de mortalidad del año 2000 y las tablas límite del CELADE, de acuerdo con las esperanzas de vida al nacer, estimadas previamente, mediante el uso del PRODEX.

El cuadro siguiente muestra los valores de la Tasa de Mortalidad Infantil del período 2020 - 2050.

Cuadro 4		Tasa de Mortalidad Infantil, 2020 - 2050		
Período	Mortalidad infantil	Período	Mortalidad infantil	
2020 - 2021	22.0	2036 - 2037		19.6
2021 - 2022	21.9	2037 - 2038		19.5
2022 - 2023	21.7	2038 - 2039		19.4
2023 - 2024	21.6	2039 - 2040		19.2
2024 - 2025	21.4	2040 - 2041		19.1
2025 - 2026	21.3	2041 - 2042		18.9
2026 - 2027	21.1	2042 - 2043		18.8
2027 - 2028	21.0	2043 - 2044		18.7
2028 - 2029	20.8	2044 - 2045		18.5
2029 - 2030	20.7	2045 - 2046		18.4
2030 - 2031	20.5	2046 - 2047		18.2
2031 - 2032	20.4	2047 - 2048		18.1
2032 - 2033	20.2	2048 - 2049		18.0
2033 - 2034	20.1	2049 - 2050		17.8
2034 - 2035	19.9	2050 - 2051		17.7
2035 - 2036	19.8

5. ESTIMACIÓN DE LA MIGRACIÓN INTERNACIONAL

Para determinar los saldos netos migratorios internacionales que permiten evaluar el volumen y estructura de la migración internacional, se consideró la información proveniente de:

- A) Datos del Censo 2018 sobre inmigrantes y emigrantes internacionales.
- B) Datos del Proyecto de Investigación de la Migración Internacional en Latinoamérica (IMILA) del CELADE, sobre población nacida en Guatemala, censada en otros países.
- C) Datos sobre guatemaltecos censados en Estados Unidos de Norteamérica en 1990, 2000 y 2010.

Con las estimaciones obtenidas y en el proceso de conciliación censal se estimaron los saldos migratorios netos por sexo y edad para cada año de la estimación, los resultados se presentan en el gráfico siguiente.

Gráfico 4 Saldo migratorio, 1950 - 2020

Fuente: INE. Conciliación censal 2019.

El análisis de la información disponible pone en evidencia que la salida de personas del país, sobre todo hacia Estados Unidos, México y Canadá, se convirtió en un fenómeno creciente, especialmente en el período 1970 - 2000. Guatemala se caracteriza por ser un país con saldo migratorio negativo (mayor número de emigrantes que de inmigrantes), y la población masculina es la de más alta migración, con una estructura migratoria diferencial por edades; esto significa mayor emigración de jóvenes adultos.

5.1. Proyección de la migración internacional

Para efectos de la proyección de la migración internacional se plantea una hipótesis de saldo migratorio neto decreciente a partir del año 2015 y una mayor igualdad en la composición por sexo y edad de los saldos migratorios.

6.

