

Unified Emoji Reference

Peter Edberg, Oct. 25, 2011 (updated Oct 28, 2011)

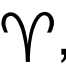

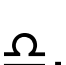

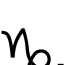

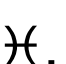

The following table lists the 114 emoji from the core set that were mapped to (unified with) characters or sequences of characters that existed in Unicode 5.2 or earlier.

Within a row, the first three columns give the SJIS code and glyph for each carrier's representation (if any) of an emoji character mapped to the Unicode character or sequence shown column 6 (fallback mappings to a carrier's set are not shown). For mappings to single Unicode characters, column 5 shows the glyph for that Unicode character as shown in the Unicode 6.0 charts.

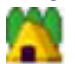

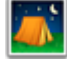

Finally, column 4 suggests the variety of glyphs that may be used on a single platform (here Mac OS X Lion) to represent the Unicode character or sequence. Glyphs shown before the comma (if any) are from standard non-emoji-specific fonts (typically Apple Symbols, Zapf Dingbats, or a Japanese font from the Hiragino family). Glyphs shown after the comma (if any) are from the emoji-specific Apple Color Emoji font. If there is no glyph after the comma, the Unicode character/sequence is always represented using a glyph from one of the standard fonts. If there is "(n/a)" after the comma, that character is also not capable of being entered from the emoji keyboard in iOS 5.0. Two of the characters have no glyph in any font, and are marked "(n/a)".