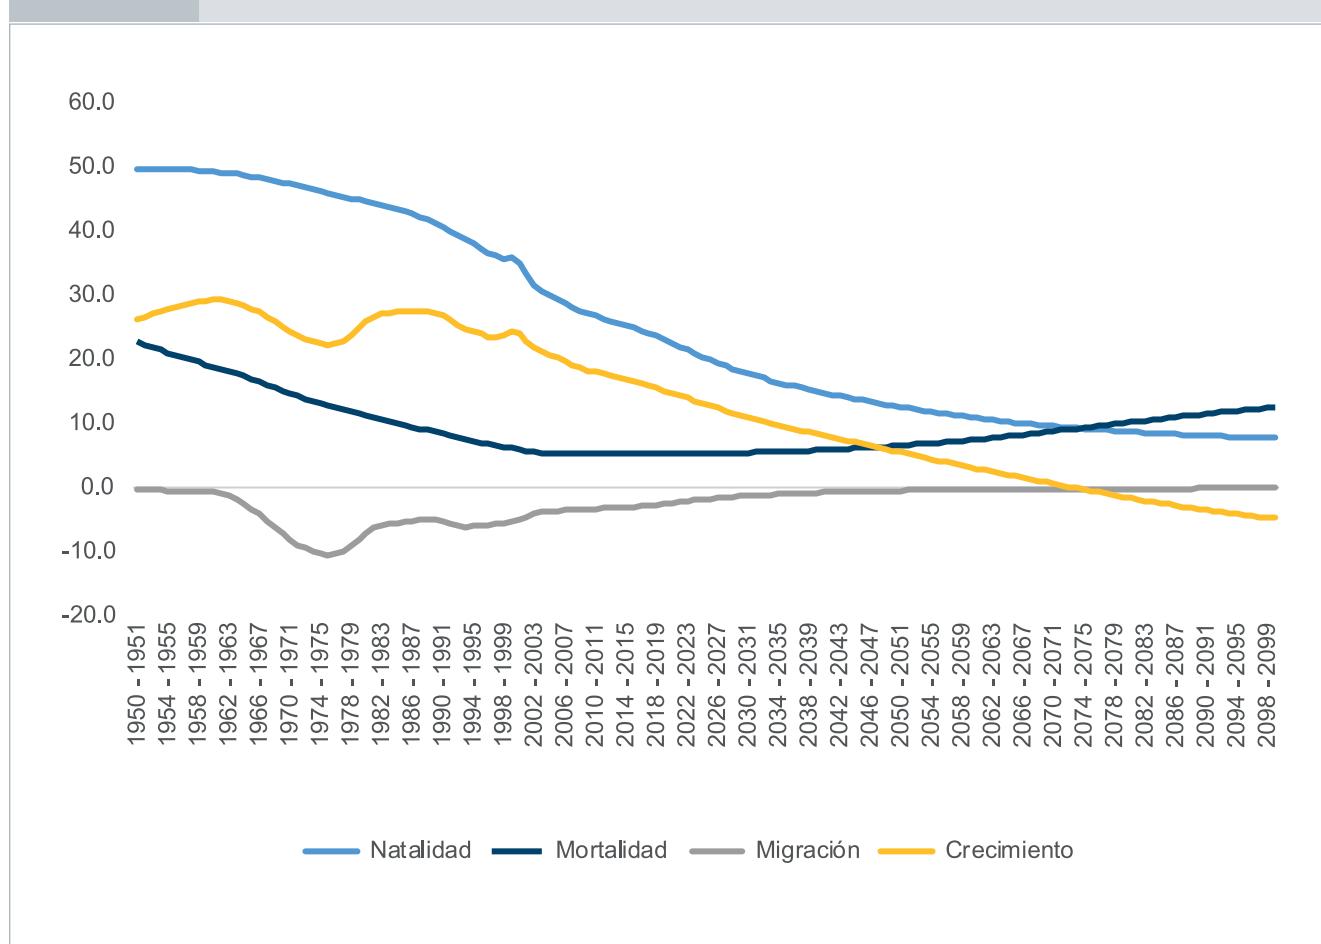

RESULTADOS DE LA ESTIMACIÓN Y PROYECCIÓN DE LA POBLACIÓN

La República de Guatemala es un país que aún se encuentra en una etapa moderada de la transición demográfica, presenta un descenso lento de la mortalidad y natalidad. Esta particularidad se resume en una población con crecimiento de alto a moderado y estructura de población joven. A medida que se avance en el proceso de la transición demográfica, se tendrá un menor crecimiento y será evidente un cambio en la estructura de la población. No se puede dejar de mencionar que la migración influye con el ritmo de cambio en este proceso.

En el siguiente gráfico se presentan las tendencias históricas y lo proyectado de la evolución de las variables demográficas hasta el año 2100.

Gráfico 5

Evolución histórica de las variables demográficas, 1950 - 2100

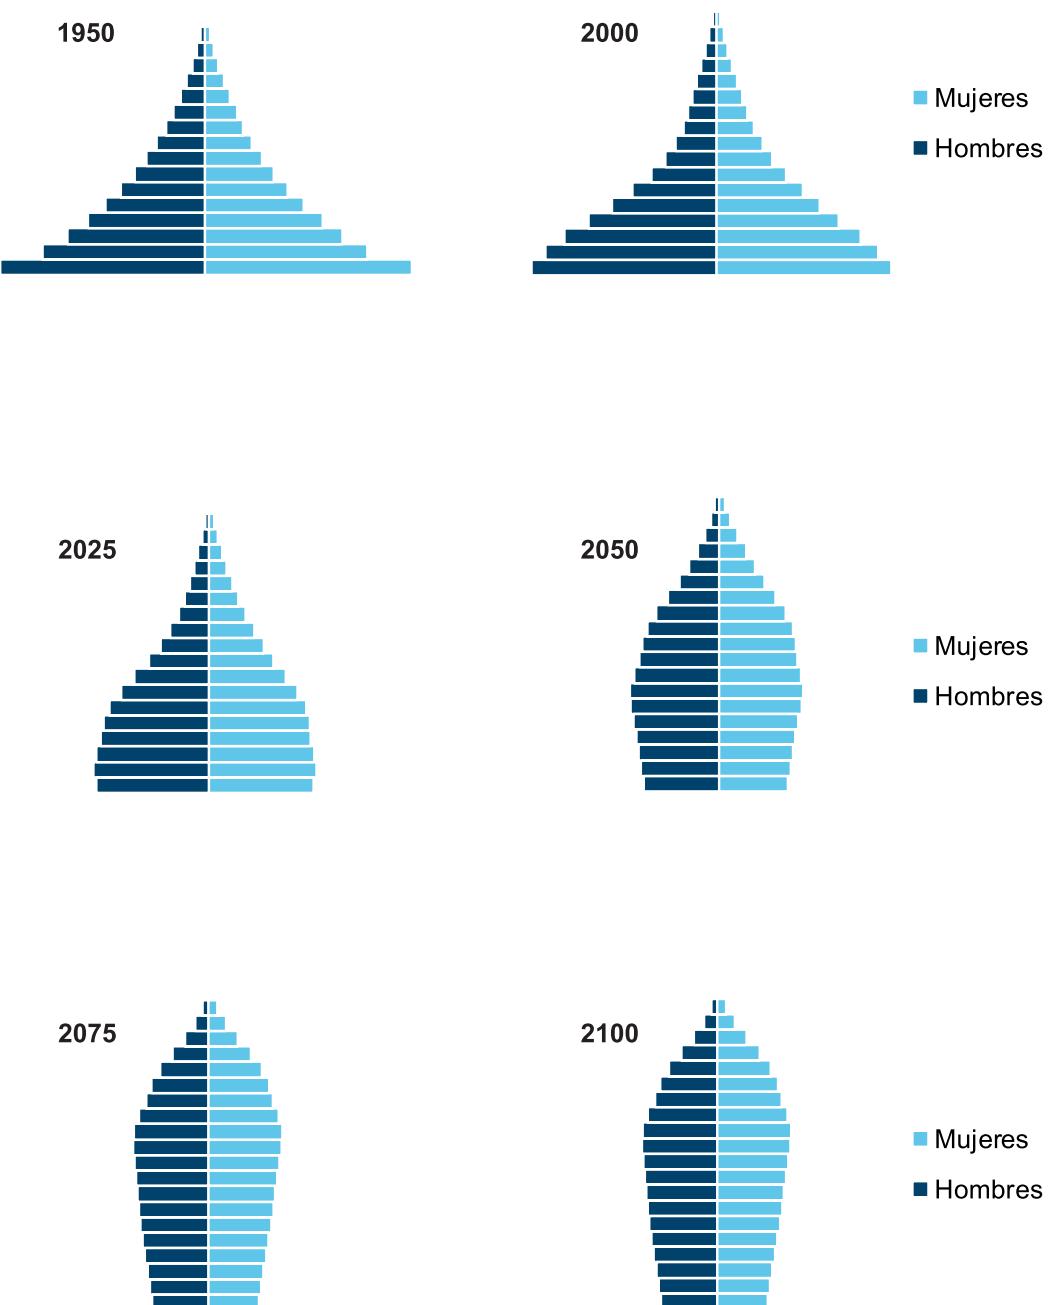

Fuente: INE. Conciliación censal 2019.

En el gráfico anterior se presentan las estructuras por sexo y edad a lo largo de 100 años, transcurridos desde 1950 y los cambios que se espera que sucederán hasta el 2100.

El cambio en las estructuras de la población por sexo y edad puede observarse en el gráfico siguiente. En el anexo se presentan los resultados de la estimación y proyección de la población por sexo, edades simples y grupos de edad para el período 2000 - 2050, así como los componentes del cambio, mortalidad, fecundidad y migración internacional.
